 label="Right" icon="icons/alR.png" onclick="setAlign('right')">
<menuitem type="separator">
<menuitem command="publish" disabled>
```

```

<hr>
<menuitem type="command" disabled
 label="Publish" icon="icons/pub.png" onclick="publish()">
</menu>

```

## 4.11.5 Context menus

### 4.11.5.1 Declaring a context menu

The `contextmenu` attribute gives the element's context menu. The value must be the `IDp51` of a `menup571` element in the same `home subtreep42` whose `typep572` attribute is in the `popup menup572` state.

**Note** When a user right-clicks on an element with a `contextmenup577` attribute, the user agent will first fire a `contextmenup1144` event at the element, and then, if that event is not canceled, a `showp1145` event at the `menup571` element.

#### Example

Here is an example of a context menu for an input control:

```

<form name="npc">
 <label>Character name: <input name=char type=text contextmenu=namemenu required></label>
 <menu type=popup id=namemenu>
 <menuitem label="Pick random name" onclick="document.forms.npc.elements.char.value =
getRandomName ()">
 <menuitem label="Prefill other fields based on name"
onclick="prefillFields (document.forms.npc.elements.char.value)">
 </menu>
</form>

```

This adds two items to the control's context menu, one called "Pick random name", and one called "Prefill other fields based on name". They invoke scripts that are not shown in the example above.

### 4.11.5.2 Processing model

Each element has an **assigned context menu**, which can be null. If an element A has a `contextmenup577` attribute, and there is an element with the ID given by A's `contextmenup577` attribute's value in A's `home subtreep42`, and the first such element in `tree orderp42` is a `menup571` element whose `typep572` attribute is in the `popup menup572` state, then A's **assigned context menu<sup>p577</sup>** is that element. Otherwise, if A has a parent element, then A's **assigned context menu<sup>p577</sup>** is the **assigned context menu<sup>p577</sup>** of its parent element. Otherwise, A's **assigned context menu<sup>p577</sup>** is null.

When an element's context menu is requested (e.g. by the user right-clicking the element, or pressing a context menu key), the user agent must apply the appropriate rules from the following list:

#### ↪ If the user requested a context menu using a pointing device

The user agent must `firep43` a `trustedp43` event with the name `contextmenup1144`, that bubbles and is cancelable, and that uses the `MouseEventp51` interface, at the element for which the menu was requested. The context information of the event must be initialised to the same values as the last `MouseEventp51` user interaction event that was fired as part of the gesture that was interpreted as a request for the context menu.

#### ↪ Otherwise

The user agent must `fire a synthetic mouse event named contextmenup846 that bubbles and is cancelable at the element for which the menu was requested.`

**Note** Typically, therefore, the firing of the `contextmenup1144` event will be the default action of a `mouseupp52` or `keyupp52` event. The exact sequence of events is UA-dependent, as it will vary based on platform conventions.

The default action of the `contextmenup1144` event depends on whether or not the element for which the menu was requested has a non-null `assigned context menup577` when the event dispatch has completed, as follows.

If the [assigned context menu](#)<sup>p577</sup> of the element for which the menu was requested is null, the default action must be for the user agent to show its default context menu, if it has one.

Otherwise, let *subject* be the element for which the menu was requested, and let *menu* be the [assigned context menu](#)<sup>p577</sup> of *target* immediately after the [contextmenu](#)<sup>p1144</sup> event's dispatch has completed. The user agent must [fire](#)<sup>p43</sup> a [trusted](#)<sup>p43</sup> event with the name [show](#)<sup>p1145</sup> at *menu*, using the [RelatedEvent](#)<sup>p579</sup> interface, with the [relatedTarget](#)<sup>p579</sup> attribute initialised to *subject*. The event must be cancelable.

If *this* event (the [show](#)<sup>p1145</sup> event) is not canceled, then the user agent must [build and show](#)<sup>p572</sup> the menu for *menu* with *subject* as the subject.

The user agent may also provide access to its default context menu, if any, with the context menu shown. For example, it could merge the menu items from the two menus together, or provide the page's context menu as a submenu of the default menu. In general, user agents are encouraged to de-emphasise their own contextual menu items, so as to give the author's context menu the appearance of legitimacy — to allow documents to feel like "applications" rather than "mere Web pages".

User agents may provide means for bypassing the context menu processing model, ensuring that the user can always access the UA's default context menus. For example, the user agent could handle right-clicks that have the Shift key depressed in such a way that it does not fire the [contextmenu](#)<sup>p1144</sup> event and instead always shows the default context menu.

The [contextMenu](#) IDL attribute must [reflect](#)<sup>p88</sup> the [contextmenu](#)<sup>p577</sup> content attribute.

### Example

In this example, an image of cats is given a context menu with four possible commands:

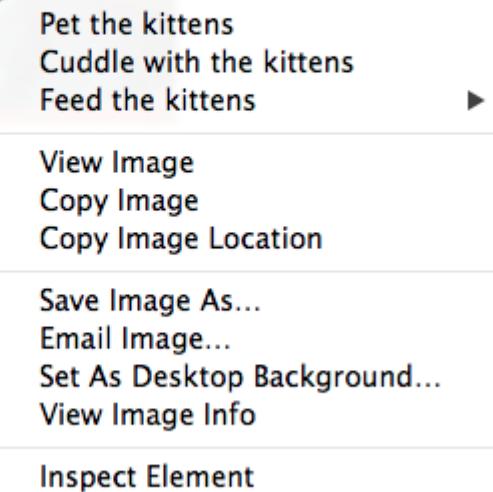

```

<menu type="popup" id="catsmenu">
 <MenuItem label="Pet the kittens" onclick="kittens.pet()">
 <MenuItem label="Cuddle with the kittens" onclick="kittens.cuddle()">
 <menu label="Feed the kittens">
 <MenuItem label="Fish" onclick="kittens.feed(fish)">
 <MenuItem label="Chicken" onclick="kittens.feed(chicken)">
 </menu>
</menu>
```

When a user of a mouse-operated visual Web browser right-clicks on the image, the browser might pop up a context menu like this:

When the user clicks the disclosure triangle, such a user agent would expand the context menu in place, to show the browser's own commands:

#### 4.11.5.3 The `RelatedEvent`<sup>p579</sup> interfaces

IDL

```
[Constructor(DOMString type, optional RelatedEventInit eventInitDict)]
interface RelatedEvent : Event {
 readonly attribute EventTarget? relatedTarget;
};

dictionary RelatedEventInit : EventInit {
 EventTarget? relatedTarget;
};
```

Note

`event.relatedTarget`<sup>p579</sup>

Returns the other event target involved in this event. For example, when a `show`<sup>p145</sup> event fires on a `menu`<sup>p571</sup> element, the other event target involved in the event would be the element for which the menu is being shown.

The `relatedTarget` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the other event target that is related to the event.

#### 4.11.6 Commands

##### 4.11.6.1 Facets

A **command** is the abstraction behind menu items, buttons, and links. Once a command is defined, other parts of the interface can refer to the same command, allowing many access points to a single feature to share facets such as the `Disabled State`<sup>p580</sup>.

Commands are defined to have the following **facets**:

## Type

The kind of command: "command", meaning it is a normal command; "radio", meaning that triggering the command will, amongst other things, set the [Checked State<sup>p580</sup>](#) to true (and probably uncheck some other commands); or "checkbox", meaning that triggering the command will, amongst other things, toggle the value of the [Checked State<sup>p580</sup>](#).

## ID

The name of the command, for referring to the command from the markup or from script. If a command has no ID, it is an **anonymous command**.

## Label

The name of the command as seen by the user.

## Hint

A helpful or descriptive string that can be shown to the user.

## Icon

An [absolute URL<sup>p48</sup>](#) identifying a graphical image that represents the action. A command might not have an Icon.

## Access Key

A key combination selected by the user agent that triggers the command. A command might not have an Access Key.

## Hidden State

Whether the command is hidden or not (basically, whether it should be shown in menus).

## Disabled State

Whether the command is relevant and can be triggered or not.

## Checked State

Whether the command is checked or not.

## Action

The actual effect that triggering the command will have. This could be a scripted event handler, a [URL<sup>p48</sup>](#) to which to [navigate<sup>p791</sup>](#), or a form submission.

These facets are exposed on elements using the **command API**:

### Note

`element . commandTypep581`

Exposes the [Type<sup>p580</sup>](#) facet of the command.

`element . idp51`

Exposes the [ID<sup>p580</sup>](#) facet of the command.

`element . commandLabelp581`

Exposes the [Label<sup>p580</sup>](#) facet of the command.

`element . titlep123`

Exposes the [Hint<sup>p580</sup>](#) facet of the command.

`element . commandIconp581`

Exposes the [Icon<sup>p580</sup>](#) facet of the command.

`element . accessKeyLabelp739`

Exposes the [Access Key<sup>p580</sup>](#) facet of the command.

`element . commandHiddenp581`

Exposes the [Hidden State<sup>p580</sup>](#) facet of the command.

`element . commandDisabledp581`

Exposes the [Disabled State<sup>p580</sup>](#) facet of the command.

`element.commandCheckedp581`

Exposes the [Checked State<sup>p580</sup>](#) facet of the command.

`element.clickp725()`

Triggers the [Action<sup>p580</sup>](#) of the command.

The [commandType](#) attribute must return a string whose value is either "command", "radio", or "checkbox", depending on whether the [Type<sup>b580</sup>](#) of the command defined by the element is "command", "radio", or "checkbox" respectively. If the element does not define a command, it must return null.

The [commandLabel](#) attribute must return the command's [Label<sup>p580</sup>](#), or null if the element does not define a command or does not specify a [Label<sup>p580</sup>](#).

The [commandIcon](#) attribute must return the [absolute URL<sup>p48</sup>](#) of the command's [Icon<sup>p580</sup>](#). If the element does not specify an icon, or if the element does not define a command, then the attribute must return null.

The [commandHidden](#) attribute must return true if the command's [Hidden State<sup>p580</sup>](#) is that the command is hidden, and false if the command is not hidden. If the element does not define a command, the attribute must return null.

The [commandDisabled](#) attribute must return true if the command's [Disabled State<sup>p580</sup>](#) is that the command is disabled, and false if the command is not disabled. This attribute is not affected by the command's [Hidden State<sup>p580</sup>](#). If the element does not define a command, the attribute must return null.

The [commandChecked](#) attribute must return true if the command's [Checked State<sup>p580</sup>](#) is that the command is checked, and false if it is that the command is not checked. If the element does not define a command, the attribute must return null.

**Note** *The [ID<sup>p580</sup>](#) facet is exposed by the [id<sup>p51</sup>](#) IDL attribute, the [Hint<sup>p580</sup>](#) facet is exposed by the [title<sup>p123</sup>](#) IDL attribute, and the [AccessKey<sup>p580</sup>](#) facet is exposed by the [accessKeyLabel<sup>p739</sup>](#) IDL attribute.*

**Note**

`document.commandsp581`

Returns an [HTMLCollection<sup>p51</sup>](#) of the elements in the [Document<sup>p102</sup>](#) that define commands and have IDs.

The [commands](#) attribute of the document's [Document<sup>p102</sup>](#) interface must return an [HTMLCollection<sup>p51</sup>](#) rooted at the [Document<sup>p102</sup>](#) node, whose filter matches only elements that [define commands<sup>p579</sup>](#) and have [IDs<sup>p580</sup>](#).

User agents may expose the [commands<sup>p579</sup>](#) that match the following criteria:

- The [Hidden State<sup>p580</sup>](#) facet is false (visible)
- The element is [in a Document<sup>p42</sup>](#) that has an associated [browsing context<sup>p762</sup>](#).
- Neither the element nor any of its ancestors has a [hidden<sup>p723</sup>](#) attribute specified.
- The element is not a [menuitem<sup>p574</sup>](#) element, or it is a child of a [currently relevant menu element<sup>p572</sup>](#), or it has an [Access Key<sup>p580</sup>](#).

User agents are encouraged to do this especially for commands that have [Access Keys<sup>p580</sup>](#), as a way to advertise those keys to the user.

**Example** For example, such commands could be listed in the user agent's menu bar.

#### 4.11.6.2 Using the `a` element to define a command

An [a<sup>p208</sup>](#) element with an [href<sup>p245</sup>](#) attribute [defines a command<sup>p579</sup>](#).

The [Type<sup>b580</sup>](#) of the command is "command".

The [ID](#)<sup>p580</sup> of the command is the value of the [id](#)<sup>p122</sup> attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#)<sup>p580</sup>.

The [Label](#)<sup>p580</sup> of the command is the string given by the element's [textContent](#)<sup>p51</sup> IDL attribute.

The [Hint](#)<sup>p580</sup> of the command is the value of the [title](#)<sup>p122</sup> attribute of the element. If the attribute is not present, the [Hint](#)<sup>p580</sup> is the empty string.

The [Icon](#)<sup>p580</sup> of the command is the [absolute URL](#)<sup>p48</sup> obtained from [resolving](#)<sup>p82</sup> the value of the [src](#)<sup>p273</sup> attribute of the first [img](#)<sup>p272</sup> element descendant of the element in [tree order](#)<sup>p42</sup>, relative to that element, if there is such an element and resolving its attribute is successful. Otherwise, there is no [Icon](#)<sup>p580</sup> for the command.

The [AccessKey](#)<sup>p580</sup> of the command is the element's [assigned access key](#)<sup>p739</sup>, if any.

The [Hidden State](#)<sup>p580</sup> of the command is true (hidden) if the element has a [hidden](#)<sup>p723</sup> attribute, and false otherwise.

The [Disabled State](#)<sup>p580</sup> facet of the command is true if the element or one of its ancestors is [inert](#)<sup>p724</sup>, and false otherwise.

The [Checked State](#)<sup>p580</sup> of the command is always false. (The command is never checked.)

The [Action](#)<sup>p580</sup> of the command, if the element has a defined [activation behaviour](#)<sup>p725</sup>, is to [run synthetic click activation steps](#)<sup>p724</sup> on the element. Otherwise, it is just to [fire a click event](#)<sup>p846</sup> at the element.

#### 4.11.6.3 Using the `button` element to define a command

A [button](#)<sup>p495</sup> element always [defines a command](#)<sup>p579</sup>.

The [Type](#)<sup>p580</sup>, [ID](#)<sup>p580</sup>, [Label](#)<sup>p580</sup>, [Hint](#)<sup>p580</sup>, [Icon](#)<sup>p580</sup>, [Access Key](#)<sup>p580</sup>, [Hidden State](#)<sup>p580</sup>, [Checked State](#)<sup>p580</sup>, and [Action](#)<sup>p580</sup> facets of the command are determined [as for a elements](#)<sup>p581</sup> (see the previous section).

The [Disabled State](#)<sup>p580</sup> of the command is true if the element or one of its ancestors is [inert](#)<sup>p724</sup>, or if the element's [disabled](#)<sup>p530</sup> state is set, and false otherwise.

#### 4.11.6.4 Using the `input` element to define a command

An [input](#)<sup>p452</sup> element whose [type](#)<sup>p454</sup> attribute is in one of the [Submit Button](#)<sup>p478</sup>, [Reset Button](#)<sup>p481</sup>, [Image Button](#)<sup>p479</sup>, [Button](#)<sup>p482</sup>, [Radio Button](#)<sup>p475</sup>, or [Checkbox](#)<sup>p475</sup> states [defines a command](#)<sup>p579</sup>.

The [Type](#)<sup>p580</sup> of the command is "radio" if the [type](#)<sup>p454</sup> attribute is in the [Radio Button](#)<sup>p475</sup> state, "checkbox" if the [type](#)<sup>p454</sup> attribute is in the [Checkbox](#)<sup>p475</sup> state, and "command" otherwise.

The [ID](#)<sup>p580</sup> of the command is the value of the [id](#)<sup>p122</sup> attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#)<sup>p580</sup>.

The [Label](#)<sup>p580</sup> of the command depends on the Type of the command:

If the [Type](#)<sup>p580</sup> is "command", then it is the string given by the [value](#)<sup>p457</sup> attribute, if any, and a UA-dependent, locale-dependent value that the UA uses to label the button itself if the attribute is absent.

Otherwise, the [Type](#)<sup>p580</sup> is "radio" or "checkbox". If the element is a [labeled control](#)<sup>p451</sup>, the [textContent](#)<sup>p51</sup> of the first [label](#)<sup>p451</sup> element in [tree order](#)<sup>p42</sup> whose [labeled control](#)<sup>p451</sup> is the element in question is the [Label](#)<sup>p580</sup> (in DOM terms, this is the string given by `element.labels[0].textContent`). Otherwise, the value of the [value](#)<sup>p457</sup> attribute, if present, is the [Label](#)<sup>p580</sup>. Otherwise, the [Label](#)<sup>p580</sup> is the empty string.

The [Hint](#)<sup>p580</sup> of the command is the value of the [title](#)<sup>p122</sup> attribute of the [input](#)<sup>p452</sup> element. If the attribute is not present, the [Hint](#)<sup>p580</sup> is the empty string.

If the element's [type](#)<sup>p454</sup> attribute is in the [Image Button](#)<sup>p479</sup> state, and the element has a [src](#)<sup>p273</sup> attribute, and that attribute's value can be successfully [resolved](#)<sup>p82</sup> relative to the element, then the [Icon](#)<sup>p580</sup> of the command is the [absolute URL](#)<sup>p48</sup> obtained from resolving that attribute that way. Otherwise, there is no [Icon](#)<sup>p580</sup> for the command.

The [AccessKey](#)<sup>p580</sup> of the command is the element's [assigned access key](#)<sup>p739</sup>, if any.

The [Hidden State](#)<sup>p580</sup> of the command is true (hidden) if the element has a [hidden](#)<sup>p723</sup> attribute, and false otherwise.

The [Disabled State](#)<sup>p580</sup> of the command is true if the element or one of its ancestors is [inert](#)<sup>p724</sup>, or if the element's [disabled](#)<sup>p530</sup> state is set, and false otherwise.

The [Checked State](#)<sup>p580</sup> of the command is true if the command is of [Type](#)<sup>p580</sup> "radio" or "checkbox" and the element is [checked](#)<sup>p527</sup> attribute, and false otherwise.

The [Action](#)<sup>p580</sup> of the command, if the element has a defined [activation behaviour](#)<sup>p725</sup>, is to [run synthetic click activation steps](#)<sup>p724</sup> on the element. Otherwise, it is just to [fire a click event](#)<sup>p846</sup> at the element.

#### 4.11.6.5 Using the `option` element to define a command

An [option](#)<sup>p505</sup> element with an ancestor [select](#)<sup>p498</sup> element and either no [value](#)<sup>p506</sup> attribute or a [value](#)<sup>p506</sup> attribute that is not the empty string [defines a command](#)<sup>p579</sup>.

The [Type](#)<sup>p580</sup> of the command is "radio" if the [option](#)<sup>p505</sup>'s nearest ancestor [select](#)<sup>p498</sup> element has no [multiple](#)<sup>p499</sup> attribute, and "checkbox" if it does.

The [ID](#)<sup>p580</sup> of the command is the value of the [id](#)<sup>p122</sup> attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#)<sup>p580</sup>.

The [Label](#)<sup>p580</sup> of the command is the value of the [option](#)<sup>p505</sup> element's [label](#)<sup>p506</sup> attribute, if there is one, or else the value of [option](#)<sup>p505</sup> element's [textContent](#)<sup>p51</sup> IDL attribute, with [leading and trailing whitespace stripped](#)<sup>p59</sup>, and with any sequences of two or more [space characters](#)<sup>p58</sup> replaced by a single U+0020 SPACE character.

The [Hint](#)<sup>p580</sup> of the command is the string given by the element's [title](#)<sup>p122</sup> attribute, if any, and the empty string if the attribute is absent.

There is no [Icon](#)<sup>p580</sup> for the command.

The [AccessKey](#)<sup>p580</sup> of the command is the element's [assigned access key](#)<sup>p739</sup>, if any.

The [Hidden State](#)<sup>p580</sup> of the command is true (hidden) if the element has a [hidden](#)<sup>p723</sup> attribute, and false otherwise.

The [Disabled State](#)<sup>p580</sup> of the command is true if the element is [disabled](#)<sup>p506</sup>, or if its nearest ancestor [select](#)<sup>p498</sup> element is [disabled](#)<sup>p530</sup>, or if it or one of its ancestors is [inert](#)<sup>p724</sup>, and false otherwise.

The [Checked State](#)<sup>p580</sup> of the command is true (checked) if the element's [selectedness](#)<sup>p507</sup> is true, and false otherwise.

The [Action](#)<sup>p580</sup> of the command depends on its [Type](#)<sup>p580</sup>. If the command is of [Type](#)<sup>p580</sup> "radio" then it must [pick](#)<sup>p499</sup> the [option](#)<sup>p505</sup> element. Otherwise, it must [toggle](#)<sup>p500</sup> the [option](#)<sup>p505</sup> element.

#### 4.11.6.6 Using the `menuitem` element to define a command

A [menuitem](#)<sup>p574</sup> element that does not have a [command](#)<sup>p575</sup> attribute [defines a command](#)<sup>p579</sup>.

The [Type](#)<sup>p580</sup> of the command is "radio" if the [menuitem](#)<sup>p574</sup>'s [type](#)<sup>p575</sup> attribute is "[radio](#)<sup>p575</sup>", "checkbox" if the attribute's value is "[checkbox](#)<sup>p575</sup>", and "command" otherwise.

The [ID](#)<sup>p580</sup> of the command is the value of the [id](#)<sup>p122</sup> attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#)<sup>p580</sup>.

The [Label](#)<sup>p580</sup> of the command is the value of the element's [label](#)<sup>p575</sup> attribute, if there is one, or the empty string if it doesn't.

The [Hint](#)<sup>p580</sup> of the command is the string given by the element's [title](#)<sup>p575</sup> attribute, if any, and the empty string if the attribute is absent.

The [Icon](#)<sup>p580</sup> for the command is the [absolute URL](#)<sup>p48</sup> obtained from [resolving](#)<sup>p82</sup> the value of the element's [icon](#)<sup>p575</sup> attribute, relative to the element, if it has such an attribute and resolving it is successful. Otherwise, there is no [Icon](#)<sup>p580</sup> for the command.

The [AccessKey](#)<sup>p580</sup> of the command is the element's [assigned access key](#)<sup>p739</sup>, if any.

The [Hidden State](#)<sup>p580</sup> of the command is true (hidden) if the element has a [hidden](#)<sup>p723</sup> attribute, and false otherwise.

The [Disabled State](#)<sup>p580</sup> of the command is true if the element or one of its ancestors is [inert](#)<sup>p724</sup>, or if the element has a [disabled](#)<sup>p575</sup> attribute, and false otherwise.

The [Checked State](#)<sup>p580</sup> of the command is true (checked) if the element has a [checked](#)<sup>p575</sup> attribute, and false otherwise.

The [Action](#)<sup>p580</sup> of the command, if the element has a defined [activation behaviour](#)<sup>p725</sup>, is to [run synthetic click activation steps](#)<sup>p724</sup> on the element. Otherwise, it is just to [fire a click event](#)<sup>p846</sup> at the element.

#### 4.11.6.7 Using the `command` attribute on `menuitem` elements to define a command indirectly

A [menuitem](#)<sup>p574</sup> element with a [master command](#)<sup>p575</sup> [defines a command](#)<sup>p579</sup>.

The [Type](#)<sup>p580</sup> of the command is the [Type](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

The [ID](#)<sup>p580</sup> of the command is the value of the [id](#)<sup>p122</sup> attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#)<sup>p580</sup>.

The [Label](#)<sup>p580</sup> of the command is the [Label](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

If the element has a [title](#)<sup>p122</sup> attribute, then the [Hint](#)<sup>p580</sup> of the command is the value of that [title](#)<sup>p122</sup> attribute. Otherwise, the [Hint](#)<sup>p580</sup> of the command is the [Hint](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

The [Icon](#)<sup>p580</sup> of the command is the [Icon](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

The [AccessKey](#)<sup>p580</sup> of the command is the element's [assigned access key](#)<sup>p739</sup>, if any.

The [Hidden State](#)<sup>p580</sup> of the command is the [Hidden State](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

The [Disabled State](#)<sup>p580</sup> of the command is the [Disabled State](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

The [Checked State](#)<sup>p580</sup> of the command is the [Checked State](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

The [Action](#)<sup>p580</sup> of the command is to invoke the [Action](#)<sup>p580</sup> of the [master command](#)<sup>p575</sup>.

#### 4.11.6.8 Using the `accesskey` attribute on a `label` element to define a command

A [label](#)<sup>p451</sup> element that has an [assigned access key](#)<sup>p739</sup> and a [labeled control](#)<sup>p451</sup> and whose [labeled control](#)<sup>p451</sup> [defines a command](#)<sup>p579</sup>, itself [defines a command](#)<sup>p579</sup>.

The [Type](#)<sup>p580</sup> of the command is "command".

The [ID](#)<sup>p580</sup> of the command is the value of the [id](#)<sup>p122</sup> attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#)<sup>p580</sup>.

The [Label](#)<sup>p580</sup> of the command is the string given by the element's [textContent](#)<sup>p51</sup> IDL attribute.

The [Hint](#)<sup>p580</sup> of the command is the value of the [title](#)<sup>p122</sup> attribute of the element.

There is no [Icon](#) for the command.

The [AccessKey](#) of the command is the element's [assigned access key](#).

The [Hidden State](#), [Disabled State](#), and [Action](#) facets of the command are the same as the respective facets of the element's [labeled control](#).

The [Checked State](#) of the command is always false. (The command is never checked.)

#### 4.11.6.9 Using the `accesskey` attribute on a `legend` element to define a command

A [legend](#) element that has an [assigned access key](#) and is a child of a [fieldset](#) element that has a descendant that is not a descendant of the [legend](#) element and is neither a [label](#) element nor a [legend](#) element but that [defines a command](#), itself [defines a command](#).

The [Type](#) of the command is "command".

The [ID](#) of the command is the value of the [id](#) attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#).

The [Label](#) of the command is the string given by the element's [textContent](#) IDL attribute.

The [Hint](#) of the command is the value of the [title](#) attribute of the element.

There is no [Icon](#) for the command.

The [AccessKey](#) of the command is the element's [assigned access key](#).

The [Hidden State](#), [Disabled State](#), and [Action](#) facets of the command are the same as the respective facets of the first element in [tree order](#) that is a descendant of the parent of the [legend](#) element that [defines a command](#) but is not a descendant of the [legend](#) element and is neither a [label](#) nor a [legend](#) element.

The [Checked State](#) of the command is always false. (The command is never checked.)

#### 4.11.6.10 Using the `accesskey` attribute to define a command on other elements

An element that has an [assigned access key](#) [defines a command](#).

If one of the earlier sections that define elements that [define commands](#) define that this element [defines a command](#), then that section applies to this element, and this section does not. Otherwise, this section applies to that element.

The [Type](#) of the command is "command".

The [ID](#) of the command is the value of the [id](#) attribute of the element, if the attribute is present and not empty. Otherwise the command is an [anonymous command](#).

The [Label](#) of the command depends on the element. If the element is a [labeled control](#), the [textContent](#) of the first [label](#) element in [tree order](#) whose [labeled control](#) is the element in question is the [Label](#) (in DOM terms, this is the string given by `element.labels[0].textContent`). Otherwise, the [Label](#) is the [textContent](#) of the element itself.

The [Hint](#) of the command is the value of the [title](#) attribute of the element. If the attribute is not present, the [Hint](#) is the empty string.

There is no [Icon](#) for the command.

The [AccessKey](#) of the command is the element's [assigned access key](#).

The [Hidden State](#) of the command is true (hidden) if the element has a [hidden](#) attribute, and false otherwise.

The [Disabled State](#) of the command is true if the element or one of its ancestors is [inert](#), and false otherwise.

The [Checked State](#)<sup>p580</sup> of the command is always false. (The command is never checked.)

The [Action](#)<sup>p580</sup> of the command is to run the following steps:

1. Run the [focusing steps](#)<sup>p730</sup> for the element.
2. If the element has a defined [activation behaviour](#)<sup>p725</sup>, [run synthetic click activation steps](#)<sup>p724</sup> on the element.
3. Otherwise, if the element does not have a defined [activation behaviour](#)<sup>p725</sup>, [fire a click event](#)<sup>p846</sup> at the element.

#### 4.11.7 The `dialog` element

**Categories**<sup>p113</sup>:

[Flow content](#)<sup>p115</sup>.

[Sectioning root](#)<sup>p176</sup>.

**Contexts in which this element can be used**<sup>p113</sup>:

Where [flow content](#)<sup>p115</sup> is expected.

**Content model**<sup>p113</sup>:

Source: [caniuse.com](http://caniuse.com)

The [dialog](#)<sup>p586</sup> element represents a part of an application that a user interacts with to perform a task, for example a dialog box, inspector, or window.

The [open](#) attribute is a [boolean attribute](#)<sup>p59</sup>. When specified, it indicates that the [dialog](#)<sup>p586</sup> element is active and that the user can interact with it.

A [dialog](#)<sup>p586</sup> element without an [open](#)<sup>p586</sup> attribute specified should not be shown to the user. This requirement may be implemented indirectly through the style layer. For example, user agents that [support the suggested default rendering](#)<sup>p46</sup> implement this requirement using the CSS rules described in the [rendering section](#)<sup>p1058</sup>.

The [tabindex](#)<sup>p729</sup> attribute must not be specified on [dialog](#)<sup>p586</sup> elements.

Note

`dialog . showp587([ anchor])`

Displays the [dialog](#)<sup>p586</sup> element.

The argument, if provided, provides an anchor point to which the element will be fixed.

`dialog . showModalp587([ anchor])`

Displays the [dialog](#)<sup>p586</sup> element and makes it the top-most modal dialog.

The argument, if provided, provides an anchor point to which the element will be fixed.

This method honors the `autofocus`<sup>p533</sup> attribute.

`dialog.closep588( [ result ] )`

Closes the `dialog`<sup>p586</sup> element.

The argument, if provided, provides a return value.

`dialog.returnValuep588 [= result ]`

Returns the `dialog`<sup>p586</sup>'s return value.

Can be set, to update the return value.

Spec bugs: [24718](#)

When the `show()` method is invoked, the user agent must run the following steps:

1. If the element already has an `open`<sup>p586</sup> attribute, then abort these steps.
2. Add an `open`<sup>p586</sup> attribute to the `dialog`<sup>p586</sup> element, whose value is the empty string.
3. If the `show()`<sup>p587</sup> method was invoked with an argument, `set up the position`<sup>p588</sup> of the `dialog`<sup>p586</sup> element, using that argument as the anchor. Otherwise, set the `dialog`<sup>p586</sup> to the `normal alignment`<sup>p588</sup> mode.
4. Run the `dialog focusing steps`<sup>p587</sup> for the `dialog`<sup>p586</sup> element.

Each `Document`<sup>p102</sup> has a stack of `dialog`<sup>p586</sup> elements known as the **pending dialog stack**. When a `Document`<sup>p102</sup> is created, this stack must be initialised to be empty.

When an element is added to the `pending dialog stack`<sup>p587</sup>, it must also be added to the `top layer`<sup>p52</sup> layer. When an element is removed from the `pending dialog stack`<sup>p587</sup>, it must be removed from the `top layer`<sup>p52</sup>. `[FULLSCREEN]`<sup>p1150</sup>

When the `showModal()` method is invoked, the user agent must run the following steps:

1. Let `subject` be the `dialog`<sup>p586</sup> element on which the method was invoked.
2. If `subject` already has an `open`<sup>p586</sup> attribute, then throw an `InvalidStateError`<sup>p50</sup> exception and abort these steps.
3. If `subject` is not `in a Document`<sup>p42</sup>, then throw an `InvalidStateError`<sup>p50</sup> exception and abort these steps.
4. Add an `open`<sup>p586</sup> attribute to `subject`, whose value is the empty string.
5. If the `showModal()`<sup>p587</sup> method was invoked with an argument, `set up the position`<sup>p588</sup> of `subject`, using that argument as the anchor. Otherwise, set the `dialog`<sup>p586</sup> to the `centered alignment`<sup>p588</sup> mode.
6. Let `subject`'s `node document` be `blocked by the modal dialog`<sup>p724</sup> `subject`.
7. Push `subject` onto `subject`'s `node document`'s `pending dialog stack`<sup>p587</sup>.
8. Run the `dialog focusing steps`<sup>p587</sup> for `subject`.

The `dialog focusing steps` for a `dialog`<sup>p586</sup> element `subject` are as follows:

1. If for some reason `subject` is not a `control group owner`<sup>p727</sup> at this point, or if it is `inert`<sup>p724</sup>, abort these steps.
2. Let `control` be the first non-`inert`<sup>p724</sup> `focusable area`<sup>p726</sup> in `subject`'s `control group`<sup>p727</sup> whose `DOM anchor`<sup>p726</sup> has an `autofocus`<sup>p533</sup> attribute specified.  
If there isn't one, then let `control` be the first non-`inert`<sup>p724</sup> `focusable area`<sup>p726</sup> in `subject`'s `control group`<sup>p727</sup>.  
If there isn't one of those either, then let `control` be `subject`.
3. Run the `focusing steps`<sup>p730</sup> for `control`.

If at any time a [dialog](#)<sup>p586</sup> element is [removed from a Document](#)<sup>p42</sup>, then if that [dialog](#)<sup>p586</sup> is in that [Document](#)<sup>p102</sup>'s [pending dialog stack](#)<sup>p587</sup>, the following steps must be run:

1. Let *subject* be that [dialog](#)<sup>p586</sup> element and *document* be the [Document](#)<sup>p102</sup> from which it is being removed.
2. Remove *subject* from *document*'s [pending dialog stack](#)<sup>p587</sup>.
3. If *document*'s [pending dialog stack](#)<sup>p587</sup> is not empty, then let *document* be [blocked by the modal dialog](#)<sup>p724</sup> that is at the top of *document*'s [pending dialog stack](#)<sup>p587</sup>. Otherwise, let *document* be no longer [blocked by a modal dialog](#)<sup>p724</sup> at all.

When the `close()` method is invoked, the user agent must [close the dialog](#)<sup>p588</sup> that the method was invoked on. If the method was invoked with an argument, that argument must be used as the return value; otherwise, there is no return value.

When a [dialog](#)<sup>p586</sup> element *subject* is to be **closed**, optionally with a return value *result*, the user agent must run the following steps:

1. If *subject* does not have an [open](#)<sup>p586</sup> attribute, then abort these steps.
2. Remove *subject*'s [open](#)<sup>p586</sup> attribute.
3. If the argument *result* was provided, then set the [returnValue](#)<sup>p588</sup> attribute to the value of *result*.
4. If *subject* is in its [Document](#)<sup>p102</sup>'s [pending dialog stack](#)<sup>p587</sup>, then run these substeps:
  1. Remove *subject* from that [pending dialog stack](#)<sup>p587</sup>.
  2. If that [pending dialog stack](#)<sup>p587</sup> is not empty, then let *subject*'s [node document](#) be [blocked by the modal dialog](#)<sup>p724</sup> that is at the top of the [pending dialog stack](#)<sup>p587</sup>. Otherwise, let *document* be no longer [blocked by a modal dialog](#)<sup>p724</sup> at all.
5. [Queue a task](#)<sup>p835</sup> to [fire a simple event](#)<sup>p846</sup> named [close](#)<sup>p1144</sup> at *subject*.

The `returnValue` IDL attribute, on getting, must return the last value to which it was set. On setting, it must be set to the new value. When the element is created, it must be set to the empty string.

**Cancelling dialogs:** When a [Document](#)<sup>p102</sup>'s [pending dialog stack](#)<sup>p587</sup> is not empty, user agents may provide a user interface that, upon activation, [queues a task](#)<sup>p835</sup> to [fire a simple event](#)<sup>p846</sup> named [cancel](#)<sup>p1144</sup> that is cancelable at the top [dialog](#)<sup>p586</sup> element on the [Document](#)<sup>p102</sup>'s [pending dialog stack](#)<sup>p587</sup>. The default action of this event must be to check if that element has an [open](#)<sup>p586</sup> attribute, and if it does, [close the dialog](#)<sup>p588</sup> with no return value.

**Note** An example of such a UI mechanism would be the user pressing the "Escape" key.

All [dialog](#)<sup>p586</sup> elements are always in one of three modes: **normal alignment**, **centered alignment**, and **magic alignment**. When a [dialog](#)<sup>p586</sup> element is created, it must be placed in the [normal alignment](#)<sup>p588</sup> mode. In this mode, normal CSS requirements apply to the element. The [centered alignment](#)<sup>p588</sup> mode is only used for [dialog](#)<sup>p586</sup> elements that are in the [top layer](#)<sup>b52</sup>. [\[FULLSCREEN\]](#)<sup>p1150</sup> [\[CSS\]](#)<sup>p1149</sup>

When an element *subject* is placed in [centered alignment](#)<sup>p588</sup> mode, and when it is in that mode and has new rendering boxes created, the user agent must set up the element such that its top static position, for the purposes of calculating the used value of the 'top' property, is the value that would place the element's top margin edge as far from the top of the viewport as the element's bottom margin edge from the bottom of the viewport, if the element's height is less than the height of the viewport, and otherwise is the value that would place the element's top margin edge at the top of the viewport.

If there is a [dialog](#)<sup>p586</sup> element with [centered alignment](#)<sup>p588</sup> and that is [being rendered](#)<sup>p1058</sup> when its [browsing context](#)<sup>p762</sup> changes viewport width (as measured in CSS pixels), then the user agent must recreate the element's boxes, recalculating its top static position as in the previous paragraph.

This top static position of a [dialog](#)<sup>p586</sup> element with [centered alignment](#)<sup>p588</sup> must remain the element's top static position until its boxes are recreated. (The element's static position is only used in calculating the used value of the 'top' property in certain situations; it's not used, for instance, to position the element if its 'position' property is set to 'static'.)

When a user agent is to **set up the position** of an element *subject* using an anchor *anchor*, it must run the following steps:

1. If *anchor* is a [MouseEvent](#)<sup>p51</sup> object, then run these substeps:

1. If *anchor*'s target element does not have a rendered box, or is in a different document than *subject*, then let *subject* be in the [centered alignment<sup>p588</sup>](#) mode, and abort the [set up the position<sup>p588</sup>](#) steps.
2. Let *anchor element* be an anonymous element rendered as a box with zero height and width (so its margin and border boxes both just form a point), positioned so that its top and left are at the coordinate identified by the event, and whose properties all compute to their initial values.

Otherwise, let *anchor element* be *anchor*.

2. Put *subject* in the [magic alignment<sup>p588</sup>](#) mode, aligned to *anchor element*.

While an element *A* has [magic alignment<sup>p588</sup>](#), aligned to an element *B*, the following requirements apply:

- If at any time either *A* or *B* cease having rendered boxes, *A* and *B* cease being in the same [Document<sup>p102</sup>](#), or *B* ceases being earlier than *A* in [tree order<sup>p42</sup>](#), then, if *subject* is in the [pending dialog stack<sup>p587</sup>](#), let *subject*'s mode become [centered alignment<sup>p588</sup>](#), otherwise, let *subject*'s mode become [normal alignment<sup>p588</sup>](#).
- *A*'s 'position' property must compute to the keyword '[absolute-anchored<sup>p590</sup>](#)' rather than whatever it would otherwise compute to (i.e. the 'position' property's specified value is ignored).

**Note** *The '[absolute-anchored<sup>p590</sup>](#)' keyword's requirements are described below.*

- The anchor points for *A* and *B* are defined as per the appropriate entry in the following list:

↪ **If the computed value of 'anchor-point' is 'none' on both *A* and *B***

The anchor points of *A* and *B* are the center points of their respective first boxes' border boxes.

↪ **If the computed value of 'anchor-point' is 'none' on *A* and a specific point on *B***

The anchor point of *B* is the point given by its 'anchor-point' property.

If the anchor point of *B* is the center point of *B*'s first box's border box, then *A*'s anchor point is the center point of its first box's margin box.

Otherwise, *A*'s anchor point is on one of its margin edges. Consider four hypothetical half-infinite lines L1, L2, L3, and L4 that each start in the center of *B*'s first box's border box, and that extend respectively through the top left corner, top right corner, bottom right corner, and bottom left corner of *B*'s first box's border box. *A*'s anchor point is determined by the location of *B*'s anchor point relative to these four hypothetical lines, as follows:

If the anchor point of *B* lies on L1 or L2, or inside the area bounded by L1 and L2 that also contains the points above *B*'s first box's border box, then let *A*'s anchor point be the horizontal center of *A*'s bottom margin edge.

Otherwise, if the anchor point of *B* lies on L3 or L4, or inside the area bounded by L4 and L4 that also contains the points below *B*'s first box's border box, then let *A*'s anchor point be the horizontal center of *A*'s top margin edge.

Otherwise, if the anchor point of *B* lies inside the area bounded by L4 and L1 that also contains the points to the left of *B*'s first box's border box, then let *A*'s anchor point be the vertical center of *A*'s right margin edge.

Otherwise, the anchor point of *B* lies inside the area bounded by L2 and L3 that also contains the points to the right of *B*'s first box's border box; let *A*'s anchor point be the vertical center of *A*'s left margin edge.

↪ **If the computed value of 'anchor-point' is a specific point on *A* and 'none' on *B***

The anchor point of *A* is the point given by its 'anchor-point' property.

If the anchor point of *A* is the center point of *A*'s first box's margin box, then *B*'s anchor point is the center point of its first box's border box.

Otherwise, *B*'s anchor point is on one of its border edges. Consider four hypothetical half-infinite lines L1, L2, L3, and L4 that each start in the center of *A*'s first box's margin box, and that extend respectively through the top left corner, top right corner, bottom right corner, and bottom left corner of *A*'s first box's margin box. *B*'s anchor point is determined by the location of *A*'s anchor point relative to these four hypothetical lines, as follows:

If the anchor point of *A* lies on L1 or L2, or inside the area bounded by L1 and L2 that also contains the points above *A*'s first box's margin box, then let *B*'s anchor point be the horizontal center of *B*'s bottom border edge.

Otherwise, if the anchor point of A lies on L3 or L4, or inside the area bounded by L4 and L4 that also contains the points below A's first box's margin box, then let B's anchor point be the horizontal center of B's top border edge.

Otherwise, if the anchor point of A lies inside the area bounded by L4 and L1 that also contains the points to the left of A's first box's margin box, then let B's anchor point be the vertical center of B's right border edge.

Otherwise, the anchor point of A lies inside the area bounded by L2 and L3 that also contains the points to the right of A's first box's margin box; let B's anchor point be the vertical center of B's left border edge.

↪ If the computed value of 'anchor-point' is a specific point on both A and B

The anchor points of A and B are the points given by their respective 'anchor-point' properties.

**Note** *The rules above generally use A's margin box, but B's border box. This is because while A always has a margin box, and using the margin box allows for the dialog to be positioned offset from the box it is annotating, B sometimes does not have a margin box (e.g. if it is a table-cell), or has a margin box whose position may be not entirely clear (e.g. in the face of margin collapsing and 'clear' handling of in-flow blocks).*

In cases where B does not have a border box but its border box is used by the algorithm above, user agents must use its first box's content area instead. (This is in particular an issue with boxes in tables that have 'border-collapse' set to 'collapse'.)

- When an element's 'position' property computes to '**absolute-anchored**', the 'float' property does not apply and must compute to 'none', the 'display' property must compute to a value as described by the table in [the section of CSS 2.1 describing the relationships between 'display', 'position', and 'float'](#), and the element's box must be positioned using the rules for absolute positioning but with its static position set such that if the box is positioned in its static position, its anchor point is exactly aligned over the anchor point of the element to which it is [magically aligned<sup>p588</sup>](#). Elements aligned in this way are *absolutely positioned*. For the purposes of determining the containing block of other elements, the '[absolute-anchored<sup>p590</sup>](#)' keyword must be treated like the 'absolute' keyword.

**Note** *The trivial example of an element that does not have a rendered box is one whose 'display' property computes to 'none'. However, there are many other cases; e.g. table columns do not have boxes (their properties merely affect other boxes).*

**Note** *If an element to which another element is anchored changes rendering, the anchored element will be repositioned accordingly. (In other words, the requirements above are live, they are not just calculated once per anchored element.)*

**Note** *The '[absolute-anchored<sup>p590</sup>](#)' keyword is not a keyword that can be specified in CSS; the 'position' property can only compute to this value if the [dialog<sup>p586</sup>](#) element is positioned via the APIs described above.*

User agents in visual interactive media should allow the user to pan the viewport to access all parts of a [dialog<sup>p586</sup>](#) element's border box, even if the element is larger than the viewport and the viewport would otherwise not have a scroll mechanism (e.g. because the viewport's 'overflow' property is set to 'hidden').

The `open` IDL attribute must [reflect<sup>p88</sup>](#) the [open<sup>p586</sup>](#) content attribute.

**Example**

This dialog box has some small print. The [main<sup>p205</sup>](#) element is used to draw the user's attention to the more important parts.

```
<dialog>
 <h1>Add to Wallet</h1>
 <main>
 <p>How many gold coins do you want to add to your wallet?</p>
 <p><input name=amt type=number min=0 step=0.01 value=100></p>
 </main>
 <p><small>You add coins at your own risk.</small></p>
 <p><label><input name=round type=checkbox> Only add perfectly round coins </label>
 <p><input type=button onclick="submit()" value="Add Coins"></p>
</dialog>
```

This section will eventually be moved to a CSS specification; it is specified here only on an interim basis until an editor can be found to own this.

#### 'anchor-point'

<i>Value:</i>	none   <position>
<i>Initial:</i>	none
<i>Applies to:</i>	all elements
<i>Inherited:</i>	no
<i>Percentages:</i>	refer to width or height of box; see prose
<i>Media:</i>	visual
<i>Computed value:</i>	The specified value, but with any lengths replaced by their corresponding absolute length
<i>Animatable:</i>	no
<i>Canonical order:</i>	per grammar

The 'anchor-point' property specifies a point to which dialog boxes are to be aligned.

If the value is a <position>, the anchor point is the point given by the value, which must be interpreted relative to the element's first rendered box's margin box. Percentages must be calculated relative to the element's first rendered box's margin box (specifically, its width for the horizontal position and its height for the vertical position). [\[CSSVALUES\]<sup>p1149</sup>](#) [\[CSS\]<sup>p1149</sup>](#)

If the value is the keyword 'none', then no explicit anchor point is defined. The user agent will pick an anchor point automatically if necessary (as described in the definition of the [open\(\)<sup>p590</sup>](#) method above).

## 4.12 Scripting

Scripts allow authors to add interactivity to their documents.

Authors are encouraged to use declarative alternatives to scripting where possible, as declarative mechanisms are often more maintainable, and many users disable scripting.

### Example

For example, instead of using script to show or hide a section to show more details, the [details<sup>p567</sup>](#) element could be used.

Authors are also encouraged to make their applications degrade gracefully in the absence of scripting support.

### Example

For example, if an author provides a link in a table header to dynamically resort the table, the link could also be made to function without scripts by requesting the sorted table from the server.

## 4.12.1 The `script` element

Spec bugs: 23165, 23156,  
18298, 25943, 27332, 23157

### Categories<sup>p113</sup>:

[Metadata content<sup>p115</sup>](#).

[Flow content<sup>p115</sup>](#).

[Phrasing content<sup>p116</sup>](#).

[Script-supporting element<sup>p117</sup>](#).

### Contexts in which this element can be used<sup>p113</sup>:

Where [metadata content<sup>p115</sup>](#) is expected.

Where [phrasing content<sup>p116</sup>](#) is expected.

Where [script-supporting elements<sup>p117</sup>](#) are expected.

## Content model<sup>p113</sup>:

If there is no `src`<sup>p592</sup> attribute, depends on the value of the `type`<sup>p592</sup> attribute, but must match [script content restrictions](#)<sup>p599</sup>.

If there is a `src`<sup>p592</sup> attribute, the element must be either empty or contain only [script documentation](#)<sup>p601</sup> that also matches [script content restrictions](#)<sup>p599</sup>.

## Tag omission in text/html<sup>p113</sup>:

Neither tag is ommissible.

## Content attributes<sup>p113</sup>:

### [Global attributes](#)<sup>p120</sup>

`src`<sup>p592</sup> — Address of the resource

`type`<sup>p592</sup> — Type of embedded resource

`charset`<sup>p592</sup> — Character encoding of the external script resource

`async`<sup>p592</sup> — Execute script when available, without blocking

`defer`<sup>p592</sup> — Defer script execution

`crossorigin`<sup>p593</sup> — How the element handles crossorigin requests

## DOM interface<sup>p113</sup>:

```
IDL
interface HTMLScriptElement : HTMLElement {
 attribute DOMString src;
 attribute DOMString type;
 attribute DOMString charset;
 attribute boolean async;
 attribute boolean defer;
 attribute DOMString? crossOrigin;
 attribute DOMString text;

 // also has obsolete members
};
```

The `script`<sup>p591</sup> element allows authors to include dynamic script and data blocks in their documents. The element does not [represent](#)<sup>p111</sup> content for the user.

When used to include dynamic scripts, the scripts may either be embedded inline or may be imported from an external file using the `src`<sup>p592</sup> attribute. If the language is not that described by "text/javascript", then the `type`<sup>p592</sup> attribute must be present, as described below. Whatever language is used, the contents of the `script`<sup>p591</sup> element must conform with the requirements of that language's specification.

When used to include data blocks (as opposed to scripts), the data must be embedded inline, the format of the data must be given using the `type`<sup>p592</sup> attribute, the `src`<sup>p592</sup> attribute must not be specified, and the contents of the `script`<sup>p591</sup> element must conform to the requirements defined for the format used.

The `type` attribute gives the language of the script or format of the data. If the attribute is present, its value must be a [valid MIME type](#)<sup>p42</sup>. The `charset` parameter must not be specified. The default, which is used if the attribute is absent, is "text/javascript".

The `src` attribute, if specified, gives the address of the external script resource to use. The value of the attribute must be a [valid non-empty URL potentially surrounded by spaces](#)<sup>p82</sup> identifying a script resource of the type given by the `type`<sup>p592</sup> attribute, if the attribute is present, or of the type "text/javascript", if the attribute is absent. A resource is a script resource of a given type if that type identifies a scripting language and the resource conforms with the requirements of that language's specification.

The `charset` attribute gives the character encoding of the external script resource. The attribute must not be specified if the `src`<sup>p592</sup> attribute is not present. If the attribute is set, its value must be an [ASCII case-insensitive](#)<sup>p58</sup> match for one of the `labels`<sup>p44</sup> of an `encoding`<sup>p44</sup>, and must specify the same `encoding`<sup>p44</sup> as the `charset` parameter of the [Content-Type metadata](#)<sup>p86</sup> of the external file, if any. [\[ENCODING\]](#)<sup>p110</sup>

The `async` and `defer` attributes are [boolean attributes](#)<sup>p59</sup> that indicate how the script should be executed. The `defer`<sup>p592</sup> and `async`<sup>p592</sup> attributes must not be specified if the `src`<sup>p592</sup> attribute is not present.

	Support:	
Chrome	8+	
IE	10+	
Chrome for Android	40+	
Firefox	3.5+	
iOS Safari	5.0-5.1+	
Android Browser	3+	
UC Browser for Android	9.9+	
Opera Mini	None	
Safari	5+	
Opera	15+	
IE Mobile	10+	
Firefox for Android	33+	

There are three possible modes that can be selected using these attributes. If the `async`<sup>p592</sup> attribute is present, then the script will be executed as soon as it is available, but without blocking further parsing of the page. If the `async`<sup>p592</sup> attribute is not present but the `defer`<sup>p592</sup> attribute is present, then the script is executed when the page has finished parsing. If neither attribute is present, then the script is fetched and executed immediately, before the user agent continues parsing the page.

**Note** *The exact processing details for these attributes are, for mostly historical reasons, somewhat non-trivial, involving a number of aspects of HTML. The implementation requirements are therefore by necessity scattered throughout the specification. The algorithms below (in this section) describe the core of this processing, but these algorithms reference and are referenced by the parsing rules for `script`<sup>p591</sup> `start`<sup>p1003</sup> and `end`<sup>p1017</sup> tags in HTML, in foreign content<sup>p1032</sup>, and in XML<sup>p1055</sup>, the rules for the `document.write()`<sup>p851</sup> method, the handling of `scripting`<sup>p828</sup>, etc.*

The `defer`<sup>p592</sup> attribute may be specified even if the `async`<sup>p592</sup> attribute is specified, to cause legacy Web browsers that only support `defer`<sup>b592</sup> (and not `async`<sup>b592</sup>) to fall back to the `defer`<sup>b592</sup> behaviour instead of the blocking behaviour that is the default.

The `crossorigin` attribute is a [CORS settings attribute](#)<sup>p87</sup>. It controls, for scripts that are obtained from other [origins](#)<sup>p776</sup>, whether error information will be exposed.

Changing the `src`<sup>p592</sup>, `type`<sup>p592</sup>, `charset`<sup>p592</sup>, `async`<sup>p592</sup>, `defer`<sup>p592</sup>, and `crossorigin`<sup>p593</sup> attributes dynamically has no direct effect; these attribute are only used at specific times described below.

A `script`<sup>p591</sup> element has several associated pieces of state.

The first is a flag indicating whether or not the script block has been "already started". Initially, `script`<sup>p591</sup> elements must have this flag unset (script blocks, when created, are not "already started"). The [cloning steps](#)<sup>p51</sup> for `script`<sup>p591</sup> elements must set the "already started" flag on the copy if it is set on the element being cloned.

The second is a flag indicating whether the element was "parser-inserted". Initially, `script`<sup>p591</sup> elements must have this flag unset. It is set by the [HTML parser](#)<sup>p952</sup> and the [XML parser](#)<sup>p1054</sup> on `script`<sup>p591</sup> elements they insert and affects the processing of those elements.

The third is a flag indicating whether the element will "non-blocking". Initially, `script`<sup>p591</sup> elements must have this flag set. It is unset by the [HTML parser](#)<sup>p952</sup> and the [XML parser](#)<sup>p1054</sup> on `script`<sup>p591</sup> elements they insert. In addition, whenever a `script`<sup>p591</sup> element whose "non-blocking"<sup>p593</sup> flag is set has a `async`<sup>p592</sup> content attribute added, the element's "non-blocking"<sup>p593</sup> flag must be unset.

The fourth is a flag indicating whether or not the script block is "ready to be parser-executed". Initially, `script`<sup>p591</sup> elements must have this flag unset (script blocks, when created, are not "ready to be parser-executed"). This flag is used only for elements that are also "parser-inserted"<sup>p593</sup>, to let the parser know when to execute the script.

The last few pieces of state are ***the script block's type***, ***the script block's character encoding***, and ***the script block's fallback character encoding***. They are determined when the script is prepared, based on the attributes on the element at that time, and the `script`<sup>p591</sup> element's [node document](#).

When a `script`<sup>p591</sup> element that is not marked as being "parser-inserted"<sup>p593</sup> experiences one of the events listed in the following list, the user agent must [immediately](#)<sup>p41</sup> [prepare](#)<sup>p593</sup> the `script`<sup>p591</sup> element:

- The `script`<sup>p591</sup> element gets [inserted into a document](#)<sup>p42</sup>, at the time the [node is inserted](#)<sup>p43</sup> according to the DOM, after any other `script`<sup>p591</sup> elements inserted at the same time that are earlier in the [Document](#)<sup>p102</sup> in [tree order](#)<sup>p42</sup>.
- The `script`<sup>p591</sup> element is [in a Document](#)<sup>p42</sup> and a node or document fragment is [inserted](#)<sup>p43</sup> into the `script`<sup>p591</sup> element, after any `script`<sup>p591</sup> elements [inserted](#)<sup>p43</sup> at that time.
- The `script`<sup>p591</sup> element is [in a Document](#)<sup>p42</sup> and has a `src`<sup>p592</sup> attribute set where previously the element had no such attribute.

To [prepare a script](#), the user agent must act as follows:

1. If the `script`<sup>p591</sup> element is marked as having "already started"<sup>p593</sup>, then the user agent must abort these steps at this point. The script is not executed.
2. If the element has its "parser-inserted"<sup>p593</sup> flag set, then set `was-parser-inserted` to true and unset the element's "parser-inserted"<sup>p593</sup> flag. Otherwise, set `was-parser-inserted` to false.

**Note** *This is done so that if parser-inserted `script`<sup>p591</sup> elements fail to run when the parser tries to run them, e.g. because they are empty or specify an unsupported scripting language, another script can later mutate them and cause them to run again.*

3. If `was-parser-inserted` is true and the element does not have an `asyncp592` attribute, then set the element's "`non-blocking`"<sup>p593</sup> flag to true.

**Note** This is done so that if a parser-inserted `scriptp591` element fails to run when the parser tries to run it, but it is later executed after a script dynamically updates it, it will execute in a non-blocking fashion even if the `asyncp592` attribute isn't set.

4. If the element has no `srcp592` attribute, and its child nodes, if any, consist only of comment nodes and empty `Textp51` nodes, then the user agent must abort these steps at this point. The script is not executed.
5. If the element is not `in a Documentp42`, then the user agent must abort these steps at this point. The script is not executed.
6. If either:
- the `scriptp591` element has a `typep592` attribute and its value is the empty string, or
  - the `scriptp591` element has no `typep592` attribute but it has a `languagep1098` attribute and that attribute's value is the empty string, or
  - the `scriptp591` element has neither a `typep592` attribute nor a `languagep1098` attribute, then  
...let `the script block's typep593` for this `scriptp591` element be "text/javascript".

Otherwise, if the `scriptp591` element has a `typep592` attribute, let `the script block's typep593` for this `scriptp591` element be the value of that attribute with any leading or trailing sequences of `space charactersp58` removed.

Otherwise, the element has a non-empty `languagep1098` attribute; let `the script block's typep593` for this `scriptp591` element be the concatenation of the string "text/" followed by the value of the `languagep1098` attribute.

**Note** The `languagep1098` attribute is never conforming, and is always ignored if there is a `typep592` attribute present.

7. If the user agent does not support the scripting language<sup>b599</sup> given by `the script block's typep593` for this `scriptp591` element, then the user agent must abort these steps at this point. The script is not executed.
8. If `was-parser-inserted` is true, then flag the element as "`parser-inserted`"<sup>p593</sup> again, and set the element's "`non-blocking`"<sup>p593</sup> flag to raise. Spec bugs: 28076
9. The user agent must set the element's "`already started`"<sup>p593</sup> flag.

**Note** The state of the element at this moment is later used<sup>p596</sup> to determine the script source.

10. If the element is flagged as "`parser-inserted`"<sup>p593</sup>, but the element's `node document` is not the `Documentp102` of the parser that created the element, then abort these steps.
11. If `scripting is disabled`<sup>p828</sup> for the `scriptp591` element, then the user agent must abort these steps at this point. The script is not executed.

**Note** The definition of `scripting is disabled`<sup>p828</sup> means that, amongst others, the following scripts will not execute: scripts in `XMLHttpRequestp52`'s `responseXMLp52` documents, scripts in `DOMParser`-created documents, scripts in documents created by `XSLTProcessorp48`'s `transformToDocument`<sup>p48</sup> feature, and scripts that are first inserted by a script into a `Documentp102` that was created using the `createDocument()`<sup>p51</sup> API. `[XHR]p1154 [DOMPARSING]p1149 [DOM]p1149`

12. If the `scriptp591` element has an `eventp1098` attribute and a `forp1098` attribute, then run these substeps:
1. Let `for` be the value of the `forp1098` attribute.
  2. Let `event` be the value of the `eventp1098` attribute.
  3. Strip leading and trailing whitespace<sup>p59</sup> from `event` and `for`.
  4. If `for` is not an `ASCII case-insensitive`<sup>p58</sup> match for the string "window", then the user agent must abort these steps at this point. The script is not executed.
  5. If `event` is not an `ASCII case-insensitive`<sup>p58</sup> match for either the string "onload" or the string "onload()", then the user agent must abort these steps at this point. The script is not executed.

13. If the `scriptp591` element has a `charsetp592` attribute, then let `the script block's character encoding`<sup>p593</sup> for this `scriptp591` element be the result of `getting an encoding` from the value of the `charsetp592` attribute.

Otherwise, let `the script block's fallback character encoding`<sup>p593</sup> for this `scriptp591` element be the same as `the encoding of the document itself`<sup>p51</sup>.

**Note** Only one of these two pieces of state is set.

14. If the element has a `src`<sup>p592</sup> content attribute, run these substeps:

1. Let `src` be the value of the element's `src`<sup>p592</sup> attribute.
2. If `src` is the empty string, [queue a task](#)<sup>p835</sup> to [fire a simple event](#)<sup>p846</sup> named `error`<sup>p1144</sup> at the element, and abort these steps.
3. [Resolve](#)<sup>p82</sup> `src` relative to the element.
4. If the previous step failed, [queue a task](#)<sup>p835</sup> to [fire a simple event](#)<sup>p846</sup> named `error`<sup>p1144</sup> at the element, and abort these steps.
5. Do a [potentially CORS-enabled fetch](#)<sup>p87</sup> of the resulting [absolute URL](#)<sup>p48</sup>, with the `mode` being the current state of the element's `crossorigin`<sup>p593</sup> content attribute, the `origin` being the [origin](#)<sup>p76</sup> of the `script`<sup>p591</sup> element's [node document](#), and the `default origin behaviour` set to `taint`.

The resource obtained in this fashion can be either [CORS-same-origin](#)<sup>p87</sup> or [CORS-cross-origin](#)<sup>p87</sup>. This only affects how error reporting happens.

For performance reasons, user agents may start fetching the script (as defined above) as soon as the `src`<sup>p592</sup> attribute is set, instead, in the hope that the element will be inserted into the document (and that the `crossorigin`<sup>p593</sup> attribute won't change value in the meantime). Either way, once the element is [inserted into the document](#)<sup>p42</sup>, the load must have started as described in this step. If the UA performs such prefetching, but the element is never inserted in the document, or the `src`<sup>p592</sup> attribute is dynamically changed, or the `crossorigin`<sup>p593</sup> attribute is dynamically changed, then the user agent will not execute the script so obtained, and the fetching process will have been effectively wasted.

15. Then, the first of the following options that describes the situation must be followed:

↪ If the element has a `src`<sup>p592</sup> attribute, and the element has a `defer`<sup>p592</sup> attribute, and the element has been flagged as `"parser-inserted"`<sup>p593</sup>, and the element does not have an `async`<sup>p592</sup> attribute

The element must be added to the end of the [list of scripts that will execute when the document has finished parsing](#) associated with the [Document](#)<sup>p102</sup> of the parser that created the element.

The [task](#)<sup>p834</sup> that the [networking task source](#)<sup>p839</sup> places on the [task queue](#)<sup>p834</sup> once the [fetching algorithm](#)<sup>p84</sup> has completed must set the element's `"ready to be parser-executed"`<sup>p593</sup> flag. The parser will handle executing the script.

↪ If the element has a `src`<sup>p592</sup> attribute, and the element has been flagged as `"parser-inserted"`<sup>p593</sup>, and the element does not have an `async`<sup>p592</sup> attribute

The element is the [pending parsing-blocking script](#)<sup>p596</sup> of the [Document](#)<sup>p102</sup> of the parser that created the element. (There can only be one such script per [Document](#)<sup>p102</sup> at a time.)

The [task](#)<sup>p834</sup> that the [networking task source](#)<sup>p839</sup> places on the [task queue](#)<sup>p834</sup> once the [fetching algorithm](#)<sup>p84</sup> has completed must set the element's `"ready to be parser-executed"`<sup>p593</sup> flag. The parser will handle executing the script.

↪ If the element does not have a `src`<sup>p592</sup> attribute, and the element has been flagged as `"parser-inserted"`<sup>p593</sup>, and either the parser that created the `script`<sup>p591</sup> is an [XML parser](#)<sup>p1054</sup> or it's an [HTML parser](#)<sup>p952</sup> whose [script nesting level](#)<sup>p954</sup> is not greater than one, and the [Document](#)<sup>p102</sup> of the [HTML parser](#)<sup>p952</sup> or [XML parser](#)<sup>p1054</sup> that created the `script`<sup>p591</sup> element has a [style sheet that is blocking scripts](#)<sup>p157</sup>

The element is the [pending parsing-blocking script](#)<sup>p596</sup> of the [Document](#)<sup>p102</sup> of the parser that created the element. (There can only be one such script per [Document](#)<sup>p102</sup> at a time.)

Set the element's `"ready to be parser-executed"`<sup>p593</sup> flag. The parser will handle executing the script.

↪ If the element has a `src`<sup>p592</sup> attribute, does not have an `async`<sup>p592</sup> attribute, and does not have the `"non-blocking"`<sup>p593</sup> flag set

The element must be added to the end of the [list of scripts that will execute in order as soon as possible](#) associated with the [node document](#) of the `script`<sup>p591</sup> element at the time the [prepare a script](#)<sup>p593</sup> algorithm started.

The [task](#)<sup>p834</sup> that the [networking task source](#)<sup>p839</sup> places on the [task queue](#)<sup>p834</sup> once the [fetching algorithm](#)<sup>p84</sup> has completed must run the following steps:

1. If the element is not now the first element in the [list of scripts that will execute in order as soon as possible](#)<sup>p595</sup> to which it was added above, then mark the element as ready but abort these steps without executing the script yet.
2. *Execution:* [Execute the script block](#)<sup>p596</sup> corresponding to the first script element in this [list of scripts that will execute in order as soon as possible](#)<sup>p595</sup>.
3. Remove the first element from this [list of scripts that will execute in order as soon as possible](#)<sup>p595</sup>.
4. If this [list of scripts that will execute in order as soon as possible](#)<sup>p595</sup> is still not empty and the first entry has already been marked as ready, then jump back to the step labeled *execution*.

↪ **If the element has a `src`**<sup>p592</sup> attribute

The element must be added to the **set of scripts that will execute as soon as possible** of the [node document](#) of the [script](#)<sup>p591</sup> element at the time the [prepare a script](#)<sup>p593</sup> algorithm started.

The [task](#)<sup>p834</sup> that the [networking task source](#)<sup>p839</sup> places on the [task queue](#)<sup>p834</sup> once the [fetching algorithm](#)<sup>p84</sup> has completed must [execute the script block](#)<sup>p596</sup> and then remove the element from the **set of scripts that will execute as soon as possible**<sup>p595</sup>.

↪ **Otherwise**

The user agent must [immediately](#)<sup>p41</sup> [execute the script block](#)<sup>p596</sup>, even if other scripts are already executing.

Fetching an external script must [delay the load event](#)<sup>p1033</sup> of the element's [node document](#) until the [task](#)<sup>p834</sup> that is [queued](#)<sup>p835</sup> by the [networking task source](#)<sup>p839</sup> once the resource has been [fetched](#)<sup>p84</sup> (defined above) has been run.

The **pending parsing-blocking script** of a [Document](#)<sup>p102</sup> is used by the [Document](#)<sup>p102</sup>'s parser(s).

**Note** *If a [script](#)<sup>p591</sup> element that blocks a parser gets moved to another [Document](#)<sup>p102</sup> before it would normally have stopped blocking that parser, it nonetheless continues blocking that parser until the condition that causes it to be blocking the parser no longer applies (e.g. if the script is a [pending parsing-blocking script](#)<sup>p596</sup> because there was [a style sheet that is blocking scripts](#)<sup>p157</sup> when it was parsed, but then the script is moved to another [Document](#)<sup>p102</sup> before the style sheet loads, the script still blocks the parser until the style sheets are all loaded, at which time the script executes and the parser is unblocked).*

When the user agent is required to **execute a script block**, it must run the following steps:

1. If the element is flagged as "[parser-inserted](#)"<sup>p593</sup>, but the element's [node document](#) is not the [Document](#)<sup>p102</sup> of the parser that created the element, then abort these steps.
2. Jump to the appropriate set of steps from the list below:

↪ **If the load resulted in an error (for example a DNS error, or an HTTP 404 error)**

Executing the script block must just consist of [firing a simple event](#)<sup>p846</sup> named [error](#)<sup>p114</sup> at the element.

↪ **If the load was successful**

Executing the script block must consist of running the following steps. For the purposes of these steps, the script is considered to be from an *external file* if, while the [prepare a script](#)<sup>p593</sup> algorithm above was running for this script, the [script](#)<sup>p591</sup> element had a [src](#)<sup>p592</sup> attribute specified.

1. Initialise **the script block's source** as follows:

↪ **If the script is from an external file and [the script block's type](#)<sup>p593</sup> is a text-based language**

The contents of that file, interpreted as a Unicode string, are the script source.

To obtain the Unicode string, the user agent run the following steps:

1. If the resource's [Content Type metadata](#)<sup>p86</sup>, if any, specifies a character encoding, and the user agent supports that encoding, then let *character encoding* be that encoding, and jump to the bottom step in this series of steps.
2. If the algorithm above set [the script block's character encoding](#)<sup>p593</sup>, then let *character encoding* be that encoding, and jump to the bottom step in this series of steps.
3. Let *character encoding* be [the script block's fallback character encoding](#)<sup>p593</sup>.

- If the specification for [the script block's type](#)<sup>p593</sup> gives specific rules for decoding files in that format to Unicode, follow them, using *character encoding* as the character encoding specified by higher-level protocols, if necessary.

Otherwise, [decode](#)<sup>p47</sup> the file to Unicode, using *character encoding* as the fallback encoding.

**Note** *The decode*<sup>p47</sup> algorithm overrides character encoding if the file contains a BOM.

↪ If the script is from an external file and [the script block's type](#)<sup>p593</sup> is an XML-based language

The external file is the script source. When it is later executed, it must be interpreted in a manner consistent with the specification defining the language given by [the script block's type](#).

↪ If the script is inline and [the script block's type](#)<sup>p593</sup> is a text-based language

The value of the [text](#)<sup>p598</sup> IDL attribute at the time the element's ["already started"](#)<sup>p593</sup> flag was last set is the script source.

↪ If the script is inline and [the script block's type](#)<sup>p593</sup> is an XML-based language

The child nodes of the [script](#)<sup>p591</sup> element at the time the element's ["already started"](#)<sup>p593</sup> flag was last set are the script source.

- [Fire a simple event](#)<sup>p846</sup> named [beforeScriptExecute](#)<sup>p1144</sup> that bubbles and is cancelable at the [script](#)<sup>p591</sup> element.

If the event is canceled, then abort these steps.

- If the script is from an external file, then increment the [ignore-destructive-writes counter](#)<sup>p851</sup> of the [script](#)<sup>p591</sup> element's [node document](#). Let *neutralised doc* be that [Document](#)<sup>p102</sup>.
- Let *old script element* be the value to which the [script](#)<sup>p591</sup> element's [node document](#)'s [currentScript](#)<sup>p108</sup> object was most recently initialised.
- Initialise the [script](#)<sup>p591</sup> element's [node document](#)'s [currentScript](#)<sup>p108</sup> object to the [script](#)<sup>p591</sup> element.
- [Create a script](#)<sup>p832</sup>, using [the script block's source](#)<sup>p596</sup>, the [URL](#)<sup>p48</sup> from which the script was obtained, [the script block's type](#)<sup>p593</sup> as the scripting language, and the [environment settings object](#)<sup>p829</sup> of the [script](#)<sup>p591</sup> element's [node document](#)'s [Window](#)<sup>p768</sup> object.

If the script came from a resource that was [fetched](#)<sup>p84</sup> in the steps above, and the resource was [CORS-cross-origin](#)<sup>p87</sup>, then pass the *muted errors* flag to the [create a script](#)<sup>p832</sup> algorithm as well.

**Note** This is where the script is compiled and actually executed.

- Initialise the [script](#)<sup>p591</sup> element's [node document](#)'s [currentScript](#)<sup>p108</sup> object to *old script element*.
- Decrement the [ignore-destructive-writes counter](#)<sup>p851</sup> of *neutralised doc*, if it was incremented in the earlier step.
- [Fire a simple event](#)<sup>p846</sup> named [afterScriptExecute](#)<sup>p1144</sup> that bubbles (but is not cancelable) at the [script](#)<sup>p591</sup> element.
- If the script is from an external file, [fire a simple event](#)<sup>p846</sup> named [load](#)<sup>p1144</sup> at the [script](#)<sup>p591</sup> element.

Otherwise, the script is internal; [queue a task](#)<sup>p835</sup> to [fire a simple event](#)<sup>p846</sup> named [load](#)<sup>p1144</sup> at the [script](#)<sup>p591</sup> element.

The IDL attributes [src](#), [type](#), [charset](#), [defer](#), each must [reflect](#)<sup>p88</sup> the respective content attributes of the same name.

The [crossOrigin](#) IDL attribute must [reflect](#)<sup>p88</sup> the [crossorigin](#)<sup>p593</sup> content attribute.

The [async](#) IDL attribute controls whether the element will execute asynchronously or not. If the element's ["non-blocking"](#)<sup>p593</sup> flag is set, then, on getting, the [async](#)<sup>p597</sup> IDL attribute must return true, and on setting, the ["non-blocking"](#)<sup>p593</sup> flag must first be unset, and then the content attribute must be removed if the IDL attribute's new value is false, and must be set to the empty string if the IDL attribute's new value is true. If the element's ["non-blocking"](#)<sup>p593</sup> flag is not set, the IDL attribute must [reflect](#)<sup>p88</sup> the [async](#)<sup>p592</sup> content attribute.

**Note**

`script.textp598 [= value]`

Returns the contents of the element, ignoring child nodes that aren't `Textp51` nodes.

Can be set, to replace the element's children with the given value.

The IDL attribute `text` must return a concatenation of the contents of all the `Textp51` nodes that are children of the `scriptp591` element (ignoring any other nodes such as comments or elements), in tree order. On setting, it must act the same way as the `textContentp51` IDL attribute.

**Note** When inserted using the `document.write()p851` method, `scriptp591` elements execute (typically blocking further script execution or HTML parsing), but when inserted using `innerHTMLp52` and `outerHTMLp52` attributes, they do not execute at all.

**Example**

In this example, two `scriptp591` elements are used. One embeds an external script, and the other includes some data.

```
<script src="game-engine.js"></script>
<script type="text/x-game-map">
....U.....
o.....A....
....A....AAA...
.A...AAA...AAAA...
</script>
```

The data in this case might be used by the script to generate the map of a video game. The data doesn't have to be used that way, though; maybe the map data is actually embedded in other parts of the page's markup, and the data block here is just used by the site's search engine to help users who are looking for particular features in their game maps.

**Example**

The following sample shows how a script element can be used to define a function that is then used by other parts of the document. It also shows how a `scriptp591` element can be used to invoke script while the document is being parsed, in this case to initialise the form's output.

```
<script>
function calculate(form) {
 var price = 52000;
 if (form.elements.brakes.checked)
 price += 1000;
 if (form.elements.radio.checked)
 price += 2500;
 if (form.elements.turbo.checked)
 price += 5000;
 if (form.elements.sticker.checked)
 price += 250;
 form.elements.result.value = price;
}
</script>
<form name="pricecalc" onsubmit="return false" onchange="calculate(this)">
<fieldset>
<legend>Work out the price of your car</legend>
<p>Base cost: £52000.</p>
<p>Select additional options:</p>

<label><input type=checkbox name=brakes> Ceramic brakes (£1000)</label>
<label><input type=checkbox name=radio> Satellite radio (£2500)</label>
<label><input type=checkbox name=turbo> Turbo charger (£5000)</label>
<label><input type=checkbox name=sticker> "XZ" sticker (£250)</label>

<p>Total: £<output name=result></output></p>
</fieldset>
<script>
```

```
 calculate(document.forms.pricecalc);
 </script>
</form>
```

#### 4.12.1.1 Scripting languages

A user agent is said to **support the scripting language** if each component of [the script block's type<sup>p593</sup>](#) is an ASCII case-insensitive<sup>p58</sup> match for the corresponding component in the [MIME type<sup>p42</sup>](#) string of a scripting language that the user agent implements.

The following lists the [MIME type<sup>p42</sup>](#) strings that user agents must recognize, and the languages to which they refer:

[application/ecmascript<sup>p1145</sup>](#)  
[application/javascript<sup>p1145</sup>](#)  
[application/x-ecmascript<sup>p1145</sup>](#)  
[application/x-javascript<sup>p1145</sup>](#)  
[text/ecmascript<sup>p1146</sup>](#)  
[text/javascript<sup>p1146</sup>](#)  
[text/javascript1.0<sup>p1146</sup>](#)  
[text/javascript1.1<sup>p1146</sup>](#)  
[text/javascript1.2<sup>p1146</sup>](#)  
[text/javascript1.3<sup>p1146</sup>](#)  
[text/javascript1.4<sup>p1146</sup>](#)  
[text/javascript1.5<sup>p1146</sup>](#)  
[text/jscript<sup>p1146</sup>](#)  
[text/livescript<sup>p1146</sup>](#)  
[text/x-ecmascript<sup>p1147</sup>](#)  
[text/x-javascript<sup>p1147</sup>](#)

JavaScript. [\[ECMA262\]<sup>p1150</sup>](#)

User agents may support other [MIME types<sup>p42</sup>](#) for other languages, but must not support other [MIME types<sup>p42</sup>](#) for the languages in the list above. User agents are not required to support the languages listed above.

The following [MIME types<sup>p42</sup>](#) (with or without parameters) must not be interpreted as scripting languages:

- [text/plain](#)
- [text/xml<sup>p1147</sup>](#)
- [application/octet-stream](#)
- [application/xml<sup>p1145</sup>](#)

**Note** These types are explicitly listed here because they are poorly-defined types that are nonetheless likely to be used as formats for data blocks, and it would be problematic if they were suddenly to be interpreted as script by a user agent.

When examining types to determine if they represent supported languages, user agents must not ignore MIME parameters. Types are to be compared including all parameters.

**Note** For example, types that include the `charset` parameter will not be recognised as referencing any of the scripting languages listed above.

#### 4.12.1.2 Restrictions for contents of `script` elements

**Note** The easiest and safest way to avoid the rather strange restrictions described in this section is to always escape "`<!--`" as "`<\!--`", "`<script`" as "`<\script`", and "`</script`" as "`<\/script`" when these sequences appear in literals in scripts (e.g. in strings, regular expressions, or comments), and to avoid writing code that uses such constructs in expressions. Doing so avoids the pitfalls that the restrictions in this section are prone to triggering: namely, that, for historical reasons, parsing of [script<sup>p591</sup>](#) blocks in HTML is a strange and exotic practice that acts unintuitively in the face of these sequences.

The [textContent<sup>p51</sup>](#) of a [script<sup>p591</sup>](#) element must match the `script` production in the following ABNF, the character set for which is Unicode.  
[ABNF]<sup>p1148</sup>

```
script = outer *(comment-open inner comment-close outer)

outer = < any string that doesn't contain a substring that matches not-in-outer >
not-in-outer = comment-open
inner = < any string that doesn't contain a substring that matches not-in-inner >
not-in-inner = comment-close / script-open

comment-open = "<!--"
comment-close = "-->"
script-open = "<" s c r i p t tag-end

s = %x0053 ; U+0053 LATIN CAPITAL LETTER S
s =/%x0073 ; U+0073 LATIN SMALL LETTER S
c = %x0043 ; U+0043 LATIN CAPITAL LETTER C
c =/%x0063 ; U+0063 LATIN SMALL LETTER C
r = %x0052 ; U+0052 LATIN CAPITAL LETTER R
r =/%x0072 ; U+0072 LATIN SMALL LETTER R
i = %x0049 ; U+0049 LATIN CAPITAL LETTER I
i =/%x0069 ; U+0069 LATIN SMALL LETTER I
p = %x0050 ; U+0050 LATIN CAPITAL LETTER P
p =/%x0070 ; U+0070 LATIN SMALL LETTER P
t = %x0054 ; U+0054 LATIN CAPITAL LETTER T
t =/%x0074 ; U+0074 LATIN SMALL LETTER T

tag-end = %x0009 ; U+0009 CHARACTER TABULATION (tab)
tag-end =/%x000A ; U+000A LINE FEED (LF)
tag-end =/%x000C ; U+000C FORM FEED (FF)
tag-end =/%x0020 ; U+0020 SPACE
tag-end =/%x002F ; U+002F SOLIDUS (/)
tag-end =/%x003E ; U+003E GREATER-THAN SIGN (>)
```

When a [script<sup>p591</sup>](#) element contains [script documentation<sup>p601</sup>](#), there are further restrictions on the contents of the element, as described in the section below.

### Example

The following script illustrates this issue. Suppose you have a script that contains a string, as in:

```
var example = 'Consider this string: <!-- <script>';
console.log(example);
```

If one were to put this string directly in a [script<sup>p591</sup>](#) block, it would violate the restrictions above:

```
<script>
 var example = 'Consider this string: <!-- <script>';
 console.log(example);
</script>
```

The bigger problem, though, and the reason why it would violate those restrictions, is that actually the script would get parsed weirdly: *the script block above is not terminated*. That is, what looks like a "`</script>`" end tag in this snippet is actually still part of the [script<sup>p591</sup>](#) block. The script doesn't execute (since it's not terminated); if it somehow were to execute, as it might if the markup looked as follows, it would fail because the script (highlighted here) is not valid JavaScript:

```
<script>
 var example = 'Consider this string: <!-- <script>';
 console.log(example);
</script>
<!-- despite appearances, this is actually part of the script still! -->
<script>
```

```
... // this is the same script block still...
</script>
```

What is going on here is that for legacy reasons, "<!--" and "<script" strings in `scriptp591` elements in HTML need to be balanced in order for the parser to consider closing the block.

By escaping the problematic strings as mentioned at the top of this section, the problem is avoided entirely:

```
<script>
 var example = 'Consider this string: <\!-- <\script>';
 console.log(example);
</script>
<!-- this is just a comment between script blocks -->
<script>
 ... // this is a new script block
</script>
```

It is possible for these sequences to naturally occur in script expressions, as in the following examples:

```
if (x<!--y) { ... }
if (player<script) { ... }
```

In such cases the characters cannot be escaped, but the expressions can be rewritten so that the sequences don't occur, as in:

```
if (x < !--y) { ... }
if (!--y > x) { ... }
if (!(--y) > x) { ... }
if (player < script) { ... }
if (script > player) { ... }
```

Doing this also avoids a different pitfall as well: for related historical reasons, the string "<!--" in JavaScript is actually treated as a line comment start, just like "//".

#### 4.12.1.3 Inline documentation for external scripts

If a `scriptp591` element's `srcp592` attribute is specified, then the contents of the `scriptp591` element, if any, must be such that the value of the `textp598` IDL attribute, which is derived from the element's contents, matches the `documentation` production in the following ABNF, the character set for which is Unicode. [ABNF]<sup>p1148</sup>

```
documentation = *(*(space / tab / comment) [line-comment] newline)
comment = slash star *(not-star / star not-slash) 1*star slash
line-comment = slash slash *not-newline

; characters
tab = %x0009 ; U+0009 CHARACTER TABULATION (tab)
newline = %x000A ; U+000A LINE FEED (LF)
space = %x0020 ; U+0020 SPACE
star = %x002A ; U+002A ASTERISK (*)
slash = %x002F ; U+002F SOLIDUS (/)
not-newline = %x0000-0009 / %x000B-10FFFF
 ; a Unicode character other than U+000A LINE FEED (LF)
not-star = %x0000-0029 / %x002B-10FFFF
 ; a Unicode character other than U+002A ASTERISK (*)
not-slash = %x0000-002E / %x0030-10FFFF
 ; a Unicode character other than U+002F SOLIDUS (/)
```

**Note** This corresponds to putting the contents of the element in JavaScript comments.

**Note** This requirement is in addition to the earlier restrictions on the syntax of contents of `scriptp591` elements.

**Example**

This allows authors to include documentation, such as license information or API information, inside their documents while still referring to external script files. The syntax is constrained so that authors don't accidentally include what looks like valid script while also providing a `src`<sup>p592</sup> attribute.

```
<script src="cool-effects.js">
 // create new instances using:
 // var e = new Effect();
 // start the effect using .play, stop using .stop:
 // e.play();
 // e.stop();
</script>
```

#### 4.12.1.4 Interaction of `script`<sup>p591</sup> elements and XSLT

*This section is non-normative.*

This specification does not define how XSLT interacts with the `script`<sup>p591</sup> element. However, in the absence of another specification actually defining this, here are some guidelines for implementors, based on existing implementations:

- When an XSLT transformation program is triggered by an `<?xml-stylesheet?>` processing instruction and the browser implements a direct-to-DOM transformation, `script`<sup>p591</sup> elements created by the XSLT processor need to be marked "`parser-inserted`"<sup>p593</sup> and run in document order (modulo scripts marked `defer`<sup>p592</sup> or `async`<sup>p592</sup>), `immediately`<sup>p41</sup>, as the transformation is occurring.
- The `XSLTProcessor.transformToDocument()`<sup>p48</sup> method adds elements to a `Document`<sup>p102</sup> that is not in a `browsing context`<sup>p762</sup>, and, accordingly, any `script`<sup>p591</sup> elements they create need to have their "`already started`"<sup>p593</sup> flag set in the `prepare a script`<sup>p593</sup> algorithm and never get executed (`scripting is disabled`<sup>p828</sup>). Such `script`<sup>p591</sup> elements still need to be marked "`parser-inserted`"<sup>p593</sup>, though, such that their `async`<sup>p597</sup> IDL attribute will return false in the absence of an `async`<sup>p592</sup> content attribute.
- The `XSLTProcessor.transformToFragment()`<sup>p48</sup> method needs to create a fragment that is equivalent to one built manually by creating the elements using `document.createElementNS()`<sup>p51</sup>. For instance, it needs to create `script`<sup>p591</sup> elements that aren't "`parser-inserted`"<sup>p593</sup> and that don't have their "`already started`"<sup>p593</sup> flag set, so that they will execute when the fragment is inserted into a document.

The main distinction between the first two cases and the last case is that the first two operate on `Document`<sup>p102</sup>s and the last operates on a fragment.

#### 4.12.2 The `noscript` element

**Categories**<sup>p113</sup>:

[Metadata content](#)<sup>p115</sup>.

[Flow content](#)<sup>p115</sup>.

[Phrasing content](#)<sup>p116</sup>.

**Contexts in which this element can be used**<sup>p113</sup>:

In a `head`<sup>p138</sup> element of an [HTML document](#)<sup>p51</sup>, if there are no ancestor `noscript`<sup>p602</sup> elements.

Where [phrasing content](#)<sup>p116</sup> is expected in [HTML documents](#)<sup>p51</sup>, if there are no ancestor `noscript`<sup>p602</sup> elements.

**Content model**<sup>p113</sup>:

When [scripting is disabled](#)<sup>p828</sup>, in a `head`<sup>p138</sup> element: in any order, zero or more [link](#)<sup>p141</sup> elements, zero or more [style](#)<sup>p154</sup> elements, and zero or more [meta](#)<sup>p145</sup> elements.

When [scripting is disabled](#)<sup>p828</sup>, not in a `head`<sup>p138</sup> element: [transparent](#)<sup>p117</sup>, but there must be no `noscript`<sup>p602</sup> element descendants.

Otherwise: text that conforms to the requirements given in the prose.

**Tag omission in text/html**<sup>p113</sup>:

Neither tag is ommissible.

**Content attributes**<sup>p113</sup>:

[Global attributes](#)<sup>p120</sup>

**DOM interface<sup>p113</sup>:**

Uses [HTMLElement<sup>p112</sup>](#).

The [noscript<sup>p602</sup>](#) element [represents<sup>p111</sup>](#) nothing if [scripting is enabled<sup>p828</sup>](#), and [represents<sup>p111</sup>](#) its children if [scripting is disabled<sup>p828</sup>](#). It is used to present different markup to user agents that support scripting and those that don't support scripting, by affecting how the document is parsed.

When used in [HTML documents<sup>p51</sup>](#), the allowed content model is as follows:

**In a [head<sup>p138</sup>](#) element, if [scripting is disabled<sup>p828</sup>](#) for the [noscript<sup>p602</sup>](#) element**

The [noscript<sup>p602</sup>](#) element must contain only [link<sup>p141</sup>](#), [style<sup>p154</sup>](#), and [meta<sup>p145</sup>](#) elements.

**In a [head<sup>p138</sup>](#) element, if [scripting is enabled<sup>p828</sup>](#) for the [noscript<sup>p602</sup>](#) element**

The [noscript<sup>p602</sup>](#) element must contain only text, except that invoking the [HTML fragment parsing algorithm<sup>p1043</sup>](#) with the [noscript<sup>p602</sup>](#) element as the [context<sup>p1043</sup>](#) element and the text contents as the [input](#) must result in a list of nodes that consists only of [link<sup>p141</sup>](#), [style<sup>p154</sup>](#), and [meta<sup>p145</sup>](#) elements that would be conforming if they were children of the [noscript<sup>p602</sup>](#) element, and no [parse errors<sup>p953</sup>](#).

**Outside of [head<sup>p138</sup>](#) elements, if [scripting is disabled<sup>p828</sup>](#) for the [noscript<sup>p602</sup>](#) element**

The [noscript<sup>p602</sup>](#) element's content model is [transparent<sup>p117</sup>](#), with the additional restriction that a [noscript<sup>p602</sup>](#) element must not have a [noscript<sup>p602</sup>](#) element as an ancestor (that is, [noscript<sup>p602</sup>](#) can't be nested).

**Outside of [head<sup>p138</sup>](#) elements, if [scripting is enabled<sup>p828</sup>](#) for the [noscript<sup>p602</sup>](#) element**

The [noscript<sup>p602</sup>](#) element must contain only text, except that the text must be such that running the following algorithm results in a conforming document with no [noscript<sup>p602</sup>](#) elements and no [script<sup>p591</sup>](#) elements, and such that no step in the algorithm throws an exception or causes an [HTML parser<sup>p952</sup>](#) to flag a [parse error<sup>p953</sup>](#).

1. Remove every [script<sup>p591</sup>](#) element from the document.
2. Make a list of every [noscript<sup>p602</sup>](#) element in the document. For every [noscript<sup>p602</sup>](#) element in that list, perform the following steps:
  1. Let s be the concatenation of all the [Text<sup>p51</sup>](#) node children of the [noscript<sup>p602</sup>](#) element.
  2. Set the [outerHTML<sup>p52</sup>](#) attribute of the [noscript<sup>p602</sup>](#) element to the value of s. (This, as a side-effect, causes the [noscript<sup>p602</sup>](#) element to be removed from the document.) [\[DOMPARSING\]<sup>p1149</sup>](#)

**Note** All these contortions are required because, for historical reasons, the [noscript<sup>p602</sup>](#) element is handled differently by the [HTML parser<sup>p952</sup>](#) based on whether [scripting was enabled or not<sup>p965</sup>](#) when the parser was invoked.

The [noscript<sup>p602</sup>](#) element must not be used in [XML documents<sup>p51</sup>](#).

**Note** The [noscript<sup>p602</sup>](#) element is only effective in [the HTML syntax<sup>p941</sup>](#), it has no effect in [the XHTML syntax<sup>p1054</sup>](#). This is because the way it works is by essentially "turning off" the parser when scripts are enabled, so that the contents of the element are treated as pure text and not as real elements. XML does not define a mechanism by which to do this.

The [noscript<sup>p602</sup>](#) element has no other requirements. In particular, children of the [noscript<sup>p602</sup>](#) element are not exempt from [form submission<sup>p557</sup>](#), [scripting](#), and so forth, even when [scripting is enabled<sup>p828</sup>](#) for the element.

**Example**

In the following example, a [noscript<sup>p602</sup>](#) element is used to provide fallback for a script.

```
<form action="calcSquare.php">
<p>
 <label for=x>Number</label>:
 <input id="x" name="x" type="number">
</p>
<script>
 var x = document.getElementById('x');
 var output = document.createElement('p');
 output.textContent = 'Type a number; it will be squared right then!';
</script>
```

```

 x.form.appendChild(output);
 x.form.onsubmit = function () { return false; }
 x.oninput = function () {
 var v = x.valueAsNumber;
 output.textContent = v + ' squared is ' + v * v;
 };
 </script>
<noscript>
 <input type=submit value="Calculate Square">
</noscript>
</form>

```

When script is disabled, a button appears to do the calculation on the server side. When script is enabled, the value is computed on-the-fly instead.

The [noscript](#)<sup>p602</sup> element is a blunt instrument. Sometimes, scripts might be enabled, but for some reason the page's script might fail. For this reason, it's generally better to avoid using [noscript](#)<sup>p602</sup>, and to instead design the script to change the page from being a scriptless page to a scripted page on the fly, as in the next example:

```

<form action="calcSquare.php">
<p>
 <label for=x>Number</label>:
 <input id="x" name="x" type="number">
</p>
<input id="submit" type=submit value="Calculate Square">
<script>
 var x = document.getElementById('x');
 var output = document.createElement('p');
 output.textContent = 'Type a number; it will be squared right then!';
 x.form.appendChild(output);
 x.form.onsubmit = function () { return false; }
 x.oninput = function () {
 var v = x.valueAsNumber;
 output.textContent = v + ' squared is ' + v * v;
 };
 var submit = document.getElementById('submit');
 submit.parentNode.removeChild(submit);
</script>
</form>

```

The above technique is also useful in XHTML, since [noscript](#)<sup>p602</sup> is not supported in [the XHTML syntax](#)<sup>p1054</sup>.

#### 4.12.3 The `template` element

**Categories**<sup>p113</sup>:

[Metadata content](#)<sup>p115</sup>.

[Flow content](#)<sup>p115</sup>.

[Phrasing content](#)<sup>p116</sup>.

[Script-supporting element](#)<sup>p117</sup>.

**Contexts in which this element can be used**<sup>p113</sup>:

Where [metadata content](#)<sup>p115</sup> is expected.

Where [phrasing content](#)<sup>p116</sup> is expected.

Where [script-supporting elements](#)<sup>p117</sup> are expected.

As a child of a [colgroup](#)<sup>p406</sup> element that doesn't have a [span](#)<sup>p407</sup> attribute.

**Content model**<sup>p113</sup>:

Either: [Metadata content](#)<sup>p115</sup>.

Or: [Flow content](#)<sup>p115</sup>.

Or: The content model of [menu](#)<sup>p571</sup> elements whose [type](#)<sup>p572</sup> attribute is in the [popup menu state](#)<sup>p572</sup>.

#### Tag omission in text/html<sup>p113</sup>:

Neither tag is omissible.

#### Content attributes<sup>p113</sup>:

[Global attributes](#)<sup>p120</sup>

#### DOM interface<sup>p113</sup>:

```
IDL
interface HTMLOptionsCollection : HTMLElement {
 readonly attribute DocumentFragment content;
};
```

The [template](#)<sup>p604</sup> element is used to declare fragments of HTML that can be cloned and inserted in the document by script.

In a rendering, the [template](#)<sup>p604</sup> element [represents](#)<sup>p111</sup> nothing.

#### Note

[template . content](#)<sup>p606</sup>

Returns the contents of the [template](#)<sup>p604</sup>, which are stored in a [DocumentFragment](#)<sup>p51</sup> associated with a different [Document](#)<sup>p102</sup> so as to avoid the [template](#)<sup>p604</sup> contents interfering with the main [Document](#)<sup>p102</sup>. (For example, this avoids form controls from being submitted, scripts from executing, and so forth.)

Each [template](#)<sup>p604</sup> element has an associated [DocumentFragment](#)<sup>p51</sup> object that is its **template contents**. When a [template](#)<sup>p604</sup> element is created, the user agent must run the following steps to establish the [template contents](#)<sup>p605</sup>:

1. Let *doc* be the [template](#)<sup>p604</sup> element's [node document](#)'s [appropriate template contents owner document](#)<sup>p605</sup>.
2. Create a [DocumentFragment](#)<sup>p51</sup> object whose [node document](#) is *doc*.
3. Set the [template](#)<sup>p604</sup> element's [template contents](#)<sup>p605</sup> to the newly created [DocumentFragment](#)<sup>p51</sup> object.

A [Document](#)<sup>p102</sup> *doc*'s **appropriate template contents owner document** is the [Document](#)<sup>p102</sup> returned by the following algorithm:

1. If *doc* is not a [Document](#)<sup>p102</sup> created by this algorithm, run these substeps:
  1. If *doc* does not yet have an **associated inert template document** then run these substeps:
    1. Let *new doc* be a new [Document](#)<sup>p102</sup> (that does not have a [browsing context](#)<sup>p762</sup>). This is "a [Document](#)<sup>p102</sup> created by this algorithm" for the purposes of the step above.
    2. If *doc* is an [HTML document](#)<sup>p51</sup>, mark *new doc* as an [HTML document](#)<sup>p51</sup> also.
    3. Let *doc*'s [associated inert template document](#)<sup>p605</sup> be *new doc*.

- Set `doc` to `doc`'s [associated inert template document](#)<sup>p605</sup>.

**Note** Each `Document`<sup>p102</sup> not created by this algorithm thus gets a single `Document`<sup>p102</sup> to act as its proxy for owning the `template contents`<sup>p605</sup> of all its `template`<sup>p604</sup> elements, so that they aren't in a [browsing context](#)<sup>p762</sup> and thus remain inert (e.g. scripts do not run). Meanwhile, `template`<sup>p604</sup> elements inside `Document`<sup>p102</sup> objects that are created by this algorithm just reuse the same `Document`<sup>p102</sup> owner for their contents.

- Return `doc`.

When a `template`<sup>p604</sup> element's `node document` changes, the user agent must run the following steps:

- Let `doc` be the `template`<sup>p604</sup> element's new `node document`'s [appropriate template contents owner document](#)<sup>p605</sup>.
- [Adopt](#)<sup>p51</sup> the `template`<sup>p604</sup> element's `template contents`<sup>p605</sup> (a `DocumentFragment`<sup>p51</sup> object) into `doc`.

The `content` IDL attribute must return the `template`<sup>p604</sup> element's `template contents`<sup>p605</sup>.

The [cloning steps](#)<sup>p51</sup> for a `template`<sup>p604</sup> element `node` being cloned to a copy `copy` must run the following steps:

- If the `clone children` flag is not set in the calling `clone`<sup>p51</sup> algorithm, abort these steps.
- Let `copied contents` be the result of [cloning](#)<sup>p51</sup> all the children of `node`'s `template contents`<sup>p605</sup>, with `document` set to `copy`'s `template contents`<sup>p605</sup>'s `node document`, and with the `clone children` flag set.
- Append `copied contents` to `copy`'s `template contents`<sup>p605</sup>.

#### Example

In this example, a script populates a table four-column with data from a data structure, using a `template`<sup>p604</sup> to provide the element structure instead of manually generating the structure from markup.

```
<!DOCTYPE html>
<title>Cat data</title>
<script>
 // Data is hard-coded here, but could come from the server
 var data = [
 { name: 'Pillar', color: 'Ticked Tabby', sex: 'Female (neutered)', legs: 3 },
 { name: 'Hederal', color: 'Tuxedo', sex: 'Male (neutered)', legs: 4 },
];
</script>
<table>
 <thead>
 <tr>
 <th>Name <th>Colour <th>Sex <th>Legs
 <tbody>
 <template id="row">
 <tr><td><td><td><td>
 </template>
 </tbody>
</table>
<script>
 var template = document.querySelector('#row');
 for (var i = 0; i < data.length; i++) {
 var cat = data[i];
 var clone = template.content.cloneNode(true);
 var cells = clone.querySelectorAll('td');
 cells[0].textContent = cat.name;
 cells[1].textContent = cat.color;
 cells[2].textContent = cat.sex;
 cells[3].textContent = cat.legs;
 template.parentNode.appendChild(clone);
 }
</script>
```

This example uses `cloneNode()`<sup>p51</sup> on the `template`<sup>p604</sup>'s contents; it could equivalently have used `document.importNode()`<sup>p51</sup>, which does the same thing. The only difference between these two APIs is when the `node document` is updated: with `cloneNode()`<sup>p51</sup> it is updated when the nodes are appended with `appendChild()`<sup>p51</sup>, with `document.importNode()`<sup>p51</sup> it is updated when the nodes are cloned.

#### 4.12.3.1 Interaction of `template`<sup>p604</sup> elements with XSLT and XPath

*This section is non-normative.*

This specification does not define how XSLT and XPath interact with the `template`<sup>p604</sup> element. However, in the absence of another specification actually defining this, here are some guidelines for implementors, which are intended to be consistent with other processing described in this specification:

- An XSLT processor based on an XML parser that acts as described in this specification<sup>p1054</sup> needs to act as if `template`<sup>p604</sup> elements contain as descendants their `template contents`<sup>p605</sup> for the purposes of the transform.
- An XSLT processor that outputs a DOM needs to ensure that nodes that would go into a `template`<sup>p604</sup> element are instead placed into the element's `template contents`<sup>p605</sup>.
- XPath evaluation using the XPath DOM API when applied to a `Document`<sup>p102</sup> parsed using the `HTML parser`<sup>p952</sup> or the `XML parser`<sup>p1054</sup> described in this specification needs to ignore `template contents`<sup>p605</sup>.

#### 4.12.4 The `canvas` element

[Global attributes](#)<sup>p120</sup>

[width](#)<sup>p608</sup> — Horizontal dimension

[height](#)<sup>p608</sup> — Vertical dimension

**DOM interface**<sup>p113</sup>:

```
IDL
typedef (CanvasRenderingContext2D or WebGLRenderingContext) RenderingContext;

interface HTMLCanvasElement : HTMLElement {
 attribute unsigned long width;
 attribute unsigned long height;

 RenderingContext? getContext(DOMString contextId, any... arguments);
 boolean probablySupportsContext(DOMString contextId, any... arguments);
}
```

```

void setContext(RenderingContext context);
CanvasProxy transferControlToProxy();

DOMString toDataURL(optional DOMString type, any... arguments);
void toBlob(FileCallback? _callback, optional DOMString type, any... arguments);
}

```

The [canvas<sup>p607</sup>](#) element provides scripts with a resolution-dependent bitmap canvas, which can be used for rendering graphs, game graphics, art, or other visual images on the fly.

Authors should not use the [canvas<sup>p607</sup>](#) element in a document when a more suitable element is available. For example, it is inappropriate to use a [canvas<sup>p607</sup>](#) element to render a page heading: if the desired presentation of the heading is graphically intense, it should be marked up using appropriate elements (typically [h1<sup>p168</sup>](#)) and then styled using CSS and supporting technologies such as Web Components.

When authors use the [canvas<sup>p607</sup>](#) element, they must also provide content that, when presented to the user, conveys essentially the same function or purpose as the [canvas<sup>p607</sup>](#)' bitmap. This content may be placed as content of the [canvas<sup>p607</sup>](#) element. The contents of the [canvas<sup>p607</sup>](#) element, if any, are the element's [fallback content<sup>p116</sup>](#).

In interactive visual media, if [scripting is enabled<sup>p828</sup>](#) for the [canvas<sup>p607</sup>](#) element, and if support for [canvas<sup>p607</sup>](#) elements has been enabled, the [canvas<sup>p607</sup>](#) element [represents<sup>p111</sup> embedded content<sup>p116</sup>](#) consisting of a dynamically created image, the element's bitmap.

In non-interactive, static, visual media, if the [canvas<sup>p607</sup>](#) element has been previously associated with a rendering context (e.g. if the page was viewed in an interactive visual medium and is now being printed, or if some script that ran during the page layout process painted on the element), then the [canvas<sup>p607</sup>](#) element [represents<sup>p111</sup> embedded content<sup>p116</sup>](#) with the element's current bitmap and size. Otherwise, the element represents its [fallback content<sup>p116</sup>](#) instead.

In non-visual media, and in visual media if [scripting is disabled<sup>p828</sup>](#) for the [canvas<sup>p607</sup>](#) element or if support for [canvas<sup>p607</sup>](#) elements has been disabled, the [canvas<sup>p607</sup>](#) element [represents<sup>p111</sup>](#) its [fallback content<sup>p116</sup>](#) instead.

When a [canvas<sup>p607</sup>](#) element [represents<sup>p111</sup> embedded content<sup>p116</sup>](#), the user can still focus descendants of the [canvas<sup>p607</sup>](#) element (in the [fallback content<sup>p116</sup>](#)). When an element is [focused<sup>p728</sup>](#), it is the target of keyboard interaction events (even though the element itself is not visible). This allows authors to make an interactive canvas keyboard-accessible: authors should have a one-to-one mapping of interactive regions to [focusable areas<sup>p726</sup>](#) in the [fallback content<sup>p116</sup>](#). (Focus has no effect on mouse interaction events.) [\[DOMEVENTS\]<sup>p1149</sup>](#)

An element whose nearest [canvas<sup>p607</sup>](#) element ancestor is [being rendered<sup>p1058</sup>](#) and [represents<sup>p111</sup> embedded content<sup>p116</sup>](#) is an element that is [being used as relevant canvas fallback content](#).

The [canvas<sup>p607</sup>](#) element has two attributes to control the size of the element's bitmap: [width](#) and [height](#). These attributes, when specified, must have values that are [valid non-negative integers<sup>p61</sup>](#). The [rules for parsing non-negative integers<sup>p61</sup>](#) must be used to obtain their numeric values. If an attribute is missing, or if parsing its value returns an error, then the default value must be used instead. The [width<sup>p608</sup>](#) attribute defaults to 300, and the [height<sup>p608</sup>](#) attribute defaults to 150.

The intrinsic dimensions of the [canvas<sup>p607</sup>](#) element when it [represents<sup>p111</sup> embedded content<sup>p116</sup>](#) are equal to the dimensions of the element's bitmap.

The user agent must use a square pixel density consisting of one pixel of image data per coordinate space unit for the bitmaps of a [canvas<sup>p607</sup>](#) and its rendering contexts.

**Note** A [canvas<sup>p607</sup>](#) element can be sized arbitrarily by a style sheet, its bitmap is then subject to the 'object-fit' CSS property.  
[\[CSSIMAGES\]<sup>p1149</sup>](#)

The bitmaps of [canvas](#)<sup>p607</sup> elements, as well as some of the bitmaps of rendering contexts, such as those described in the section on the [CanvasRenderingContext2D](#)<sup>p613</sup> object below, have an **origin-clean** flag, which can be set to true or false. Initially, when the [canvas](#)<sup>p607</sup> element is created, its bitmap's [origin-clean](#)<sup>p609</sup> flag must be set to true.

A [canvas](#)<sup>p607</sup> bitmap can also have a [hit region list](#)<sup>p652</sup>, as described in the [CanvasRenderingContext2D](#)<sup>p613</sup> section below.

A [canvas](#)<sup>p607</sup> element can have a rendering context bound to it. Initially, it does not have a bound rendering context. To keep track of whether it has a rendering context or not, and what kind of rendering context it is, a [canvas](#)<sup>p607</sup> also has a **canvas context mode**, which is initially **none** but can be changed to either **direct-2d**, **direct-webgl**, **indirect**, or **proxied** by algorithms defined in this specification.

When its [canvas context mode](#)<sup>p609</sup> is **none**<sup>p609</sup>, a [canvas](#)<sup>p607</sup> element has no rendering context, and its bitmap must be fully transparent black with an intrinsic width equal to the numeric value of the element's [width](#)<sup>p608</sup> attribute and an intrinsic height equal to the numeric value of the element's [height](#)<sup>p608</sup> attribute, those values being interpreted in CSS pixels, and being updated as the attributes are set, changed, or removed.

When a [canvas](#)<sup>p607</sup> element represents [embedded content](#)<sup>p116</sup>, it [provides a paint source](#)<sup>p53</sup> whose width is the element's intrinsic width, whose height is the element's intrinsic height, and whose appearance is the element's bitmap.

Whenever the [width](#)<sup>p608</sup> and [height](#)<sup>p608</sup> content attributes are set, removed, changed, or redundantly set to the value they already have, if the [canvas context mode](#)<sup>p609</sup> is **direct-2d**<sup>p609</sup>, the user agent must [set bitmap dimensions](#)<sup>p619</sup> to the numeric values of the [width](#)<sup>p608</sup> and [height](#)<sup>p608</sup> content attributes.

The [width](#) and [height](#) IDL attributes must [reflect](#)<sup>p88</sup> the respective content attributes of the same name, with the same defaults.

#### Note

**context = canvas . getContext**<sup>p610</sup>(*contextId* [, ... ])

Returns an object that exposes an API for drawing on the canvas. The first argument specifies the desired API, either "[2d](#)" or "[webgl](#)". Subsequent arguments are handled by that API.

This specification defines the "[2d](#)" context below. There is also a specification that defines a "[webgl](#)" context. [\[WEBGL\]](#)<sup>p1154</sup>

Returns null if the given context ID is not supported, if the canvas has already been initialised with the other context type (e.g. trying to get a "[2d](#)" context after getting a "[webgl](#)" context).

Throws an [InvalidStateError](#)<sup>p50</sup> exception if the [setContext\(\)](#)<sup>p610</sup> or [transferControlToProxy\(\)](#)<sup>p612</sup> methods have been used.

**supported = canvas . probablySupportsContext**<sup>p610</sup>(*contextId* [, ... ])

Returns false if calling [getContext\(\)](#)<sup>p610</sup> with the same arguments would definitely return null, and true otherwise.

This return value is not a guarantee that [getContext\(\)](#)<sup>p610</sup> will or will not return an object, as conditions (e.g. availability of system resources) can vary over time.

Throws an [InvalidStateError](#)<sup>p50</sup> exception if the [setContext\(\)](#)<sup>p610</sup> or [transferControlToProxy\(\)](#)<sup>p612</sup> methods have been used.

**canvas . setContext**<sup>p610</sup>(*context*)

Sets the [canvas](#)<sup>p607</sup>' rendering context to the given object.

Throws an [InvalidStateError](#)<sup>p50</sup> exception if the [getContext\(\)](#)<sup>p610</sup> or [transferControlToProxy\(\)](#)<sup>p612</sup> methods have been used.

There are two ways for a [canvas](#)<sup>p607</sup> element to acquire a rendering context: the [canvas](#)<sup>p607</sup> element can provide one via the [getContext\(\)](#)<sup>p610</sup> method, and one can be assigned to it via the [setContext\(\)](#)<sup>p610</sup> method. In addition, the whole issue of a rendering context can be taken out of the [canvas](#)<sup>p607</sup> element's hands and passed to a [CanvasProxy](#)<sup>p611</sup> object, which itself can then be assigned a rendering context using its [setContext\(\)](#)<sup>p612</sup> method.

These three methods are mutually exclusive; calling any of the three makes the other two start throwing [InvalidStateError](#)<sup>p50</sup> exceptions when called.

Each rendering context has a **context bitmap mode**, which is one of **fixed**, **unbound**, or **bound**. Initially, rendering contexts must be in the [unbound](#)<sup>p609</sup> mode.

The `getContext(contextId, arguments...)` method of the `canvas` element, when invoked, must run the steps in the cell of the following table whose column header describes the `canvas` element's `canvas context mode` and whose row header describes the method's first argument.

	<code>none</code>	<code>direct-2d</code>	<code>direct-webgl</code>	<code>indirect</code>	<code>proxied</code>
" <code>2d</code> "	Follow the <a href="#">2D context creation algorithm</a> defined in the section below, passing it the <code>canvas</code> element and the method's <code>arguments...</code> , to obtain a <code>CanvasRenderingContext2D</code> object; if this does not throw an exception, then set the <code>canvas</code> element's <code>context mode</code> to <code>direct-2d</code> , set the <code>CanvasRenderingContext2D</code> object's <code>context bitmap mode</code> to <code>fixed</code> , and return the <code>CanvasRenderingContext2D</code> object	Return the same object as was return the last time the method was invoked with this same first argument.	Return null.	Throw an <code>InvalidStateError</code> exception.	Throw an <code>InvalidStateError</code> exception.
" <code>webgl</code> ", if the user agent supports the WebGL feature in its current configuration	Follow the instructions given in the WebGL specification's <code>Context Creation</code> section to obtain either a <code>WebGLRenderingContext</code> or null; if the returned value is null, then return null and abort these steps, otherwise, set the <code>canvas</code> element's <code>context mode</code> to <code>direct-webgl</code> , set the new <code>WebGLRenderingContext</code> object's <code>context bitmap mode</code> to <code>fixed</code> , and return the <code>WebGLRenderingContext</code> object [WEBGL] <sup>1154</sup>	Return null.	Return the same object as was return the last time the method was invoked with this same first argument.	Throw an <code>InvalidStateError</code> exception.	Throw an <code>InvalidStateError</code> exception.
A vendor-specific extension*	Behave as defined for the extension.	Behave as defined for the extension.	Behave as defined for the extension.	Throw an <code>InvalidStateError</code> exception.	Throw an <code>InvalidStateError</code> exception.
An unsupported value†	Return null.	Return null.	Return null.	Throw an <code>InvalidStateError</code> exception.	Throw an <code>InvalidStateError</code> exception.

\* Vendors may define experimental contexts using the syntax `vendorname-context`, for example, `moz-3d`.

† For example, the "`webgl`" value in the case of a user agent having exhausted the graphics hardware's abilities and having no software fallback implementation.

The `probablySupportsContext(contextId, arguments...)` method of the `canvas` element, when invoked, must return false if calling `getContext()` on the same object and with the same arguments would definitely return null at this time, and true otherwise.

The `setContext(context)` method of the `canvas` element, when invoked, must run the following steps:

1. If the `canvas` element's `canvas context mode` is neither `none` nor `indirect`, throw an `InvalidStateError` exception and abort these steps.
2. If `context's context bitmap mode` is `fixed`, then throw an `InvalidStateError` exception and abort these steps.
3. If `context's context bitmap mode` is `bound`, then run `context's unbinding steps` and set its `context's context bitmap mode` to `unbound`.
4. Run `context's binding steps` to bind it to this `canvas` element.
5. Set the `canvas` element's `context mode` to `indirect` and the `context's context bitmap mode` to `bound`.

### Note

`url = canvas . toDataURL([ type, ... ])`

Returns a `data: URL` for the image in the canvas.

The first argument, if provided, controls the type of the image to be returned (e.g. PNG or JPEG). The default is `image/png`; that type is also used if the given type isn't supported. The other arguments are specific to the type, and control the way that the image is generated, as given [in the table below](#)<sup>1171</sup>.

When trying to use types other than "`image/png`", authors can check if the image was really returned in the requested format by checking to see if the returned string starts with one of the exact strings "`data:image/png,`" or "`data:image/png;`". If it does, the

image is PNG, and thus the requested type was not supported. (The one exception to this is if the canvas has either no height or no width, in which case the result might simply be "data:, ".)

`canvas.toBlobp611(callback [, type, ...])`

Creates a [blob<sup>p52</sup>](#) object representing a file containing the image in the canvas, and invokes a callback with a handle to that object.

The second argument, if provided, controls the type of the image to be returned (e.g. PNG or JPEG). The default is `image/png`; that type is also used if the given type isn't supported. The other arguments are specific to the type, and control the way that the image is generated, as given [in the table below<sup>p671</sup>](#).

The `toDataURL()` method must run the following steps:

1. If the [canvas<sup>p607</sup>](#) element's bitmap's [origin-clean<sup>p609</sup>](#) flag is set to false, throw a [SecurityError<sup>p50</sup>](#) exception and abort these steps.
2. If the [canvas<sup>p607</sup>](#) element's bitmap has no pixels (i.e. either its horizontal dimension or its vertical dimension is zero) then return the string "data:," and abort these steps. (This is the shortest [data: URL](#); it represents the empty string in a `text/plain` resource.)
3. Let `file` be [a serialisation of the canvas element's bitmap as a file<sup>p670</sup>](#), using the method's arguments (if any) as the `arguments`.
4. Return a [data: URL](#) representing `file`. [\[RFC2397\]<sup>p1152</sup>](#)

The `toBlob()` method must run the following steps:

1. If the [canvas<sup>p607</sup>](#) element's bitmap's [origin-clean<sup>p609</sup>](#) flag is set to false, throw a [SecurityError<sup>p50</sup>](#) exception and abort these steps.
2. Let `callback` be the first argument.
3. Let `arguments` be the second and subsequent arguments to the method, if any.
4. If the [canvas<sup>p607</sup>](#) element's bitmap has no pixels (i.e. either its horizontal dimension or its vertical dimension is zero) then let `result` be null.  
Otherwise, let `result` be a [blob<sup>p52</sup>](#) object representing [a serialisation of the canvas element's bitmap as a file<sup>p670</sup>](#), using `arguments`. [\[FILEAPI\]<sup>p1150</sup>](#)
5. Return, but continue running these steps [in parallel<sup>p41</sup>](#).
6. If `callback` is null, abort these steps.
7. [Queue a task<sup>p835</sup>](#) to invoke the [FileCallback<sup>p101</sup>](#) `callback` with `result` as its argument. The [task source<sup>p835</sup>](#) for this task is the **canvas blob serialisation task source**.

#### 4.12.4.1 Proxying canvases to workers

Since DOM nodes cannot be accessed across worker boundaries, a proxy object is needed to enable workers to render to [canvas<sup>p607</sup>](#) elements in [Document<sup>p102</sup>](#)s.

**IDL**

```
[Exposed=(Window,Worker)]
interface CanvasProxy {
 void setContext(RenderingContext context);
};

// CanvasProxy implements Transferable;
```

**Note** `canvasProxy = canvas.transferControlToProxyp612()`

Returns a [CanvasProxy<sup>p611</sup>](#) object that can be used to transfer control for this canvas over to another document (e.g. an [iframe<sup>p299</sup>](#) from another [origin<sup>p776</sup>](#)) or to a worker.

Throws an [InvalidStateError](#)<sup>p50</sup> exception if the [getContext\(\)](#)<sup>p610</sup> or [setContext\(\)](#)<sup>p610</sup> methods have been used.

#### **canvasProxy . setContext<sup>p612</sup>(context)**

Sets the [CanvasProxy](#)<sup>p611</sup> object's [canvas](#)<sup>p607</sup> element's rendering context to the given object.

Throws an [InvalidStateError](#)<sup>p50</sup> exception if the [CanvasProxy](#)<sup>p611</sup> has been [transferred](#)<sup>p98</sup>.

The [transferControlToProxy\(\)](#) method of the [canvas](#)<sup>p607</sup> element, when invoked, must run the following steps:

1. If the [canvas](#)<sup>p607</sup> element's [canvas context mode](#)<sup>p609</sup> is not [none](#)<sup>p609</sup>, throw an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
2. Set the [canvas](#)<sup>p607</sup> element's [context mode](#)<sup>p609</sup> to [proxied](#)<sup>b609</sup>.
3. Return a [CanvasProxy](#)<sup>p611</sup> object bound to this [canvas](#)<sup>p607</sup> element.

A [CanvasProxy](#)<sup>p611</sup> object can be [neutered](#)<sup>p98</sup> (like any [Transferable](#)<sup>p98</sup> object), meaning it can no longer be [transferred](#)<sup>p98</sup>, and can be [disabled](#), meaning it can no longer be bound to rendering contexts. When first created, a [CanvasProxy](#)<sup>p611</sup> object must be neither.

A [CanvasProxy](#)<sup>p611</sup> is created with a link to a [canvas](#)<sup>p607</sup> element. A [CanvasProxy](#)<sup>p611</sup> object that has not been [disabled](#)<sup>p612</sup> must have a strong reference to its canvas element.

The [setContext\(context\)](#) method of [CanvasProxy](#)<sup>p611</sup> objects, when invoked, must run the following steps:

1. If the [CanvasProxy](#)<sup>p611</sup> object has been [disabled](#)<sup>p612</sup>, throw an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
2. If the [CanvasProxy](#)<sup>p611</sup> object has not been [neutered](#)<sup>p98</sup>, then [neuter](#)<sup>p98</sup> it.
3. If [context's context bitmap mode](#)<sup>p609</sup> is [fixed](#)<sup>p609</sup>, then throw an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
4. If [context's context bitmap mode](#)<sup>p609</sup> is [bound](#)<sup>p609</sup>, then run [context's unbinding steps](#)<sup>p620</sup> and set its [context's context bitmap mode](#)<sup>p609</sup> to [unbound](#)<sup>p609</sup>.
5. Run [context's binding steps](#)<sup>p620</sup> to bind it to this [CanvasProxy](#)<sup>p611</sup> object's [canvas](#)<sup>p607</sup> element.
6. Set the [context's context bitmap mode](#)<sup>p609</sup> to [bound](#)<sup>p609</sup>.

To [transfer](#)<sup>p98</sup> a [CanvasProxy](#)<sup>p611</sup> object *old* to a new owner *owner*, a user agent must create a new [CanvasProxy](#)<sup>p611</sup> object linked to the same [canvas](#)<sup>p607</sup> element as *old*, thus obtaining *new*, must [neuter](#)<sup>p98</sup> and [disable](#)<sup>p612</sup> the *old* object, and must finally return *new*.

#### **Example**

Here is a clock implemented on a worker. First, the main page:

```
<!DOCTYPE HTML>
<title>Clock</title>
<canvas></canvas>
<script>
 var canvas = document.getElementsByTagName('canvas')[0];
 var proxy = canvas.transferControlToProxy();
 var worker = new Worker('clock.js');
 worker.postMessage(proxy, [proxy]);
</script>
```

Second, the worker:

```
onmessage = function (event) {
 var context = new CanvasRenderingContext2D();
 event.data.setContext(context); // event.data is the CanvasProxy object
 setInterval(function () {
 context.clearRect(0, 0, context.width, context.height);
 context.fillText(new Date(), 0, 100);
```

```
 context.commit();
 }, 1000);
};
```

#### 4.12.4.2 The 2D rendering context

Spec bugs: [17427](#), [27429](#),  
[18220](#), [27315](#)

IDL

```

```

### Note

**context = canvas.getContext<sup>p610</sup>('2d', { [ alpha<sup>p618</sup>: false ] })**

Returns a CanvasRenderingContext2D<sup>p613</sup> object that is permanently bound to a particular canvas<sup>p607</sup> element.

If the alpha<sup>p618</sup> setting is provided and set to false, then the canvas is forced to always be opaque.

**context = new CanvasRenderingContext2D<sup>p618</sup>( [ width, height ] )**

Returns an unbound CanvasRenderingContext2D<sup>p613</sup> object with an implied bitmap with the given dimensions in CSS pixels (300x150, if the arguments are omitted).

**context.canvas<sup>p620</sup>**

Returns the canvas<sup>p607</sup> element, if the rendering context was obtained using the getContext()<sup>p610</sup> method.

**context.width<sup>p620</sup>**

**context.height<sup>p620</sup>**

Return the dimensions of the bitmap, in CSS pixels.

Can be set, to update the bitmap's dimensions. If the rendering context is bound to a canvas, this will also update the canvas' intrinsic dimensions.

**context.commit<sup>p619</sup>()**

If the rendering context is bound to a canvas<sup>p607</sup>, display the current frame.

A CanvasRenderingContext2D<sup>p613</sup> object can be obtained in two ways: the getContext()<sup>p610</sup> method on a canvas<sup>p607</sup> element (which invokes the 2D context creation algorithm<sup>p618</sup>), and the CanvasRenderingContext2D()<sup>p618</sup> constructor.

A CanvasRenderingContext2D<sup>p613</sup> object has a **scratch bitmap** and can be bound to an **output bitmap**. These are initialised when the object is created, and can be subsequently adjusted when the rendering context is bound<sup>p620</sup> or unbound<sup>p620</sup>. In some cases, these bitmaps are the same underlying bitmap. In general, the scratch bitmap<sup>p617</sup> is what scripts interact with, and the output bitmap<sup>p617</sup> is what is being displayed. These bitmaps always have the same dimensions.

Each such bitmap has an origin-clean<sup>p609</sup> flag, which can be set to true or false. Initially, when one of these bitmaps is created, its origin-clean<sup>p609</sup> flag must be set to true.

These bitmaps also have a hit region list<sup>p652</sup>, which is described in a later section. Initially, this list is empty.

Scratch bitmaps<sup>p617</sup> have a **list of pending interface actions**, which can contain instructions to draw the user's attention to a location on the bitmap, and instructions to scroll to a location on the bitmap. Initially, this list is also empty.

Scratch bitmaps<sup>p617</sup> also have an **alpha** flag, which can be set to true or false. Initially, when one of these bitmaps is created, its alpha<sup>p617</sup> flag must be set to true. When a scratch bitmap<sup>p617</sup> has its alpha<sup>p617</sup> flag set to false, then its alpha channel must be fixed to 1.0 (fully opaque) for all pixels, and attempts to change the alpha component of any pixel must be silently ignored.

**Note** Thus, such a bitmap starts off as fully-opaque black instead of fully-transparent black; clearRect()<sup>p644</sup> always results in fully-opaque black pixels, every fourth byte from getImageData()<sup>p660</sup> is always 255, the putImageData()<sup>p660</sup> method effectively ignores every fourth byte in its input, and so on. However, the alpha component of styles and images drawn onto the canvas are still honoured up to the

point where they would impact the [scratch bitmap](#)'s alpha channel; for instance, drawing a 50% transparent white square on a freshly created [scratch bitmap](#) with its [alpha](#) flag set to false will result in a fully-opaque gray square.

The [CanvasRenderingContext2D](#) 2D rendering context represents a flat linear Cartesian surface whose origin (0,0) is at the top left corner, with the coordinate space having x values increasing when going right, and y values increasing when going down. The x-coordinate of the right-most edge is equal to the width of the rendering context's [scratch bitmap](#) in CSS pixels; similarly, the y-coordinate of the bottom-most edge is equal to the height of the rendering context's [scratch bitmap](#) in CSS pixels.

The size of the coordinate space does not necessarily represent the size of the actual bitmaps that the user agent will use internally or during rendering. On high-definition displays, for instance, the user agent may internally use bitmaps with two device pixels per unit in the coordinate space, so that the rendering remains at high quality throughout. Anti-aliasing can similarly be implemented using over-sampling with bitmaps of a higher resolution than the final image on the display.

The **2D context creation algorithm**, which is passed a *target* (a [canvas](#) element) and optionally some arguments, consists of running the following steps:

1. If the algorithm was passed some arguments, let *arg* be the first such argument. Otherwise, let *arg* be *undefined*.
2. Let *settings* be the result of [coercing the arg context arguments for 2D](#).
3. Create a new [CanvasRenderingContext2D](#) object.
4. Initialise its [canvas](#) attribute to point to *target*.
5. Let the new [CanvasRenderingContext2D](#) object's [output bitmap](#) and [scratch bitmap](#) both be the same bitmap as *target*'s bitmap (so that they are shared).
6. [Set bitmap dimensions](#) to the numeric values of *target*'s [width](#) and [height](#) content attributes.
7. Process each of the members of *settings* as follows:
  - [alpha](#)**  
If false, then set the *target*'s bitmap's [alpha](#) flag to false.
8. Return the new [CanvasRenderingContext2D](#) object.

The [CanvasRenderingContext2D\(\)](#) constructor, when invoked, must run the following steps:

1. Create a new [CanvasRenderingContext2D](#) object.
2. Initialise its [canvas](#) attribute to null.
3. Let the new [CanvasRenderingContext2D](#) object's [scratch bitmap](#) be a new bitmap.
4. If the constructor was called with arguments, let *width* and *height* be the first and second arguments, respectively. Otherwise, let *width* and *height* be 300 and 150, respectively.
5. [Set bitmap dimensions](#) to *width* and *height*.
6. Let the new [CanvasRenderingContext2D](#) object have no [output bitmap](#).
7. Return the new [CanvasRenderingContext2D](#) object.

When a user agent is required to **coerce context arguments for 2D**, it must run the following steps:

1. Let *input* be the argument to coerce.
2. Let *jsval* be the result of [converting](#) *input* to an ECMAScript value. If this throws an exception, then propagate the exception and abort these steps.

3. Let *dict* be the result of [converting \*jsval\*](#) to the dictionary type [CanvasRenderingContext2DSettings<sup>p613</sup>](#). If this throws an exception, then propagate the exception and abort these steps.
4. Return *dict*.

When the user agent is required to **commit the scratch bitmap** for a rendering context, it must run the following steps:

1. Let *bitmap copy* be a copy of the rendering context's [scratch bitmap<sup>p617</sup>](#).
2. Let *origin-clean flag copy* be a copy of the rendering context's [scratch bitmap<sup>p617</sup>](#)'s [origin-clean<sup>p609</sup>](#) flag.
3. Let *hit region list copy* be a copy of the rendering context's [scratch bitmap<sup>p617</sup>](#)'s [hit region list<sup>p652</sup>](#).
4. Let *list of pending interface actions copy* be a copy of the rendering context's [scratch bitmap<sup>p617</sup>](#)'s [list of pending interface actions<sup>p617</sup>](#).
5. Empty the [scratch bitmap<sup>p617</sup>](#)'s [list of pending interface actions<sup>p617</sup>](#).
6. If the rendering context has no [output bitmap<sup>p617</sup>](#), abort these steps.
7. Let *output bitmap* be the rendering context's [output bitmap<sup>p617</sup>](#).
8. Let *canvas* be the [canvas<sup>p607</sup>](#) element to which the rendering context was most recently [bound<sup>p620</sup>](#).
9. [Queue a task<sup>p835</sup>](#) associated with *canvas*' [Document<sup>p102</sup>](#) to perform the following substeps:
  1. Overwrite *output bitmap* with *bitmap copy*.
  2. Overwrite *output bitmap*'s [origin-clean<sup>p609</sup>](#) flag with *origin-clean flag copy*.
  3. Overwrite *output bitmap*'s [hit region list<sup>p652</sup>](#) with *hit region list copy*.
  4. Follow the directions in the *list of pending interface actions copy*.

The algorithm above must use the **canvas updating task source** (which is just used by this algorithm).

The **commit()** method must run the following steps:

1. If the rendering context's [context bitmap mode<sup>p609</sup>](#) is [fixed<sup>p609</sup>](#), throw an [InvalidStateError<sup>p50</sup>](#) exception and abort these steps.
2. [Commit the scratch bitmap<sup>p619</sup>](#) for the rendering context.

**Note** The [scratch bitmap<sup>p617</sup>](#) is only [committed<sup>p619</sup>](#) when the [commit\(\)<sup>p619</sup>](#) method is called. (This doesn't matter for [canvas<sup>p607</sup>](#) elements in [direct-2d<sup>p609</sup>](#) mode, since there the [scratch bitmap<sup>p617</sup>](#) is also the [canvas<sup>p607</sup>](#) element's bitmap so every drawing operation is immediately drawn.)

When the user agent is to **set bitmap dimensions** to *width* and *height*, it must run the following steps:

1. [Reset the rendering context to its default state<sup>p622</sup>](#).
2. Clear the [scratch bitmap<sup>p617</sup>](#)'s [hit region list<sup>p652</sup>](#) and its [list of pending interface actions<sup>p617</sup>](#).
3. Resize the [scratch bitmap<sup>p617</sup>](#) to the new *width* and *height* and clear it to fully transparent black.
4. If the rendering context has an [output bitmap<sup>p617</sup>](#), and the [scratch bitmap<sup>p617</sup>](#) is a different bitmap than the [output bitmap<sup>p617</sup>](#), then resize the [output bitmap<sup>p617</sup>](#) to the new *width* and *height* and clear it to fully transparent black.
5. If the rendering context's [context bitmap mode<sup>p609</sup>](#) is [fixed<sup>p609</sup>](#), then run these substeps:
  1. Let *canvas* be the [canvas<sup>p607</sup>](#) element to which the rendering context's [canvas<sup>p620</sup>](#) attribute was initialised.
  2. If the rendering context's [context bitmap mode<sup>p609</sup>](#) is [fixed<sup>p609</sup>](#) and the numeric value of the *canvas*' [width<sup>p608</sup>](#) content attribute differs from *width*, then set *canvas*' [width<sup>p608</sup>](#) content attribute to the shortest possible string representing *width* as a [valid non-negative integer<sup>p611</sup>](#).

- If the rendering context's [context bitmap mode](#)<sup>p609</sup> is [fixed](#)<sup>p609</sup> and the numeric value of the [canvas](#)' [height](#)<sup>p608</sup> content attribute differs from [height](#), then set [canvas](#)' [height](#)<sup>p608</sup> content attribute to the shortest possible string representing [height](#) as a [valid non-negative integer](#)<sup>p61</sup>.

### Example

Only one square appears to be drawn in the following example:

```
// canvas is a reference to a <canvas> element
var context = canvas.getContext('2d');
context.fillRect(0,0,50,50);
canvas.setAttribute('width', '300'); // clears the canvas
context.fillRect(0,100,50,50);
canvas.width = canvas.width; // clears the canvas
context.fillRect(100,0,50,50); // only this square remains
```

When the user agent is to run the **unbinding steps** for a rendering context, it must run the following steps:

- [Reset the rendering context to its default state](#)<sup>b622</sup>.
- Clear the [scratch bitmap](#)<sup>p617</sup>'s [hit region list](#)<sup>p652</sup> and its [list of pending interface actions](#)<sup>p617</sup>.
- Clear the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [scratch bitmap](#)<sup>p617</sup> to a transparent black.
- Set the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [scratch bitmap](#)<sup>p617</sup>'s [origin-clean](#)<sup>p609</sup> flag to true.
- Let the [CanvasRenderingContext2D](#)<sup>p613</sup> object have no [output bitmap](#)<sup>p617</sup>.

When the user agent is to run the **binding steps** to bind the rendering context to the [canvas](#)<sup>b607</sup> element *target*, it must run the following steps:

- [Reset the rendering context to its default state](#)<sup>b622</sup>.
- Clear the [scratch bitmap](#)<sup>p617</sup>'s [hit region list](#)<sup>p652</sup> and its [list of pending interface actions](#)<sup>p617</sup>.
- Resize the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [scratch bitmap](#)<sup>p617</sup> to the dimensions of *target*'s bitmap and clear it to fully transparent black.
- Set the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [scratch bitmap](#)<sup>p617</sup>'s [origin-clean](#)<sup>p609</sup> flag to true.
- Let the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [output bitmap](#)<sup>p617</sup> be *target*'s bitmap.

The [canvas](#) attribute must return the value it was initialised to when the object was created.

The [width](#) attribute, on getting, must return the width of the rendering context's [scratch bitmap](#)<sup>p617</sup>, in CSS pixels. On setting, it must [set bitmap dimensions](#)<sup>p619</sup> to the new value and the current height of the rendering context's [scratch bitmap](#)<sup>p617</sup> in CSS pixels, respectively.

The [height](#) attribute, on getting, must return the height of the rendering context's [scratch bitmap](#)<sup>p617</sup>, in CSS pixels. On setting, it must [set bitmap dimensions](#)<sup>p619</sup> to the current width of the rendering context's [scratch bitmap](#)<sup>p617</sup> in CSS pixels and the new value, respectively.

Except where otherwise specified, for the 2D context interface, **any method call with a numeric argument whose value is infinite or a NaN value must be ignored**.

Whenever the CSS value [currentColor](#) is used as a colour in the [CanvasRenderingContext2D](#)<sup>p613</sup> API, the "computed value of the 'color' property" for the purposes of determining the computed value of the [currentColor](#) keyword is the value described by the appropriate entry in the following list:

**If the rendering context's [context bitmap mode](#)<sup>p609</sup> is [fixed](#)<sup>p609</sup> and the [canvas](#)<sup>p607</sup> element is [being rendered](#)<sup>p1058</sup>**

The "computed value of the 'color' property" for the purposes of determining the computed value of the [currentColor](#) keyword is the computed value of the 'color' property on the [canvas](#)<sup>p607</sup> element at the time that the colour is specified (e.g. when the appropriate attribute is set, or when the method is called; not when the colour is rendered or otherwise used). [\[CSSCOLOR\]](#)<sup>p1149</sup>

## In all other cases

The "computed value of the 'color' property" for the purposes of determining the computed value of the `currentColor` keyword is fully opaque black. [CSSCOLOR]<sup>p1149</sup>

In the case of `addColorStop()`<sup>p642</sup> on `CanvasGradient`<sup>p615</sup>, the "computed value of the 'color' property" for the purposes of determining the computed value of the `currentColor` keyword is always fully opaque black (there is no associated element). [CSSCOLOR]<sup>p1149</sup>

**Note** This is because `CanvasGradient`<sup>p615</sup> objects are `canvas`<sup>p607</sup>-neutral — a `CanvasGradient`<sup>p615</sup> object created by one `canvas`<sup>p607</sup> can be used by another, and there is therefore no way to know which is the "element in question" at the time that the colour is specified.

**Note** Similar concerns exist with font-related properties; the rules for those are described in detail in the relevant section below.

The `CanvasFillRule`<sup>p613</sup> enumeration is used to select the **fill rule** algorithm by which to determine if a point is inside or outside a path.

The value " `nonzero`" value indicates the non-zero winding rule, wherein a point is considered to be outside a shape if the number of times a half-infinite straight line drawn from that point crosses the shape's path going in one direction is equal to the number of times it crosses the path going in the other direction.

The " `evenodd`" value indicates the even-odd rule, wherein a point is considered to be outside a shape if the number of times a half-infinite straight line drawn from that point crosses the shape's path is even.

If a point is not outside a shape, it is inside the shape.

### 4.12.4.2.1 Implementation notes

This section is non-normative.

Although the way the specification is written it might sound like an implementation needs to track up to four bitmaps per canvas or rendering context — one `scratch bitmap`<sup>p617</sup>, one `output bitmap`<sup>p617</sup> for the rendering context, one bitmap for the `canvas`<sup>p607</sup>, and one bitmap for the actually currently rendered image — user agents can in fact generally optimise this to only one or two.

The `scratch bitmap`<sup>p617</sup>, when it isn't the same bitmap as the `output bitmap`<sup>p617</sup>, is only directly observable if it is read, and therefore implementations can, instead of updating this bitmap, merely remember the sequence of drawing operations that have been applied to it until such time as the bitmap's actual data is needed (for example because of a call to `commit()`<sup>p619</sup>, `drawImage()`<sup>p651</sup>, or the `createImageBitmap()`<sup>p875</sup> factory method). In many cases, this will be more memory efficient.

The bitmap of a `canvas`<sup>p607</sup> element is the one bitmap that's pretty much always going to be needed in practice. The `output bitmap`<sup>p617</sup> of a rendering context, when it has one, is always just an alias to a `canvas`<sup>p607</sup> element's bitmap.

Additional bitmaps are sometimes needed, e.g. to enable fast drawing when the canvas is being painted at a different size than its intrinsic size, or to enable double buffering so that the rendering commands from the `scratch bitmap`<sup>p617</sup> can be applied without the rendering being updated midway.

### 4.12.4.2.2 The canvas state

Each `CanvasRenderingContext2D`<sup>p613</sup> rendering context maintains a stack of drawing states. **Drawing states** consist of:

- The current `transformation matrix`<sup>p638</sup>.
- The current `clipping region`<sup>p649</sup>.
- The current values of the following attributes: `strokeStyle`<sup>p641</sup>, `fillStyle`<sup>p641</sup>, `globalAlpha`<sup>p663</sup>, `lineWidth`<sup>p623</sup>, `lineCap`<sup>p623</sup>, `lineJoin`<sup>p623</sup>, `miterLimit`<sup>p624</sup>, `lineDashOffset`<sup>p624</sup>, `shadowOffsetX`<sup>p664</sup>, `shadowOffsetY`<sup>p664</sup>, `shadowBlur`<sup>p664</sup>, `shadowColor`<sup>p664</sup>, `globalCompositeOperation`<sup>p663</sup>, `font`<sup>p627</sup>, `textAlign`<sup>p627</sup>, `textBaseline`<sup>p627</sup>, `direction`<sup>p628</sup>, `imageSmoothingEnabled`<sup>p663</sup>.
- The current `dash list`<sup>p624</sup>.

**Note** The `current default path`<sup>p647</sup> and the rendering context's bitmaps are not part of the drawing state. The `current default path`<sup>p647</sup> is persistent, and can only be reset using the `beginPath()`<sup>p648</sup> method. The bitmaps depend on whether and how the rendering context is bound to a `canvas`<sup>p607</sup> element.

**Note**

```
context . savep622()
```

Pushes the current state onto the stack.

```
context . restorep622()
```

Pops the top state on the stack, restoring the context to that state.

The `save()` method must push a copy of the current drawing state onto the drawing state stack.

The `restore()` method must pop the top entry in the drawing state stack, and reset the drawing state it describes. If there is no saved state, the method must do nothing.

When the user agent is to **reset the rendering context to its default state**, it must clear the drawing state stack and everything that [drawing state<sup>p621</sup>](#) consists of to initial values.

#### 4.12.4.2.3 DrawingStyle<sup>p616</sup> objects

All the line styles (line width, caps, joins, and dash patterns) and text styles (fonts) described in the next two sections apply to [CanvasRenderingContext2D<sup>p613</sup>](#) objects and to [DrawingStyle<sup>p616</sup>](#) objects. This section defines the constructor used to obtain a [DrawingStyle<sup>p616</sup>](#) object. This object is then used by methods on [Path2D<sup>p616</sup>](#) objects to control how text and paths are rasterised and stroked.

**Note**

```
styles = new DrawingStylep622([element])
```

Creates a new [DrawingStyle<sup>p616</sup>](#) object, optionally using a specific element for resolving relative keywords and sizes in font specifications.

Each [DrawingStyle<sup>p616</sup>](#) object can have a **styles scope object**.

The `DrawingStyle()` constructor, when invoked, must return a newly created [DrawingStyle<sup>p616</sup>](#) object. If the constructor was passed an argument, then the [DrawingStyle<sup>p616</sup>](#) object's [styles scope object<sup>p622</sup>](#) is that element. Otherwise, if the [JavaScript global environment<sup>p50</sup>](#) is a [document environment<sup>p828</sup>](#), the object's [styles scope object<sup>p622</sup>](#) is the [Document<sup>p102</sup>](#) object of the [active document<sup>p762</sup>](#) of the [browsing context<sup>p762</sup>](#) of the [Window<sup>p768</sup>](#) object on which the interface object of the invoked constructor is found. Otherwise, the [JavaScript global environment<sup>p50</sup>](#) is a [worker environment<sup>p828</sup>](#), and the [styles scope object<sup>p622</sup>](#) is the worker.

#### 4.12.4.2.4 Line styles

**Note**

```
context . lineWidthp623 [= value]
```

```
styles . lineWidthp623 [= value]
```

Returns the current line width.

Can be set, to change the line width. Values that are not finite values greater than zero are ignored.

```
context . lineCapp623 [= value]
```

```
styles . lineCapp623 [= value]
```

Returns the current line cap style.

Can be set, to change the line cap style.

The possible line cap styles are "butt", "round", and "square". Other values are ignored.

```
context.lineJoinp623 [= value]
```

```
styles.lineJoinp623 [= value]
```

Returns the current line join style.

Can be set, to change the line join style.

The possible line join styles are "bevel", "round", and "miter". Other values are ignored.

```
context.miterLimitp624 [= value]
```

```
styles.miterLimitp624 [= value]
```

Returns the current miter limit ratio.

Can be set, to change the miter limit ratio. Values that are not finite values greater than zero are ignored.

```
context.setLineDashp624(segments)
```

```
styles.setLineDashp624(segments)
```

Sets the current line dash pattern (as used when stroking). The argument is a list of distances for which to alternately have the line on and the line off.

```
segments = context.getLineDashp624()
```

```
segments = styles.getLineDashp624()
```

Returns a copy of the current line dash pattern. The array returned will always have an even number of entries (i.e. the pattern is normalized).

```
context.lineDashOffsetp624
```

```
styles.lineDashOffsetp624
```

Returns the phase offset (in the same units as the line dash pattern).

Can be set, to change the phase offset. Values that are not finite values are ignored.

Objects that implement the [CanvasDrawingStyles<sup>p615</sup>](#) interface have attributes and methods (defined in this section) that control how lines are treated by the object.

The **lineWidth** attribute gives the width of lines, in coordinate space units. On getting, it must return the current value. On setting, zero, negative, infinite, and NaN values must be ignored, leaving the value unchanged; other values must change the current value to the new value.

When the object implementing the [CanvasDrawingStyles<sup>p615</sup>](#) interface is created, the **lineWidth<sup>p623</sup>** attribute must initially have the value 1.0.

The **lineCap** attribute defines the type of endings that UAs will place on the end of lines. The three valid values are "butt", "round", and "square".

On getting, it must return the current value. On setting, if the new value is one of the literal strings "butt", "round", and "square", then the current value must be changed to the new value; other values must be ignored, leaving the value unchanged.

When the object implementing the [CanvasDrawingStyles<sup>p615</sup>](#) interface is created, the **lineCap<sup>p623</sup>** attribute must initially have the value "butt".

The **lineJoin** attribute defines the type of corners that UAs will place where two lines meet. The three valid values are "bevel", "round", and "miter".

On getting, it must return the current value. On setting, if the new value is one of the literal strings "bevel", "round", and "miter", then the current value must be changed to the new value; other values must be ignored, leaving the value unchanged.

When the object implementing the [CanvasDrawingStyles<sup>p615</sup>](#) interface is created, the **lineJoin<sup>p623</sup>** attribute must initially have the value "miter".

When the `lineJoin`<sup>p623</sup> attribute has the value "miter", strokes use the miter limit ratio to decide how to render joins. The miter limit ratio can be explicitly set using the `miterLimit` attribute. On getting, it must return the current value. On setting, zero, negative, infinite, and NaN values must be ignored, leaving the value unchanged; other values must change the current value to the new value.

When the object implementing the `CanvasDrawingStyles`<sup>p615</sup> interface is created, the `miterLimit`<sup>p624</sup> attribute must initially have the value 10.0.

Each `CanvasDrawingStyles`<sup>p615</sup> object has a **dash list**, which is either empty or consists of an even number of non-negative numbers. Initially, the `dash list`<sup>p624</sup> must be empty.

When the `setLineDash()` method is invoked, it must run the following steps:

1. Let `a` be the argument.
2. If any value in `a` is not finite (e.g. an Infinity or a NaN value), or if any value is negative (less than zero), then abort these steps (without throwing an exception; user agents could show a message on a developer console, though, as that would be helpful for debugging).
3. If the number of elements in `a` is odd, then let `a` be the concatenation of two copies of `a`.
4. Let the object's `dash list`<sup>p624</sup> be `a`.

When the `getLineDash()` method is invoked, it must return a sequence whose values are the values of the object's `dash list`<sup>p624</sup>, in the same order.

It is sometimes useful to change the "phase" of the dash pattern, e.g. to achieve a "marching ants" effect. The phase can be set using the `lineDashOffset` attribute. On getting, it must return the current value. On setting, infinite and NaN values must be ignored, leaving the value unchanged; other values must change the current value to the new value.

When the object implementing the `CanvasDrawingStyles`<sup>p615</sup> interface is created, the `lineDashOffset`<sup>p624</sup> attribute must initially have the value 0.0.

When a user agent is to **trace a path**, given an object `style` that implements the `CanvasDrawingStyles`<sup>p615</sup> interface, it must run the following algorithm. This algorithm returns a new `path`<sup>p630</sup>.

1. Let `path` be a copy of the path being traced.
2. Prune all zero-length `line segments`<sup>p630</sup> from `path`.
3. Remove from `path` any subpaths containing no lines (i.e. subpaths with just one point).
4. Replace each point in each subpath of `path` other than the first point and the last point of each subpath by a *join* that joins the line leading to that point to the line leading out of that point, such that the subpaths all consist of two points (a starting point with a line leading out of it, and an ending point with a line leading into it), one or more lines (connecting the points and the joins), and zero or more joins (each connecting one line to another), connected together such that each subpath is a series of one or more lines with a join between each one and a point on each end.
5. Add a straight closing line to each closed subpath in `path` connecting the last point and the first point of that subpath; change the last point to a join (from the previously last line to the newly added closing line), and change the first point to a join (from the newly added closing line to the first line).
6. If the `style`'s `dash list`<sup>p624</sup> is empty, jump to the step labeled *convert*.
7. Let `pattern width` be the concatenation of all the entries of the `style`'s `dash list`<sup>p624</sup>, in coordinate space units.
8. For each subpath `subpath` in `path`, run the following substeps. These substeps mutate the subpaths in `path` *in vivo*.
  1. Let `subpath width` be the length of all the lines of `subpath`, in coordinate space units.
  2. Let `offset` be the value of the `style`'s `lineDashOffset`<sup>p624</sup>, in coordinate space units.
  3. While `offset` is greater than `pattern width`, decrement it by `pattern width`.

While `offset` is less than zero, increment it by `pattern width`.

4. Define  $L$  to be a linear coordinate line defined along all lines in *subpath*, such that the start of the first line in the subpath is defined as coordinate 0, and the end of the last line in the subpath is defined as coordinate *subpath width*.

5. Let *position* be zero minus *offset*.

6. Let *index* be 0.

7. Let *current state* be *off* (the other states being *on* and *zero-on*).

8. *Dash on*: Let *segment length* be the value of the styles [dash list<sup>p624</sup>](#)'s *index $th$*  entry.

9. Increment *position* by *segment length*.

10. If *position* is greater than *subpath width*, then end these substeps for this subpath and start them again for the next subpath; if there are no more subpaths, then jump to the step labeled *convert* instead.

11. If *segment length* is non-zero, let *current state* be *on*.

12. Increment *index* by one.

13. *Dash off*: Let *segment length* be the value of the styles [dash list<sup>p624</sup>](#)'s *index $th$*  entry.

14. Let *start* be the offset *position* on  $L$ .

15. Increment *position* by *segment length*.

16. If *position* is less than zero, then jump to the step labeled *post-cut*.

17. If *start* is less than zero, then let *start* be zero.

18. If *position* is greater than *subpath width*, then let *end* be the offset *subpath width* on  $L$ . Otherwise, let *end* be the offset *position* on  $L$ .

19. Jump to the first appropriate step:

↪ **If segment length is zero and current state is off**

Do nothing, just continue to the next step.

↪ **If current state is off**

Cut the line on which *end* finds itself short at *end* and place a point there, cutting the subpath that it was in in two; remove all line segments, joins, points, and subpaths that are between *start* and *end*; and finally place a single point at *start* with no lines connecting to it.

The point has a *directionality* for the purposes of drawing line caps (see below). The directionality is the direction that the original line had at that point (i.e. when  $L$  was defined above).

↪ **Otherwise**

Cut the line on which *start* finds itself into two at *start* and place a point there, cutting the subpath that it was in in two, and similarly cut the line on which *end* finds itself short at *end* and place a point there, cutting the subpath that it was in in two, and then remove all line segments, joins, points, and subpaths that are between *start* and *end*.

If *start* and *end* are the same point, then this results in just the line being cut in two and two points being inserted there, with nothing being removed, unless a join also happens to be at that point, in which case the join must be removed.

20. *Post-cut*: If *position* is greater than *subpath width*, then jump to the step labeled *convert*.

21. If *segment length* is greater than zero, let *positioned-at-on-dash* be false.

22. Increment *index* by one. If it is equal to the number of entries in the styles [dash list<sup>p624</sup>](#), then let *index* be 0.

23. Return to the step labeled *dash on*.

9. *Convert*: This is the step that converts the path to a new path that represents its stroke.

Create a new `pathp630` that describes the edge of the areas that would be covered if a straight line of length equal to the `styles.lineWidthp623` was swept along each subpath in `path` while being kept at an angle such that the line is orthogonal to the path being swept, replacing each point with the end cap necessary to satisfy the `styles.lineCapp623` attribute as described previously and elaborated below, and replacing each join with the join necessary to satisfy the `styles.lineJoinp623` type, as defined below.

**Caps:** Each point has a flat edge perpendicular to the direction of the line coming out of it. This is then augmented according to the value of the `styles.lineCapp623`. The "butt"" value means that no additional line cap is added. The "round"" value means that a semi-circle with the diameter equal to the `styles.lineWidthp623` width must additionally be placed on to the line coming out of each point. The "square"" value means that a rectangle with the length of the `styles.lineWidthp623` width and the width of half the `styles.lineWidthp623` width, placed flat against the edge perpendicular to the direction of the line coming out of the point, must be added at each point.

Points with no lines coming out of them must have two caps placed back-to-back as if it was really two points connected to each other by an infinitesimally short straight line in the direction of the point's *directionality* (as defined above).

**Joins:** In addition to the point where a join occurs, two additional points are relevant to each join, one for each line: the two corners found half the line width away from the join point, one perpendicular to each line, each on the side furthest from the other line.

A triangle connecting these two opposite corners with a straight line, with the third point of the triangle being the join point, must be added at all joins. The `lineJoinp623` attribute controls whether anything else is rendered. The three aforementioned values have the following meanings:

The "bevel"" value means that this is all that is rendered at joins.

The "round"" value means that an arc connecting the two aforementioned corners of the join, abutting (and not overlapping) the aforementioned triangle, with the diameter equal to the line width and the origin at the point of the join, must be added at joins.

The "miter"" value means that a second triangle must (if it can given the miter length) be added at the join, with one line being the line between the two aforementioned corners, abutting the first triangle, and the other two being continuations of the outside edges of the two joining lines, as long as required to intersect without going over the miter length.

The miter length is the distance from the point where the join occurs to the intersection of the line edges on the outside of the join. The miter limit ratio is the maximum allowed ratio of the miter length to half the line width. If the miter length would cause the miter limit ratio (as set by the style `miterLimitp624` attribute) to be exceeded, this second triangle must not be added.

The subpaths in the newly created path must be oriented such that for any point, the number of times a half-infinite straight line drawn from that point crosses a subpath is even if and only if the number of times a half-infinite straight line drawn from that same point crosses a subpath going in one direction is equal to the number of times it crosses a subpath going in the other direction.

10. Return the newly created path.

#### 4.12.4.2.5 Text styles

##### Note

`context.fontp627 [= value]`  
`styles.fontp627 [= value]`

Returns the current font settings.

Can be set, to change the font. The syntax is the same as for the CSS 'font' property; values that cannot be parsed as CSS font values are ignored.

Relative keywords and lengths are computed relative to the font of the `canvasp607` element.

`context.textAlignp627 [= value]`  
`styles.textAlignp627 [= value]`

Returns the current text alignment settings.

Can be set, to change the alignment. The possible values are and their meanings are given below. Other values are ignored. The default is "start".

`context.textBaselinep627 [= value]`

`styles.textBaselinep627 [= value]`

Returns the current baseline alignment settings.

Can be set, to change the baseline alignment. The possible values and their meanings are given below. Other values are ignored. The default is "[alphabetic<sup>p628</sup>](#)".

`context.directionp628 [= value]`

`styles.directionp628 [= value]`

Returns the current directionality.

Can be set, to change the directionality. The possible values and their meanings are given below. Other values are ignored. The default is "[inherit<sup>p629</sup>](#)".

Objects that implement the [CanvasDrawingStyles<sup>p615</sup>](#) interface have attributes (defined in this section) that control how text is laid out (rasterised or outlined) by the object. Such objects can also have a **font style source object**. For [CanvasRenderingContext2D<sup>p613</sup>](#) objects whose [context bitmap mode<sup>p609</sup>](#) is [fixed<sup>p609</sup>](#), this is their [canvas<sup>p607</sup>](#) element; for other [CanvasRenderingContext2D<sup>p613</sup>](#) objects, if the [JavaScript global environment<sup>p50</sup>](#) is a [document environment<sup>p828</sup>](#), the object's [font style source object<sup>p627</sup>](#) is the [Document<sup>p102</sup>](#) object of the [active document<sup>p762</sup>](#) of the [browsing context<sup>p762</sup>](#) of the [Window<sup>p768</sup>](#) object on which the interface object of the [CanvasRenderingContext2D<sup>p613</sup>](#) object is found; otherwise the [JavaScript global environment<sup>p50</sup>](#) is a [worker environment<sup>p828</sup>](#) and the [font style source object<sup>p627</sup>](#) is the worker. For [DrawingStyle<sup>p616</sup>](#) objects, it's the [styles scope object<sup>p622</sup>](#).

The **font** IDL attribute, on setting, must be [parsed as a CSS <font> value](#) (but without supporting property-independent style sheet syntax like 'inherit'), and the resulting font must be assigned to the context, with the 'line-height' component forced to 'normal', with the 'font-size' component converted to CSS pixels, and with system fonts being computed to explicit values. If the new value is syntactically incorrect (including using property-independent style sheet syntax like 'inherit' or 'initial'), then it must be ignored, without assigning a new font value. [\[CSS\]<sup>p1149</sup>](#)

Font family names must be interpreted in the context of the [font style source object<sup>p627</sup>](#) when the font is to be used; any fonts embedded using @font-face or loaded using [FontFace<sup>p53</sup>](#) objects that are visible to the [font style source object<sup>p627</sup>](#) must therefore be available once they are loaded. (Each [font style source object<sup>p627</sup>](#) has a [font source](#), which determines what fonts are available.) If a font is used before it is fully loaded, or if the [font style source object<sup>p627</sup>](#) does not have that font in scope at the time the font is to be used, then it must be treated as if it was an unknown font, falling back to another as described by the relevant CSS specifications. [\[CSSFONTS\]<sup>p1149</sup>](#) [\[CSSFONTLOAD\]<sup>p1149</sup>](#)

On getting, the [font<sup>p627</sup>](#) attribute must return the [serialised form<sup>p53</sup>](#) of the current font of the context (with no 'line-height' component). [\[CSSOM\]<sup>p1149</sup>](#)

### Example

For example, after the following statement:

```
context.font = 'italic 400 12px/2 Unknown Font, sans-serif';
```

...the expression `context.font` would evaluate to the string "italic 12px "Unknown Font", sans-serif". The "400" font weight doesn't appear because that is the default value. The line-height doesn't appear because it is forced to "normal", the default value.

When the object implementing the [CanvasDrawingStyles<sup>p615</sup>](#) interface is created, the font of the context must be set to 10px sans-serif. When the 'font-size' component is set to lengths using percentages, 'em' or 'ex' units, or the 'larger' or 'smaller' keywords, these must be interpreted relative to the computed value of the 'font-size' property of the [font style source object<sup>p627</sup>](#) at the time that the attribute is set, if it is an element. When the 'font-weight' component is set to the relative values 'bolder' and 'lighter', these must be interpreted relative to the computed value of the 'font-weight' property of the [font style source object<sup>p627</sup>](#) at the time that the attribute is set, if it is an element. If the computed values are undefined for a particular case (e.g. because the [font style source object<sup>p627</sup>](#) is not an element or is not [being rendered<sup>p1058</sup>](#)), then the relative keywords must be interpreted relative to the normal-weight 10px sans-serif default.

The **textAlign** IDL attribute, on getting, must return the current value. On setting, if the value is one of [start<sup>p628</sup>](#), [end<sup>p628</sup>](#), [left<sup>p628</sup>](#), [right<sup>p628</sup>](#), or [center<sup>p628</sup>](#), then the value must be changed to the new value. Otherwise, the new value must be ignored. When the object implementing the [CanvasDrawingStyles<sup>p615</sup>](#) interface is created, the [textAlign<sup>p627</sup>](#) attribute must initially have the value [start<sup>p628</sup>](#).

The **textBaseline** IDL attribute, on getting, must return the current value. On setting, if the value is one of [top<sup>p628</sup>](#), [hanging<sup>p628</sup>](#), [middle<sup>p628</sup>](#), [alphabetic<sup>p628</sup>](#), [ideographic<sup>p628</sup>](#), or [bottom<sup>p629</sup>](#), then the value must be changed to the new value. Otherwise, the new value must be ignored.

When the object implementing the [CanvasDrawingStyles<sup>p615</sup>](#) interface is created, the [textBaseline<sup>p627</sup>](#) attribute must initially have the value [alphabetic<sup>p628</sup>](#).

The [direction](#) IDL attribute, on getting, must return the current value. On setting, if the value is one of "[ltr<sup>p629</sup>](#)", "[rtl<sup>p629</sup>](#)", or "[inherit<sup>p629</sup>](#)", then the value must be changed to the new value. Otherwise, the new value must be ignored. When the object implementing the [CanvasDrawingStyles<sup>p615</sup>](#) interface is created, the [direction<sup>p628</sup>](#) attribute must initially have the value "[inherit<sup>p629</sup>](#)".

The [textAlign<sup>p627</sup>](#) attribute's allowed keywords are as follows:

**start**

Align to the start edge of the text (left side in left-to-right text, right side in right-to-left text).

**end**

Align to the end edge of the text (right side in left-to-right text, left side in right-to-left text).

**left**

Align to the left.

**right**

Align to the right.

**center**

Align to the center.

The [textBaseline<sup>p627</sup>](#) attribute's allowed keywords correspond to alignment points in the font:

The keywords map to these alignment points as follows:

**top**

The top of the em square

**hanging**

The hanging baseline

**middle**

The middle of the em square

**alphabetic**

The alphabetic baseline

**ideographic**

The ideographic baseline

## **bottom**

The bottom of the em square

The [direction](#)<sup>p628</sup> attribute's allowed keywords are as follows:

## **ltr**

Treat input to the [text preparation algorithm](#)<sup>p629</sup> as left-to-right text.

## **rtl**

Treat input to the [text preparation algorithm](#)<sup>p629</sup> as right-to-left text.

## **inherit**

Default to the directionality of the [canvas](#)<sup>p607</sup> element or [Document](#)<sup>p102</sup> as appropriate.

The **text preparation algorithm** is as follows. It takes as input a string *text*, a [CanvasDrawingStyles](#)<sup>p615</sup> object *target*, and an optional length *maxWidth*. It returns an array of glyph shapes, each positioned on a common coordinate space, a *physical alignment* whose value is one of *left*, *right*, and *center*, and an inline box. (Most callers of this algorithm ignore the *physical alignment* and the inline box.)

1. If *maxWidth* was provided but is less than or equal to zero, return an empty array.
2. Replace all the [space characters](#)<sup>p58</sup> in *text* with U+0020 SPACE characters.
3. Let *font* be the current font of *target*, as given by that object's [font](#)<sup>p627</sup> attribute.
4. Apply the appropriate step from the following list to determine the value of *direction*:
  - ↪ If the *target* object's [direction](#)<sup>p628</sup> attribute has the value "[ltr](#)<sup>p629</sup>"  
Let *direction* be '[ltr](#)<sup>p125</sup>'.
  - ↪ If the *target* object's [direction](#)<sup>p628</sup> attribute has the value "[rtl](#)<sup>p629</sup>"  
Let *direction* be '[rtl](#)<sup>p125</sup>'.
  - ↪ If the *target* object's [font style source object](#)<sup>p627</sup> is an element  
Let *direction* be [the directionality](#)<sup>p125</sup> of the *target* object's [font style source object](#)<sup>p627</sup>.
  - ↪ If the *target* object's [font style source object](#)<sup>p627</sup> is a [Document](#)<sup>p102</sup> and that [Document](#)<sup>p102</sup> has a root element child  
Let *direction* be [the directionality](#)<sup>p125</sup> of the *target* object's [font style source object](#)<sup>p627</sup>'s root element child.
  - ↪ Otherwise  
Let *direction* be '[ltr](#)<sup>p125</sup>'.

5. Form a hypothetical infinitely-wide CSS line box containing a single inline box containing the text *text*, with all the properties at their initial values except the 'font' property of the inline box set to *font*, the 'direction' property of the inline box set to *direction*, and the 'white-space' property set to 'pre'. [\[CSS\]](#)<sup>p1149</sup>
6. If *maxWidth* was provided and the hypothetical width of the inline box in the hypothetical line box is greater than *maxWidth* CSS pixels, then change *font* to have a more condensed font (if one is available or if a reasonably readable one can be synthesized by applying a horizontal scale factor to the font) or a smaller font, and return to the previous step.
7. The *anchor point* is a point on the inline box, and the *physical alignment* is one of the values *left*, *right*, and *center*. These variables are determined by the [textAlign](#)<sup>p627</sup> and [textBaseline](#)<sup>p627</sup> values as follows:

Horizontal position:

- If [textAlign](#)<sup>p627</sup> is [left](#)<sup>p628</sup>
- If [textAlign](#)<sup>p627</sup> is [start](#)<sup>p628</sup> and *direction* is 'ltr'
- If [textAlign](#)<sup>p627</sup> is [end](#)<sup>p628</sup> and *direction* is 'rtl'

Let the *anchor point*'s horizontal position be the left edge of the inline box, and let *physical alignment* be *left*.

- If [textAlign](#)<sup>p627</sup> is [right](#)<sup>p628</sup>
- If [textAlign](#)<sup>p627</sup> is [end](#)<sup>p628</sup> and *direction* is 'ltr'
- If [textAlign](#)<sup>p627</sup> is [start](#)<sup>p628</sup> and *direction* is 'rtl'

Let the *anchor point*'s horizontal position be the right edge of the inline box, and let *physical alignment* be *right*.

If `textAlign`<sup>p627</sup> is `center`<sup>p628</sup>

Let the *anchor point's* horizontal position be half way between the left and right edges of the inline box, and let *physical alignment* be *center*.

Vertical position:

If `textBaseline`<sup>p627</sup> is `top`<sup>p628</sup>

Let the *anchor point's* vertical position be the top of the em box of the first available font of the inline box.

If `textBaseline`<sup>p627</sup> is `hanging`<sup>p628</sup>

Let the *anchor point's* vertical position be the hanging baseline of the first available font of the inline box.

If `textBaseline`<sup>p627</sup> is `middle`<sup>p628</sup>

Let the *anchor point's* vertical position be half way between the bottom and the top of the em box of the first available font of the inline box.

If `textBaseline`<sup>p627</sup> is `alphabetic`<sup>p628</sup>

Let the *anchor point's* vertical position be the alphabetic baseline of the first available font of the inline box.

If `textBaseline`<sup>p627</sup> is `ideographic`<sup>p628</sup>

Let the *anchor point's* vertical position be the ideographic baseline of the first available font of the inline box.

If `textBaseline`<sup>p627</sup> is `bottom`<sup>p629</sup>

Let the *anchor point's* vertical position be the bottom of the em box of the first available font of the inline box.

8. Let *result* be an array constructed by iterating over each glyph in the inline box from left to right (if any), adding to the array, for each glyph, the shape of the glyph as it is in the inline box, positioned on a coordinate space using CSS pixels with its origin is at the *anchor point*.
9. Return *result*, *physical alignment*, and the inline box.

#### 4.12.4.2.6 Building paths

Each object implementing the `CanvasPathMethods`<sup>p615</sup> interface has a `path`<sup>p630</sup>. A **path** has a list of zero or more subpaths. Each subpath consists of a list of one or more points, connected by straight or curved **line segments**, and a flag indicating whether the subpath is closed or not. A closed subpath is one where the last point of the subpath is connected to the first point of the subpath by a straight line. Subpaths with only one point are ignored when painting the path.

`Paths`<sup>p630</sup> have a **need new subpath** flag. When this flag is set, certain APIs create a new subpath rather than extending the previous one. When a `path`<sup>p630</sup> is created, its `need new subpath`<sup>p630</sup> flag must be set.

When an object implementing the `CanvasPathMethods`<sup>p615</sup> interface is created, its `path`<sup>p630</sup> must be initialised to zero subpaths.

##### Note

`context.moveTo`<sup>p633</sup>(*x*, *y*)

`path.moveTo`<sup>p633</sup>(*x*, *y*)

Creates a new subpath with the given point.

`context.closePath`<sup>p633</sup>()

`path.closePath`<sup>p633</sup>()

Marks the current subpath as closed, and starts a new subpath with a point the same as the start and end of the newly closed subpath.

`context.lineTo`<sup>p633</sup>(*x*, *y*)

`path.lineTo`<sup>p633</sup>(*x*, *y*)

Adds the given point to the current subpath, connected to the previous one by a straight line.

```
context.quadraticCurveTop633(cpx, cpy, x, y)
```

```
path.quadraticCurveTop633(cpx, cpy, x, y)
```

Adds the given point to the current subpath, connected to the previous one by a quadratic Bézier curve with the given control point.

```
context.bezierCurveTop633(cp1x, cp1y, cp2x, cp2y, x, y)
```

```
path.bezierCurveTop633(cp1x, cp1y, cp2x, cp2y, x, y)
```

Adds the given point to the current subpath, connected to the previous one by a cubic Bézier curve with the given control points.

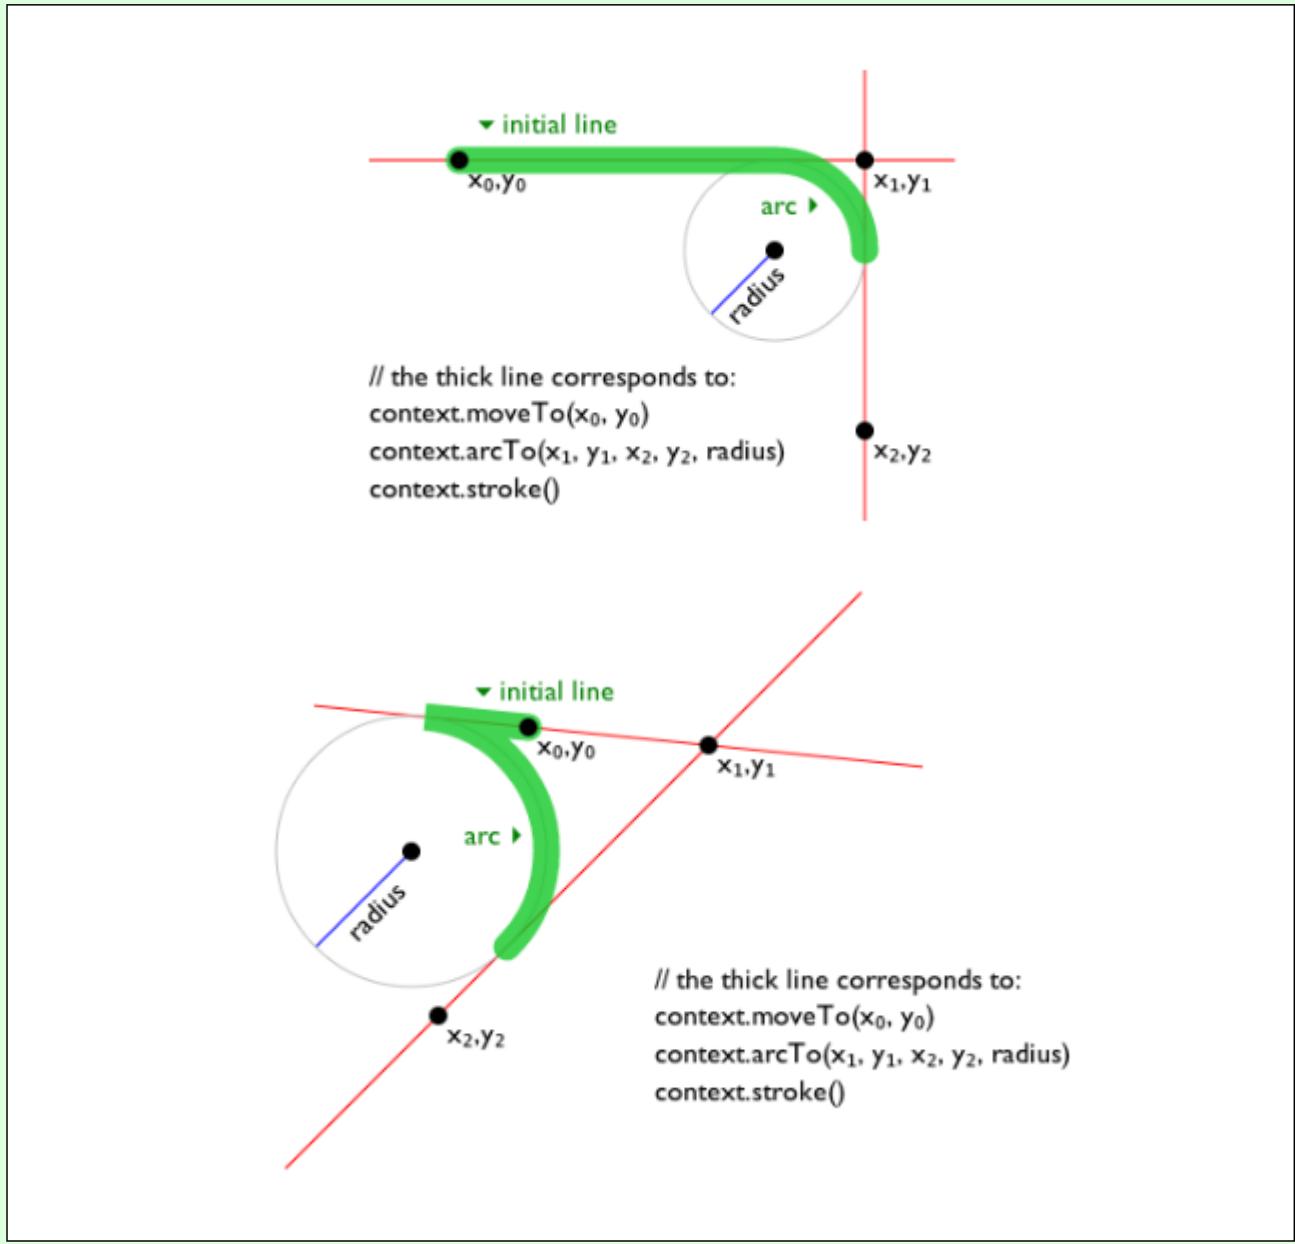

```
context.arcTop633(x1, y1, x2, y2, radiusX [, radiusY, rotation])
```

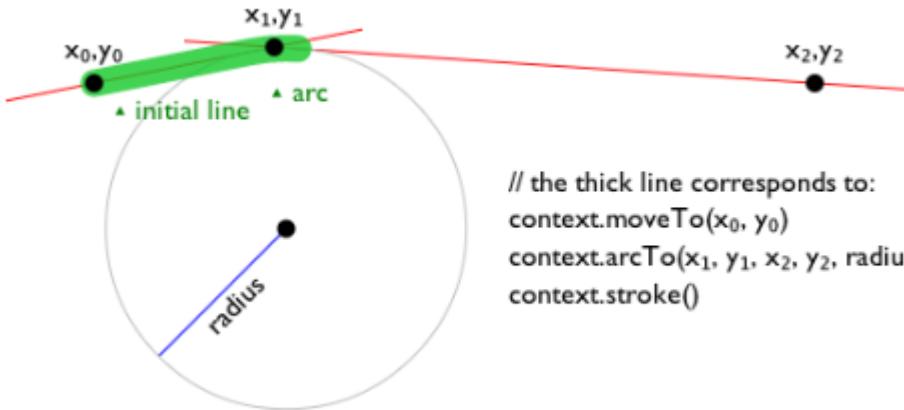

```
path.arcTop633(x1, y1, x2, y2, radiusX [, radiusY, rotation])
```

Adds an arc with the given control points and radius to the current subpath, connected to the previous point by a straight line.

If two radii are provided, the first controls the width of the arc's ellipse, and the second controls the height. If only one is provided, or if they are the same, the arc is from a circle. In the case of an ellipse, the rotation argument controls the clockwise inclination of the ellipse relative to the x-axis.

Throws an [IndexSizeError<sup>p50</sup>](#) exception if the given radius is negative.

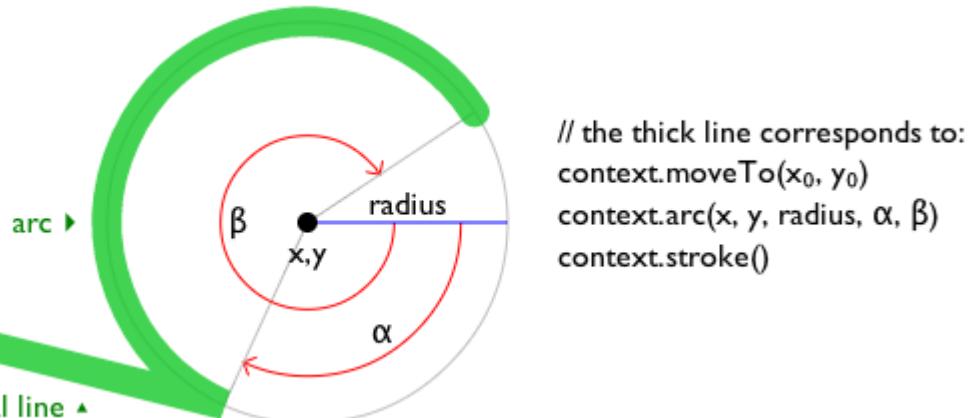

```
// the thick line corresponds to:
context.moveTo(x0, y0)
context.arcTo(x1, y1, x2, y2, radius)
context.stroke()
```

```
context.arc(x, y, radius, startAngle, endAngle [, anticlockwise])
path.arc(x, y, radius, startAngle, endAngle [, anticlockwise])
```

Adds points to the subpath such that the arc described by the circumference of the circle described by the arguments, starting at the given start angle and ending at the given end angle, going in the given direction (defaulting to clockwise), is added to the path, connected to the previous point by a straight line.

Throws an [IndexSizeError](#) exception if the given radius is negative.

```
// the thick line corresponds to:
context.moveTo(x0, y0)
context.arc(x, y, radius, alpha, beta)
context.stroke()
```

```
context.ellipse(x, y, radiusX, radiusY, rotation, startAngle, endAngle [, anticlockwise])
path.ellipse(x, y, radiusX, radiusY, rotation, startAngle, endAngle [, anticlockwise])
```

Adds points to the subpath such that the arc described by the circumference of the ellipse described by the arguments, starting at the given start angle and ending at the given end angle, going in the given direction (defaulting to clockwise), is added to the path, connected to the previous point by a straight line.

Throws an [IndexSizeError](#) exception if the given radius is negative.

```
context.rect(x, y, w, h)
path.rect(x, y, w, h)
```

Adds a new closed subpath to the path, representing the given rectangle.

The following methods allow authors to manipulate the [paths](#)<sup>p630</sup> of objects implementing the [CanvasPathMethods](#)<sup>p615</sup> interface.

For [CanvasRenderingContext2D](#)<sup>p613</sup> objects, the points passed to the methods, and the resulting lines added to [current default path](#)<sup>p647</sup> by these methods, must be transformed according to the [current transformation matrix](#)<sup>p638</sup> before being added to the path.

The `moveTo(x, y)` method must create a new subpath with the specified point as its first (and only) point.

When the user agent is to **ensure there is a subpath** for a coordinate  $(x, y)$  on a [path](#)<sup>p630</sup>, the user agent must check to see if the [path](#)<sup>p630</sup> has its [need new subpath](#)<sup>p630</sup> flag set. If it does, the user agent must create a new subpath with the point  $(x, y)$  as its first (and only) point, as if the `moveTo()`<sup>p633</sup> method had been called, and must then unset the [path](#)<sup>p630</sup>'s [need new subpath](#)<sup>p630</sup> flag.

The `closePath()` method must do nothing if the object's path has no subpaths. Otherwise, it must mark the last subpath as closed, create a new subpath whose first point is the same as the previous subpath's first point, and finally add this new subpath to the path.

**Note** *If the last subpath had more than one point in its list of points, then this is equivalent to adding a straight line connecting the last point back to the first point, thus "closing" the shape, and then repeating the last (possibly implied) `moveTo()`<sup>p633</sup> call.*

New points and the lines connecting them are added to subpaths using the methods described below. In all cases, the methods only modify the last subpath in the object's path.

The `lineTo(x, y)` method must [ensure there is a subpath](#)<sup>p633</sup> for  $(x, y)$  if the object's path has no subpaths. Otherwise, it must connect the last point in the subpath to the given point  $(x, y)$  using a straight line, and must then add the given point  $(x, y)$  to the subpath.

The `quadraticCurveTo(cpx, cpy, x, y)` method must [ensure there is a subpath](#)<sup>p633</sup> for  $(cpx, cpy)$ , and then must connect the last point in the subpath to the given point  $(x, y)$  using a quadratic Bézier curve with control point  $(cpx, cpy)$ , and must then add the given point  $(x, y)$  to the subpath. [\[BEZIER\]](#)<sup>p1148</sup>

The `bezierCurveTo(cp1x, cp1y, cp2x, cp2y, x, y)` method must [ensure there is a subpath](#)<sup>p633</sup> for  $(cp1x, cp1y)$ , and then must connect the last point in the subpath to the given point  $(x, y)$  using a cubic Bézier curve with control points  $(cp1x, cp1y)$  and  $(cp2x, cp2y)$ . Then, it must add the point  $(x, y)$  to the subpath. [\[BEZIER\]](#)<sup>p1148</sup>

The `arcTo(x1, y1, x2, y2, radiusX, radiusY, rotation)` method must first [ensure there is a subpath](#)<sup>p633</sup> for  $(x1, y1)$ . Then, the behaviour depends on the arguments and the last point in the subpath, as described below.

Negative values for `radiusX` or `radiusY` must cause the implementation to throw an [IndexSizeError](#)<sup>p50</sup> exception. If `radiusY` is omitted, user agents must act as if it had the same value as `radiusX`.

Let the point  $(x_0, y_0)$  be the last point in the subpath, transformed by the inverse of the [current transformation matrix](#)<sup>p638</sup> (so that it is in the same coordinate system as the points passed to the method).

If the point  $(x_0, y_0)$  is equal to the point  $(x_1, y_1)$ , or if the point  $(x_1, y_1)$  is equal to the point  $(x_2, y_2)$ , or if both `radiusX` and `radiusY` are zero, then the method must add the point  $(x_1, y_1)$  to the subpath, and connect that point to the previous point  $(x_0, y_0)$  by a straight line.

Otherwise, if the points  $(x_0, y_0)$ ,  $(x_1, y_1)$ , and  $(x_2, y_2)$  all lie on a single straight line, then the method must add the point  $(x_1, y_1)$  to the subpath, and connect that point to the previous point  $(x_0, y_0)$  by a straight line.

Otherwise, let *The Arc* be the shortest arc given by circumference of the ellipse that has radius `radiusX` on the major axis and radius `radiusY` on the minor axis, and whose semi-major axis is rotated `rotation` radians clockwise from the positive x-axis, and that has one point tangent to the half-infinite line that crosses the point  $(x_0, y_0)$  and ends at the point  $(x_1, y_1)$ , and that has a different point tangent to the half-infinite line that ends at the point  $(x_1, y_1)$  and crosses the point  $(x_2, y_2)$ . The points at which this ellipse touches these two lines are called the start and end tangent points respectively. The method must connect the point  $(x_0, y_0)$  to the start tangent point by a straight line, adding the start tangent point to the subpath, and then must connect the start tangent point to the end tangent point by *The Arc*, adding the end tangent point to the subpath.

The `arc(x, y, radius, startAngle, endAngle, anticlockwise)` and `ellipse(x, y, radiusX, radiusY, rotation, startAngle, endAngle, anticlockwise)` methods draw arcs.

The `arc()`<sup>p633</sup> method is equivalent to the `ellipse()`<sup>p633</sup> method in the case where the two radii are equal. When the `arc()`<sup>p633</sup> method is invoked, it must act as if the `ellipse()`<sup>p633</sup> method had been invoked with the `radiusX` and `radiusY` arguments set to the value of the `radius`

argument, the *rotation* argument set to zero, and the other arguments set to the same values as their identically named arguments on the [arc\(\)](#)<sup>p633</sup> method.

When the [ellipse\(\)](#)<sup>p633</sup> method is invoked, it must proceed as follows. First, if the object's path has any subpaths, then the method must add a straight line from the last point in the subpath to the start point of the arc. Then, it must add the start and end points of the arc to the subpath, and connect them with an arc. The arc and its start and end points are defined as follows:

Consider an ellipse that has its origin at  $(x, y)$ , that has a major-axis radius *radiusX* and a minor-axis radius *radiusY*, and that is rotated about its origin such that its semi-major axis is inclined *rotation* radians clockwise from the x-axis.

If the *anticlockwise* argument is false and *endAngle-startAngle* is equal to or greater than  $2\pi$ , or, if the *anticlockwise* argument is *true* and *startAngle-endAngle* is equal to or greater than  $2\pi$ , then the arc is the whole circumference of this ellipse, and the point at *startAngle* along this circle's circumference, measured in radians clockwise from the ellipse's semi-major axis, acts as both the start point and the end point.

Otherwise, the points at *startAngle* and *endAngle* along this circle's circumference, measured in radians clockwise from the ellipse's semi-major axis, are the start and end points respectively, and the arc is the path along the circumference of this ellipse from the start point to the end point, going anti-clockwise if the *anticlockwise* argument is *true*, and clockwise otherwise. Since the points are on the ellipse, as opposed to being simply angles from zero, the arc can never cover an angle greater than  $2\pi$  radians.

**Note** Even if the arc covers the entire circumference of the ellipse and there are no other points in the subpath, the path is not closed unless the [closePath\(\)](#)<sup>p633</sup> method is appropriately invoked.

Negative values for *radiusX* or *radiusY* must cause the implementation to throw an [IndexSizeError](#)<sup>p50</sup> exception.

The [rect\(x, y, w, h\)](#) method must create a new subpath containing just the four points  $(x, y)$ ,  $(x+w, y)$ ,  $(x+w, y+h)$ ,  $(x, y+h)$ , in that order, with those four points connected by straight lines, and must then mark the subpath as closed. It must then create a new subpath with the point  $(x, y)$  as the only point in the subpath.

[25716](#), [27847](#)

#### 4.12.4.2.7 [Path2D](#)<sup>p616</sup> objects

[Path2D](#)<sup>p616</sup> objects can be used to declare paths that are then later used on [CanvasRenderingContext2D](#)<sup>p613</sup> objects. In addition to many of the APIs described in earlier sections, [Path2D](#)<sup>p616</sup> objects have methods to combine paths, and to add text to paths.

**Note**

**path = new Path2D<sup>p635</sup>()**

Creates a new empty [Path2D](#)<sup>p616</sup> object.

**path = new Path2D<sup>p635</sup>(path)**

Creates a new [Path2D](#)<sup>p616</sup> object that is a copy of the argument.

**path = new Path2D<sup>p635</sup>(paths [, fillRule ])**

Creates a new [Path2D](#)<sup>p616</sup> object that describes a path that outlines the given *paths*, using the given fill rule.

**path = new Path2D<sup>p635</sup>(d)**

Creates a new path with the path described by the argument, interpreted as SVG path data. [\[SVG\]](#)<sup>p1153</sup>

**path . addPath<sup>p635</sup>(path [, transform ])**

**path . addPathBy strokingPath<sup>p636</sup>(path, styles [, transform ])**

Adds to the path the path given by the argument.

In the case of the stroking variants, the line styles are taken from the *styles* argument, which can be either a [DrawingStyle](#)<sup>p616</sup> object or a [CanvasRenderingContext2D](#)<sup>p613</sup> object.

```

path . addTextp636(text, styles, transform, x, y [, maxWidth])
path . addTextp636(text, styles, transform, path [, maxWidth])
path . addPathBy strokingTextp636(text, styles, transform, x, y [, maxWidth])
path . addPathBy strokingTextp636(text, styles, transform, path [, maxWidth])

```

Adds to the path a series of subpaths corresponding to the given text. If the arguments give a coordinate, the text is drawn horizontally at the given coordinates. If the arguments give a path, the text is drawn along the path. If a maximum width is provided, the text will be scaled to fit that width if necessary.

The font, and in the case of the stroking variants, the line styles, are taken from the `styles` argument, which can be either a [DrawingStyle<sup>p616</sup>](#) object or a [CanvasRenderingContext2D<sup>p613</sup>](#) object.

The [Path2D \(\)](#) constructor, when invoked, must return a newly created [Path2D<sup>p616</sup>](#) object.

The [Path2D \(path\)](#) constructor, when invoked, must return a newly created [Path2D<sup>p616</sup>](#) object, to which the subpaths of the argument are added. (In other words, it returns a copy of the argument.)

The [Path2D \(paths, fillRule\)](#) constructor, when invoked, must run the following steps:

1. Run the appropriate step from the following list, based on the constructor's second argument:

↪ **If it is "nonzero"**

Let *merged path* be a [path<sup>p630</sup>](#) that consists of a set of non-overlapping subpaths that exactly outline the points from which, in any of the [paths<sup>p630</sup>](#) provided in the constructor's first argument, the number of times a half-infinite straight line drawn from that point crosses a subpath going in one direction is not equal to the number of times it crosses a subpath going in the other direction.

↪ **If it is "evenodd"**

Let *merged path* be a [path<sup>p630</sup>](#) that consists of a set of non-overlapping subpaths that exactly outline the points from which, in any of the [paths<sup>p630</sup>](#) provided in the constructor's first argument, the number of times a half-infinite straight line drawn from that point crosses that path is odd.

The subpaths in *merged path* must be oriented such that for any point, the number of times a half-infinite straight line drawn from that point crosses a subpath is even if and only if the number of times a half-infinite straight line drawn from that same point crosses a subpath going in one direction is equal to the number of times it crosses a subpath going in the other direction.

2. Add all the subpaths in *merged path* to the [Path2D<sup>p616</sup>](#) object.
3. Set the [Path2D<sup>p616</sup>](#) object's [need new subpath<sup>p630</sup>](#) flag.

The [Path2D \(d\)](#) constructor must run the following steps:

1. Parse and interpret the *d* argument according to the SVG specification's rules for path data, thus obtaining an SVG path. [\[SVG\]<sup>p1153</sup>](#)

**Note** *The resulting path could be empty. SVG defines error handling rules for parsing and applying path data.*
2. Let  $(x, y)$  be the last point in the SVG path.
3. Create a new [Path2D<sup>b616</sup>](#) object and add all the subpaths in the SVG path, if any, to that [Path2D<sup>p616</sup>](#) object.
4. Create a new subpath in the [Path2D<sup>p616</sup>](#) object with  $(x, y)$  as the only point in the subpath.
5. Return the [Path2D<sup>p616</sup>](#) object as the constructed object.

The [addPath \(b, transform\)](#) method, when invoked on a [Path2D<sup>p616</sup>](#) object *a*, must run the following steps:

1. If the [Path2D<sup>p616</sup>](#) object *b* has no subpaths, abort these steps.

2. Create a copy of all the subpaths in *b*. Let this copy be known as *c*.
3. Transform all the coordinates and lines in *c* by the transform matrix *transform*, if it is not null.
4. Let  $(x, y)$  be the last point in the last subpath of *c*.
5. Add all the subpaths in *c* to *a*.
6. Create a new subpath in *a* with  $(x, y)$  as the only point in the subpath.

The `addPathByStrokingPath(b, styles, transform)` method, when invoked on a `Path2D`<sup>p616</sup> object *a*, must run the following steps:

1. If the `Path2D`<sup>p616</sup> object *b* has no subpaths, abort these steps.
2. Create a copy of all the subpaths in *b*. Let this copy be known as *c*.
3. Transform all the coordinates and lines in *c* by transformation matrix *transform*, if it is not null.
4. Let a new list of subpaths *d* be the result of `tracing`<sup>p624</sup> *c*, using the *styles* argument for the line styles.
5. Let  $(x, y)$  be the last point in the last subpath of *d*.
6. Add all the subpaths in *d* to *a*.
7. Create a new subpath in *a* with  $(x, y)$  as the only point in the subpath.

The `addText()` and `addPathByStrokingText()` methods each come in two variants: one rendering text at a given coordinate, and one rendering text along a given path. In both cases, the methods take a `CanvasDrawingStyles`<sup>p615</sup> object argument for the text and (if appropriate) line styles to use, an `SVGMatrix`<sup>p53</sup> object *transform* (which can be null), and a maximum width can optionally be provided.

When one of the `addText()`<sup>p636</sup> and `addPathByStrokingText()`<sup>p636</sup> variants that take as argument an  $(x, y)$  coordinate is invoked, the method must run the following algorithm:

1. Run the `text preparation algorithm`<sup>b629</sup>, passing it *text*, the `CanvasDrawingStyles`<sup>p615</sup> object argument, and, if the *maxWidth* argument was provided, that argument. Let *glyphs* be the result.
2. Move all the shapes in *glyphs* to the right by *x* CSS pixels and down by *y* CSS pixels.
3. Let *glyph paths* be a list of `paths`<sup>p630</sup> describing the shapes given in *glyphs*, with each CSS pixel in the coordinate space of *glyphs* mapped to one coordinate space unit in *glyph paths*. Subpaths in *glyph paths* must wind clockwise, regardless of how the user agent's font subsystem renders fonts and regardless of how the fonts themselves are defined.
4. Transform all the coordinates and lines in *glyph paths* by the transformation matrix *transform*, if it is not null.
5. If the method is `addPathByStrokingText()`<sup>p636</sup>, replace *glyph paths* by the result of `tracing`<sup>p624</sup> each `path`<sup>p630</sup> in *glyph paths*, using the `CanvasDrawingStyles`<sup>p615</sup> object argument for the line styles.
6. Let *merged path* be a `path`<sup>p630</sup> that consists of a set of non-overlapping subpaths that exactly outline the points from which, in any of the `paths`<sup>p630</sup> in *glyph paths*, the number of times a half-infinite straight line drawn from that point crosses that path is odd.

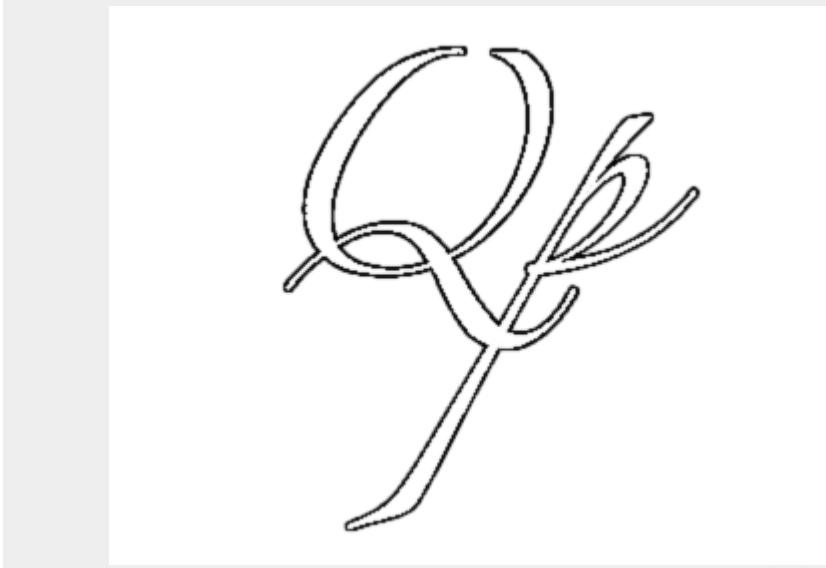

The subpaths in *merged path* must be oriented such that for any point, the number of times a half-infinite straight line drawn from that point crosses a subpath is even if and only if the number of times a half-infinite straight line drawn from that same point crosses a subpath going in one direction is equal to the number of times it crosses a subpath going in the other direction.

#### Example

For example, suppose *text* consists of two overlapping glyphs "Q" and "p" (maybe the "Q" has a flourish that crosses into the tail of the "p"). The *glyph paths* therefore consist of two paths, each with two subpaths: one for the outside of the letter shape, and one for the inside of the letter shape. There are points that, according to the even-odd fill rule, are filled in both shapes simultaneously: where they overlap. As such, the subpaths from the two glyphs actually cross each other.

The resulting *merged path* in such a situation would have just one path for these two letters, with a total of just three subpaths (one big outer outline, one for the inside of the "Q", and one for inside of the "p"). This single path would have no subpaths that cross each other.

7. Add all the subpaths in *merged path* to the [Path2D<sup>p616</sup>](#) object.
8. Set the [Path2D<sup>p616</sup>](#) object's [need new subpath<sup>p630</sup>](#) flag.

When one of the [addText\(\)<sup>p636</sup>](#) and [addPathBy strokingText\(\)<sup>p636</sup>](#) variants that take as argument a [Path2D<sup>p616</sup>](#) object is invoked, the method must run the following algorithm:

1. Let *target* be the [Path2D<sup>p616</sup>](#) object on which the method was invoked.
2. Let *path* be the [Path2D<sup>p616</sup>](#) object that was provided in the method's arguments.
3. Run the [text preparation algorithm<sup>p629</sup>](#), passing it *text*, the [CanvasDrawingStyles<sup>p615</sup>](#) object argument, and, if the *maxWidth* argument was provided, that argument. Let *glyphs* be the resulting array, and *physical alignment* be the resulting alignment value.
4. Let *width* be the aggregate length of all the subpaths in *path*, including the distances from the last point of each closed subpath to the first point of that subpath.
5. Define *L* to be a linear coordinate line for of all the subpaths in *path*, with additional lines drawn between the last point and the first point of each closed subpath, such that the first point of the first subpath is defined as point 0, and the last point of the last subpath, if the last subpath is not closed, or the second occurrence first point of that subpath, if it is closed, is defined as point *width*.

6. Let *offset* be determined according to the appropriate step below:
    - ↪ If **physical alignment is left**  
Let *offset* be zero.
    - ↪ If **physical alignment is right**  
Let *offset* be *width*.
    - ↪ If **physical alignment is center**  
Let *offset* be half of *width*.
  7. Move all the shapes in *glyphs* to the right by *offset* CSS pixels.
  8. Let *transformed path list* be an empty list of paths.
  9. For each glyph *glyph* in the *glyphs* array, run these substeps:
    1. Let *dx* be the x-coordinate of the horizontal center of the bounding box of the shape described by *glyph*, in CSS pixels.
    2. If *dx* is negative or greater than *width*, skip the remainder of these substeps for this glyph.
    3. Recast *dx* to coordinate spaces units in *path*. (This just changes the dimensionality of *dx*, not its numeric value.)
    4. Find the point *p* on *path* (or implied closing lines in *path*) that corresponds to the position *dx* on the coordinate line *L*.
    5. Let  $\theta$  be the clockwise angle from the positive x-axis to the side of the line that is tangential to *path* at the point *p* that is going in the same direction as the line at point *p*.
    6. Rotate the shape described by *glyph* clockwise by  $\theta$  about the point that is at the *dx* coordinate horizontally and the zero coordinate vertically.
    7. Let  $(x, y)$  be the coordinate of the point *p*.
    8. Move the shape described by *glyph* to the right by *x* and down by *y*.
    9. Let *glyph subpaths* be a list of subpaths describing the shape given in *glyph*, with each CSS pixel in the coordinate space of *glyph* mapped to one coordinate space unit in *glyph subpaths*. Subpaths in *glyph subpaths* must wind clockwise, regardless of how the user agent's font subsystem renders fonts and regardless of how the fonts themselves are defined.
    10. Transform all the coordinates and lines in *glyph subpaths* by the transformation matrix *transform*, if it is not null.
    11. If the method is [addPathBy strokingText \(\)<sup>p636</sup>](#), replace *glyph subpaths* by the result of [tracing<sup>p624</sup>](#) *glyph subpaths*, using the [CanvasDrawingStyles<sup>p615</sup>](#) object argument for the line styles.
    12. Add all the subpaths in *glyph subpaths* to *transformed path list*.
  10. Let *merged path* be a [path<sup>p630</sup>](#) that consists of a set of non-overlapping subpaths that exactly outline the points from which, in any of the [paths<sup>p630</sup>](#) in *transformed path list*, the number of times a half-infinite straight line drawn from that point crosses that path is odd.
- The subpaths in *merged path* must be oriented such that for any point, the number of times a half-infinite straight line drawn from that point crosses a subpath is even if and only if the number of times a half-infinite straight line drawn from that same point crosses a subpath going in one direction is equal to the number of times it crosses a subpath going in the other direction.
- Note** See [the equivalent step in the earlier algorithm<sup>p636</sup>](#) for an example of this step. It's even more likely that there will be overlap with this method, since neighboring glyphs are likely to be rotated relative to each other.
11. Add all the subpaths in *merged path* to *target*.
  12. Set the [Path2D<sup>p616</sup>](#) object's [need new subpath<sup>p630</sup>](#) flag.

#### 4.12.4.2.8 Transformations

Spec bugs: [9235](#)

Each [CanvasRenderingContext2D<sup>p613</sup>](#) object has a *current transformation matrix*, as well as methods (described in this section) to manipulate it. When a [CanvasRenderingContext2D<sup>p613</sup>](#) object is created, its transformation matrix must be initialised to the identity transform.

The transformation matrix is applied to coordinates when creating the [current default path](#)<sup>p647</sup>, and when painting text, shapes, and [Path2D](#)<sup>p616</sup> objects, on [CanvasRenderingContext2D](#)<sup>p613</sup> objects.

**Note** Most of the API uses [SVGMatrix](#)<sup>p53</sup> objects rather than this API. This API remains mostly for historical reasons.

The transformations must be performed in reverse order.

**Note** For instance, if a scale transformation that doubles the width is applied to the canvas, followed by a rotation transformation that rotates drawing operations by a quarter turn, and a rectangle twice as wide as it is tall is then drawn on the canvas, the actual result will be a square.

**Note**

`context.currentTransformp639 [= value]`

Returns the transformation matrix, as an [SVGMatrix](#)<sup>p53</sup> object.

Can be set, to change the transformation matrix.

`context.scalep639(x, y)`

Changes the transformation matrix to apply a scaling transformation with the given characteristics.

`context.rotatep639(angle)`

Changes the transformation matrix to apply a rotation transformation with the given characteristics. The angle is in radians.

`context.translatep639(x, y)`

Changes the transformation matrix to apply a translation transformation with the given characteristics.

`context.transformp639(a, b, c, d, e, f)`

Changes the transformation matrix to apply the matrix given by the arguments as described below.

`context.setTransformp640(a, b, c, d, e, f)`

Changes the transformation matrix to the matrix given by the arguments as described below.

`context.resetTransformp640()`

Changes the transformation matrix to the identity transform.

The `currentTransform`, on getting, must return the last object that it was set to. On setting, its value must be changed to the new value, and the transformation matrix must be updated to match the matrix described by the new value. When the [CanvasRenderingContext2D](#)<sup>p613</sup> object is created, the `currentTransformp639` attribute must be set a newly created [SVGMatrix](#)<sup>p53</sup> object. When the transformation matrix is mutated by the methods described in this section, the last [SVGMatrix](#)<sup>p53</sup> object to which the attribute has been set must be mutated in a corresponding fashion.

The `scale(x, y)` method must add the scaling transformation described by the arguments to the transformation matrix. The `x` argument represents the scale factor in the horizontal direction and the `y` argument represents the scale factor in the vertical direction. The factors are multiples.

The `rotate(angle)` method must add the rotation transformation described by the argument to the transformation matrix. The `angle` argument represents a clockwise rotation angle expressed in radians.

The `translate(x, y)` method must add the translation transformation described by the arguments to the transformation matrix. The `x` argument represents the translation distance in the horizontal direction and the `y` argument represents the translation distance in the vertical direction. The arguments are in coordinate space units.

The `transform(a, b, c, d, e, f)` method must replace the current transformation matrix with the result of multiplying the current transformation matrix with the matrix described by:

```
a c e
b d f
0 0 1
```

**Note** The arguments `a`, `b`, `c`, `d`, `e`, and `f` are sometimes called `m11`, `m12`, `m21`, `m22`, `dx`, and `dy` or `m11`, `m21`, `m12`, `m22`, `dx`, and `dy`. Care should be taken in particular with the order of the second and third arguments (`b` and `c`) as their order varies from API to API and APIs sometimes use the notation `m12/m21` and sometimes `m21/m12` for those positions.

The `setTransform(a, b, c, d, e, f)` method must reset the current transform to the identity matrix, and then invoke the `transformp639(a, b, c, d, e, f)` method with the same arguments.

The `resetTransform()` method must reset the current transform to the identity matrix.

#### 4.12.4.2.9 Image sources for 2D rendering contexts

Several methods in the `CanvasRenderingContext2Dp613` API take the union type `CanvasImageSourcep613` as an argument.

This union type allows objects implementing any of the following interfaces to be used as image sources:

- `HTMLImageElementp272` (`imgp272` elements)
- `HTMLVideoElementp318` (`videop317` elements)
- `HTMLCanvasElementp607` (`canvasp607` elements)
- `CanvasRenderingContext2Dp613`
- `ImageBitmapp874`

**Note** The `ImageBitmapp874` interface can be created from a number of other image-representing types, including `ImageDatap616`.

When a user agent is required to **check the usability of the `image` argument**, where `image` is a `CanvasImageSourcep613` object, the user agent must run these steps, which return either `good`, `bad`, or `aborted`:

1. If the `image` argument is an `HTMLImageElementp272` object that is in the `brokenp274` state, then throw an `InvalidStateErrorp50` exception, return `aborted`, and abort these steps.
2. If the `image` argument is an `HTMLImageElementp272` object that is not `fully decodablep279`, or if the `image` argument is an `HTMLVideoElementp318` object whose `readyStatep345` attribute is either `HAVE NOTHINGp343` or `HAVE METADATAp343`, then return `bad` and abort these steps.
3. If the `image` argument is an `HTMLImageElementp272` object with an intrinsic width or intrinsic height (or both) equal to zero, then return `bad` and abort these steps.
4. If the `image` argument is an `HTMLCanvasElementp607` object with either a horizontal dimension or a vertical dimension equal to zero, then return `bad` and abort these steps.
5. Return `good`.

When a `CanvasImageSourcep613` object represents an `HTMLImageElementp272`, the element's image must be used as the source image.

Specifically, when a `CanvasImageSourcep613` object represents an animated image in an `HTMLImageElementp272`, the user agent must use the default image of the animation (the one that the format defines is to be used when animation is not supported or is disabled), or, if there is no such image, the first frame of the animation, when rendering the image for `CanvasRenderingContext2Dp613` APIs.

When a `CanvasImageSourcep613` object represents an `HTMLVideoElementp318`, then the frame at the `current playback positionp342` when the method with the argument is invoked must be used as the source image when rendering the image for `CanvasRenderingContext2Dp613` APIs, and the source image's dimensions must be the `intrinsic widthp319` and `intrinsic heightp319` of the `media resourcep328` (i.e. after any aspect-ratio correction has been applied).

When a `CanvasImageSourcep613` object represents an `HTMLCanvasElementp607`, the element's bitmap must be used as the source image.

When a `CanvasImageSourcep613` object represents a `CanvasRenderingContext2Dp613`, the object's `scratch bitmapp617` must be used as the source image.

When a [CanvasImageSource](#)<sup>p613</sup> object represents an element that is [being rendered](#)<sup>p1058</sup> and that element has been resized, the original image data of the source image must be used, not the image as it is rendered (e.g. [width](#)<sup>p397</sup> and [height](#)<sup>p397</sup> attributes on the source element have no effect on how the object is interpreted when rendering the image for [CanvasRenderingContext2D](#)<sup>p613</sup> APIs).

When a [CanvasImageSource](#)<sup>p613</sup> object represents an [ImageBitmap](#)<sup>p874</sup>, the object's bitmap image data must be used as the source image.

The **image argument is not origin-clean** if it is an [HTMLImageElement](#)<sup>p272</sup> or [HTMLVideoElement](#)<sup>p318</sup> whose [origin](#)<sup>p776</sup> is not the [same](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> specified by the [entry settings object](#)<sup>p831</sup>, or if it is an [HTMLCanvasElement](#)<sup>p607</sup> whose bitmap's [origin-clean](#)<sup>p609</sup> flag is false, or if it is a [CanvasRenderingContext2D](#)<sup>p613</sup> object whose [scratch bitmap](#)<sup>p617</sup>'s [origin-clean](#)<sup>p609</sup> flag is false.

#### 4.12.4.2.10 Fill and stroke styles

##### Note

`context.fillStylep641 [= value]`

Returns the current style used for filling shapes.

Can be set, to change the fill style.

The style can be either a string containing a CSS colour, or a [CanvasGradient](#)<sup>p615</sup> or [CanvasPattern](#)<sup>p616</sup> object. Invalid values are ignored.

`context.strokeStylep641 [= value]`

Returns the current style used for stroking shapes.

Can be set, to change the stroke style.

The style can be either a string containing a CSS colour, or a [CanvasGradient](#)<sup>p615</sup> or [CanvasPattern](#)<sup>p616</sup> object. Invalid values are ignored.

The **fillStyle** attribute represents the colour or style to use inside shapes, and the **strokeStyle** attribute represents the colour or style to use for the lines around the shapes.

Both attributes can be either strings, [CanvasGradient](#)<sup>p615</sup>s, or [CanvasPattern](#)<sup>p616</sup>s. On setting, strings must be [parsed as CSS <color> values](#)<sup>p53</sup> and the colour assigned, and [CanvasGradient](#)<sup>p615</sup> and [CanvasPattern](#)<sup>p616</sup> objects must be assigned themselves. [\[CSSCOLOR\]](#)<sup>p1149</sup> If the value is a string but cannot be [parsed as a CSS <color> value](#)<sup>p53</sup>, then it must be ignored, and the attribute must retain its previous value. If the new value is a [CanvasPattern](#)<sup>p616</sup> object that is marked as [not origin-clean](#)<sup>p643</sup>, then the [scratch bitmap](#)<sup>p617</sup>'s [origin-clean](#)<sup>p609</sup> flag must be set to false.

When set to a [CanvasPattern](#)<sup>p616</sup> or [CanvasGradient](#)<sup>p615</sup> object, the assignment is [live](#)<sup>p43</sup>, meaning that changes made to the object after the assignment do affect subsequent stroking or filling of shapes.

On getting, if the value is a colour, then the [serialisation of the colour](#)<sup>p641</sup> must be returned. Otherwise, if it is not a colour but a [CanvasGradient](#)<sup>p615</sup> or [CanvasPattern](#)<sup>p616</sup>, then the respective object must be returned. (Such objects are opaque and therefore only useful for assigning to other attributes or for comparison to other gradients or patterns.)

The **serialisation of a colour** for a colour value is a string, computed as follows: if it has alpha equal to 1.0, then the string is a lowercase six-digit hex value, prefixed with a "#" character (U+0023 NUMBER SIGN), with the first two digits representing the red component, the next two digits representing the green component, and the last two digits representing the blue component, the digits being [lowercase ASCII hex digits](#)<sup>p59</sup>. Otherwise, the colour value has alpha less than 1.0, and the string is the colour value in the CSS [rgba\(\)](#) functional-notation format: the literal string "rgba" (U+0072 U+0067 U+0062 U+0061) followed by a U+0028 LEFT PARENTHESIS, a base-ten integer in the range 0-255 representing the red component (using [ASCII digits](#)<sup>p58</sup> in the shortest form possible), a literal U+002C COMMA and U+0020 SPACE, an integer for the green component, a comma and a space, an integer for the blue component, another comma and space, a U+0030 DIGIT ZERO, if the alpha value is greater than zero then a U+002E FULL STOP (representing the decimal point), if the alpha value is greater than zero then one or more [ASCII digits](#)<sup>p58</sup> representing the fractional part of the alpha, and finally a U+0029 RIGHT PARENTHESIS. User agents must express the fractional part of the alpha value, if any, with the level of precision necessary for the alpha value, when reparsed, to be interpreted as the same alpha value.

When the context is created, the [fillStyle](#)<sup>p641</sup> and [strokeStyle](#)<sup>p641</sup> attributes must initially have the string value "#000000".

When the value is a colour, it must not be affected by the transformation matrix when used to draw on bitmaps.

There are two types of gradients, linear gradients and radial gradients, both represented by objects implementing the opaque [CanvasGradient](#)<sup>p615</sup> interface.

Once a gradient has been created (see below), stops are placed along it to define how the colours are distributed along the gradient. The colour of the gradient at each stop is the colour specified for that stop. Between each such stop, the colours and the alpha component must be linearly interpolated over the RGBA space without premultiplying the alpha value to find the colour to use at that offset. Before the first stop, the colour must be the colour of the first stop. After the last stop, the colour must be the colour of the last stop. When there are no stops, the gradient is transparent black.

Note

**gradient.addColorStop<sup>p642</sup>(offset, color)**

Adds a colour stop with the given colour to the gradient at the given offset. 0.0 is the offset at one end of the gradient, 1.0 is the offset at the other end.

Throws an [IndexSizeError](#)<sup>p50</sup> exception if the offset is out of range. Throws a [SyntaxError](#)<sup>b50</sup> exception if the colour cannot be parsed.

**gradient = context.createLinearGradient<sup>p642</sup>(x0, y0, x1, y1)**

Returns a [CanvasGradient](#)<sup>p615</sup> object that represents a linear gradient that paints along the line given by the coordinates represented by the arguments.

**gradient = context.createRadialGradient<sup>p642</sup>(x0, y0, r0, x1, y1, r1)**

Returns a [CanvasGradient](#)<sup>p615</sup> object that represents a radial gradient that paints along the cone given by the circles represented by the arguments.

If either of the radii are negative, throws an [IndexSizeError](#)<sup>p50</sup> exception.

The `addColorStop(offset, color)` method on the [CanvasGradient](#)<sup>p615</sup> interface adds a new stop to a gradient. If the `offset` is less than 0 or greater than 1 then an [IndexSizeError](#)<sup>p50</sup> exception must be thrown. If the `color` cannot be [parsed as a CSS <color> value](#)<sup>p53</sup>, then a [SyntaxError](#)<sup>p50</sup> exception must be thrown. Otherwise, the gradient must have a new stop placed, at offset `offset` relative to the whole gradient, and with the colour obtained by parsing `color` as a CSS `<color>` value. If multiple stops are added at the same offset on a gradient, they must be placed in the order added, with the first one closest to the start of the gradient, and each subsequent one infinitesimally further along towards the end point (in effect causing all but the first and last stop added at each point to be ignored).

The `createLinearGradient(x0, y0, x1, y1)` method takes four arguments that represent the start point ( $x_0, y_0$ ) and end point ( $x_1, y_1$ ) of the gradient. The method must return a linear [CanvasGradient](#)<sup>p615</sup> initialised with the specified line.

Linear gradients must be rendered such that all points on a line perpendicular to the line that crosses the start and end points have the colour at the point where those two lines cross (with the colours coming from the [interpolation and extrapolation](#)<sup>p642</sup> described above). The points in the linear gradient must be transformed as described by the [current transformation matrix](#)<sup>p638</sup> when rendering.

If  $x_0 = x_1$  and  $y_0 = y_1$ , then the linear gradient must paint nothing.

The `createRadialGradient(x0, y0, r0, x1, y1, r1)` method takes six arguments, the first three representing the start circle with origin  $(x_0, y_0)$  and radius  $r_0$ , and the last three representing the end circle with origin  $(x_1, y_1)$  and radius  $r_1$ . The values are in coordinate space units. If either of  $r_0$  or  $r_1$  are negative, an [IndexSizeError](#)<sup>p50</sup> exception must be thrown. Otherwise, the method must return a radial [CanvasGradient](#)<sup>p615</sup> initialised with the two specified circles.

Radial gradients must be rendered by following these steps:

1. If  $x_0 = x_1$  and  $y_0 = y_1$  and  $r_0 = r_1$ , then the radial gradient must paint nothing. Abort these steps.

2. Let  $x(\omega) = (x_1 - x_0)\omega + x_0$

Let  $y(\omega) = (y_1 - y_0)\omega + y_0$

Let  $r(\omega) = (r_1 - r_0)\omega + r_0$

Let the colour at  $\omega$  be the colour at that position on the gradient (with the colours coming from the [interpolation and extrapolation](#)<sup>p642</sup> described above).

- For all values of  $\omega$  where  $r(\omega) > 0$ , starting with the value of  $\omega$  nearest to positive infinity and ending with the value of  $\omega$  nearest to negative infinity, draw the circumference of the circle with radius  $r(\omega)$  at position  $(x(\omega), y(\omega))$ , with the colour at  $\omega$ , but only painting on the parts of the bitmap that have not yet been painted on by earlier circles in this step for this rendering of the gradient.

**Note** This effectively creates a cone, touched by the two circles defined in the creation of the gradient, with the part of the cone before the start circle (0.0) using the colour of the first offset, the part of the cone after the end circle (1.0) using the colour of the last offset, and areas outside the cone untouched by the gradient (transparent black).

The resulting radial gradient must then be transformed as described by the [current transformation matrix](#)<sup>p638</sup> when rendering.

Gradients must be painted only where the relevant stroking or filling effects requires that they be drawn.

Patterns are represented by objects implementing the opaque [CanvasPattern](#)<sup>p616</sup> interface.

**Note**

**pattern = context.createPattern(*image*, *repetition*)**

Returns a [CanvasPattern](#)<sup>p616</sup> object that uses the given image and repeats in the direction(s) given by the *repetition* argument.

The allowed values for *repetition* are `repeat` (both directions), `repeat-x` (horizontal only), `repeat-y` (vertical only), and `no-repeat` (neither). If the *repetition* argument is empty, the value `repeat` is used.

If the image isn't yet fully decoded, then nothing is drawn. If the image is a canvas with no data, throws an [InvalidStateError](#)<sup>p50</sup> exception.

**pattern.setTransform(*transform*)**

Sets the transformation matrix that will be used when rendering the pattern during a fill or stroke painting operation.

To create objects of this type, the `createPattern(image, repetition)` method is used. When the method is invoked, the user agent must run the following steps:

- Let *image* be the first argument and *repetition* be the second argument.
- [Check the usability of the \*image\* argument](#)<sup>p640</sup>. If this returns `aborted`, then an exception has been thrown and the method doesn't return anything; abort these steps. If it returns `bad`, then return null and abort these steps. Otherwise it returns `good`; continue with these steps.
- If *repetition* is the empty string, let it be "`repeat`".
- If *repetition* is not a [case-sensitive](#)<sup>p58</sup> match for one of "`repeat`", "`repeat-x`", "`repeat-y`", or "`no-repeat`", throw a [SyntaxError](#)<sup>p50</sup> exception and abort these steps.
- Create a new [CanvasPattern](#)<sup>p616</sup> object with the image *image* and the repetition behaviour given by *repetition*.
- If [the \*image\* argument is not origin-clean](#)<sup>p641</sup>, then mark the [CanvasPattern](#)<sup>p616</sup> object as **not origin-clean**.
- Return the [CanvasPattern](#)<sup>p616</sup> object.

Modifying the *image* used when creating a [CanvasPattern](#)<sup>p616</sup> object after calling the `createPattern()`<sup>p643</sup> method must not affect the pattern(s) rendered by the [CanvasPattern](#)<sup>p616</sup> object.

Patterns have a transformation matrix, which controls how the pattern is used when it is painted. Initially, a pattern's transformation matrix must be the identity transform.

When the `setTransform()` method is invoked on the pattern, the user agent must replace the pattern's transformation matrix with the one described by the [SVGMatrix](#)<sup>p53</sup> object provided as an argument to the method.

When a pattern is to be rendered within an area, the user agent must run the following steps to determine what is rendered:

- Create an infinite transparent black bitmap.
- Place a copy of the image on the bitmap, anchored such that its top left corner is at the origin of the coordinate space, with one coordinate space unit per CSS pixel of the image, then place repeated copies of this image horizontally to the left and right, if the

repetition behaviour is "repeat-x", or vertically up and down, if the repetition behaviour is "repeat-y", or in all four directions all over the bitmap, if the repetition behaviour is "repeat".

If the original image data is a bitmap image, the value painted at a point in the area of the repetitions is computed by filtering the original image data. When scaling up, if the [imageSmoothingEnabled<sup>p663</sup>](#) attribute is set to false, the image must be rendered using nearest-neighbor interpolation. Otherwise, the user agent may use any filtering algorithm (for example bilinear interpolation or nearest-neighbor). When such a filtering algorithm requires a pixel value from outside the original image data, it must instead use the value from wrapping the pixel's coordinates to the original image's dimensions. (That is, the filter uses 'repeat' behaviour, regardless of the value of the pattern's repetition behaviour.)

3. Transform the resulting bitmap according to the pattern's transformation matrix.
4. Transform the resulting bitmap again, this time according to the [current transformation matrix<sup>p638</sup>](#).
5. Replace any part of the image outside the area in which the pattern is to be rendered with transparent black.
6. The resulting bitmap is what is to be rendered, with the same origin and same scale.

If a radial gradient or repeated pattern is used when the transformation matrix is singular, the resulting style must be transparent black (otherwise the gradient or pattern would be collapsed to a point or line, leaving the other pixels undefined). Linear gradients and solid colours always define all points even with singular transformation matrices.

#### 4.12.4.2.11 Drawing rectangles to the bitmap

There are three methods that immediately draw rectangles to the bitmap. They each take four arguments; the first two give the *x* and *y* coordinates of the top left of the rectangle, and the second two give the width *w* and height *h* of the rectangle, respectively.

The [current transformation matrix<sup>p638</sup>](#) must be applied to the following four coordinates, which form the path that must then be closed to get the specified rectangle: (*x*, *y*), (*x+w*, *y*), (*x+w*, *y+h*), (*x*, *y+h*).

Shapes are painted without affecting the [current default path<sup>p647</sup>](#), and are subject to the [clipping region<sup>p649</sup>](#), and, with the exception of [clearRect\(\)<sup>p644</sup>](#), also [shadow effects<sup>p663</sup>](#), [global alpha<sup>p663</sup>](#), and [global composition operators<sup>p663</sup>](#).

##### Note

`context.clearRectp644(x, y, w, h)`

Clears all pixels on the bitmap in the given rectangle to transparent black.

`context.fillRectp644(x, y, w, h)`

Paints the given rectangle onto the bitmap, using the current fill style.

`context.strokeRectp644(x, y, w, h)`

Paints the box that outlines the given rectangle onto the bitmap, using the current stroke style.

The `clearRect(x, y, w, h)` method must run the following steps:

1. Let *pixels* be the set of pixels in the specified rectangle that also intersect the current [clipping region<sup>p649</sup>](#).
2. Clear the pixels in *pixels* to a fully transparent black, erasing any previous image.
3. [Clear regions that cover the pixels<sup>p655</sup>](#) in *pixels* on the [scratch bitmap<sup>p617</sup>](#).

**Note** If either height or width are zero, this method has no effect, since the set of pixels would be empty.

The `fillRect(x, y, w, h)` method must paint the specified rectangular area using the [fillStyle<sup>p641</sup>](#). If either height or width are zero, this method has no effect.

The `strokeRect(x, y, w, h)` method must take the result of [tracing the path<sup>p624</sup>](#) described below, using the [CanvasRenderingContext2D<sup>p613</sup>](#) object's line styles, and fill it with the [strokeStyle<sup>p641</sup>](#).

If both `w` and `h` are zero, the path has a single subpath with just one point  $(x, y)$ , and no lines, and this method thus has no effect (the [trace a path](#)<sup>p624</sup> algorithm returns an empty path in that case).

If just one of either `w` or `h` is zero, then the path has a single subpath consisting of two points, with coordinates  $(x, y)$  and  $(x+w, y+h)$ , in that order, connected by a single straight line.

Otherwise, the path has a single subpath consisting of four points, with coordinates  $(x, y)$ ,  $(x+w, y)$ ,  $(x+w, y+h)$ , and  $(x, y+h)$ , connected to each other in that order by straight lines.

#### 4.12.4.2.12 Drawing text to the bitmap

Note

```
context.fillTextp645(text, x, y [, maxWidth])
context.strokeTextp645(text, x, y [, maxWidth])
```

Fills or strokes (respectively) the given text at the given position. If a maximum width is provided, the text will be scaled to fit if necessary.

```
metrics = context.measureTextp646(text)
```

Returns a [TextMetrics](#)<sup>p616</sup> object with the metrics of the given text in the current font.

```
metrics.widthp646
metrics.actualBoundingBoxLeftp646
metrics.actualBoundingBoxRightp646
metrics.fontBoundingBoxAscentp646
metrics.fontBoundingBoxDescentp646
metrics.actualBoundingBoxAscentp646
metrics.actualBoundingBoxDescentp646
metrics.emHeightAscentb646
metrics.emHeightDescentp647
metrics.hangingBaselinep647
metrics.alphabeticBaselinep647
metrics.ideographicBaselinep647
```

Returns the measurement described below.

The [CanvasRenderingContext2D](#)<sup>p613</sup> interface provides the following methods for rendering text.

The `fillText()` and `strokeText()` methods take three or four arguments, `text`, `x`, `y`, and optionally `maxWidth`, and render the given `text` at the given  $(x, y)$  coordinates ensuring that the text isn't wider than `maxWidth` if specified, using the current [font](#)<sup>p627</sup>, [textAlign](#)<sup>p627</sup>, and [textBaseline](#)<sup>p627</sup> values. Specifically, when the methods are called, the user agent must run the following steps:

1. Run the [text preparation algorithm](#)<sup>b629</sup>, passing it `text`, the [CanvasRenderingContext2D](#)<sup>p613</sup> object, and, if the `maxWidth` argument was provided, that argument. Let `glyphs` be the result.
2. Move all the shapes in `glyphs` to the right by `x` CSS pixels and down by `y` CSS pixels.
3. Paint the shapes given in `glyphs`, as transformed by the [current transformation matrix](#)<sup>p638</sup>, with each CSS pixel in the coordinate space of `glyphs` mapped to one coordinate space unit.

For `fillText()`<sup>p645</sup>, `fillStyle`<sup>p641</sup> must be applied to the shapes and `strokeStyle`<sup>p641</sup> must be ignored. For `strokeText()`<sup>p645</sup>, the reverse holds: `strokeStyle`<sup>p641</sup> must be applied to the result of [tracing](#)<sup>p624</sup> the shapes using the [CanvasRenderingContext2D](#)<sup>p613</sup> object for the line styles, and `fillStyle`<sup>p641</sup> must be ignored.

These shapes are painted without affecting the current path, and are subject to [shadow effects](#)<sup>p663</sup>, [global alpha](#)<sup>p663</sup>, the [clipping region](#)<sup>p649</sup>, and [global composition operators](#)<sup>p663</sup>.

4. If the [text preparation algorithm](#)<sup>p629</sup> used a font that has an [origin](#)<sup>p776</sup> that is not the [same](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> specified by the [entry settings object](#)<sup>p831</sup> (even if "using a font" means just checking if that font has a particular glyph in it before falling back to another font), then set the [scratch bitmap](#)<sup>p617</sup>'s [origin-clean](#)<sup>p609</sup> flag to false.

The [measureText\(\)](#) method takes one argument, *text*. When the method is invoked, the user agent must run the [text preparation algorithm](#)<sup>p629</sup>, passing it *text* and the [CanvasRenderingContext2D](#)<sup>p613</sup> object, and then using the returned inline box must create a new [TextMetrics](#)<sup>p616</sup> object with its attributes set as described in the following list. If doing these measurements requires using a font that has an [origin](#)<sup>p776</sup> that is not the [same](#)<sup>p778</sup> as that of the [Document](#)<sup>p102</sup> object that owns the [canvas](#)<sup>p607</sup> element (even if "using a font" means just checking if that font has a particular glyph in it before falling back to another font), then the method must throw a [SecurityError](#)<sup>p50</sup> exception. Otherwise, it must return the new [TextMetrics](#)<sup>p616</sup> object. [CSS]<sup>p1149</sup>

p30

#### **width** attribute

The width of that inline box, in CSS pixels. (The text's advance width.)

#### **actualBoundingBoxLeft** attribute

The distance parallel to the baseline from the alignment point given by the [textAlign](#)<sup>p627</sup> attribute to the left side of the bounding rectangle of the given text, in CSS pixels; positive numbers indicating a distance going left from the given alignment point.

**Note** *The sum of this value and the next ([actualBoundingBoxRight](#)<sup>p646</sup>) can be wider than the width of the inline box ([width](#)<sup>p646</sup>), in particular with slanted fonts where characters overhang their advance width.*

#### **actualBoundingBoxRight** attribute

The distance parallel to the baseline from the alignment point given by the [textAlign](#)<sup>p627</sup> attribute to the right side of the bounding rectangle of the given text, in CSS pixels; positive numbers indicating a distance going right from the given alignment point.

#### **fontBoundingBoxAscent** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p627</sup> attribute to the top of the highest bounding rectangle of all the fonts used to render the text, in CSS pixels; positive numbers indicating a distance going up from the given baseline.

**Note** *This value and the next are useful when rendering a background that must have a consistent height even if the exact text being rendered changes. The [actualBoundingBoxAscent](#)<sup>p646</sup> attribute (and its corresponding attribute for the descent) are useful when drawing a bounding box around specific text.*

#### **fontBoundingBoxDescent** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p627</sup> attribute to the bottom of the lowest bounding rectangle of all the fonts used to render the text, in CSS pixels; positive numbers indicating a distance going down from the given baseline.

#### **actualBoundingBoxAscent** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p627</sup> attribute to the top of the bounding rectangle of the given text, in CSS pixels; positive numbers indicating a distance going up from the given baseline.

**Note** *This number can vary greatly based on the input text, even if the first font specified covers all the characters in the input. For example, the [actualBoundingBoxAscent](#)<sup>p646</sup> of a lowercase "o" from an alphabetic baseline would be less than that of an uppercase "F". The value can easily be negative; for example, the distance from the top of the em box ([textBaseline](#)<sup>p627</sup> value "[top](#)<sup>p628</sup>") to the top of the bounding rectangle when the given text is just a single comma "," would likely (unless the font is quite unusual) be negative.*

#### **actualBoundingBoxDescent** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p627</sup> attribute to the bottom of the bounding rectangle of the given text, in CSS pixels; positive numbers indicating a distance going down from the given baseline.

#### **emHeightAscent** attribute

The distance from the horizontal line indicated by the [textBaseline](#)<sup>p627</sup> attribute to the highest top of the em squares in the line box, in CSS pixels; positive numbers indicating that the given baseline is below the top of that em square (so this value will usually be positive). Zero if the given baseline is the top of that em square; half the font size if the given baseline is the middle of that em square.

#### **emHeightDescent** attribute

The distance from the horizontal line indicated by the [textBaseline<sup>p627</sup>](#) attribute to the lowest bottom of the em squares in the line box, in CSS pixels; positive numbers indicating that the given baseline is below the bottom of that em square (so this value will usually be negative). (Zero if the given baseline is the top of that em square.)

#### **hangingBaseline** attribute

The distance from the horizontal line indicated by the [textBaseline<sup>p627</sup>](#) attribute to the hanging baseline of the line box, in CSS pixels; positive numbers indicating that the given baseline is below the hanging baseline. (Zero if the given baseline is the hanging baseline.)

#### **alphabeticBaseline** attribute

The distance from the horizontal line indicated by the [textBaseline<sup>p627</sup>](#) attribute to the alphabetic baseline of the line box, in CSS pixels; positive numbers indicating that the given baseline is below the alphabetic baseline. (Zero if the given baseline is the alphabetic baseline.)

#### **ideographicBaseline** attribute

The distance from the horizontal line indicated by the [textBaseline<sup>p627</sup>](#) attribute to the ideographic baseline of the line box, in CSS pixels; positive numbers indicating that the given baseline is below the ideographic baseline. (Zero if the given baseline is the ideographic baseline.)

**Note** *Glyphs rendered using [fillText\(\)<sup>p645</sup>](#) and [strokeText\(\)<sup>p645</sup>](#) can spill out of the box given by the font size (the em square size) and the width returned by [measureText\(\)<sup>p646</sup>](#) (the text width). Authors are encouraged to use the bounding box values described above if this is an issue.*

**Note** *A future version of the 2D context API may provide a way to render fragments of documents, rendered using CSS, straight to the canvas. This would be provided in preference to a dedicated way of doing multiline layout.*

#### 4.12.4.2.13 Drawing paths to the canvas

The context always has a **current default path**. There is only one [current default path<sup>p647</sup>](#), it is not part of the [drawing state<sup>p621</sup>](#). The [current default path<sup>p647</sup>](#) is a [path<sup>p630</sup>](#), as described above.

#### **Note**

`context.beginPathp648()`

Resets the [current default path<sup>p647</sup>](#).

`context.fillp648( [ fillRule ] )`

`context.fillp648(path [, fillRule ])`

Fills the subpaths of the [current default path<sup>p647</sup>](#) or the given path with the current fill style, obeying the given fill rule.

`context.strokep648()`

`context.strokep648(path)`

Strokes the subpaths of the [current default path<sup>p647</sup>](#) or the given path with the current stroke style.

`context.drawFocusIfNeededp648(element)`

`context.drawFocusIfNeededp648(path, element)`

If the given element is [focused<sup>p728</sup>](#), draws a focus ring around the [current default path<sup>p647</sup>](#) or the given path, following the platform conventions for focus rings.

`context.scrollPathIntoViewp649()`

`context.scrollPathIntoViewp649(path)`

Scrolls the [current default path<sup>p647</sup>](#) or the given path into view. This is especially useful on devices with small screens, where the whole canvas might not be visible at once.

```
context.clipp649([fillRule])
context.clipp649(path [, fillRule])
```

Further constrains the clipping region to the [current default path<sup>p647</sup>](#) or the given path, using the given fill rule to determine what points are in the path.

```
context.resetClipp649()
```

Unconstrains the clipping region.

```
context.isPointInPathp649(x, y [, fillRule])
```

```
context.isPointInPathp649(path, x, y [, fillRule])
```

Returns true if the given point is in the [current default path<sup>p647</sup>](#) or the given path, using the given fill rule to determine what points are in the path.

```
context.isPointInStrokep649(x, y)
```

```
context.isPointInStrokep649(path, x, y)
```

Returns true if the given point would be in the region covered by the stroke of the [current default path<sup>p647</sup>](#) or the given path, given the current stroke style.

The [beginPath\(\)](#) method must empty the list of subpaths in the context's [current default path<sup>p647</sup>](#) so that it once again has zero subpaths.

Where the following method definitions use the term *intended path*, it means the [Path2D<sup>p616</sup>](#) argument, if one was provided, or the [current default path<sup>p647</sup>](#) otherwise.

When the intended path is a [Path2D<sup>p616</sup>](#) object, the coordinates and lines of its subpaths must be transformed according to the [CanvasRenderingContext2D<sup>p613</sup>](#) object's [current transformation matrix<sup>p638</sup>](#) when used by these methods (without affecting the [Path2D<sup>p616</sup>](#) object itself). When the intended path is the [current default path<sup>p647</sup>](#), it is not affected by the transform. (This is because transformations already affect the [current default path<sup>p647</sup>](#) when it is constructed, so applying it when it is painted as well would result in a double transformation.)

The [fill\(\)](#) method must fill all the subpaths of the intended path, using [fillStyle<sup>p641</sup>](#), and using the [fill rule<sup>p621</sup>](#) indicated by the [fillRule](#) argument. Open subpaths must be implicitly closed when being filled (without affecting the actual subpaths).

The [stroke\(\)](#) method must [trace<sup>p624</sup>](#) the intended path, using the [CanvasRenderingContext2D<sup>p613</sup>](#) object for the line styles, and then fill the resulting path using the [strokeStyle<sup>p641</sup>](#) attribute, using the [non-zero winding rule<sup>p621</sup>](#).

**Note** As a result of how the algorithm to [trace a path<sup>p624</sup>](#) is defined, overlapping parts of the paths in one stroke operation are treated as if their union was what was painted.

**Note** The stroke style is affected by the transformation during painting, even if the intended path is the [current default path<sup>p647</sup>](#).

Paths, when filled or stroked, must be painted without affecting the [current default path<sup>p647</sup>](#) or any [Path2D<sup>p616</sup>](#) objects, and must be subject to [shadow effects<sup>p663</sup>](#), [global alpha<sup>p663</sup>](#), the [clipping region<sup>p649</sup>](#), and [global composition operators<sup>p663</sup>](#). (The effect of transformations is described above and varies based on which path is being used.)

The [drawFocusIfNeeded\(element\)](#) method, when invoked, must run the following steps:

1. If [element](#) is not [focused<sup>p728</sup>](#) or is not a descendant of the element with whose context the method is associated, then abort these steps.
2. Draw a focus ring of the appropriate style along the intended path, following platform conventions.

**Note** Some platforms only draw focus rings around elements that have been focused from the keyboard, and not those focused from the mouse. Other platforms simply don't draw focus rings around some elements at all unless relevant accessibility features are enabled. This API is intended to follow these conventions. User agents that implement distinctions based on the manner in which the element was focused are encouraged to classify focus driven by the [focus\(\)<sup>p737</sup>](#) method based on the kind of user interaction event from which the call was triggered (if any).

The focus ring should not be subject to the [shadow effects](#)<sup>p663</sup>, the [global alpha](#)<sup>p663</sup>, the [global composition operators](#)<sup>p663</sup>, the [fillStyle](#)<sup>p641</sup> attribute, the [strokeStyle](#)<sup>p641</sup> attribute, or any of the [CanvasDrawingStyles](#)<sup>p615</sup> members, but *should* be subject to the [clipping region](#)<sup>p649</sup>. (The effect of transformations is described above and varies based on which path is being used.)

3. Optionally, run the appropriate step from the following list:

If the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [context bitmap mode](#)<sup>p609</sup> is [fixed](#)<sup>p609</sup>

[Inform the user](#)<sup>p649</sup> that the focus is at the location given by the intended path. User agents may wait until the next time the [event loop](#)<sup>p834</sup> reaches its *update the rendering* step to optionally inform the user.

#### Otherwise

Add instructions to the [scratch bitmap](#)<sup>p617</sup>'s [list of pending interface actions](#)<sup>p617</sup> that [inform the user](#)<sup>p649</sup> that the focus is at the location of the bitmap given by the intended path.

User agents should not implicitly close open subpaths in the intended path when drawing the focus ring.

**Note** *This might be a moot point, however. For example, if the focus ring is drawn as an axis-aligned bounding rectangle around the points in the intended path, then whether the subpaths are closed or not has no effect. This specification intentionally does not specify precisely how focus rings are to be drawn: user agents are expected to honor their platform's native conventions.*

The [scrollPathIntoView\(\)](#) method, when invoked, if the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [context bitmap mode](#)<sup>p609</sup> is [fixed](#)<sup>p609</sup>, must run the following steps; and otherwise, must add instructions to the [scratch bitmap](#)<sup>p617</sup>'s [list of pending interface actions](#)<sup>p617</sup> that run the following steps:

1. Let *the specified rectangle* be the rectangle of the bounding box of the intended path.
2. Let *notional child* be a hypothetical element that is a rendered child of the [canvas](#)<sup>p607</sup> element whose dimensions are those of *the specified rectangle*.
3. [Scroll notional child into view](#)<sup>p53</sup> with the *align to top* flag set.
4. Optionally, [inform the user](#)<sup>p649</sup> that the caret or selection (or both) cover *the specified rectangle* of the canvas. If the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [context bitmap mode](#)<sup>p609</sup> was [fixed](#)<sup>p609</sup> when the method was invoked, the user agent may wait until the next time the [event loop](#)<sup>p834</sup> reaches its *update the rendering* step to optionally inform the user.

"Inform the user", as used in this section, does not imply any persistent state change. It could mean, for instance, calling a system accessibility API to notify assistive technologies such as magnification tools so that the user's magnifier moves to the given area of the canvas. However, it does not associate the path with the element, or provide a region for tactile feedback, etc. To persistently associate a region with information provided to accessibility tools, use the [addHitRegion\(\)](#)<sup>p655</sup> API.

The [clip\(\)](#) method must create a new **clipping region** by calculating the intersection of the current clipping region and the area described by the intended path, using the [fill rule](#)<sup>p621</sup> indicated by the *fillRule* argument. Open subpaths must be implicitly closed when computing the clipping region, without affecting the actual subpaths. The new clipping region replaces the current clipping region.

When the context is initialised, the clipping region must be set to the largest infinite surface (i.e. by default, no clipping occurs).

The [resetClip\(\)](#) method must create a new [clipping region](#)<sup>p649</sup> that is the largest infinite surface. The new clipping region replaces the current clipping region.

The [isPointInPath\(\)](#) method must return true if the point given by the x and y coordinates passed to the method, when treated as coordinates in the canvas coordinate space unaffected by the current transformation, is inside the intended path as determined by the [fill rule](#)<sup>p621</sup> indicated by the *fillRule* argument; and must return false otherwise. Open subpaths must be implicitly closed when computing the area inside the path, without affecting the actual subpaths. Points on the path itself must be considered to be inside the path. If either of the arguments is infinite or NaN, then the method must return false.

The [isPointInStroke\(\)](#) method must return true if the point given by the x and y coordinates passed to the method, when treated as coordinates in the canvas coordinate space unaffected by the current transformation, is inside the path that results from [tracing](#)<sup>p624</sup> the intended path, using the [non-zero winding rule](#)<sup>p621</sup>, and using the [CanvasRenderingContext2D](#)<sup>p613</sup> object for the line styles; and must return false

otherwise. Points on the resulting path must be considered to be inside the path. If either of the arguments is infinite or NaN, then the method must return false.

### Example

This `canvas`<sup>p607</sup> element has a couple of checkboxes. The path-related commands are highlighted:

```
<canvas height=400 width=750>
<label><input type=checkbox id=showA> Show As</label>
<label><input type=checkbox id=showB> Show Bs</label>
<!-- ... -->
</canvas>
<script>
 function drawCheckbox(context, element, x, y, paint) {
 context.save();
 context.font = '10px sans-serif';
 context.textAlign = 'left';
 context.textBaseline = 'middle';
 var metrics = context.measureText(element.labels[0].textContent);
 if (paint) {
 context.beginPath();
 context.strokeStyle = 'black';
 context.rect(x-5, y-5, 10, 10);
 context.stroke();
 context.addHitRegion({ control: element });
 if (element.checked) {
 context.fillStyle = 'black';
 context.fill();
 }
 context.fillText(element.labels[0].textContent, x+5, y);
 }
 context.beginPath();
 context.rect(x-7, y-7, 12 + metrics.width+2, 14);
 context.drawFocusIfNeeded(element));
 context.restore();
 }
 function drawBase() { /* ... */ }
 function drawAs() { /* ... */ }
 function drawBs() { /* ... */ }
 function redraw() {
 var canvas = document.getElementsByTagName('canvas')[0];
 var context = canvas.getContext('2d');
 context.clearRect(0, 0, canvas.width, canvas.height);
 drawCheckbox(context, document.getElementById('showA'), 20, 40, true);
 drawCheckbox(context, document.getElementById('showB'), 20, 60, true);
 drawBase();
 if (document.getElementById('showA').checked)
 drawAs();
 if (document.getElementById('showB').checked)
 drawBs();
 }
 function processClick(event) {
 var canvas = document.getElementsByTagName('canvas')[0];
 var context = canvas.getContext('2d');
 var x = event.clientX;
 var y = event.clientY;
 var node = event.target;
 while (node) {
 x -= node.offsetLeft - node.scrollLeft;
 y -= node.offsetTop - node.scrollTop;
 node = node.offsetParent;
```

```

}
drawCheckbox(context, document.getElementById('showA'), 20, 40, false);
if (context.isPointInPath(x, y))
 document.getElementById('showA').checked = !(document.getElementById('showA').checked);
drawCheckbox(context, document.getElementById('showB'), 20, 60, false);
if (context.isPointInPath(x, y))
 document.getElementById('showB').checked = !(document.getElementById('showB').checked);
redraw();
}
document.getElementsByTagName('canvas')[0].addEventListener('focus', redraw, true);
document.getElementsByTagName('canvas')[0].addEventListener('blur', redraw, true);
document.getElementsByTagName('canvas')[0].addEventListener('change', redraw, true);
document.getElementsByTagName('canvas')[0].addEventListener('click', processClick, false);
redraw();
</script>

```

#### 4.12.4.2.14 Drawing images

To draw images, the `drawImage` method can be used.

This method can be invoked with three different sets of arguments:

- `drawImage(image, dx, dy)`
- `drawImage(image, dx, dy, dw, dh)`
- `drawImage(image, sx, sy, sw, sh, dx, dy, dw, dh)`

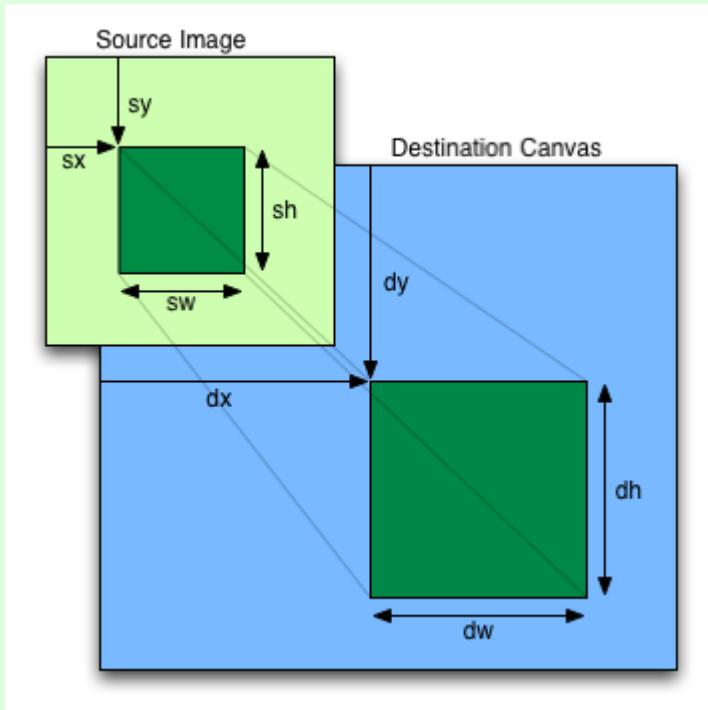

##### Note

`context.drawImagep651(image, dx, dy)`

`context.drawImagep651(image, dx, dy, dw, dh)`

`context.drawImagep651(image, sx, sy, sw, sh, dx, dy, dw, dh)`

Draws the given image onto the canvas. The arguments are interpreted as follows:

If the image isn't yet fully decoded, then nothing is drawn. If the image is a canvas with no data, throws an [InvalidStateError<sup>p50</sup>](#) exception.

When the [drawImage \(\)<sup>p651</sup>](#) method is invoked, the user agent must run the following steps:

1. [Check the usability of the \*image\* argument<sup>p640</sup>](#). If this returns *aborted*, then an exception has been thrown and the method doesn't return anything; abort these steps. If it returns *bad*, then abort these steps without drawing anything. Otherwise it returns *good*; continue with these steps.
2. Establish the source and destination rectangles as follows:

If not specified, the *dw* and *dh* arguments must default to the values of *sw* and *sh*, interpreted such that one CSS pixel in the image is treated as one unit in the [scratch bitmap<sup>p617</sup>](#)'s coordinate space. If the *sx*, *sy*, *sw*, and *sh* arguments are omitted, they must default to 0, 0, the image's intrinsic width in image pixels, and the image's intrinsic height in image pixels, respectively. If the image has no intrinsic dimensions, the *concrete object size* must be used instead, as determined using the CSS "[Concrete Object Size Resolution](#)" algorithm, with the *specified size* having neither a definite width nor height, nor any additional constraints, the object's intrinsic properties being those of the *image* argument, and the [default object size<sup>p53</sup>](#) being the size of the [scratch bitmap<sup>p617</sup>](#). [[CSS IMAGES](#)]<sup>p1149</sup>

The source rectangle is the rectangle whose corners are the four points (*sx*, *sy*), (*sx+sw*, *sy*), (*sx+sw*, *sy+sh*), (*sx*, *sy+sh*).

The destination rectangle is the rectangle whose corners are the four points (*dx*, *dy*), (*dx+dw*, *dy*), (*dx+dw*, *dy+dh*), (*dx*, *dy+dh*).

When the source rectangle is outside the source image, the source rectangle must be clipped to the source image and the destination rectangle must be clipped in the same proportion.

**Note** When the destination rectangle is outside the destination image (the [scratch bitmap<sup>p617</sup>](#)), the pixels that land outside the [scratch bitmap<sup>p617</sup>](#) are discarded, as if the destination was an infinite canvas whose rendering was clipped to the dimensions of the [scratch bitmap<sup>p617</sup>](#).

3. If one of the *sw* or *sh* arguments is zero, abort these steps. Nothing is painted.
4. Paint the region of the *image* argument specified by the source rectangle on the region of the rendering context's [scratch bitmap<sup>p617</sup>](#) specified by the destination rectangle, after applying the [current transformation matrix<sup>p638</sup>](#) to the destination rectangle.

The image data must be processed in the original direction, even if the dimensions given are negative.

When scaling up, if the [imageSmoothingEnabled<sup>p663</sup>](#) attribute is set to true, the user agent should attempt to apply a smoothing algorithm to the image data when it is scaled. Otherwise, the image must be rendered using nearest-neighbor interpolation.

**Note** This specification does not define the precise algorithm to use when scaling an image down, or when scaling an image up when the [imageSmoothingEnabled<sup>p663</sup>](#) attribute is set to true.

**Note** When a [canvas<sup>p607</sup>](#) or [CanvasRenderingContext2D<sup>p613</sup>](#) object is drawn onto itself, the [drawing model<sup>p665</sup>](#) requires the source to be copied before the image is drawn, so it is possible to copy parts of a [canvas<sup>p607</sup>](#) or [scratch bitmap<sup>p617</sup>](#) onto overlapping parts of itself.

If the original image data is a bitmap image, the value painted at a point in the destination rectangle is computed by filtering the original image data. The user agent may use any filtering algorithm (for example bilinear interpolation or nearest-neighbor). When the filtering algorithm requires a pixel value from outside the original image data, it must instead use the value from the nearest edge pixel. (That is, the filter uses 'clamp-to-edge' behaviour.) When the filtering algorithm requires a pixel value from outside the source rectangle but inside the original image data, then the value from the original image data must be used.

**Note** Thus, scaling an image in parts or in whole will have the same effect. This does mean that when sprites coming from a single sprite sheet are to be scaled, adjacent images in the sprite sheet can interfere. This can be avoided by ensuring each sprite in the sheet is surrounded by a border of transparent black, or by copying sprites to be scaled into temporary [canvas<sup>p607</sup>](#) elements and drawing the scaled sprites from there.

Images are painted without affecting the current path, and are subject to [shadow effects<sup>p663</sup>](#), [global alpha<sup>p663</sup>](#), the [clipping region<sup>p649</sup>](#), and [global composition operators<sup>p663</sup>](#).

5. If the *image* argument is not origin-clean<sup>p641</sup>, set the [scratch bitmap<sup>p617</sup>](#)'s [origin-clean<sup>p609</sup>](#) flag to false.

#### 4.12.4.2.15 Hit regions

A **hit region list** is a list of [hit regions<sup>p652</sup>](#) for a bitmap.

Each **hit region** consists of the following information:

- A **set of pixels** on the bitmap for which this region is responsible.
- A **bounding circumference** on the bitmap that surrounds the [hit region's set of pixels<sup>p653</sup>](#) as they stood when it was created.
- Optionally, a non-empty string representing an **ID** for distinguishing the region from others.
- Optionally, a reference to another region that acts as the **parent** for this one.
- A count of regions that have this one as their [parent<sup>p653</sup>](#), known as the **hit region's child count**.
- A **cursor specification**, in the form of either a CSS cursor value, or the string "inherit" meaning that the cursor of the [hit region's parent<sup>p653</sup>](#), if any, or of the [canvas<sup>p607</sup>](#) element, if not, is to be used instead.
- Optionally, either a [control<sup>p653</sup>](#), or an [unbacked region description<sup>p653</sup>](#).

A **control** is a reference to an [Element<sup>p51</sup>](#) node, to which, in certain conditions, the user agent will route events, and from which the user agent will determine the state of the hit region for the purposes of accessibility tools. (The control is ignored when it is not a descendant of the [canvas<sup>p607</sup>](#) element.)

An **unbacked region description** consists of the following:

- Optionally, a **label**.
- An **ARIA role**, which, if the [unbacked region description<sup>p653</sup>](#) also has a label, could be the empty string.

### Note

#### `context.addHitRegionp655(options)`

Adds a hit region to the bitmap. The argument is an object with the following members:

##### `path (default null)`

A [Path2D<sup>p616</sup>](#) object that describes the pixels that form part of the region. If this member is not provided or is set to null, the [current default path<sup>p647</sup>](#) is used instead.

##### `fillRule (default "nonzerop621)`

The [fill rule<sup>p621</sup>](#) to use when determining which pixels are inside the path.

##### `id (default empty string)`

The ID to use for this region. This is used in [MouseEvent<sup>p51</sup>](#) events on the [canvas<sup>p607</sup>](#) ([event.region<sup>p657</sup>](#)) and as a way to reference this region in later calls to [addHitRegion\(\)<sup>p655</sup>](#).

##### `parentID (default null)`

The ID of the parent region, for purposes of navigation by accessibility tools and for cursor fallback.

##### `cursor (default "inherit")`

The cursor to use when the mouse is over this region. The value "inherit" means to use the cursor for the parent region (as specified by the [parentID<sup>p653</sup>](#) member), if any, or to use the [canvas<sup>p607</sup>](#) element's cursor if the region has no parent.

##### `control (default null)`

An element (that is a descendant of the [canvas<sup>p607</sup>](#)) to which events are to be routed, and which accessibility tools are to use as a surrogate for describing and interacting with this region.

##### `label (default null)`

A text label for accessibility tools to use as a description of this region, if there is no control.

##### `role (default null)`

An ARIA role for accessibility tools to use to determine how to represent this region, if there is no control.

Hit regions can be used for a variety of purposes:

- With an ID, they can make hit detection easier by having the user agent check which region the mouse is over and include the ID in the mouse events.

- With a control, they can make routing events to DOM elements automatic, allowing e.g. clicks on a `canvas`<sup>b607</sup> to automatically submit a form via a `button`<sup>p495</sup> element.
- With a label, they can make it easier for users to explore a `canvas`<sup>b607</sup> without seeing it, e.g. by touch on a mobile device.
- With a cursor, they can make it easier for different regions of the `canvas`<sup>b607</sup> to have different cursors, with the user agent automatically switching between them.

#### `context.removeHitRegionb657(id)`

Removes a hit region (and all its descendants) from the canvas bitmap. The argument is the ID of a region added using `addHitRegion()`<sup>p655</sup>.

The pixels that were covered by this region and its descendants are effectively cleared by this operation, leaving the regions non-interactive. In particular, regions that occupied the same pixels before the removed regions were added, overlapping them, do not resume their previous role.

#### `context.clearHitRegionsb657()`

Removes all hit regions from the canvas bitmap.

A `hit region`<sup>p652</sup> A is an **ancestor region** of a `hit region`<sup>b652</sup> B if B has a `parent`<sup>p653</sup> and its `parent`<sup>p653</sup> is either A or another `hit region`<sup>p652</sup> for which A is an `ancestor region`<sup>p654</sup>.

The **region identified by the ID /ID** in a bitmap `bitmap` is the value returned by the following algorithm (which can return a `hit region`<sup>p652</sup> or nothing):

- If `/ID` is null, return nothing and abort these steps.
- Let `list` be the `hit region list`<sup>b652</sup> associated with `bitmap`.
- If there is a `hit region`<sup>p652</sup> in `list` whose `ID`<sup>p653</sup> is a `case-sensitive`<sup>p58</sup> match for `/ID`, then return that `hit region`<sup>p652</sup> and abort these steps.
- Otherwise, return nothing.

The **region representing the control control** for a bitmap `bitmap` is the value returned by the following algorithm (which can return a `hit region`<sup>p652</sup> or nothing):

- Let `list` be the `hit region list`<sup>b652</sup> associated with `bitmap`.
- If there is a `hit region`<sup>p652</sup> in `list` whose `control`<sup>p653</sup> is `control`, then return that `hit region`<sup>p652</sup> and abort these steps.
- Otherwise, return nothing.

The **control represented by a region region** for a `canvas`<sup>p607</sup> element `ancestor` is the value returned by the following algorithm (which can return an element or nothing):

- If `region` has no `control`<sup>p653</sup>, return nothing and abort these steps.
- Let `control` be `region's control`<sup>b653</sup>.
- If `control` is not a descendant of `ancestor`, then return nothing and abort these steps.
- If `control` is no longer a `supported interactive canvas fallback element`<sup>p655</sup>, then return nothing and abort these steps.
- Otherwise, return `control`.

The **cursor for a hit region region** of a `canvas`<sup>p607</sup> element `ancestor` is the value returned by the following algorithm:

- Loop:** If `region` has a `cursor specification`<sup>p653</sup> other than "inherit", then return that `hit region's cursor specification`<sup>p653</sup> and abort these steps.
- If `region` has a `parent`<sup>p653</sup>, then let `region` be that `hit region's parent`<sup>p653</sup>, and return to the step labeled `loop`.
- Otherwise, return the used value of the 'cursor' property for the `canvas`<sup>p607</sup> element, if any; if there isn't one, return 'auto'. [CSSUI]<sup>p1149</sup>

The region for a pixel *pixel* on a bitmap *bitmap* is the value returned by the following algorithm (which can return a [hit region<sup>p652</sup>](#) or nothing):

1. Let *list* be the [hit region list<sup>p652</sup>](#) associated with *bitmap*.
2. If there is a [hit region<sup>p652</sup>](#) in *list* whose [set of pixels<sup>p653</sup>](#) contains *pixel*, then return that [hit region<sup>p652</sup>](#) and abort these steps.
3. Otherwise, return nothing.

To clear regions that cover the pixels *pixels* on a bitmap *bitmap*, the user agent must run the following steps:

1. Let *list* be the [hit region list<sup>p652</sup>](#) associated with *bitmap*.
2. Remove all pixels in *pixels* from the [set of pixels<sup>p653</sup>](#) of each [hit region<sup>p652</sup>](#) in *list*.
3. [Garbage-collect the regions<sup>p655</sup>](#) of *bitmap*.

To garbage-collect the regions of a bitmap *bitmap*, the user agent must run the following steps:

1. Let *list* be the [hit region list<sup>p652</sup>](#) associated with *bitmap*.
2. Loop: Let *victim* be the first [hit region<sup>p652</sup>](#) in *list* to have an empty [set of pixels<sup>p653</sup>](#) and a zero [child count<sup>p653</sup>](#), if any. If there is no such [hit region<sup>p652</sup>](#), abort these steps.
3. If *victim* has a [parent<sup>p653</sup>](#), then decrement that [hit region's child count<sup>p653</sup>](#) by one.
4. Remove *victim* from *list*.
5. Jump back to the step labeled *loop*.

**Note** Adding a new region and calling [clearRect\(\)<sup>p644</sup>](#) are the two ways this clearing algorithm can be invoked. The [hit region list<sup>p652</sup>](#) itself is also reset when the rendering context is reset, e.g. when a [CanvasRenderingContext2D<sup>p613</sup>](#) object is bound to or unbound from a [canvas<sup>p607</sup>](#), or when the dimensions of the bitmap are changed.

An element is a **supported interactive canvas fallback element** if it is one of the following:

- an [a<sup>p208</sup>](#) element that [represents<sup>p111</sup>](#) a [hyperlink<sup>p245</sup>](#) and that does not have any [img<sup>p272</sup>](#) descendants
- a [button<sup>p495</sup>](#) element
- an [input<sup>p452</sup>](#) element whose [type<sup>p454</sup>](#) attribute is in one of the [Checkbox<sup>p475</sup>](#) or [Radio Button<sup>p475</sup>](#) states
- an [input<sup>p452</sup>](#) element that is a [button<sup>p447</sup>](#) but its [type<sup>p454</sup>](#) attribute is not in the [Image Button<sup>p479</sup>](#) state
- a [select<sup>p498</sup>](#) element with a [multiple<sup>p499</sup>](#) attribute or a [display size<sup>p499</sup>](#) greater than 1
- an [option<sup>p505</sup>](#) element that is in a [list of options<sup>p499</sup>](#) of a [select<sup>p498</sup>](#) element with a [multiple<sup>p499</sup>](#) attribute or a [display size<sup>p499</sup>](#) greater than 1
- a [sorting interface th element<sup>p423</sup>](#)
- an element that would not be [interactive content<sup>p116</sup>](#) except for having the [tabindex<sup>p729</sup>](#) attribute specified
- a non-[interactive<sup>p116</sup>](#) [table<sup>p398</sup>](#), [caption<sup>p405</sup>](#), [thead<sup>p409</sup>](#), [tbody<sup>p408</sup>](#), [tfoot<sup>p410</sup>](#), [tr<sup>p411</sup>](#), [td<sup>p412</sup>](#), or [th<sup>p414</sup>](#) element

When the [addHitRegion\(\)<sup>p653</sup>](#) method is invoked, the user agent must run the following steps:

1. Let *arguments* be the dictionary object provided as the method's argument.
2. If the *arguments* object's [path<sup>p653</sup>](#) member is not null, let *source path* be the [path<sup>p653</sup>](#) member's value. Otherwise, let it be the [CanvasRenderingContext2D<sup>p613</sup>](#) object's [current default path<sup>p647</sup>](#).
3. Transform all the coordinates and lines in *source path* by the current transform matrix, if the *arguments* object's [path<sup>p653</sup>](#) member is not null.
4. Let *specified pixels* be the pixels contained in *source path*, using the [fill rule<sup>p621</sup>](#) indicated by the [fillRule<sup>p653</sup>](#) member.
5. Remove from *specified pixels* any pixels not contained within the [clipping region<sup>p649</sup>](#).
6. If the *arguments* object's [id<sup>p653</sup>](#) member is the empty string, let it be null instead.
7. If the *arguments* object's [id<sup>p653</sup>](#) member is not null, then let *previous region for this ID* be [the region identified by the ID<sup>p654</sup>](#) given by the [id<sup>p653</sup>](#) member's value in this [scratch bitmap<sup>p617</sup>](#), if any. If the [id<sup>p653</sup>](#) member is null or no such region currently exists, let *previous region for this ID* be null.

8. If the *arguments* object's `parentID`<sup>p653</sup> member is the empty string, let it be null instead.
9. If the *arguments* object's `parentID`<sup>p653</sup> member is not null, then let *parent region* be [the region identified by the ID](#)<sup>p654</sup> given by the `parentID`<sup>p653</sup> member's value in the [scratch bitmap](#)<sup>p617</sup>, if any. If the `parentID`<sup>p653</sup> member is null or no such region currently exists, let *parent region* be null.
10. If the *arguments* object's `label`<sup>p653</sup> member is the empty string, let it be null instead.
11. If any of the following conditions are met, throw a [NotSupportedError](#)<sup>p50</sup> exception and abort these steps.
  - The *arguments* object's `control`<sup>p653</sup> and `label`<sup>p653</sup> members are both non-null.
  - The *arguments* object's `control`<sup>p653</sup> and `role`<sup>p653</sup> members are both non-null.
  - The *arguments* object's `role`<sup>p653</sup> member's value is the empty string, and the `label`<sup>p653</sup> member's value is either null or the empty string.
  - The *specified pixels* has no pixels.
  - The *arguments* object's `control`<sup>p653</sup> member is neither null nor a [supported interactive canvas fallback element](#)<sup>p655</sup>.
  - The *parent region* is not null but has a `control`<sup>p653</sup>.
  - The *previous region for this ID* is the same [hit region](#)<sup>p652</sup> as the *parent region*.
  - The *previous region for this ID* is an [ancestor region](#)<sup>p654</sup> of the *parent region*.
12. If the `parentID`<sup>p653</sup> member is not null but *parent region* is null, then throw a [NotFoundError](#)<sup>p50</sup> exception and abort these steps.
13. If any of the following conditions are met, throw a [SyntaxError](#)<sup>p50</sup> exception and abort these steps.
  - The *arguments* object's `cursor`<sup>p653</sup> member is not null but is neither an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "inherit", nor a valid CSS 'cursor' property value. [\[CSSUI\]](#)<sup>p1149</sup>
  - The *arguments* object's `role`<sup>p653</sup> member is not null but its value is not an [ordered set of unique space-separated tokens](#)<sup>p80</sup> whose tokens are all [case-sensitive](#)<sup>p58</sup> matches for names of non-abstract WAI-ARIA roles. [\[ARIA\]](#)<sup>p1148</sup>
14. Let *region* be a newly created [hit region](#)<sup>p652</sup>, with its information configured as follows:

#### Hit region's set of pixels<sup>p653</sup>

The *specified pixels*

#### Hit region's bounding circumference<sup>p653</sup>

A user-agent-defined shape that wraps the pixels contained in *source path*. (In the simplest case, this can just be the bounding rectangle; this specification allows it to be any shape in order to allow other interfaces.)

#### Hit region's ID<sup>p653</sup>

If the *arguments* object's `id`<sup>p653</sup> member is not null: the value of the `id`<sup>p653</sup> member. Otherwise, *region* has no `id`<sup>p653</sup>.

#### Hit region's parent<sup>p653</sup>

If *parent region* is not null: *parent region*. Otherwise, *region* has no `parent`<sup>p653</sup>.

#### Hit region's child count<sup>p653</sup>

Initially zero.

#### Hit region's cursor specification<sup>p653</sup>

If the *arguments* object's `cursor`<sup>p653</sup> member is not null: the value of the `cursor`<sup>p653</sup> member. Otherwise, the string "inherit".

#### Hit region's control<sup>p653</sup>

If the *arguments* object's `control`<sup>p653</sup> member is not null: the value of the `control`<sup>p653</sup> member. Otherwise, *region* has no `control`<sup>p653</sup>.

#### Hit region's label<sup>p653</sup>

If the *arguments* object's `label`<sup>p653</sup> member is not null: the value of the `label`<sup>p653</sup> member. Otherwise, *region* has no `label`<sup>p653</sup>.

#### Hit region's ARIA role<sup>p653</sup>

If the *arguments* object's `role`<sup>p653</sup> member is not null: the value of the `role`<sup>p653</sup> member (which might be the empty string). Otherwise, if the *arguments* object's `label`<sup>p653</sup> member is not null: the empty string. Otherwise, *region* has no `ariaRole`<sup>p653</sup>.

15. If the *arguments* object's `cursor`<sup>p653</sup> member is not null, then act as if a CSS rule for the [canvas](#)<sup>p607</sup> element setting its 'cursor' property had been seen, whose value was the [hit region's cursor specification](#)<sup>p653</sup>.

**Note** For example, if the user agent prefetches cursor values, this would cause that to happen in response to an appropriately-formed `addHitRegion()` call.

16. If there is a *previous region with this ID*, remove it, and all *hit regions* for which it is an *ancestor region*, from the *scratch bitmap*'s *hit region list*; then, if it had a *parent region*, decrement that *hit region's child count* by one.
17. If there is a *parent region*, increment its *hit region's child count* by one.
18. *Clear regions that cover the pixels* in *region's set of pixels* on this *scratch bitmap*.
19. Add *region* to the *scratch bitmap*'s element's *hit region list*.

When the `removeHitRegion()` method is invoked, the user agent must run the following steps:

1. Let *region* be *the region identified by the ID* given by the method's argument in the rendering context's *scratch bitmap*. If no such region currently exists, abort these steps.

**Note** If the method's argument is the empty string, then no region will match.

2. Remove *region*, and all *hit regions* for which it is an *ancestor region*, from the rendering context's *scratch bitmap*'s *hit region list*; then, if it had a *parent region*, decrement that *hit region's child count* by one.
3. *Garbage-collect the regions* of the rendering context's *scratch bitmap*.

When the `clearHitRegions()` method is invoked, the user agent must remove all the *hit regions* from the rendering context's *scratch bitmap*'s *hit region list*.

The `MouseEvent` interface is extended to support hit regions:

**IDL**

```
partial interface MouseEvent {
 readonly attribute DOMString? region;
};

partial dictionary MouseEventInit {
 DOMString? region;
};
```

**Note** `event.region`

If the mouse was over a *hit region*, then this returns the *hit region's ID*, if it has one.

Otherwise, returns null.

The `region` attribute on `MouseEvent` objects must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the *hit region's ID* if the mouse was over a hit region when the event was fired.

When a `MouseEvent` is to be fired at a `canvas` element by the user agent in response to a pointing device action other than a click (e.g. a `mousedown` event or a `mousemove` event), the user agent must run the `canvas MouseEvent rerouting steps` immediately prior to dispatching the event. This does not affect default actions (so for instance, if the event gets rerouted to an element that has a default action for `mousemove` events, this default action doesn't trigger).

**Note** Actual clicks are handled by the `run authentic click activation steps`, which also invoke these steps.

The `canvas MouseEvent rerouting steps` are as follows. If these steps say to *act as normal*, that means that the event must be fired as it would have had these requirements not been applied.

1. If the pointing device is not indicating a pixel on the `canvas`, then act as normal and abort these steps.
2. If the `canvas` element has no *hit region list*, then act as normal and abort these steps.
3. Let *pixel* be the pixel indicated by the pointing device.

4. Let *region* be the [hit region](#)<sup>p652</sup> that is [the region for the pixel](#)<sup>p655</sup> *pixel* on this [canvas](#)<sup>p607</sup> element's bitmap, if any.
5. If there is no *region*, then act as normal and abort these steps.
6. Let *id* be the *region*'s [ID](#)<sup>p653</sup>, if any.
7. If there is an *id*, then initialise the event object's [region](#)<sup>p657</sup> attribute to *id*.
8. Let *control* be the [control represented by](#)<sup>p654</sup> *region* for this [canvas](#)<sup>p607</sup> element, if any.
9. If there is a *control*, then target the event object at *control* instead of the [canvas](#)<sup>p607</sup> element.
10. Continue dispatching the event, but with the updated event object and target as given in the above steps.

The [Touch](#)<sup>p52</sup> interface is extended to support hit regions also: [\[TOUCH\]](#)<sup>p1153</sup>

IDL

```
partial interface Touch {
 readonly attribute DOMString? region;
};
```

Note

[touch.region](#)<sup>p658</sup>

If the [touch point](#)<sup>p52</sup> was over a [hit region](#)<sup>p652</sup> when it was first placed on the surface, then this returns the [hit region's ID](#)<sup>p653</sup>, if it has one. Otherwise, returns null.

The [region](#) attribute on a [Touch](#)<sup>p52</sup> object representing a [touch point](#)<sup>p52</sup> *T* must return the value obtained by running the following algorithm when *T* was first placed on the surface: [\[TOUCH\]](#)<sup>p1153</sup>

1. If the [touch point](#)<sup>p52</sup> is not on a pixel on the [canvas](#)<sup>p607</sup>, then return null and abort these steps.
2. If the [canvas](#)<sup>p607</sup> element has no [hit region list](#)<sup>p652</sup>, then return null and abort these steps.
3. Let *pixel* be the pixel that the [touch point](#)<sup>p52</sup> is on.
4. Let *region* be the [hit region](#)<sup>p652</sup> that is [the region for the pixel](#)<sup>p655</sup> *pixel* on this [canvas](#)<sup>p607</sup> element's bitmap, if any.
5. If there is no *region*, then return null and abort these steps.
6. Let *id* be the *region*'s [ID](#)<sup>p653</sup>, if any, or else null.
7. Return *id*.

When a user's pointing device cursor is positioned over a [canvas](#)<sup>p607</sup> element, user agents should render the pointing device cursor according to the cursor specification described by [the cursor for the hit region](#)<sup>p654</sup> that is [the region for the pixel](#)<sup>p655</sup> that the pointing device designates on the [canvas](#)<sup>p607</sup> element's bitmap.

User agents are encouraged to make use of the information present in a [canvas](#)<sup>p607</sup> element's [hit region list](#)<sup>p652</sup> to improve the accessibility of [canvas](#)<sup>p607</sup> elements.

Each [hit region](#)<sup>p652</sup> should be handled in a fashion equivalent to a node in a virtual DOM tree rooted at the [canvas](#)<sup>p607</sup> element. The hierarchy of this virtual DOM tree must match the hierarchy of the [hit regions](#)<sup>p652</sup>, as described by the [parent](#)<sup>p653</sup> of each region. Regions without a [parent](#)<sup>p653</sup> must be treated as children of the [canvas](#)<sup>p607</sup> element for the purpose of this virtual DOM tree. For each node in such a DOM tree, the [hit region's bounding circumference](#)<sup>p653</sup> gives the region of the screen to use when representing the node (if appropriate).

The semantics of a [hit region](#)<sup>p652</sup> for the purposes of this virtual DOM tree are those of the [the control represented by the region](#)<sup>p654</sup>, if it has one, or else of a non-interactive element whose ARIA role, if any, is that given by the [hit region's ARIA role](#)<sup>p653</sup>, and whose textual representation, if any, is given by the [hit region's label](#)<sup>p653</sup>.

For the purposes of accessibility tools, when an element C is a descendant of a `canvas`<sup>p607</sup> element and there is [a region representing the control](#)<sup>p654</sup> C for that `canvas`<sup>p607</sup> element's bitmap, then the element's position relative to the document should be presented as if it was that region in the `canvas`<sup>p607</sup> element's virtual DOM tree.

The semantics of a [hit region](#)<sup>p652</sup> for the purposes of this virtual DOM tree are those of the [the control represented by the region](#)<sup>p654</sup>, if it has one, or else of a non-interactive element whose ARIA role, if any, is that given by the [hit region's ARIA role](#)<sup>p653</sup>, and whose textual representation, if any, is given by the [hit region's label](#)<sup>p653</sup>.

**Note** *Thus, for instance, a user agent on a touch-screen device could provide haptic feedback when the user crosses over a [hit region's bounding circumference](#)<sup>p653</sup>, and then read the [hit region's label](#)<sup>p653</sup> to the user. Similarly, a desktop user agent with a virtual accessibility focus separate from the keyboard input focus could allow the user to navigate through the hit regions, using the virtual DOM tree described above to enable hierarchical navigation. When an interactive control inside the `canvas`<sup>p607</sup> element [gains focus](#)<sup>p728</sup>, if the control has a corresponding region, then that [hit region's bounding circumference](#)<sup>p653</sup> could be used to determine what area of the display to magnify.*

#### 4.12.4.2.16 Pixel manipulation

Spec bugs: [28040](#), [28064](#)

Note

`imagedata = new ImageDatap660(sw, sh)`

`imagedata = context.createImageDatap660(sw, sh)`

Returns an `ImageData`<sup>p616</sup> object with the given dimensions. All the pixels in the returned object are transparent black.

Throws an `IndexSizeError`<sup>p50</sup> exception if either of the width or height arguments are zero.

`imagedata = context.createImageDatap660(imagedata)`

Returns an `ImageData`<sup>p616</sup> object with the same dimensions as the argument. All the pixels in the returned object are transparent black.

`imagedata = new ImageDatap660(data, sw [, sh ] )`

Returns an `ImageData`<sup>p616</sup> object using the data provided in the `Uint8ClampedArray`<sup>p50</sup> argument, interpreted using the given dimensions.

As each pixel in the data is represented by four numbers, the length of the data needs to be a multiple of four times the given width. If the height is provided as well, then the length needs to be exactly the width times the height times 4.

Throws an `IndexSizeError`<sup>p50</sup> exception if the given data and dimensions can't be interpreted consistently, or if either dimension is zero.

`imagedata = context.getImageDatap660(sx, sy, sw, sh)`

Returns an `ImageData`<sup>p616</sup> object containing the image data for the given rectangle of the bitmap.

Throws an `IndexSizeError`<sup>p50</sup> exception if the either of the width or height arguments are zero.

`imagedata.widthp660`

`imagedata.heightp660`

Returns the actual dimensions of the data in the `ImageData`<sup>p616</sup> object, in pixels.

`imagedata.datap660`

Returns the one-dimensional array containing the data in RGBA order, as integers in the range 0 to 255.

`context.putImageDatap660(imagedata, dx, dy [, dirtyX, dirtyY, dirtyWidth, dirtyHeight ] )`

Paints the data from the given `ImageData`<sup>p616</sup> object onto the bitmap. If a dirty rectangle is provided, only the pixels from that rectangle are painted.

The `globalAlpha`<sup>p663</sup> and `globalCompositeOperation`<sup>p663</sup> attributes, as well as the shadow attributes, are ignored for the purposes of this method call; pixels in the canvas are replaced wholesale, with no composition, alpha blending, no shadows, etc.

Throws a `NotSupportedError`<sup>p50</sup> exception if any of the arguments are not finite.

Throws an `InvalidStateError`<sup>p50</sup> exception if the `imagedata` object's data has been [neutered](#)<sup>p98</sup>.

⋮

The `ImageData()` constructors and the `createImageData()` methods are used to instantiate new `ImageData`<sup>p616</sup> objects.

When the `ImageData()`<sup>p660</sup> constructor is invoked with two numeric arguments `sw` and `sh`, it must return a new `ImageData`<sup>p616</sup> object representing a transparent black rectangle with a width equal to `sw` and a height equal to `sh`, if both `sw` and `sh` are non-zero. If one or both of `sw` and `sh` are zero, then the constructor must throw an `IndexSizeError`<sup>p50</sup> exception instead.

When the `ImageData()`<sup>p660</sup> constructor is invoked with its first argument being an `Uint8ClampedArray`<sup>p50</sup> source and its second and (optionally) third argument(s) being numeric arguments `sw` and `sh`, it must run the following steps:

1. Let `length` be the number of bytes in `source`.
2. If `length` is not a non-zero integral multiple of four, throw an `InvalidStateError`<sup>p50</sup> exception and abort these steps.
3. Let `length` be `length` divided by four.
4. If `length` is not an integral multiple of `sw`, throw an `IndexSizeError`<sup>p50</sup> exception and abort these steps.
5. Let `height` be `length` divided by `sw`.
6. If the `sh` argument was not omitted, and its value is not equal to `height`, then throw an `IndexSizeError`<sup>p50</sup> exception and abort these steps.
7. Return a new `ImageData`<sup>p616</sup> object whose width is `sw`, whose height is `height`, and whose data is `source`.

**Note** *At this step, the `length` is guaranteed to be greater than zero (otherwise the second step above would have aborted the steps), so if `sw` is zero, this step will throw the exception and abort these steps.*

**Note** *The resulting object's data is not a copy of source, it's the actual `Uint8ClampedArray`<sup>p50</sup> object passed as the first argument to the constructor.*

When the `createImageData()`<sup>p660</sup> method is invoked with two numeric arguments `sw` and `sh`, it must return a new `ImageData`<sup>p616</sup> object representing a transparent black rectangle with a width equal to the absolute magnitude of `sw` and a height equal to the absolute magnitude of `sh`, if both `sw` and `sh` are non-zero. If one or both of `sw` and `sh` are zero, then the constructor must throw an `IndexSizeError`<sup>p50</sup> exception instead.

When the `createImageData()`<sup>p660</sup> method is invoked with a single `imagedata` argument, it must return a new `ImageData`<sup>p616</sup> object representing a transparent black rectangle with the same dimensions as the `ImageData`<sup>p616</sup> object passed as the argument.

The `getImageData(sx, sy, sw, sh)` method must, if either the `sw` or `sh` arguments are zero, throw an `IndexSizeError`<sup>p50</sup> exception; otherwise, if the `scratch bitmap`<sup>p617</sup>'s `origin-clean`<sup>p609</sup> flag is set to false, it must throw a `SecurityError`<sup>p50</sup> exception; otherwise, it must return an `ImageData`<sup>p616</sup> object with width `sw` and height `sh` representing the `scratch bitmap`<sup>p617</sup> for the area of that bitmap denoted by the rectangle whose corners are the four points  $(sx, sy)$ ,  $(sx+sw, sy)$ ,  $(sx+sw, sy+sh)$ ,  $(sx, sy+sh)$ , in the bitmap's coordinate space units. Pixels outside the `scratch bitmap`<sup>p617</sup> must be returned as transparent black. Pixels must be returned as non-premultiplied alpha values.

New `ImageData`<sup>p616</sup> objects must be initialised so that their `width` attribute is set to the number of pixels per row in the image data, their `height` attribute is set to the number of rows in the image data, and their `data` attribute, except where an existing array is provided, is initialised to a new `Uint8ClampedArray`<sup>p50</sup> object. The `Uint8ClampedArray`<sup>p50</sup> object must use a new `Canvas Pixel ArrayBuffer`<sup>p660</sup> for its storage, and must have a zero start offset and a length equal to the length of its storage, in bytes. The `Canvas Pixel ArrayBuffer`<sup>p660</sup> must contain the image data. At least one pixel's worth of image data must be returned. [ECMA262]<sup>p1150</sup>

A `Canvas Pixel ArrayBuffer` is an `ArrayBuffer`<sup>p50</sup> whose data is represented in left-to-right order, row by row top to bottom, starting with the top left, with each pixel's red, green, blue, and alpha components being given in that order for each pixel. Each component of each pixel represented in this array must be in the range 0..255, representing the 8 bit value for that component. The components must be assigned consecutive indices starting with 0 for the top left pixel's red component. [ECMA262]<sup>p1150</sup>

The `putImageData()` method writes data from `ImageData`<sup>p616</sup> structures back to the rendering context's `scratch bitmap`<sup>p617</sup>. Its arguments are: `imagedata`, `dx`, `dy`, `dirtyX`, `dirtyY`, `dirtyWidth`, and `dirtyHeight`.

When the last four arguments to this method are omitted, they must be assumed to have the values 0, 0, the `width`<sup>p660</sup> member of the `imagedata` structure, and the `height`<sup>p660</sup> member of the `imagedata` structure, respectively.

When invoked, the method must act as follows:

1. If the *imagedata* argument's `data`<sup>p660</sup> attribute has been `neutered`<sup>p98</sup>, throw an `InvalidStateError`<sup>p50</sup> exception and abort these steps.
2. If *dirtyWidth* is negative, let *dirtyX* be *dirtyX+dirtyWidth*, and let *dirtyWidth* be equal to the absolute magnitude of *dirtyWidth*.  
If *dirtyHeight* is negative, let *dirtyY* be *dirtyY+dirtyHeight*, and let *dirtyHeight* be equal to the absolute magnitude of *dirtyHeight*.
3. If *dirtyX* is negative, let *dirtyWidth* be *dirtyWidth+dirtyX*, and let *dirtyX* be zero.  
If *dirtyY* is negative, let *dirtyHeight* be *dirtyHeight+dirtyY*, and let *dirtyY* be zero.
4. If *dirtyX+dirtyWidth* is greater than the `width`<sup>p660</sup> attribute of the *imagedata* argument, let *dirtyWidth* be the value of that `width`<sup>p660</sup> attribute, minus the value of *dirtyX*.  
If *dirtyY+dirtyHeight* is greater than the `height`<sup>p660</sup> attribute of the *imagedata* argument, let *dirtyHeight* be the value of that `height`<sup>p660</sup> attribute, minus the value of *dirtyY*.
5. If, after those changes, either *dirtyWidth* or *dirtyHeight* is negative or zero, stop these steps without affecting any bitmaps.
6. For all integer values of *x* and *y* where  $\text{dirtyX} \leq x < \text{dirtyX}+\text{dirtyWidth}$  and  $\text{dirtyY} \leq y < \text{dirtyY}+\text{dirtyHeight}$ , copy the four channels of the pixel with coordinate (*x*, *y*) in the *imagedata* data structure's `Canvas Pixel ArrayBuffer`<sup>p660</sup> to the pixel with coordinate (*dx+x*, *dy+y*) in the rendering context's `scratch bitmap`<sup>p617</sup>.

The handling of pixel rounding when the specified coordinates are not integers is not defined by this specification, except that the following must result in no visible changes to the rendering:

```
context.putImageData(context.getImageData(x, y, w, h), p, q);
```

...for any value of *x*, *y*, *w*, and *h* and where *p* is the smaller of *x* and the sum of *x* and *w*, and *q* is the smaller of *y* and the sum of *y* and *h*; and except that the following two calls:

```
context.createImageData(w, h);
context.getImageData(0, 0, w, h);
```

...must return `ImageData`<sup>p616</sup> objects with the same dimensions as each other, for any value of *w* and *h*. In other words, while user agents may round the arguments of these methods, any rounding performed must be performed consistently for all of the methods described in this section. (The constructors only work with integer values.)

**Note** Due to the lossy nature of converting to and from premultiplied alpha colour values, pixels that have just been set using `putImageData()`<sup>p660</sup> might be returned to an equivalent `getImageData()`<sup>p660</sup> as different values.

The current path, `transformation matrix`<sup>p638</sup>, `shadow attributes`<sup>p663</sup>, `global alpha`<sup>p663</sup>, the `clipping region`<sup>p649</sup>, and `global composition operator`<sup>p663</sup> must not affect the methods described in this section.

### Example

In the following example, the script generates an `ImageData`<sup>p616</sup> object so that it can draw onto it.

```
// canvas is a reference to a <canvas> element
var context = canvas.getContext('2d');

// create a blank slate
var data = context.createImageData(canvas.width, canvas.height);

// create some plasma
FillPlasma(data, 'green'); // green plasma

// add a cloud to the plasma
AddCloud(data, data.width/2, data.height/2); // put a cloud in the middle

// paint the plasma+cloud on the canvas
context.putImageData(data, 0, 0);

// support methods
```

```
function FillPlasma(data, color) { ... }
function AddCloud(data, x, y) { ... }
```

### Example

Here is an example of using [getImageData\(\)](#) and [putImageData\(\)](#) to implement an edge detection filter.

```
<!DOCTYPE HTML>
<html>
<head>
<title>Edge detection demo</title>
<script>
var image = new Image();
function init() {
 image.onload = demo;
 image.src = "image.jpeg";
}
function demo() {
 var canvas = document.getElementsByTagName('canvas')[0];
 var context = canvas.getContext('2d');

 // draw the image onto the canvas
 context.drawImage(image, 0, 0);

 // get the image data to manipulate
 var input = context.getImageData(0, 0, canvas.width, canvas.height);

 // get an empty slate to put the data into
 var output = context.createImageData(canvas.width, canvas.height);

 // alias some variables for convenience
 // notice that we are using input.width and input.height here
 // as they might not be the same as canvas.width and canvas.height
 // (in particular, they might be different on high-res displays)
 var w = input.width, h = input.height;
 var inputData = input.data;
 var outputData = output.data;

 // edge detection
 for (var y = 1; y < h-1; y += 1) {
 for (var x = 1; x < w-1; x += 1) {
 for (var c = 0; c < 3; c += 1) {
 var i = (y*w + x)*4 + c;
 outputData[i] = 127 + -inputData[i - w*4 - 4] - inputData[i - w*4] - inputData[i - w*4 + 4] +
 -inputData[i - 4] + 8*inputData[i] - inputData[i + 4] +
 -inputData[i + w*4 - 4] - inputData[i + w*4] - inputData[i + w*4 + 4];
 }
 outputData[(y*w + x)*4 + 3] = 255; // alpha
 }
 }

 // put the image data back after manipulation
 context.putImageData(output, 0, 0);
}
</script>
</head>
<body onload="init()">
<canvas></canvas>
```

```
</body>
</html>
```

#### 4.12.4.2.17 Compositing

##### Note

`context.globalAlphap663 [= value]`

Returns the current alpha value applied to rendering operations.

Can be set, to change the alpha value. Values outside of the range 0.0 .. 1.0 are ignored.

`context.globalCompositeOperationp663 [= value]`

Returns the current composition operation, from the values defined in the Compositing and Blending specification. [\[COMPOSITE\]<sup>p1148</sup>](#).

Can be set, to change the composition operation. Unknown values are ignored.

All drawing operations are affected by the global compositing attributes, [globalAlpha<sup>p663</sup>](#) and [globalCompositeOperation<sup>p663</sup>](#).

The [globalAlpha](#) attribute gives an alpha value that is applied to shapes and images before they are composited onto the [scratch bitmap<sup>p617</sup>](#). The value must be in the range from 0.0 (fully transparent) to 1.0 (no additional transparency). If an attempt is made to set the attribute to a value outside this range, including Infinity and Not-a-Number (NaN) values, the attribute must retain its previous value. When the context is created, the [globalAlpha<sup>p663</sup>](#) attribute must initially have the value 1.0.

The [globalCompositeOperation](#) attribute sets the **current composition operator**, which controls how shapes and images are drawn onto the [scratch bitmap<sup>p617</sup>](#), once they have had [globalAlpha<sup>p663</sup>](#) and the current transformation matrix applied. The possible values are those defined in the Compositing and Blending specification, and include the values [source-over](#) and [copy](#). [\[COMPOSITE\]<sup>p1148</sup>](#) Spec bugs: [27313](#)

These values are all case-sensitive — they must be used exactly as defined. User agents must not recognise values that are not a [case-sensitive<sup>p58</sup>](#) match for one of the values given in the Compositing and Blending specification. [\[COMPOSITE\]<sup>p1148</sup>](#)

On setting, if the user agent does not recognise the specified value, it must be ignored, leaving the value of [globalCompositeOperation<sup>p663</sup>](#) unaffected. Otherwise, the attribute must be set to the given new value.

When the context is created, the [globalCompositeOperation<sup>p663</sup>](#) attribute must initially have the value [source-over<sup>p663</sup>](#).

#### 4.12.4.2.18 Image smoothing

##### Note

`context.imageSmoothingEnabledp663 [= value]`

Returns whether pattern fills and the [drawImage\(\)<sup>p651</sup>](#) method will attempt to smooth images if their pixels don't line up exactly with the display, when scaling images up.

Can be set, to change whether images are smoothed (true) or not (false).

The [imageSmoothingEnabled](#) attribute, on getting, must return the last value it was set to. On setting, it must be set to the new value. When the [CanvasRenderingContext2D<sup>p613</sup>](#) object is created, the attribute must be set to true.

#### 4.12.4.2.19 Shadows

All drawing operations are affected by the four global shadow attributes.

##### Note

`context.shadowColorp664 [= value]`

Returns the current shadow colour.

Can be set, to change the shadow colour. Values that cannot be parsed as CSS colours are ignored.

`context.shadowOffsetXp664 [= value]`

`context.shadowOffsetYp664 [= value]`

Returns the current shadow offset.

Can be set, to change the shadow offset. Values that are not finite numbers are ignored.

`context.shadowBlurp664 [= value]`

Returns the current level of blur applied to shadows.

Can be set, to change the blur level. Values that are not finite numbers greater than or equal to zero are ignored.

The `shadowColor` attribute sets the colour of the shadow.

When the context is created, the `shadowColorp664` attribute initially must be fully-transparent black.

On getting, the [serialisation of the colour<sup>p641</sup>](#) must be returned.

On setting, the new value must be [parsed as a CSS <color> value<sup>p53</sup>](#) and the colour assigned. If the value cannot be parsed as a CSS <color> value then it must be ignored, and the attribute must retain its previous value. [\[CSSCOLOR\]<sup>p1149</sup>](#)

The `shadowOffsetX` and `shadowOffsetY` attributes specify the distance that the shadow will be offset in the positive horizontal and positive vertical distance respectively. Their values are in coordinate space units. They are not affected by the current transformation matrix.

When the context is created, the shadow offset attributes must initially have the value 0.

On getting, they must return their current value. On setting, the attribute being set must be set to the new value, except if the value is infinite or NaN, in which case the new value must be ignored.

The `shadowBlur` attribute specifies the level of the blurring effect. (The units do not map to coordinate space units, and are not affected by the current transformation matrix.)

When the context is created, the `shadowBlurp664` attribute must initially have the value 0.

On getting, the attribute must return its current value. On setting the attribute must be set to the new value, except if the value is negative, infinite or NaN, in which case the new value must be ignored.

**Shadows are only drawn if** the opacity component of the alpha component of the colour of `shadowColorp664` is non-zero and either the `shadowBlurp664` is non-zero, or the `shadowOffsetXp664` is non-zero, or the `shadowOffsetYp664` is non-zero.

[When shadows are drawn<sup>p664</sup>](#), they must be rendered as follows:

1. Let  $A$  be an infinite transparent black bitmap on which the source image for which a shadow is being created has been rendered.
2. Let  $B$  be an infinite transparent black bitmap, with a coordinate space and an origin identical to  $A$ .
3. Copy the alpha channel of  $A$  to  $B$ , offset by `shadowOffsetXp664` in the positive  $x$  direction, and `shadowOffsetYp664` in the positive  $y$  direction.
4. If `shadowBlurp664` is greater than 0:
  1. Let  $\sigma$  be half the value of `shadowBlurp664`.
  2. Perform a 2D Gaussian Blur on  $B$ , using  $\sigma$  as the standard deviation.

User agents may limit values of  $\sigma$  to an implementation-specific maximum value to avoid exceeding hardware limitations during the Gaussian blur operation.

5. Set the red, green, and blue components of every pixel in  $B$  to the red, green, and blue components (respectively) of the colour of [shadowColor<sup>p664</sup>](#).
6. Multiply the alpha component of every pixel in  $B$  by the alpha component of the colour of [shadowColor<sup>p664</sup>](#).
7. The shadow is in the bitmap  $B$ , and is rendered as part of the [drawing model<sup>p665</sup>](#) described below.

If the current composition operation is [copy<sup>p663</sup>](#), shadows effectively won't render (since the shape will overwrite the shadow).

#### **4.12.4.2.20 Drawing model**

When a shape or image is painted, user agents must follow these steps, in the order given (or act as if they do):

1. Render the shape or image onto an infinite transparent black bitmap, creating image  $A$ , as described in the previous sections. For shapes, the current fill, stroke, and line styles must be honored, and the stroke must itself also be subjected to the current transformation matrix.
2. [When shadows are drawn<sup>p664</sup>](#), render the shadow from image  $A$ , using the current shadow styles, creating image  $B$ .
3. [When shadows are drawn<sup>p664</sup>](#), multiply the alpha component of every pixel in  $B$  by [globalAlpha<sup>p663</sup>](#).
4. [When shadows are drawn<sup>p664</sup>](#), composite  $B$  within the [clipping region<sup>p649</sup>](#) over the current [scratch bitmap<sup>p617</sup>](#) using the [current composition operator<sup>p663</sup>](#).
5. Multiply the alpha component of every pixel in  $A$  by [globalAlpha<sup>p663</sup>](#).
6. Composite  $A$  within the [clipping region<sup>p649</sup>](#) over the current [scratch bitmap<sup>p617</sup>](#) using the [current composition operator<sup>p663</sup>](#).

When compositing onto the [scratch bitmap<sup>p617</sup>](#), pixels that would fall outside of the [scratch bitmap<sup>p617</sup>](#) must be discarded.

#### **4.12.4.2.21 Best practices**

When a canvas is interactive, authors should include focusable elements in the element's fallback content corresponding to each focusable part of the canvas, as in the [example above<sup>p650</sup>](#).

To expose text and interactive content on a [canvas<sup>p607</sup>](#) to users of accessibility tools, authors should use the [addHitRegion\(\)<sup>p655</sup>](#) API. When rendering focus rings, to ensure that focus rings have the appearance of native focus rings, authors should use the [drawFocusIfNeeded\(\)<sup>p648</sup>](#) method, passing it the element for which a ring is being drawn. This method only draws the focus ring if the element is [focused<sup>p728</sup>](#), so that it can simply be called whenever drawing the element, without checking whether the element is focused or not first.

In addition to drawing focus rings, authors should use the [scrollPathIntoView\(\)<sup>p649</sup>](#) method when an element in the canvas is focused, to make sure it is visible on the screen (if applicable).

Authors should avoid implementing text editing controls using the [canvas<sup>p607</sup>](#) element. Doing so has a large number of disadvantages:

- Mouse placement of the caret has to be reimplemented.
- Keyboard movement of the caret has to be reimplemented (possibly across lines, for multiline text input).
- Scrolling of the text field has to be implemented (horizontally for long lines, vertically for multiline input).
- Native features such as copy-and-paste have to be reimplemented.
- Native features such as spell-checking have to be reimplemented.
- Native features such as drag-and-drop have to be reimplemented.
- Native features such as page-wide text search have to be reimplemented.
- Native features specific to the user, for example custom text services, have to be reimplemented. This is close to impossible since each user might have different services installed, and there is an unbounded set of possible such services.

- Bidirectional text editing has to be reimplemented.
- For multiline text editing, line wrapping has to be implemented for all relevant languages.
- Text selection has to be reimplemented.
- Dragging of bidirectional text selections has to be reimplemented.
- Platform-native keyboard shortcuts have to be reimplemented.
- Platform-native input method editors (IMEs) have to be reimplemented.
- Undo and redo functionality has to be reimplemented.
- Accessibility features such as magnification following the caret or selection have to be reimplemented.

This is a huge amount of work, and authors are most strongly encouraged to avoid doing any of it by instead using the [input<sup>p452</sup>](#) element, the [textarea<sup>p508</sup>](#) element, or the [contenteditable<sup>p739</sup>](#) attribute.

#### 4.12.4.2.22 Examples

*This section is non-normative.*

##### Example

Here is an example of a script that uses canvas to draw [pretty glowing lines](#).

```
<canvas width="800" height="450"></canvas>
<script>

var context = document.getElementsByTagName('canvas')[0].getContext('2d');

var lastX = context.canvas.width * Math.random();
var lastY = context.canvas.height * Math.random();
var hue = 0;
function line() {
 context.save();
 context.translate(context.canvas.width/2, context.canvas.height/2);
 context.scale(0.9, 0.9);
 context.translate(-context.canvas.width/2, -context.canvas.height/2);
 context.beginPath();
 context.lineWidth = 5 + Math.random() * 10;
 context.moveTo(lastX, lastY);
 lastX = context.canvas.width * Math.random();
 lastY = context.canvas.height * Math.random();
 context.bezierCurveTo(context.canvas.width * Math.random(),
 context.canvas.height * Math.random(),
 context.canvas.width * Math.random(),
 context.canvas.height * Math.random(),
 lastX, lastY);

 hue = hue + 10 * Math.random();
 context.strokeStyle = 'hsl(' + hue + ', 50%, 50%)';
 context.shadowColor = 'white';
 context.shadowBlur = 10;
 context.stroke();
 context.restore();
}
setInterval(line, 50);

function blank() {
 context.fillStyle = 'rgba(0,0,0,0.1)';
 context.fillRect(0, 0, context.canvas.width, context.canvas.height);
}
```

```

 }
 setInterval(blank, 40);

</script>

```

### Example

The 2D rendering context for [canvas](#)<sup>p607</sup> is often used for sprite-based games. The following example demonstrates this:

Blue Robot Player Sprite by [JohnColburn](#). Licensed under the terms of the Creative Commons Attribution Share-Alike 3.0 Unported license. This work is itself licensed under a [Creative Commons Attribution-ShareAlike 3.0 Unported License](#).

[Walk](#) [Stop](#)

Here is the source for this example:

```

<!DOCTYPE HTML>
<title>Blue Robot Demo</title>
<base href="https://www.whatwg.org/demos/canvas/blue-robot/">
<style>
 html { overflow: hidden; min-height: 200px; min-width: 380px; }
 body { height: 200px; position: relative; margin: 8px; }
 .buttons { position: absolute; bottom: 0px; left: 0px; margin: 4px; }
</style>
<canvas width="380" height="200"></canvas>
<script>
var Landscape = function (context, width, height) {
 this.offset = 0;
 this.width = width;
 this.advance = function (dx) {
 this.offset += dx;
 };
 this.horizon = height * 0.7;
 // This creates the sky gradient (from a darker blue to white at the bottom)
 this.sky = context.createLinearGradient(0, 0, 0, this.horizon);
 this.sky.addColorStop(0.0, 'rgb(55,121,179)');
 this.sky.addColorStop(0.7, 'rgb(121,194,245)');
 this.sky.addColorStop(1.0, 'rgb(164,200,214)');
 // this creates the grass gradient (from a darker green to a lighter green)
 this.earth = context.createLinearGradient(0, this.horizon, 0, height);
 this.earth.addColorStop(0.0, 'rgb(81,140,20)');
 this.earth.addColorStop(1.0, 'rgb(123,177,57)');
 this.paintBackground = function (context, width, height) {
 // first, paint the sky and grass rectangles
 context.fillStyle = this.sky;
 context.fillRect(0, 0, width, this.horizon);
 context.fillStyle = this.earth;
 context.fillRect(0, this.horizon, width, height-this.horizon);
 // then, draw the cloudy banner
 // we make it cloudy by having the draw text off the top of the
 // canvas, and just having the blurred shadow shown on the canvas
 context.save();
 };
}

```

```

 context.translate(width-((this.offset+(this.width*3.2)) % (this.width*4.0))+0, 0);
 context.shadowColor = 'white';
 context.shadowOffsetY = 30+this.horizon/3; // offset down on canvas
 context.shadowBlur = '5';
 context.fillStyle = 'white';
 context.textAlign = 'left';
 context.textBaseline = 'top';
 context.font = '20px sans-serif';
 context.fillText('WHATWG ROCKS', 10, -30); // text up above canvas
 context.restore();
 // then, draw the background tree
 context.save();
 context.translate(width-((this.offset+(this.width*0.2)) % (this.width*1.5))+30, 0);
 context.beginPath();
 context.fillStyle = 'rgb(143,89,2)';
 context.strokeStyle = 'rgb(10,10,10)';
 context.lineWidth = 2;
 context.rect(0, this.horizon+5, 10, -50); // trunk
 context.fill();
 context.stroke();
 context.beginPath();
 context.fillStyle = 'rgb(78,154,6)';
 context.arc(5, this.horizon-60, 30, 0, Math.PI*2); // leaves
 context.fill();
 context.stroke();
 context.restore();
 };
 this.paintForeground = function (context, width, height) {
 // draw the box that goes in front
 context.save();
 context.translate(width-((this.offset+(this.width*0.7)) % (this.width*1.1))+0, 0);
 context.beginPath();
 context.rect(0, this.horizon - 5, 25, 25);
 context.fillStyle = 'rgb(220,154,94)';
 context.strokeStyle = 'rgb(10,10,10)';
 context.lineWidth = 2;
 context.fill();
 context.stroke();
 context.restore();
 };
};

</script>
<script>
var BlueRobot = function () {
 this.sprites = new Image();
 this.sprites.src = 'blue-robot.png'; // this sprite sheet has 8 cells
 this.targetMode = 'idle';
 this.walk = function () {
 this.targetMode = 'walk';
 };
 this.stop = function () {
 this.targetMode = 'idle';
 };
 this.frameIndex = {
 'idle': [0], // first cell is the idle frame
 'walk': [1,2,3,4,5,6], // the walking animation is cells 1-6
 'stop': [7], // last cell is the stopping animation
 };
 this.mode = 'idle';
 this.frame = 0; // index into frameIndex
 this.tick = function () {

```

```

// this advances the frame and the robot
// the return value is how many pixels the robot has moved
this.frame += 1;
if (this.frame >= this.frameIndex[this.mode].length) {
 // we've reached the end of this animation cycle
 this.frame = 0;
 if (this.mode != this.targetMode) {
 // switch to next cycle
 if (this.mode == 'walk') {
 // we need to stop walking before we decide what to do next
 this.mode = 'stop';
 } else if (this.mode == 'stop') {
 if (this.targetMode == 'walk')
 this.mode = 'walk';
 else
 this.mode = 'idle';
 } else if (this.mode == 'idle') {
 if (this.targetMode == 'walk')
 this.mode = 'walk';
 }
 }
}
if (this.mode == 'walk')
 return 8;
return 0;
},
this.paint = function (context, x, y) {
 if (!this.sprites.complete) return;
 // draw the right frame out of the sprite sheet onto the canvas
 // we assume each frame is as high as the sprite sheet
 // the x,y coordinates give the position of the bottom center of the sprite
 context.drawImage(this.sprites,
 this.frameIndex[this.mode][this.frame] * this.sprites.height, 0,
 this.sprites.height, this.sprites.height,
 x-this.sprites.height/2, y-this.sprites.height, this.sprites.height,
 this.sprites.height);
 };
 };
</script>
<script>
var canvas = document.getElementsByTagName('canvas')[0];

```

#### 4.12.4.3 Colour spaces and colour correction

The `canvas`<sup>p607</sup> APIs must perform colour correction at only two points: when rendering images with their own gamma correction and colour space information onto a bitmap, to convert the image to the colour space used by the bitmaps (e.g. using the 2D Context's `drawImage()`<sup>p651</sup> method with an `HTMLImageElement`<sup>p272</sup> object), and when rendering the actual canvas bitmap to the output device.

**Note** *Thus, in the 2D context, colours used to draw shapes onto the canvas will exactly match colours obtained through the `getImageData()`<sup>p660</sup> method.*

The `toDataURL()`<sup>p611</sup> method must not include colour space information in the resources they return. Where the output format allows it, the colour of pixels in resources created by `toDataURL()`<sup>p611</sup> must match those returned by the `getImageData()`<sup>p660</sup> method.

In user agents that support CSS, the colour space used by a `canvas`<sup>p607</sup> element must match the colour space used for processing any colours for that element in CSS.

The gamma correction and colour space information of images must be handled in such a way that an image rendered directly using an `img`<sup>p272</sup> element would use the same colours as one painted on a `canvas`<sup>p607</sup> element that is then itself rendered. Furthermore, the rendering of images that have no colour correction information (such as those returned by the `toDataURL()`<sup>p611</sup> method) must be rendered with no colour correction.

**Note** *Thus, in the 2D context, calling the `drawImage()`<sup>p651</sup> method to render the output of the `toDataURL()`<sup>p611</sup> method to the canvas, given the appropriate dimensions, has no visible effect.*

#### 4.12.4.4 Serialising bitmaps to a file

When a user agent is to create a **serialisation of the bitmap as a file**, optionally with some given *arguments*, and optionally with a *native* flag set, it must create an image file in the format given by the first value of *arguments*, or, if there are no *arguments*, in the PNG format. [[PNG](#)]<sup>p1151</sup>

If the *native* flag is set, or if the bitmap has one pixel per coordinate space unit, then the image file must have the same pixel data (before compression, if applicable) as the bitmap, and if the file format used supports encoding resolution metadata, the resolution of that bitmap (device pixels per coordinate space units being interpreted as image pixels per CSS pixel) must be given as well.

Otherwise, the image file's pixel data must be the bitmap's pixel data scaled to one image pixel per coordinate space unit, and if the file format used supports encoding resolution metadata, the resolution must be given as 96dpi (one image pixel per CSS pixel).

If *arguments* is not empty, the first value must be interpreted as a [MIME type](#)<sup>p42</sup> giving the format to use. If the type has any parameters, it must be treated as not supported.

**Example** For example, the value "`image/png`"<sup>p1146</sup> would mean to generate a PNG image, the value "`image/jpeg`"<sup>p1146</sup> would mean to generate a JPEG image, and the value "`image/svg+xml`"<sup>b1146</sup> would mean to generate an SVG image (which would require that the user agent track how the bitmap was generated, an unlikely, though potentially awesome, feature).

User agents must support PNG ("`image/png`"<sup>p1146</sup>). User agents may support other types. If the user agent does not support the requested type, it must create the file using the PNG format. [[PNG](#)]<sup>p1151</sup>

User agents must [convert the provided type to ASCII lowercase](#)<sup>p58</sup> before establishing if they support that type.

For image types that do not support an alpha channel, the serialised image must be the bitmap image composited onto a solid black background using the source-over operator.

If the first argument in *arguments* gives a type corresponding to one of the types given in the first column of the following table, and the user agent supports that type, then the subsequent arguments, if any, must be treated as described in the second cell of that row.

Type	Arguments for serialisation methods Other arguments	Reference
<a href="#">image/ jpeg<sup>p1146</sup></a>	The second argument, if it is a number in the range 0.0 to 1.0 inclusive, must be treated as the desired quality level. If it is not a number or is outside that range, the user agent must use its default value, as if the argument had been omitted.	<a href="#">JPEG<sup>p1150</sup></a> Spec bugs: <a href="#">26919</a>

For the purposes of these rules, an argument is considered to be a number if it is converted to an IDL double value by the rules for handling arguments of type [any](#) in the Web IDL specification. [\[WEBIDL\]<sup>p1154</sup>](#)

Other arguments must be ignored and must not cause the user agent to throw an exception. A future version of this specification will probably define other parameters to be passed to these methods to allow authors to more carefully control compression settings, image metadata, etc.

#### 4.12.4.5 Security with [canvas<sup>p607</sup>](#) elements

*This section is non-normative.*

**Information leakage** can occur if scripts from one [origin<sup>p776</sup>](#) can access information (e.g. read pixels) from images from another origin (one that isn't the [same<sup>p778</sup>](#)).

To mitigate this, bitmaps used with [canvas<sup>p607</sup>](#) elements are defined to have a flag indicating whether they are [origin-clean<sup>p609</sup>](#). All bitmaps start with their [origin-clean<sup>p609</sup>](#) set to true. The flag is set to false when cross-origin images or fonts are used.

The [toDataURL\(\)<sup>p611</sup>](#), [toBlob\(\)<sup>p611</sup>](#), and [getImageData\(\)<sup>p660</sup>](#) methods check the flag and will throw a [SecurityError<sup>p50</sup>](#) exception rather than leak cross-origin data.

The flag can be reset in certain situations; for example, when a [CanvasRenderingContext2D<sup>p613</sup>](#) is bound to a new [canvas<sup>p607</sup>](#), the bitmap is cleared and its flag reset.

## 4.13 Common idioms without dedicated elements

### 4.13.1 The main part of the content

The main content of a page — not including headers and footers, navigation links, sidebars, advertisements, and so forth — can be marked up in a variety of ways, depending on the needs of the author.

The simplest solution is to not mark up the main content at all, and just leave it as implicit. Another way to think of this is that the [body<sup>p157</sup>](#) elements marks up the main content of the page, and the bits that aren't main content are excluded through the use of more appropriate elements like [aside<sup>p166</sup>](#) and [nav<sup>p163</sup>](#).

#### Example

Here is a short Web page marked up along this minimalistic school of thought. The main content is highlighted. Notice how all the *other* content in the [body<sup>p157</sup>](#) is marked up with elements to indicate that it's not part of the main content, in this case [header<sup>p171</sup>](#), [nav<sup>p163</sup>](#), and [footer<sup>p173</sup>](#).

```
<!DOCTYPE HTML>
<html>
 <head>
 <title> My Toys </title>
 </head>
 <body>
 <header>
 <h1>My toys</h1>
```

```

</header>
<nav>
 <p>Home</p>
 <p>Contact</p>
</nav>
<p>I really like my chained book and my telephone. I'm not such a
fan of my big ball.</p>
<p>Another toy I like is my mirror.</p>
<footer>
 <p>© copyright 2010 by the boy</p>
</footer>
</body>
</html>

```

If the main content is an independent unit of content that one could imagine syndicating independently, then the [article<sup>b159</sup>](#) element would be appropriate to mark up the main content of the document.

### Example

The document in the previous example is here recast as a blog post:

```

<!DOCTYPE HTML>
<html>
 <head>
 <title> The Boy Blog: My Toys </title>
 </head>
 <body>
 <header>
 <h1>The Boy Blog</h1>
 </header>
 <nav>
 <p>Home</p>
 <p>Contact</p>
 </nav>
 <article>
 <header>
 <h1>My toys</h1>
 <p>Published August 4th</p>
 </header>
 <p>I really like my chained book and my telephone. I'm not such a
fan of my big ball.</p>
 <p>Another toy I like is my mirror.</p>
 </article>
 <footer>
 <p>© copyright 2010 by the boy</p>
 </footer>
 </body>
</html>

```

If the main content is not an independent unit of content so much as a section of a larger work, for instance a chapter, then the [section<sup>b161</sup>](#) element would be appropriate to mark up the main content of the document.

### Example

Here is the same document, but as a chapter in an online book:

```

<!DOCTYPE HTML>
<html>
 <head>
 <title> Chapter 2: My Toys – The Book of the Boy </title>
 </head>
 <body>
 <header>
 <hgroup>

```

```

<h1>The Book of the Boy</h1>
<h2>A book about boy stuff</h2>
</hgroup>
</header>
<nav>
<p>Front Page</p>
<p>Table of Contents</p>
<p>Chapter 1 – Chapter 3</p>
</nav>
<section>
<h1>Chapter 2: My Toys</h1>
<p>I really like my chained book and my telephone. I'm not such a
fan of my big ball.</p>
<p>Another toy I like is my mirror.</p>
</section>
</body>
</html>

```

If neither `articlep155` nor `sectionp161` would be appropriate, but the main content still needs an explicit element, for example for styling purposes, then the `mainp205` element can be used.

### Example

This is the same as the original example, but using `mainp205` for the main content instead of leaving it implied:

```

<!DOCTYPE HTML>
<html>
<head>
<title> My Toys </title>
<style>
body > main { background: navy; color: yellow; }
</style>
</head>
<body>
<header>
<h1>My toys</h1>
</header>
<nav>
<p>Home</p>
<p>Contact</p>
</nav>
<main>
<p>I really like my chained book and my telephone. I'm not such a
fan of my big ball.</p>
<p>Another toy I like is my mirror.</p>
</main>
<footer>
<p>© copyright 2010 by the boy</p>
</footer>
</body>
</html>

```

## 4.13.2 Bread crumb navigation

Spec bugs: [26920](#)

This specification does not provide a machine-readable way of describing bread-crumb navigation menus. Authors are encouraged to just use a series of links in a paragraph. The `navp163` element can be used to mark the section containing these paragraphs as being navigation blocks.

### Example

In the following example, the current page can be reached via two paths.

```

<nav>
 <p>
 Main ▶
 Products ▶
 Dishwashers ▶
 <a>Second hand
 </p>
 <p>
 Main ▶
 Second hand ▶
 <a>Dishwashers
 </p>
</nav>

```

#### 4.13.3 Tag clouds

Spec bugs: [23610](#)

This specification does not define any markup specifically for marking up lists of keywords that apply to a group of pages (also known as *tag clouds*). In general, authors are encouraged to either mark up such lists using [ul](#)<sup>p197</sup> elements with explicit inline counts that are then hidden and turned into a presentational effect using a style sheet, or to use SVG.

##### Example

Here, three tags are included in a short tag cloud:

```

<style>
 @media screen, print, handheld, tv {
 /* should be ignored by non-visual browsers */
 .tag-cloud > li > span { display: none; }
 .tag-cloud > li { display: inline; }
 .tag-cloud-1 { font-size: 0.7em; }
 .tag-cloud-2 { font-size: 0.9em; }
 .tag-cloud-3 { font-size: 1.1em; }
 .tag-cloud-4 { font-size: 1.3em; }
 .tag-cloud-5 { font-size: 1.5em; }
 }
</style>
...
<ul class="tag-cloud">
 <li class="tag-cloud-4">apple (popular)
 <li class="tag-cloud-2">kiwi (rare)
 <li class="tag-cloud-5">pear (very
 popular)

```

The actual frequency of each tag is given using the [title](#)<sup>p122</sup> attribute. A CSS style sheet is provided to convert the markup into a cloud of differently-sized words, but for user agents that do not support CSS or are not visual, the markup contains annotations like "(popular)" or "(rare)" to categorise the various tags by frequency, thus enabling all users to benefit from the information.

The [ul](#)<sup>p197</sup> element is used (rather than [ol](#)<sup>p195</sup>) because the order is not particularly important: while the list is in fact ordered alphabetically, it would convey the same information if ordered by, say, the length of the tag.

The [tag](#)<sup>p257</sup> [rel](#)<sup>p246</sup>-keyword is *not* used on these [a](#)<sup>p208</sup> elements because they do not represent tags that apply to the page itself; they are just part of an index listing the tags themselves.

#### 4.13.4 Conversations

This specification does not define a specific element for marking up conversations, meeting minutes, chat transcripts, dialogues in screenplays, instant message logs, and other situations where different players take turns in discourse.

Instead, authors are encouraged to mark up conversations using [p<sup>p187</sup>](#) elements and punctuation. Authors who need to mark the speaker for styling purposes are encouraged to use [span<sup>p242</sup>](#) or [b<sup>p236</sup>](#). Paragraphs with their text wrapped in the [i<sup>p235</sup>](#) element can be used for marking up stage directions.

### Example

This example demonstrates this using an extract from Abbot and Costello's famous sketch, *Who's on first*:

```
<p> Costello: Look, you gotta first baseman?
<p> Abbott: Certainly.
<p> Costello: Who's playing first?
<p> Abbott: That's right.
<p> Costello becomes exasperated.
<p> Costello: When you pay off the first baseman every month, who gets the money?
<p> Abbott: Every dollar of it.
```

### Example

The following extract shows how an IM conversation log could be marked up, using the [data<sup>p226</sup>](#) element to provide Unix timestamps for each line. Note that the timestamps are provided in a format that the [time<sup>p227</sup>](#) element does not support, so the [data<sup>p226</sup>](#) element is used instead (namely, Unix `time_t` timestamps). Had the author wished to mark up the data using one of the date and time formats supported by the [time<sup>p227</sup>](#) element, that element could have been used instead of [data<sup>p226</sup>](#). This could be advantageous as it would allow data analysis tools to detect the timestamps unambiguously, without coordination with the page author.

```
<p> <data value="1319898155">14:22</data> egof I'm not that nerdy, I've only seen 30% of
the star trek episodes
<p> <data value="1319898192">14:23</data> kaj if you know what percentage of the star
trek episodes you have seen, you are inarguably nerdy
<p> <data value="1319898200">14:23</data> egof it's unarguably
<p> <data value="1319898228">14:23</data> <i>* kaj blinks</i>
<p> <data value="1319898260">14:24</data> kaj you are not helping your case
```

### Example

HTML does not have a good way to mark up graphs, so descriptions of interactive conversations from games are more difficult to mark up. This example shows one possible convention using [dl<sup>p199</sup>](#) elements to list the possible responses at each point in the conversation. Another option to consider is describing the conversation in the form of a DOT file, and outputting the result as an SVG image to place in the document. [\[DOT\]<sup>p1149</sup>](#)

```
<p> Next, you meet a fisherman. You can say one of several greetings:
<dl>
 <dt> "Hello there!"
 <dd>
 <p> He responds with "Hello, how may I help you?"; you can respond with:
 <dl>
 <dt> "I would like to buy a fish."
 <dd> <p> He sells you a fish and the conversation finishes.
 <dt> "Can I borrow your boat?"
 <dd>
 <p> He is surprised and asks "What are you offering in return?".
 <dl>
 <dt> "Five gold." (if you have enough)
 <dt> "Ten gold." (if you have enough)
 <dt> "Fifteen gold." (if you have enough)
 <dd> <p> He lends you his boat. The conversation ends.
 <dt> "A fish." (if you have one)
 <dt> "A newspaper." (if you have one)
 <dt> "A pebble." (if you have one)
 <dd> <p> "No thanks", he replies. Your conversation options
 at this point are the same as they were after asking to borrow
 his boat, minus any options you've suggested before.
 </dl>
 </dd>
</dl>
</dd>
```

```

<dt> "Vote for me in the next election!"
<dd> <p> He turns away. The conversation finishes.
<dt> "Sir, are you aware that your fish are running away?"
<dd>
<p> He looks at you skeptically and says "Fish cannot run, sir".
<dl>
<dt> "You got me!"
<dd> <p> The fisherman sighs and the conversation ends.
<dt> "Only kidding."
<dd> <p> "Good one!" he retorts. Your conversation options at this point are the same as those following "Hello there!" above.
<dt> "Oh, then what are they doing?"
<dd> <p> He looks at his fish, giving you an opportunity to steal his boat, which you do. The conversation ends.
</dl>
</dd>
</dl>

```

### Example

In some games, conversations are simpler: each character merely has a fixed set of lines that they say. In this example, a game FAQ/walkthrough lists some of the known possible responses for each character:

```

<section>
<h1>Dialogue</h1>
<p><small>Some characters repeat their lines in order each time you interact with them, others randomly pick from amongst their lines. Those who respond in order have numbered entries in the lists below.</small>
<h2>The Shopkeeper</h2>

How may I help you?
Fresh apples!
A loaf of bread for madam?

<h2>The pilot</h2>
<p>Before the accident:

I'm about to fly out, sorry!
Sorry, I'm just waiting for flight clearance and then I'll be off!

<p>After the accident:

I'm about to fly out, sorry!
Ok, I'm not leaving right now, my plane is being cleaned.
Ok, it's not being cleaned, it needs a minor repair first.
Ok, ok, stop bothering me! Truth is, I had a crash.

<h2>Clan Leader</h2>
<p>During the first clan meeting:

Hey, have you seen my daughter? I bet she's up to something nefarious again...
Nice weather we're having today, eh?
The name is Bailey, Jeff Bailey. How can I help you today?
A glass of water? Fresh from the well!

<p>After the earthquake:

Everyone is safe in the shelter, we just have to put out the fire!
I'll go and tell the fire brigade, you keep hosing it down!

</section>

```

#### 4.13.5 Footnotes

HTML does not have a dedicated mechanism for marking up footnotes. Here are the suggested alternatives.

For short inline annotations, the `titlep122` attribute could be used.

**Example**

In this example, two parts of a dialogue are annotated with footnote-like content using the `titlep122` attribute.

```
<p> Customer: Hello! I wish to register a complaint. Hello. Miss?
<p> Shopkeeper: Watcha mean, miss?
<p> Customer: Uh, I'm sorry, I have a cold. I wish to make a complaint.
<p> Shopkeeper: Sorry, we're
closing for lunch.
```

**Note**

*Unfortunately, relying on the `titlep122` attribute is currently discouraged as many user agents do not expose the attribute in an accessible manner as required by this specification (e.g. requiring a pointing device such as a mouse to cause a tooltip to appear, which excludes keyboard-only users and touch-only users, such as anyone with a modern phone or tablet).*

**Note**

*If the `titlep122` attribute is used, CSS can be used to draw the reader's attention to the elements with the attribute.*

**Example**

For example, the following CSS places a dashed line below elements that have a `titlep122` attribute.

```
[title] { border-bottom: thin dashed; }
```

For longer annotations, the `ap208` element should be used, pointing to an element later in the document. The convention is that the contents of the link be a number in square brackets.

**Example**

In this example, a footnote in the dialogue links to a paragraph below the dialogue. The paragraph then reciprocally links back to the dialogue, allowing the user to return to the location of the footnote.

```
<p> Announcer: Number 16: The <i>hand</i>.
<p> Interviewer: Good evening. I have with me in the studio tonight
Mr Norman St John Polevaulter, who for the past few years has been
contradicting people. Mr Polevaulter, why do you
contradict people?
<p> Norman: I don't. ^{[1]}
<p> Interviewer: You told me you did!
...
<section>
 <p id="fn1">[1] This is, naturally, a lie,
 but paradoxically if it were true he could not say so without
 contradicting the interviewer and thus making it false.</p>
</section>
```

For side notes, longer annotations that apply to entire sections of the text rather than just specific words or sentences, the `asidep166` element should be used.

**Example**

In this example, a sidebar is given after a dialogue, giving it some context.

```
<p> Customer: I will not buy this record, it is scratched.
<p> Shopkeeper: I'm sorry?
<p> Customer: I will not buy this record, it is scratched.
<p> Shopkeeper: No no no, this's'a tobacconist's.
<aside>
```

```

<p>In 1970, the British Empire lay in ruins, and foreign
nationalists frequented the streets — many of them Hungarians
(not the streets — the foreign nationals). Sadly, Alexander
Yalt has been publishing incompetently-written phrase books.
</aside>

```

For figures or tables, footnotes can be included in the relevant [figcaption<sup>p205</sup>](#) or [caption<sup>p405</sup>](#) element, or in surrounding prose.

### Example

In this example, a table has cells with footnotes that are given in prose. A [figure<sup>p202</sup>](#) element is used to give a single legend to the combination of the table and its footnotes.

```

<figure>
 <figcaption>Table 1. Alternative activities for knights.</figcaption>
 <table>
 <tr>
 <th> Activity
 <th> Location
 <th> Cost
 <tr>
 <td> Dance
 <td> Wherever possible
 <td> £0^{1}
 <tr>
 <td> Routines, chorus scenes^{2}
 <td> Undisclosed
 <td> Undisclosed
 <tr>
 <td> Dining^{3}
 <td> Camelot
 <td> Cost of ham, jam, and spam^{4}
 </table>
 <p id="fn1">1. Assumed.</p>
 <p id="fn2">2. Footwork impeccable.</p>
 <p id="fn3">3. Quality described as "well".</p>
 <p id="fn4">4. A lot.</p>
 </figure>

```

## 4.14 Disabled elements

An element is said to be **actually disabled** if it one of the following:

- a [button<sup>p495</sup>](#) element that is [disabled<sup>p530</sup>](#)
- an [input<sup>p452</sup>](#) element that is [disabled<sup>p530</sup>](#)
- a [select<sup>p498</sup>](#) element that is [disabled<sup>p530</sup>](#)
- a [textarea<sup>p508</sup>](#) element that is [disabled<sup>p530</sup>](#)
- an [optgroup<sup>p504</sup>](#) element that has a [disabled<sup>p505</sup>](#) attribute
- an [option<sup>p505</sup>](#) element that is [disabled<sup>p506</sup>](#)
- a [menuitem<sup>p574</sup>](#) element that has a [disabled<sup>p575</sup>](#) attribute
- a [fieldset<sup>p524</sup>](#) element that is a [disabled fieldset<sup>p525</sup>](#)

**Note** This definition is used to determine what elements [can be focused<sup>p729</sup>](#) and which elements match the [:disabled<sup>p681</sup>](#) pseudo-class.

## 4.15 Matching HTML elements using selectors

### 4.15.1 Case-sensitivity

Spec bugs: [24005](#)

The Selectors specification leaves the case-sensitivity of element names, attribute names, and attribute values to be defined by the host language.

[SELECTORS]<sup>p1153</sup>

**Note** *The Selectors specification defines that ID and class selectors, when matched against elements in documents that are in quirks mode<sup>p51</sup>, will be work in an ASCII case-insensitive<sup>p58</sup>.*

When comparing a CSS element type selector to the names of [HTML elements<sup>p42</sup>](#) in [HTML documents<sup>p51</sup>](#), the CSS element type selector must first be [converted to ASCII lowercase<sup>p58</sup>](#). The same selector when compared to other elements must be compared according to its original case. In both cases, the comparison is [case-sensitive<sup>p58</sup>](#).

When comparing the name part of a CSS attribute selector to the names of namespace-less attributes on [HTML elements<sup>p42</sup>](#) in [HTML documents<sup>p51</sup>](#), the name part of the CSS attribute selector must first be [converted to ASCII lowercase<sup>p58</sup>](#). The same selector when compared to other attributes must be compared according to its original case. In both cases, the comparison is [case-sensitive<sup>p58</sup>](#).

Everything else must be treated as entirely [case-sensitive<sup>p58</sup>](#) for the purposes of selector matching. This includes:

- IDs and classes in [no-quirks mode<sup>p51</sup>](#) and [limited-quirks mode<sup>p51</sup>](#)
- the names of elements not in the [HTML namespace<sup>p101</sup>](#)
- the names of [HTML elements<sup>p42</sup>](#) in [XML documents<sup>p51</sup>](#)
- the names of attributes of elements not in the [HTML namespace<sup>p101</sup>](#)
- the names of attributes of [HTML elements<sup>p42</sup>](#) in [XML documents<sup>p51</sup>](#)
- the names of attributes that themselves have namespaces
- all attribute values

### 4.15.2 Pseudo-classes

There are a number of dynamic selectors that can be used with HTML. This section defines when these selectors match HTML elements.

[SELECTORS]<sup>p1153</sup> [CSSUI]<sup>p1149</sup>

**:link**

**:visited**

All [a<sup>p208</sup>](#) elements that have an [href<sup>p245</sup>](#) attribute, all [area<sup>p390</sup>](#) elements that have an [href<sup>p245</sup>](#) attribute, and all [link<sup>p141</sup>](#) elements that have an [href<sup>p142</sup>](#) attribute, must match one of [:link<sup>p679</sup>](#) and [:visited<sup>p679</sup>](#).

Other specifications might apply more specific rules regarding how these elements are to match these pseudo-classes, to mitigate some privacy concerns that apply with straightforward implementations of this requirement.

**:active**

The [:active<sup>p679</sup>](#) pseudo-class is defined to match an element “while an element is **being activated** by the user”.

To determine whether a particular element is [being activated<sup>p679</sup>](#) for the purposes of defining the [:active<sup>p679</sup>](#) pseudo-class only, an HTML user agent must use the first relevant entry in the following list.

**If the element has a descendant that is currently matching the [:active<sup>p679</sup>](#) pseudo-class**

The element is [being activated<sup>p679</sup>](#).

**If the element is the [labeled control<sup>p451</sup>](#) of a [label<sup>p451</sup>](#) element that is currently matching [:active<sup>p679</sup>](#)**

The element is [being activated<sup>p679</sup>](#).

**If the element is a [button<sup>p495</sup>](#) element**

**If the element is an [input<sup>p452</sup>](#) element whose [type<sup>p454</sup>](#) attribute is in the [Submit Button<sup>p478</sup>](#), [Image Button<sup>p479</sup>](#), [Reset Button<sup>p481</sup>](#), or [Button<sup>p482</sup>](#) state**

The element is [being activated<sup>p679</sup>](#) if it is [in a formal activation state<sup>p680</sup>](#) and it is not [disabled<sup>p530</sup>](#).

**Example** For example, if the user is using a keyboard to push a [button](#) element by pressing the space bar, the element would match this pseudo-class in between the time that the element received the [keydown](#) event and the time the element received the [keyup](#) event.

#### If the element is a [menuitem](#) element

The element is [being activated](#) if it is [in a formal activation state](#) and it does not have a [disabled](#) attribute.

#### If the element is an [a](#) element that has an [href](#) attribute

#### If the element is an [area](#) element that has an [href](#) attribute

#### If the element is a [link](#) element that has an [href](#) attribute

#### If the element has its [tabindex focus flag](#) set

The element is [being activated](#) if it is [in a formal activation state](#).

#### If the element is [being actively pointed at](#)

The element is [being activated](#).

An element is said to be **in a formal activation state** between the time the user begins to indicate an intent to trigger the element's [activation behaviour](#) and either the time the user stops indicating an intent to trigger the element's [activation behaviour](#), or the time the element's [activation behaviour](#) has finished running, which ever comes first.

An element is said to be **being actively pointed at** while the user indicates the element using a pointing device while that pointing device is in the "down" state (e.g. for a mouse, between the time the mouse button is pressed and the time it is depressed; for a finger in a multitouch environment, while the finger is touching the display surface).

#### :hover

The [:hover](#) pseudo-class is defined to match an element "while the user designates an element with a pointing device". For the purposes of defining the [:hover](#) pseudo-class only, an HTML user agent must consider an element as being one that the user designates if it is:

- An element that the user indicates using a pointing device.
- An element that has a descendant that the user indicates using a pointing device.
- An element that is the [labeled control](#) of a [label](#) element that is currently matching [:hover](#).

**Example** Consider in particular a fragment such as:

```
<p> <label for=c> <input id=a> </label> <input id=c> </p>
```

If the user designates the element with ID "a" with their pointing device, then the [p](#) element (and all its ancestors not shown in the snippet above), the [label](#) element, the element with ID "a", and the element with ID "c" will match the [:hover](#) pseudo-class. The element with ID "a" matches it from condition 1, the [label](#) and [p](#) elements match it because of condition 2 (one of their descendants is designated), and the element with ID "c" matches it through condition 3 (its [label](#) element matches [:hover](#)). However, the element with ID "b" does *not* match [:hover](#): its descendant is not designated, even though it matches [:hover](#).

#### :focus

For the purposes of the CSS ':focus' pseudo-class, an **element has the focus** when its [top-level browsing context](#) has the system focus, it is not itself a [browsing context container](#), and it is one of the elements listed in the [focus chain](#) of the [currently focused area of the top-level browsing context](#).

#### :enabled

The [:enabled](#) pseudo-class must match any element that is one of the following:

- a [button](#) element that is not [disabled](#)
- an [input](#) element that is not [disabled](#)
- a [select](#) element that is not [disabled](#)
- a [textarea](#) element that is not [disabled](#)

- an [optgroup](#)<sup>p504</sup> element that does not have a [disabled](#)<sup>p505</sup> attribute
- an [option](#)<sup>p505</sup> element that is not [disabled](#)<sup>p506</sup>
- a [menuitem](#)<sup>p574</sup> element that does not have a [disabled](#)<sup>p575</sup> attribute
- a [fieldset](#)<sup>p524</sup> element that is not a [disabled fieldset](#)<sup>p525</sup>

#### **:disabled**

The [:disabled](#)<sup>p681</sup> pseudo-class must match any element that is [actually disabled](#)<sup>p678</sup>.

#### **:checked**

The [:checked](#)<sup>p681</sup> pseudo-class must match any element falling into one of the following categories:

- [input](#)<sup>p452</sup> elements whose [type](#)<sup>p454</sup> attribute is in the [Checkbox](#)<sup>p475</sup> state and whose [checkedness](#)<sup>p527</sup> state is true
- [input](#)<sup>p452</sup> elements whose [type](#)<sup>p454</sup> attribute is in the [Radio Button](#)<sup>p475</sup> state and whose [checkedness](#)<sup>p527</sup> state is true
- [option](#)<sup>p505</sup> elements whose [selectedness](#)<sup>p507</sup> is true
- [menuitem](#)<sup>p574</sup> elements whose [type](#)<sup>p575</sup> attribute is in the [Checkbox](#)<sup>p575</sup> state and that have a [checked](#)<sup>p575</sup> attribute
- [menuitem](#)<sup>p574</sup> elements whose [type](#)<sup>p575</sup> attribute is in the [Radio](#)<sup>p575</sup> state and that have a [checked](#)<sup>p575</sup> attribute

#### **:indeterminate**

The [:indeterminate](#)<sup>p681</sup> pseudo-class must match any element falling into one of the following categories:

- [input](#)<sup>p452</sup> elements whose [type](#)<sup>p454</sup> attribute is in the [Checkbox](#)<sup>p475</sup> state and whose [indeterminate](#)<sup>p457</sup> IDL attribute is set to true
- [input](#)<sup>p452</sup> elements whose [type](#)<sup>p454</sup> attribute is in the [Radio Button](#)<sup>p475</sup> state and whose [radio button group](#)<sup>p479</sup> contains no [input](#)<sup>p452</sup> elements whose [checkedness](#)<sup>p527</sup> state is true.
- [progress](#)<sup>p518</sup> elements with no [value](#)<sup>p518</sup> content attribute

#### **:default**

The [:default](#)<sup>p681</sup> pseudo-class must match any element falling into one of the following categories:

- [button](#)<sup>p495</sup> elements that are their form's [default button](#)<sup>p558</sup>
- [input](#)<sup>p452</sup> elements whose [type](#)<sup>p454</sup> attribute is in the [Submit Button](#)<sup>p478</sup> or [Image Button](#)<sup>p479</sup> state, and that are their form's [default button](#)<sup>p558</sup>
- [input](#)<sup>p452</sup> elements to which the [checked](#)<sup>p457</sup> attribute applies and that have a [checked](#)<sup>p457</sup> attribute
- [option](#)<sup>p505</sup> elements that have a [selected](#)<sup>p506</sup> attribute

#### **:valid**

The [:valid](#)<sup>p681</sup> pseudo-class must match any element falling into one of the following categories:

- elements that are [candidates for constraint validation](#)<sup>p553</sup> and that [satisfy their constraints](#)<sup>p553</sup>
- [form](#)<sup>p447</sup> elements that are not the [form owner](#)<sup>p527</sup> of any elements that themselves are [candidates for constraint validation](#)<sup>p553</sup> but do not [satisfy their constraints](#)<sup>p553</sup>
- [fieldset](#)<sup>p524</sup> elements that have no descendant elements that themselves are [candidates for constraint validation](#)<sup>p553</sup> but do not [satisfy their constraints](#)<sup>p553</sup>

#### **:invalid**

The [:invalid](#)<sup>p681</sup> pseudo-class must match any element falling into one of the following categories:

- elements that are [candidates for constraint validation](#)<sup>p553</sup> but that do not [satisfy their constraints](#)<sup>p553</sup>
- [form](#)<sup>p447</sup> elements that are the [form owner](#)<sup>p527</sup> of one or more elements that themselves are [candidates for constraint validation](#)<sup>p553</sup> but do not [satisfy their constraints](#)<sup>p553</sup>

- [fieldset](#)<sup>p524</sup> elements that have one or more descendant elements that themselves are [candidates for constraint validation](#)<sup>p553</sup>, [have range limitations](#)<sup>p487</sup>, and that do not [satisfy their constraints](#)<sup>p553</sup>

#### [:in-range](#)

The [:in-range](#)<sup>p682</sup> pseudo-class must match all elements that are [candidates for constraint validation](#)<sup>p553</sup>, [have range limitations](#)<sup>p487</sup>, and that are neither [suffering from an underflow](#)<sup>p553</sup> nor [suffering from an overflow](#)<sup>p553</sup>.

#### [:out-of-range](#)

The [:out-of-range](#)<sup>p682</sup> pseudo-class must match all elements that are [candidates for constraint validation](#)<sup>p553</sup>, [have range limitations](#)<sup>p487</sup>, and that are either [suffering from an underflow](#)<sup>p553</sup> or [suffering from an overflow](#)<sup>p553</sup>.

#### [:required](#)

The [:required](#)<sup>p682</sup> pseudo-class must match any element falling into one of the following categories:

- [input](#)<sup>p452</sup> elements that are [required](#)<sup>p484</sup>
- [select](#)<sup>p498</sup> elements that have a [required](#)<sup>p499</sup> attribute
- [textarea](#)<sup>p508</sup> elements that have a [required](#)<sup>p511</sup> attribute

#### [:optional](#)

The [:optional](#)<sup>p682</sup> pseudo-class must match any element falling into one of the following categories:

- [input](#)<sup>p452</sup> elements to which the [required](#)<sup>p484</sup> attribute applies that are not [required](#)<sup>p484</sup>
- [select](#)<sup>p498</sup> elements that do not have a [required](#)<sup>p499</sup> attribute
- [textarea](#)<sup>p508</sup> elements that do not have a [required](#)<sup>p511</sup> attribute

#### [:read-only](#)

#### [:read-write](#)

The [:read-write](#)<sup>p682</sup> pseudo-class must match any element falling into one of the following categories, which for the purposes of Selectors are thus considered *user-alterable*: [\[SELECTORS\]](#)<sup>p1153</sup>

- [input](#)<sup>p452</sup> elements to which the [readonly](#)<sup>p483</sup> attribute applies, and that are [mutable](#)<sup>p527</sup> (i.e. that do not have the [readonly](#)<sup>p483</sup> attribute specified and that are not [disabled](#)<sup>p530</sup>)
- [textarea](#)<sup>p508</sup> elements that do not have a [readonly](#)<sup>b509</sup> attribute, and that are not [disabled](#)<sup>p530</sup>
- elements that are [editing hosts](#)<sup>b741</sup> or [editable](#)<sup>b741</sup> and are neither [input](#)<sup>p452</sup> elements nor [textarea](#)<sup>b508</sup> elements

The [:read-only](#)<sup>p682</sup> pseudo-class must match all other [HTML elements](#)<sup>p42</sup>.

#### [:dir\(ltr\)](#)

The [:dir\(ltr\)](#)<sup>p682</sup> pseudo-class must match all elements whose [directionality](#)<sup>p125</sup> is '[ltr](#)'<sup>p125</sup>.

#### [:dir rtl](#)

The [:dir\(rtl\)](#)<sup>p682</sup> pseudo-class must match all elements whose [directionality](#)<sup>p125</sup> is '[rtl](#)'<sup>p125</sup>.

**Note** Another section of this specification defines the [target element](#)<sup>p801</sup> used with the [:target](#)<sup>p801</sup> pseudo-class.

**Note** This specification does not define when an element matches the [:lang\(\)](#) dynamic pseudo-class, as it is defined in sufficient detail in a language-agnostic fashion in the Selectors specification. [\[SELECTORS\]](#)<sup>p1153</sup>

## 5 Microdata

### 5.1 Introduction

#### 5.1.1 Overview

*This section is non-normative.*

Sometimes, it is desirable to annotate content with specific machine-readable labels, e.g. to allow generic scripts to provide services that are customised to the page, or to enable content from a variety of cooperating authors to be processed by a single script in a consistent manner.

For this purpose, authors can use the microdata features described in this section. Microdata allows nested groups of name-value pairs to be added to documents, in parallel with the existing content.

#### 5.1.2 The basic syntax

*This section is non-normative.*

At a high level, microdata consists of a group of name-value pairs. The groups are called [items<sup>p689</sup>](#), and each name-value pair is a property. Items and properties are represented by regular elements.

To create an item, the [itemscope<sup>p689</sup>](#) attribute is used.

To add a property to an item, the [itemprop<sup>p692</sup>](#) attribute is used on one of the [item's<sup>p689</sup>](#) descendants.

#### Example

Here there are two items, each of which has the property "name":

```
<div itemscope>
 <p>My name is Elizabeth.</p>
</div>

<div itemscope>
 <p>My name is Daniel.</p>
</div>
```

Markup without the microdata-related attributes does not have any effect on the microdata model.

#### Example

These two examples are exactly equivalent, at a microdata level, as the previous two examples respectively:

```
<div itemscope>
 <p>My name is Elizabeth.</p>
</div>

<section>
 <div itemscope>
 <aside>
 <p>My name is Daniel.</p>
 </aside>
 </div>
</section>
```

Properties generally have values that are strings.

#### Example

Here the item has three properties:

```

<div itemscope>
 <p>My name is Neil.</p>
 <p>My band is called Four Parts Water.</p>
 <p>I am British.</p>
</div>

```

When a string value is a [URL](#), it is expressed using the [a](#) element and its [href](#) attribute, the [img](#) element and its [src](#) attribute, or other elements that link to or embed external resources.

### Example

In this example, the item has one property, "image", whose value is a URL:

```

<div itemscope>

</div>

```

When a string value is in some machine-readable format unsuitable for human consumption, it is expressed using the [value](#) attribute of the [data](#) element, with the human-readable version given in the element's contents.

### Example

Here, there is an item with a property whose value is a product ID. The ID is not human-friendly, so the product's name is used the human-visible text instead of the ID.

```

<h1 itemscope>
 <data itemprop="product-id" value="9678AOU879">The Instigator 2000</data>
</h1>

```

For numeric data, the [meter](#) element and its [value](#) attribute can be used instead.

### Example

Here a rating is given using a [meter](#) element.

```

<div itemscope itemtype="http://schema.org/Product">
 Panasonic White 60L Refrigerator

 <div itemprop="aggregateRating">
 <itemscope itemtype="http://schema.org/AggregateRating">
 <meter itemprop="ratingValue" min=0 value=3.5 max=5>Rated 3.5/5</meter>
 (based on 11 customer reviews)
 </div>
 </div>

```

Similarly, for date- and time-related data, the [time](#) element and its [datetime](#) attribute can be used instead.

### Example

In this example, the item has one property, "birthday", whose value is a date:

```

<div itemscope>
 I was born on <time itemprop="birthday" datetime="2009-05-10">May 10th 2009</time>.
</div>

```

Properties can also themselves be groups of name-value pairs, by putting the [itemscope](#) attribute on the element that declares the property.

Items that are not part of others are called [top-level microdata items](#).

### Example

In this example, the outer item represents a person, and the inner one represents a band:

```

<div itemscope>
 <p>Name: Amanda</p>
 <p>Band: Jazz Band (12 players)</p>
</div>

```

The outer item here has two properties, "name" and "band". The "name" is "Amanda", and the "band" is an item in its own right, with two properties, "name" and "size". The "name" of the band is "Jazz Band", and the "size" is "12".

The outer item in this example is a top-level microdata item.

Properties that are not descendants of the element with the `itemscope`<sup>p689</sup> attribute can be associated with the `item`<sup>p689</sup> using the `itemref`<sup>p690</sup> attribute. This attribute takes a list of IDs of elements to crawl in addition to crawling the children of the element with the `itemscope`<sup>p689</sup> attribute.

### Example

This example is the same as the previous one, but all the properties are separated from their `items`<sup>p689</sup>:

```
<div itemscope id="amanda" itemref="a b"></div>
<p id="a">Name: Amanda</p>
<div id="b" itemprop="band" itemscope itemref="c"></div>
<div id="c">
 <p>Band: Jazz Band</p>
 <p>Size: 12 players</p>
</div>
```

This gives the same result as the previous example. The first item has two properties, "name", set to "Amanda", and "band", set to another item. That second item has two further properties, "name", set to "Jazz Band", and "size", set to "12".

An `item`<sup>p689</sup> can have multiple properties with the same name and different values.

### Example

This example describes an ice cream, with two flavors:

```
<div itemscope>
<p>Flavors in my favorite ice cream:</p>

 <li itemprop="flavor">Lemon sorbet
 <li itemprop="flavor">Apricot sorbet

</div>
```

This thus results in an item with two properties, both "flavor", having the values "Lemon sorbet" and "Apricot sorbet".

An element introducing a property can also introduce multiple properties at once, to avoid duplication when some of the properties have the same value.

### Example

Here we see an item with two properties, "favorite-color" and "favorite-fruit", both set to the value "orange":

```
<div itemscope>
orange
</div>
```

It's important to note that there is no relationship between the microdata and the content of the document where the microdata is marked up.

### Example

There is no semantic difference, for instance, between the following two examples:

```
<figure>

<figcaption>The Castle (1986)</figcaption>
</figure>

<meta itemprop="name" content="The Castle">
<figure>

<figcaption>The Castle (1986)</figcaption>
</figure>
```

Both have a figure with a caption, and both, completely unrelated to the figure, have an item with a name-value pair with the name "name" and the value "The Castle". The only difference is that if the user drags the caption out of the document, in the former case, the item will be included in the drag-and-drop data. In neither case is the image in any way associated with the item.

### 5.1.3 Typed items

*This section is non-normative.*

The examples in the previous section show how information could be marked up on a page that doesn't expect its microdata to be re-used. Microdata is most useful, though, when it is used in contexts where other authors and readers are able to cooperate to make new uses of the markup.

For this purpose, it is necessary to give each [item<sup>p689</sup>](#) a type, such as "http://example.com/person", or "http://example.org/cat", or "http://band.example.net/". Types are identified as [URLs<sup>p48</sup>](#).

The type for an [item<sup>p689</sup>](#) is given as the value of an [itemtype<sup>p689</sup>](#) attribute on the same element as the [itemscope<sup>p689</sup>](#) attribute.

#### Example

Here, the item's type is "http://example.org/animals#cat":

```
<section itemscope itemtype="http://example.org/animals#cat">
 <h1 itemprop="name">Hederal</h1>
 <p itemprop="desc">Hederal is a male american domestic
 shorthair, with a fluffy black fur with white paws and belly.</p>

</section>
```

In this example the "http://example.org/animals#cat" item has three properties, a "name" ("Hederal"), a "desc" ("Hederal is..."), and an "img" ("hederal.jpeg").

The type gives the context for the properties, thus selecting a vocabulary: a property named "class" given for an item with the type "http://census.example/person" might refer to the economic class of an individual, while a property named "class" given for an item with the type "http://example.com/school/teacher" might refer to the classroom a teacher has been assigned. Several types can share a vocabulary. For example, the types "http://example.org/people/teacher" and "http://example.org/people/engineer" could be defined to use the same vocabulary (though maybe some properties would not be especially useful in both cases, e.g. maybe the "http://example.org/people/engineer" type might not typically be used with the "classroom" property). Multiple types defined to use the same vocabulary can be given for a single item by listing the URLs as a space-separated list in the attribute's value. An item cannot be given two types if they do not use the same vocabulary, however.

### 5.1.4 Global identifiers for items

*This section is non-normative.*

Sometimes, an [item<sup>p689</sup>](#) gives information about a topic that has a global identifier. For example, books can be identified by their ISBN number.

Vocabularies (as identified by the [itemtype<sup>p689</sup>](#) attribute) can be designed such that [items<sup>p689</sup>](#) get associated with their global identifier in an unambiguous way by expressing the global identifiers as [URLs<sup>p48</sup>](#) given in an [itemid<sup>p690</sup>](#) attribute.

The exact meaning of the [URLs<sup>p48</sup>](#) given in [itemid<sup>p690</sup>](#) attributes depends on the vocabulary used.

#### Example

Here, an item is talking about a particular book:

```
<dl itemscope
 itemtype="http://vocab.example.net/book"
 itemid="urn:isbn:0-330-34032-8">
 <dt>Title
 <dd itemprop="title">The Reality Dysfunction
```

```

<dt>Author
<dd itemprop="author">Peter F. Hamilton
<dt>Publication date
<dd><time itemprop="pubdate" datetime="1996-01-26">26 January 1996</time>
</dl>

```

The "<http://vocab.example.net/book>" vocabulary in this example would define that the [itemid<sup>p690</sup>](#) attribute takes a [urn:URL<sup>p48</sup>](#) pointing to the ISBN of the book.

### 5.1.5 Selecting names when defining vocabularies

*This section is non-normative.*

Using microdata means using a vocabulary. For some purposes, an ad-hoc vocabulary is adequate. For others, a vocabulary will need to be designed. Where possible, authors are encouraged to re-use existing vocabularies, as this makes content re-use easier.

When designing new vocabularies, identifiers can be created either using [URLs<sup>p48</sup>](#), or, for properties, as plain words (with no dots or colons). For URLs, conflicts with other vocabularies can be avoided by only using identifiers that correspond to pages that the author has control over.

#### Example

For instance, if Jon and Adam both write content at `example.com`, at [http://example.com/~jon/...](http://example.com/~jon/) and [http://example.com/~adam/...](http://example.com/~adam/) respectively, then they could select identifiers of the form "`http://example.com/~jon/name`" and "`http://example.com/~adam/name`" respectively.

Properties whose names are just plain words can only be used within the context of the types for which they are intended; properties named using URLs can be reused in items of any type. If an item has no type, and is not part of another item, then if its properties have names that are just plain words, they are not intended to be globally unique, and are instead only intended for limited use. Generally speaking, authors are encouraged to use either properties with globally unique names (URLs) or ensure that their items are typed.

#### Example

Here, an item is an "`http://example.org/animals#cat`", and most of the properties have names that are words defined in the context of that type. There are also a few additional properties whose names come from other vocabularies.

```

<section itemscope itemtype="http://example.org/animals#cat">
 <h1 itemprop="name http://example.com/fn">Hederal</h1>
 <p itemprop="desc">Hederal is a male american domestic shorthair, with a fluffy black fur with white paws and belly.</p>

</section>

```

This example has one item with the type "`http://example.org/animals#cat`" and the following properties:

Property	Value
name	Hederal
<a href="http://example.com/fn">http://example.com/fn</a>	Hederal
desc	Hederal is a male american domestic shorthair, with a fluffy black fur with white paws and belly.
<a href="http://example.com/color">http://example.com/color</a>	black
<a href="http://example.com/color">http://example.com/color</a>	white
img	.../hederal.jpeg

### 5.1.6 Using the microdata DOM API

*This section is non-normative.*

The microdata becomes even more useful when scripts can use it to expose information to the user, for example offering it in a form that can be used by other applications.

The `document.getItems(typeNames)`<sup>p696</sup> method provides access to the [top-level microdata items](#)<sup>p694</sup>. It returns a `NodeList`<sup>p51</sup> containing the items with the specified types, or all types if no argument is specified.

Each `item`<sup>p689</sup> is represented in the DOM by the element on which the relevant `itemScope`<sup>p689</sup> attribute is found. These elements have their `element.itemScope`<sup>p696</sup> IDL attribute set to true.

The type(s) of `items`<sup>p689</sup> can be obtained using the `element.itemType`<sup>p696</sup> IDL attribute on the element with the `itemScope`<sup>p689</sup> attribute.

### Example

This sample shows how the `getItems()`<sup>p696</sup> method can be used to obtain a list of all the top-level microdata items of a particular type given in the document:

```
var cats = document.getItems("http://example.com/feline");
```

Once an element representing an `item`<sup>p689</sup> has been obtained, its properties can be extracted using the `properties`<sup>p696</sup> IDL attribute. This attribute returns an `HTMLPropertiesCollection`<sup>p95</sup>, which can be enumerated to go through each element that adds one or more properties to the item. It can also be indexed by name, which will return an object with a list of the elements that add properties with that name.

Each element that adds a property also has an `itemValue`<sup>p696</sup> IDL attribute that returns its value.

### Example

This sample gets the first item of type "http://example.net/user" and then pops up an alert using the "name" property from that item.

```
var user = document.getItems('http://example.net/user')[0];
alert('Hello ' + user.properties['name'][0].itemValue + '!');
```

The `HTMLPropertiesCollection`<sup>p95</sup> object, when indexed by name in this way, actually returns a `PropertyNodeList`<sup>p95</sup> object with all the matching properties. The `PropertyNodeList`<sup>p95</sup> object can be used to obtain all the values at once using its `getValues`<sup>p96</sup> method, which returns an array of all the values.

### Example

In an earlier example, a "http://example.org/animals#cat" item had two "http://example.com/color" values. This script looks up the first such item and then lists all its values.

```
var cat = document.getItems('http://example.org/animals#cat')[0];
var colors = cat.properties['http://example.com/color'].getValues();
var result;
if (colors.length == 0) {
 result = 'Colour unknown.';
} else if (colors.length == 1) {
 result = 'Colour: ' + colors[0];
} else {
 result = 'Colours:';
 for (var i = 0; i < colors.length; i += 1)
 result += ' ' + colors[i];
}
```

It's also possible to get a list of all the `property names`<sup>p692</sup> using the object's `names`<sup>p96</sup> IDL attribute.

### Example

This example creates a big list with a nested list for each item on the page, each with all of the property names used in that item.

```
var outer = document.createElement('ul');
var items = document.getItems();
for (var item = 0; item < items.length; item += 1) {
 var itemLi = document.createElement('li');
 var inner = document.createElement('ul');
 for (var name = 0; name < items[item].properties.names.length; name += 1) {
 var propLi = document.createElement('li');
 propLi.appendChild(document.createTextNode(items[item].properties.names[name]));
 inner.appendChild(propLi);
 }
 itemLi.appendChild(inner);
 outer.appendChild(itemLi);
}
```

```

 inner.appendChild(propLi);
 }
 itemLi.appendChild(inner);
 outer.appendChild(itemLi);
}
document.body.appendChild(outer);

```

If faced with the following from an earlier example:

```

<section itemscope itemtype="http://example.org/animals#cat">
 <h1 itemprop="name http://example.com/fn">Hederal</h1>
 <p itemprop="desc">Hederal is a male american domestic
 shorthair, with a fluffy black fur with white paws and belly.</p>

</section>

```

...it would result in the following output:

- - name
  - http://example.com/fn
  - desc
  - http://example.com/color
  - img

(The duplicate occurrence of "http://example.com/color" is not included in the list.)

## 5.2 Encoding microdata

### 5.2.1 The microdata model

The microdata model consists of groups of name-value pairs known as [items<sup>p689</sup>](#).

Each group is known as an [item<sup>p689</sup>](#). Each [item<sup>p689</sup>](#) can have [item types<sup>p689</sup>](#), a [global identifier<sup>p690</sup>](#) (if the vocabulary specified by the [item types<sup>p689</sup>](#) [support global identifiers for items<sup>p690</sup>](#)), and a list of name-value pairs. Each name in the name-value pair is known as a [property<sup>p694</sup>](#), and each [property<sup>p694</sup>](#) has one or more [values<sup>p693</sup>](#). Each [value<sup>p693</sup>](#) is either a string or itself a group of name-value pairs (an [item<sup>p689</sup>](#)). The names are unordered relative to each other, but if a particular name has multiple values, they do have a relative order.

### 5.2.2 Items

Every [HTML element<sup>p42</sup>](#) may have an [itemscope](#) attribute specified. The [itemscope<sup>p689</sup>](#) attribute is a [boolean attribute<sup>p59</sup>](#).

An element with the [itemscope<sup>p689</sup>](#) attribute specified creates a new [item](#), a group of name-value pairs.

Elements with an [itemscope<sup>p689</sup>](#) attribute may have an [itemtype](#) attribute specified, to give the [item types<sup>p689</sup>](#) of the [item<sup>p689</sup>](#).

The [itemtype<sup>p689</sup>](#) attribute, if specified, must have a value that is an [unordered set of unique space-separated tokens<sup>p80</sup>](#) that are [case-sensitive<sup>p58</sup>](#), each of which is a [valid URL<sup>p81</sup>](#) that is an [absolute URL<sup>p48</sup>](#), and all of which are defined to use the same vocabulary. The attribute's value must have at least one token.

The [item types](#) of an [item<sup>p689</sup>](#) are the tokens obtained by [splitting the element's itemtype attribute's value on spaces<sup>p80</sup>](#). If the [itemtype<sup>p689</sup>](#) attribute is missing or parsing it in this way finds no tokens, the [item<sup>p689</sup>](#) is said to have no [item types<sup>p689</sup>](#).

The [item types<sup>p689</sup>](#) must all be types defined in [applicable specifications<sup>p56</sup>](#) and must all be defined to use the same vocabulary.

Except if otherwise specified by that specification, the [URLs<sup>p48</sup>](#) given as the [item types<sup>p689</sup>](#) should not be automatically dereferenced.

**Note** A specification could define that its [item type<sup>p689</sup>](#) can be dereferenced to provide the user with help information, for example. In fact, vocabulary authors are encouraged to provide useful information at the given [URL<sup>p48</sup>](#).

[Item types<sup>p689</sup>](#) are opaque identifiers, and user agents must not dereference unknown [item types<sup>p689</sup>](#), or otherwise deconstruct them, in order to determine how to process [items<sup>p689</sup>](#) that use them.

The [itemtype<sup>p689</sup>](#) attribute must not be specified on elements that do not have an [itemscope<sup>p689</sup>](#) attribute specified.

An [item<sup>p689</sup>](#) is said to be a **typed item** when either it has an [item type<sup>p689</sup>](#), or it is the [value<sup>p693</sup>](#) of a [property<sup>p694</sup>](#) of a [typed item<sup>p690</sup>](#). The **relevant types** for a [typed item<sup>p690</sup>](#) is the [item<sup>p689</sup>](#)'s [item types<sup>p689</sup>](#), if it has any, or else is the [relevant types<sup>p690</sup>](#) of the [item<sup>p689</sup>](#) for which it is a [property<sup>p694</sup>](#)'s [value<sup>p693</sup>](#).

Elements with an [itemscope<sup>p689</sup>](#) attribute and an [itemtype<sup>p689</sup>](#) attribute that references a vocabulary that is defined to **support global identifiers for items** may also have an [itemid](#) attribute specified, to give a global identifier for the [item<sup>p689</sup>](#), so that it can be related to other [items<sup>p689</sup>](#) on pages elsewhere on the Web.

The [itemid<sup>p690</sup>](#) attribute, if specified, must have a value that is a [valid URL potentially surrounded by spaces<sup>p82</sup>](#).

The **global identifier** of an [item<sup>p689</sup>](#) is the value of its element's [itemid<sup>p690</sup>](#) attribute, if it has one, [resolved<sup>p82</sup>](#) relative to the element on which the attribute is specified. If the [itemid<sup>p690</sup>](#) attribute is missing or if resolving it fails, it is said to have no [global identifier<sup>p690</sup>](#).

The [itemid<sup>p690</sup>](#) attribute must not be specified on elements that do not have both an [itemscope<sup>p689</sup>](#) attribute and an [itemtype<sup>p689</sup>](#) attribute specified, and must not be specified on elements with an [itemscope<sup>p689</sup>](#) attribute whose [itemtype<sup>p689</sup>](#) attribute specifies a vocabulary that does not **support global identifiers for items<sup>p690</sup>**, as defined by that vocabulary's specification.

The exact meaning of a [global identifier<sup>p690</sup>](#) is determined by the vocabulary's specification. It is up to such specifications to define whether multiple items with the same global identifier (whether on the same page or on different pages) are allowed to exist, and what the processing rules for that vocabulary are with respect to handling the case of multiple items with the same ID.

Elements with an [itemscope<sup>p689</sup>](#) attribute may have an [itemref](#) attribute specified, to give a list of additional elements to crawl to find the name-value pairs of the [item<sup>p689</sup>](#).

The [itemref<sup>p690</sup>](#) attribute, if specified, must have a value that is an [unordered set of unique space-separated tokens<sup>p80</sup>](#) that are [case-sensitive<sup>p58</sup>](#), consisting of [IDs<sup>p51</sup>](#) of elements in the same [home subtree<sup>p42</sup>](#).

The [itemref<sup>p690</sup>](#) attribute must not be specified on elements that do not have an [itemscope<sup>p689</sup>](#) attribute specified.

**Note** The [itemref<sup>p690</sup>](#) attribute is not part of the microdata data model. It is merely a syntactic construct to aid authors in adding annotations to pages where the data to be annotated does not follow a convenient tree structure. For example, it allows authors to mark up data in a table so that each column defines a separate [item<sup>p689</sup>](#), while keeping the properties in the cells.

### Example

This example shows a simple vocabulary used to describe the products of a model railway manufacturer. The vocabulary has just five property names:

#### product-code

An integer that names the product in the manufacturer's catalogue.

#### name

A brief description of the product.

#### scale

One of "HO", "1", or "Z" (potentially with leading or trailing whitespace), indicating the scale of the product.

#### digital

If present, one of "Digital", "Delta", or "Systems" (potentially with leading or trailing whitespace) indicating that the product has a digital decoder of the given type.

### **track-type**

For track-specific products, one of "K", "M", "C" (potentially with leading or trailing whitespace) indicating the type of track for which the product is intended.

This vocabulary has four defined [item types<sup>p689</sup>](#):

#### **<http://md.example.com/loco>**

Rolling stock with an engine

#### **<http://md.example.com/passengers>**

Passenger rolling stock

#### **<http://md.example.com/track>**

Track pieces

#### **<http://md.example.com/lighting>**

Equipment with lighting

Each [item<sup>p689</sup>](#) that uses this vocabulary can be given one or more of these types, depending on what the product is.

Thus, a locomotive might be marked up as:

```
<dl itemscope itemtype="http://md.example.com/loco
 http://md.example.com/lighting">
 <dt>Name:
 <dd itemprop="name">Tank Locomotive (DB 80)
 <dt>Product code:
 <dd itemprop="product-code">33041
 <dt>Scale:
 <dd itemprop="scale">HO
 <dt>Digital:
 <dd itemprop="digital">Delta
</dl>
```

A turnout lantern retrofit kit might be marked up as:

```
<dl itemscope itemtype="http://md.example.com/track
 http://md.example.com/lighting">
 <dt>Name:
 <dd itemprop="name">Turnout Lantern Kit
 <dt>Product code:
 <dd itemprop="product-code">74470
 <dt>Purpose:
 <dd>For retrofitting 2 C Track
 turnouts. <meta itemprop="scale" content="HO">
</dl>
```

A passenger car with no lighting might be marked up as:

```
<dl itemscope itemtype="http://md.example.com/passengers">
 <dt>Name:
 <dd itemprop="name">Express Train Passenger Car (DB Am 203)
 <dt>Product code:
 <dd itemprop="product-code">8710
 <dt>Scale:
 <dd itemprop="scale">Z
</dl>
```

Great care is necessary when creating new vocabularies. Often, a hierarchical approach to types can be taken that results in a vocabulary where each item only ever has a single type, which is generally much simpler to manage.

### 5.2.3 Names: the `itemprop` attribute

Every [HTML element<sup>p42</sup>](#) may have an `itemprop`<sup>p692</sup> attribute specified, if doing so [adds one or more properties<sup>p694</sup>](#) to one or more [items<sup>p689</sup>](#) (as defined below).

The `itemprop`<sup>p692</sup> attribute, if specified, must have a value that is an [unordered set of unique space-separated tokens<sup>p80</sup>](#) that are [case-sensitive<sup>p58</sup>](#), representing the names of the name-value pairs that it adds. The attribute's value must have at least one token.

Each token must be either:

- If the item is a [typed item<sup>p690</sup>](#): a **defined property name** allowed in this situation according to the specification that defines the [relevant types<sup>p690</sup>](#) for the item, or
- A [valid URL<sup>p81</sup>](#) that is an [absolute URL<sup>p48</sup>](#) defined as an item property name allowed in this situation by a vocabulary specification, or
- A [valid URL<sup>p81</sup>](#) that is an [absolute URL<sup>p48</sup>](#), used as a proprietary item property name (i.e. one used by the author for private purposes, not defined in a public specification), or
- If the item is not a [typed item<sup>p690</sup>](#): a string that contains no U+002E FULL STOP characters (.) and no U+003A COLON characters (:), used as a proprietary item property name (i.e. one used by the author for private purposes, not defined in a public specification).

Specifications that introduce [defined property names<sup>p692</sup>](#) must ensure all such property names contain no U+002E FULL STOP characters (.), no U+003A COLON characters (:), and no [space characters<sup>p58</sup>](#).

**Note** *The rules above disallow U+003A COLON characters (:) in non-URL values because otherwise they could not be distinguished from URLs. Values with U+002E FULL STOP characters (.) are reserved for future extensions. Space characters<sup>p58</sup> are disallowed because otherwise the values would be parsed as multiple tokens.*

When an element with an `itemprop`<sup>p692</sup> attribute [adds a property<sup>p694</sup>](#) to multiple [items<sup>p689</sup>](#), the requirement above regarding the tokens applies for each [item<sup>p689</sup>](#) individually.

The **property names** of an element are the tokens that the element's `itemprop`<sup>p692</sup> attribute is found to contain when its value is [split on spaces<sup>p80</sup>](#), with the order preserved but with duplicates removed (leaving only the first occurrence of each name).

Within an [item<sup>p689</sup>](#), the properties are unordered with respect to each other, except for properties with the same name, which are ordered in the order they are given by the algorithm that defines [the properties of an item<sup>p694</sup>](#).

#### Example

In the following example, the "a" property has the values "1" and "2", *in that order*, but whether the "a" property comes before the "b" property or not is not important:

```
<div itemscope>
 <p itemprop="a">1</p>
 <p itemprop="a">2</p>
 <p itemprop="b">test</p>
</div>
```

Thus, the following is equivalent:

```
<div itemscope>
 <p itemprop="b">test</p>
 <p itemprop="a">1</p>
 <p itemprop="a">2</p>
</div>
```

As is the following:

```
<div itemscope>
 <p itemprop="a">1</p>
 <p itemprop="b">test</p>
 <p itemprop="a">2</p>
</div>
```

And the following:

```
<div id="x">
 <p itemprop="a">1</p>
</div>
<div itemscope itemref="x">
 <p itemprop="b">test</p>
 <p itemprop="a">2</p>
</div>
```

## 5.2.4 Values

The **property value** of a name-value pair added by an element with an [itemprop](#) attribute is as given for the first matching case in the following list:

↪ If the element also has an [itemscope](#) attribute

The value is the [item](#) created by the element.

↪ If the element is a [meta](#) element

The value is the value of the element's [content](#) attribute, if any, or the empty string if there is no such attribute.

↪ If the element is an [audio](#), [embed](#), [iframe](#), [img](#), [source](#), [track](#), or [video](#) element

The value is the [absolute URL](#) that results from [resolving](#) the value of the element's [src](#) attribute relative to the element at the time the attribute is set, or the empty string if there is no such attribute or if [resolving](#) it results in an error.

↪ If the element is an [a](#), [area](#), or [link](#) element

The value is the [absolute URL](#) that results from [resolving](#) the value of the element's [href](#) attribute relative to the element at the time the attribute is set, or the empty string if there is no such attribute or if [resolving](#) it results in an error.

↪ If the element is an [object](#) element

The value is the [absolute URL](#) that results from [resolving](#) the value of the element's [data](#) attribute relative to the element at the time the attribute is set, or the empty string if there is no such attribute or if [resolving](#) it results in an error.

↪ If the element is a [data](#) element

The value is the value of the element's [value](#) attribute, if it has one, or the empty string otherwise.

↪ If the element is a [meter](#) element

The value is the value of the element's [value](#) attribute, if it has one, or the empty string otherwise.

↪ If the element is a [time](#) element

The value is the element's [datetime value](#).

↪ Otherwise

The value is the element's [textContent](#).

The **URL property elements** are the [a](#), [area](#), [audio](#), [embed](#), [iframe](#), [img](#), [link](#), [object](#), [source](#), [track](#), and [video](#) elements.

If a property's [value](#), as defined by the property's definition, is an [absolute URL](#), the property must be specified using a [URL property element](#).

**Note** These requirements do not apply just because a property value happens to match the syntax for a URL. They only apply if the property is explicitly defined as taking such a value.

**Example** For example, a book about the first moon landing could be called "mission:moon". A "title" property from a vocabulary that defines a title as being a string would not expect the title to be given in an [a](#) element, even though it looks like a [URL](#). On the other hand, if there was a (rather narrowly scoped!) vocabulary for "books whose titles look like URLs" which had a "title" property defined to take a URL,

then the property *would* expect the title to be given in an [a<sup>b208</sup>](#) element (or one of the other [URL property elements<sup>p693</sup>](#)), because of the requirement above.

## 5.2.5 Associating names with items

To find [the properties of an item](#) defined by the element *root*, the user agent must run the following steps. These steps are also used to flag [microdata errors<sup>p694</sup>](#).

1. Let *results*, *memory*, and *pending* be empty lists of elements.
2. Add the element *root* to *memory*.
3. Add the child elements of *root*, if any, to *pending*.
4. If *root* has an [itemref<sup>p690</sup>](#) attribute, [split the value of that itemref attribute on spaces<sup>p80</sup>](#). For each resulting token *ID*, if there is an element in the [home subtree<sup>p42</sup>](#) of *root* with the [ID<sup>p51</sup>](#) *ID*, then add the first such element to *pending*.
5. *Loop*: If *pending* is empty, jump to the step labeled *end of loop*.
6. Remove an element from *pending* and let *current* be that element.
7. If *current* is already in *memory*, there is a [microdata error<sup>p694</sup>](#); return to the step labeled *loop*.
8. Add *current* to *memory*.
9. If *current* does not have an [itemscope<sup>p689</sup>](#) attribute, then: add all the child elements of *current* to *pending*.
10. If *current* has an [itemprop<sup>p692</sup>](#) attribute specified and has one or more [property names<sup>p692</sup>](#), then add *current* to *results*.
11. Return to the step labeled *loop*.
12. *End of loop*: Sort *results* in [tree order<sup>p42</sup>](#).
13. Return *results*.

A document must not contain any [items<sup>b689</sup>](#) for which the algorithm to find [the properties of an item<sup>p694</sup>](#) finds any [microdata errors](#).

An [item<sup>p689</sup>](#) is a **top-level microdata item** if its element does not have an [itemprop<sup>p692</sup>](#) attribute.

All [itemref<sup>p690</sup>](#) attributes in a [Document<sup>p102</sup>](#) must be such that there are no cycles in the graph formed from representing each [item<sup>p689</sup>](#) in the [Document<sup>p102</sup>](#) as a node in the graph and each [property<sup>p694</sup>](#) of an item whose [value<sup>p693</sup>](#) is another item as an edge in the graph connecting those two items.

A document must not contain any elements that have an [itemprop<sup>p692</sup>](#) attribute that would not be found to be a property of any of the [items<sup>p689</sup>](#) in that document were their [properties<sup>p694</sup>](#) all to be determined.

### Example

In this example, a single license statement is applied to two works, using [itemref<sup>p690</sup>](#) from the items representing the works:

```
<!DOCTYPE HTML>
<html>
 <head>
 <title>Photo gallery</title>
 </head>
 <body>
 <h1>My photos</h1>
 <figure itemscope itemtype="http://n.whatwg.org/work" itemref="licenses">

 <figcaption itemprop="title">The house I found.</figcaption>
 </figure>
 <figure itemscope itemtype="http://n.whatwg.org/work" itemref="licenses">

 <figcaption itemprop="title">The mailbox.</figcaption>
 </figure>
 <footer>
 <p id="licenses">All images licensed under the <a itemprop="license"
 href="http://www.opensource.org/licenses/mit-license.php">MIT
 license.</p>
 </footer>
</body>
</html>

```

The above results in two items with the type "<http://n.whatwg.org/work>", one with:

**work**  
     images/house.jpeg  
**title**  
     The house I found.  
**license**  
     <http://www.opensource.org/licenses/mit-license.php>

...and one with:

**work**  
     images/mailbox.jpeg  
**title**  
     The mailbox.  
**license**  
     <http://www.opensource.org/licenses/mit-license.php>

## 5.2.6 Microdata and other namespaces

Currently, the [itemscope](#)<sup>p689</sup>, [itemprop](#)<sup>p692</sup>, and other microdata attributes are only defined for [HTML elements](#)<sup>p42</sup>. This means that attributes with the literal names "itemscope", "itemprop", etc, do not cause microdata processing to occur on elements in other namespaces, such as SVG.

### Example

Thus, in the following example there is only one item, not two.

```

<p itemscope></p> <!-- this is an item (with no properties and no type) -->
<svg itemscope></svg> <!-- this is not, it's just an svg element with an invalid unknown
attribute -->

```

## 5.3 Microdata DOM API

### Note

**document.getItems<sup>p696</sup>([ types ])**

Returns a [NodeList](#)<sup>p51</sup> of the elements in the [Document](#)<sup>p102</sup> that create [items](#)<sup>p689</sup>, that are not part of other [items](#)<sup>p689</sup>, and that are of the types given in the argument, if any are listed.

The *types* argument is interpreted as a space-separated list of types.

**element.properties<sup>p696</sup>**

If the element has an [itemscope](#)<sup>p689</sup> attribute, returns an [HTMLPropertiesCollection](#)<sup>p95</sup> object with all the element's properties. Otherwise, an empty [HTMLPropertiesCollection](#)<sup>p95</sup> object.

`element.itemValuep696 [= value]`

Returns the element's [value<sup>p693</sup>](#).

Can be set, to change the element's [value<sup>p693</sup>](#). Setting the [value<sup>p693</sup>](#) when the element has no [itemprop<sup>p692</sup>](#) attribute or when the element's value is an [item<sup>p689</sup>](#) throws an [InvalidAccessError<sup>p50</sup>](#) exception.

The [document.getItems \(typeNames\)](#) method takes a string that contains an [unordered set of unique space-separated tokens<sup>p80</sup>](#) that are [case-sensitive<sup>p58</sup>](#), representing types. When called, the method must return a [live<sup>p43</sup> NodeList<sup>p51</sup>](#) object containing all the elements in the document, in [tree order<sup>p42</sup>](#), that are each [top-level microdata items<sup>p694</sup>](#) whose [types<sup>p689</sup>](#) include all the types specified in the method's argument, having obtained the types by [splitting the string on spaces<sup>p80</sup>](#). If there are no tokens specified in the argument, then the method must return a [NodeList<sup>p51</sup>](#) containing all the [top-level microdata items<sup>p694</sup>](#) in the document. When the method is invoked on a [Document<sup>p102</sup>](#) object again with the same argument, the user agent may return the same object as the object returned by the earlier call. In other cases, a new [NodeList<sup>p51</sup>](#) object must be returned.

The [itemScope](#) IDL attribute on [HTML elements<sup>p42</sup>](#) must [reflect<sup>p88</sup>](#) the [itemscope<sup>p689</sup>](#) content attribute. The [itemType](#) IDL attribute on [HTML elements<sup>p42</sup>](#) must [reflect<sup>p88</sup>](#) the [itemtype<sup>p689</sup>](#) content attribute. The [itemId](#) IDL attribute on [HTML elements<sup>p42</sup>](#) must [reflect<sup>p88</sup>](#) the [itemid<sup>p690</sup>](#) content attribute. The [itemProp](#) IDL attribute on [HTML elements<sup>p42</sup>](#) must [reflect<sup>p88</sup>](#) the [itemprop<sup>p692</sup>](#) content attribute. The [itemRef](#) IDL attribute on [HTML elements<sup>p42</sup>](#) must [reflect<sup>p88</sup>](#) the [itemref<sup>p690</sup>](#) content attribute.

The [properties](#) IDL attribute on [HTML elements<sup>p42</sup>](#) must return an [HTMLPropertiesCollection<sup>p95</sup>](#) rooted at the element's [root element<sup>p42</sup>](#) (which element this is might change during the collection's lifetime, as the element moves between different subtrees), whose filter matches only elements that are [the properties of the item<sup>p694</sup>](#) created by the element on which the attribute was invoked, while that element is an [item<sup>p689</sup>](#), and matches nothing the rest of the time.

The [itemValue](#) IDL attribute's behaviour depends on the element, as follows:

#### If the element has no [itemprop<sup>p692</sup>](#) attribute

The attribute must return null on getting and must throw an [InvalidAccessError<sup>p50</sup>](#) exception on setting.

#### If the element has an [itemscope<sup>p689</sup>](#) attribute

The attribute must return the element itself on getting and must throw an [InvalidAccessError<sup>p50</sup>](#) exception on setting.

#### If the element is a [meta<sup>p145</sup>](#) element

The attribute must act as it would if it was [reflecting<sup>p88</sup>](#) the element's [content<sup>p146</sup>](#) content attribute.

#### If the element is an [audio<sup>p321</sup>](#), [embed<sup>p307</sup>](#), [iframe<sup>p299</sup>](#), [img<sup>p272</sup>](#), [source<sup>p322</sup>](#), [track<sup>p324</sup>](#), or [video<sup>p317</sup>](#) element

The attribute must act as it would if it was [reflecting<sup>p88</sup>](#) the element's [src](#) content attribute.

#### If the element is an [a<sup>p208</sup>](#), [area<sup>p390</sup>](#), or [link<sup>p141</sup>](#) element

The attribute must act as it would if it was [reflecting<sup>p88</sup>](#) the element's [href](#) content attribute.

#### If the element is an [object<sup>p310</sup>](#) element

The attribute must act as it would if it was [reflecting<sup>p88</sup>](#) the element's [data](#) content attribute.

#### If the element is a [data<sup>p226</sup>](#) element

The attribute must act as it would if it was [reflecting<sup>p88</sup>](#) the element's [value<sup>p226</sup>](#) content attribute.

#### If the element is a [meter<sup>p519</sup>](#) element

The attribute must act as it would if it was [reflecting<sup>p88</sup>](#) the element's [value<sup>p520</sup>](#) content attribute.

#### If the element is a [time<sup>p227</sup>](#) element

On getting, if the element has a [datetime<sup>p227</sup>](#) content attribute, the IDL attribute must return that content attribute's value; otherwise, it must return the element's [textContent<sup>p51</sup>](#). On setting, the IDL attribute must act as it would if it was [reflecting<sup>p88</sup>](#) the element's [datetime<sup>p227</sup>](#) content attribute.

#### Otherwise

The attribute must act the same as the element's [textContent<sup>p51</sup>](#) attribute.

When the `itemValue`<sup>p696</sup> IDL attribute is `reflecting`<sup>p88</sup> a content attribute or acting like the element's `textContent`<sup>p51</sup> attribute, the user agent must, on setting, convert the new value to the IDL `DOMString`<sup>p49</sup> value before using it according to the mappings described above.

#### Example

In this example, a script checks to see if a particular element `element` is declaring a particular property, and if it is, it increments a counter:

```
if (element.itemProp.contains('color'))
 count += 1;
```

#### Example

This script iterates over each of the values of an element's `itemref`<sup>p690</sup> attribute, calling a function for each referenced element:

```
for (var index = 0; index < element.itemRef.length; index += 1)
 process(document.getElementById(element.itemRef[index]));
```

## 5.4 Sample microdata vocabularies

The vocabularies in this section are primarily intended to demonstrate how a vocabulary is specified, though they are also usable in their own right.

### 5.4.1 vCard

An item with the `item type`<sup>p689</sup> <http://microformats.org/profile/hcard> represents a person's or organization's contact information.

This vocabulary does not [support global identifiers for items](#)<sup>p690</sup>.

The following are the type's [defined property names](#)<sup>p692</sup>. They are based on the vocabulary defined in the vCard 4.0 specification and its extensions, where more information on how to interpret the values can be found. [\[RFC6350\]](#)<sup>p153</sup>

#### `kind`

Describes what kind of contact the item represents.

The `value`<sup>p693</sup> must be text that, when compared in a [case-sensitive](#)<sup>p58</sup> manner, is equal to one of the [kind strings](#)<sup>p704</sup>.

A single property with the name `kind`<sup>p697</sup> may be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `fn`

Gives the formatted text corresponding to the name of the person or organization.

The `value`<sup>p693</sup> must be text.

Exactly one property with the name `fn`<sup>p697</sup> must be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `n`

Gives the structured name of the person or organization.

The `value`<sup>p693</sup> must be an `item`<sup>p689</sup> with zero or more of each of the `family-name`<sup>p697</sup>, `given-name`<sup>p698</sup>, `additional-name`<sup>p698</sup>, `honorable-prefix`<sup>p698</sup>, and `honorable-suffix`<sup>p698</sup> properties.

Exactly one property with the name `n`<sup>p697</sup> must be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `family-name` (inside `n`<sup>p697</sup>)

Gives the family name of the person, or the full name of the organization.

The value<sup>p693</sup> must be text.

Any number of properties with the name family-name<sup>p697</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of the n<sup>p697</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### **given-name (inside n<sup>p697</sup>)**

Gives the given-name of the person.

The value<sup>p693</sup> must be text.

Any number of properties with the name given-name<sup>p698</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of the n<sup>p697</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### **additional-name (inside n<sup>p697</sup>)**

Gives the any additional names of the person.

The value<sup>p693</sup> must be text.

Any number of properties with the name additional-name<sup>p698</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of the n<sup>p697</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### **honorific-prefix (inside n<sup>p697</sup>)**

Gives the honorific prefix of the person.

The value<sup>p693</sup> must be text.

Any number of properties with the name honorific-prefix<sup>p698</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of the n<sup>p697</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### **honorific-suffix (inside n<sup>p697</sup>)**

Gives the honorific suffix of the person.

The value<sup>p693</sup> must be text.

Any number of properties with the name honorific-suffix<sup>p698</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of the n<sup>p697</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### **nickname**

Gives the nickname of the person or organization.

**Note** *The nickname is the descriptive name given instead of or in addition to the one belonging to a person, place, or thing. It can also be used to specify a familiar form of a proper name specified by the fn<sup>p697</sup> or n<sup>p697</sup> properties.*

The value<sup>p693</sup> must be text.

Any number of properties with the name nickname<sup>p698</sup> may be present within each item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### **photo**

Gives a photograph of the person or organization.

The value<sup>p693</sup> must be an absolute URL<sup>p48</sup>.

Any number of properties with the name photo<sup>p698</sup> may be present within each item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### **bday**

Gives the birth date of the person or organization.

The value<sup>p693</sup> must be a valid date string<sup>p67</sup>.

A single property with the name [bday](#)<sup>p698</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### [anniversary](#)

Gives the birth date of the person or organization.

The [value](#)<sup>p693</sup> must be a [valid date string](#)<sup>p67</sup>.

A single property with the name [anniversary](#)<sup>p699</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### [sex](#)

Gives the biological sex of the person.

The [value](#)<sup>p693</sup> must be one of F, meaning "female", M, meaning "male", N, meaning "none or not applicable", O, meaning "other", or U, meaning "unknown".

A single property with the name [sex](#)<sup>p699</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### [gender-identity](#)

Gives the gender identity of the person.

The [value](#)<sup>p693</sup> must be text.

A single property with the name [gender-identity](#)<sup>p699</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### [adr](#)

Gives the delivery address of the person or organization.

The [value](#)<sup>p693</sup> must be an [item](#)<sup>p689</sup> with zero or more [type](#)<sup>p699</sup>, [post-office-box](#)<sup>p699</sup>, [extended-address](#)<sup>p700</sup>, and [street-address](#)<sup>p700</sup> properties, and optionally a [locality](#)<sup>p700</sup> property, optionally a [region](#)<sup>p700</sup> property, optionally a [postal-code](#)<sup>p700</sup> property, and optionally a [country-name](#)<sup>p700</sup> property.

If no [type](#)<sup>p699</sup> properties are present within an [item](#)<sup>p689</sup> that forms the [value](#)<sup>p693</sup> of an [adr](#)<sup>p699</sup> property of an [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>, then the [address type string](#)<sup>p704</sup> [work](#)<sup>p705</sup> is implied.

Any number of properties with the name [adr](#)<sup>p699</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### [type](#) (inside [adr](#)<sup>p699</sup>)

Gives the type of delivery address.

The [value](#)<sup>p693</sup> must be text that, when compared in a [case-sensitive](#)<sup>p58</sup> manner, is equal to one of the [address type strings](#)<sup>p704</sup>.

Any number of properties with the name [type](#)<sup>p699</sup> may be present within the [item](#)<sup>p689</sup> that forms the [value](#)<sup>p693</sup> of an [adr](#)<sup>p699</sup> property of an [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>, but within each such [adr](#)<sup>p699</sup> property [item](#)<sup>p689</sup> there must only be one [type](#)<sup>p699</sup> property per distinct value.

#### [post-office-box](#) (inside [adr](#)<sup>p699</sup>)

Gives the post office box component of the delivery address of the person or organization.

The [value](#)<sup>p693</sup> must be text.

Any number of properties with the name [post-office-box](#)<sup>p699</sup> may be present within the [item](#)<sup>p689</sup> that forms the [value](#)<sup>p693</sup> of an [adr](#)<sup>p699</sup> property of an [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

**Note** *The vCard specification urges authors not to use this field.*

### **extended-address** (inside adr<sup>p699</sup>)

Gives an additional component of the delivery address of the person or organization.

The value<sup>p693</sup> must be text.

Any number of properties with the name extended-address<sup>p700</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of an adr<sup>p699</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

**Note** *The vCard specification urges authors not to use this field.*

### **street-address** (inside adr<sup>p699</sup>)

Gives the street address component of the delivery address of the person or organization.

The value<sup>p693</sup> must be text.

Any number of properties with the name street-address<sup>p700</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of an adr<sup>p699</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

### **locality** (inside adr<sup>p699</sup>)

Gives the locality component (e.g. city) of the delivery address of the person or organization.

The value<sup>p693</sup> must be text.

A single property with the name locality<sup>p700</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of an adr<sup>p699</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

### **region** (inside adr<sup>p699</sup>)

Gives the region component (e.g. state or province) of the delivery address of the person or organization.

The value<sup>p693</sup> must be text.

A single property with the name region<sup>p700</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of an adr<sup>p699</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

### **postal-code** (inside adr<sup>p699</sup>)

Gives the postal code component of the delivery address of the person or organization.

The value<sup>p693</sup> must be text.

A single property with the name postal-code<sup>p700</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of an adr<sup>p699</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

### **country-name** (inside adr<sup>p699</sup>)

Gives the country name component of the delivery address of the person or organization.

The value<sup>p693</sup> must be text.

A single property with the name country-name<sup>p700</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of an adr<sup>p699</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

### **tel**

Gives the telephone number of the person or organization.

The value<sup>p693</sup> must be either text that can be interpreted as a telephone number as defined in the CCITT specifications E.163 and X.121, or an item<sup>p689</sup> with zero or more type<sup>p701</sup> properties and exactly one value<sup>p701</sup> property. [E163]<sup>p1150</sup> [X121]<sup>p1154</sup>

If no type<sup>p701</sup> properties are present within an item<sup>p689</sup> that forms the value<sup>p693</sup> of a tel<sup>p700</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>, or if the value<sup>p693</sup> of such a tel<sup>p700</sup> property is text, then the telephone type string<sup>p705</sup> voice<sup>p705</sup> is implied.

Any number of properties with the name `tel`<sup>p700</sup> may be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `type` (inside `tel`<sup>p700</sup>)

Gives the type of telephone number.

The `value`<sup>p693</sup> must be text that, when compared in a [case-sensitive](#)<sup>p58</sup> manner, is equal to one of the [telephone type strings](#)<sup>p705</sup>.

Any number of properties with the name `type`<sup>p701</sup> may be present within the `item`<sup>p689</sup> that forms the `value`<sup>p693</sup> of a `tel`<sup>p700</sup> property of an `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>, but within each such `tel`<sup>p700</sup> property `item`<sup>p689</sup> there must only be one `type`<sup>p701</sup> property per distinct value.

#### `value` (inside `tel`<sup>p700</sup>)

Gives the actual telephone number of the person or organization.

The `value`<sup>p693</sup> must be text that can be interpreted as a telephone number as defined in the CCITT specifications E.163 and X.121. [\[E163\]](#)<sup>p1150</sup> [\[X121\]](#)<sup>p1154</sup>

Exactly one property with the name `value`<sup>p701</sup> must be present within the `item`<sup>p689</sup> that forms the `value`<sup>p693</sup> of a `tel`<sup>p700</sup> property of an `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `email`

Gives the e-mail address of the person or organization.

The `value`<sup>p693</sup> must be text.

Any number of properties with the name `email`<sup>p701</sup> may be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `impp`

Gives a [URL](#)<sup>p48</sup> for instant messaging and presence protocol communications with the person or organization.

The `value`<sup>p693</sup> must be an [absolute URL](#)<sup>p48</sup>.

Any number of properties with the name `impp`<sup>p701</sup> may be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `lang`

Gives a language understood by the person or organization.

The `value`<sup>p693</sup> must be a valid BCP 47 language tag. [\[BCP47\]](#)<sup>p1148</sup>.

Any number of properties with the name `lang`<sup>p701</sup> may be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### `tz`

Gives the time zone of the person or organization.

The `value`<sup>p693</sup> must be text and must match the following syntax:

1. Either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
2. A [valid non-negative integer](#)<sup>p61</sup> that is exactly two digits long and that represents a number in the range 00..23.
3. A U+003A COLON character (:).
4. A [valid non-negative integer](#)<sup>p61</sup> that is exactly two digits long and that represents a number in the range 00..59.

Any number of properties with the name `tz`<sup>p701</sup> may be present within each `item`<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

## **geo**

Gives the geographical position of the person or organization.

The [value<sup>p693</sup>](#) must be text and must match the following syntax:

1. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
2. One or more [ASCII digits<sup>p58</sup>](#).
3. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits<sup>p58</sup>](#).
4. A U+003B SEMICOLON character (;).
5. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
6. One or more [ASCII digits<sup>p58</sup>](#).
7. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits<sup>p58</sup>](#).

The optional components marked with an asterisk (\*) should be included, and should have six digits each.

**Note** *The value specifies latitude and longitude, in that order (i.e., "LAT LON" ordering), in decimal degrees. The longitude represents the location east and west of the prime meridian as a positive or negative real number, respectively. The latitude represents the location north and south of the equator as a positive or negative real number, respectively.*

Any number of properties with the name [geo<sup>p702</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*title\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives the job title, functional position or function of the person or organization.

The [value<sup>p693</sup>](#) must be text.

Any number of properties with the name [title<sup>p702</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*role\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives the role, occupation, or business category of the person or organization.

The [value<sup>p693</sup>](#) must be text.

Any number of properties with the name [role<sup>p702</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*logo\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives the logo of the person or organization.

The [value<sup>p693</sup>](#) must be an [absolute URL<sup>p48</sup>](#).

Any number of properties with the name [logo<sup>p702</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*agent\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives the contact information of another person who will act on behalf of the person or organization.

The [value<sup>p693</sup>](#) must be either an [item<sup>p689</sup>](#) with the type [absolute URL<sup>p48</sup>](http://microformats.org/profile/hcard<sup>p697</sup></a>, or an <a href=), or text.

Any number of properties with the name [agent<sup>p702</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*org\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives the name and units of the organization.

The value<sup>p693</sup> must be either text or an item<sup>p689</sup> with one organization-name<sup>p703</sup> property and zero or more organization-unit<sup>p703</sup> properties.

Any number of properties with the name org<sup>p702</sup> may be present within each item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### organization-name (inside org<sup>p702</sup>)

Gives the name of the organization.

The value<sup>p693</sup> must be text.

Exactly one property with the name organization-name<sup>p703</sup> must be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of an org<sup>p702</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### organization-unit (inside org<sup>p702</sup>)

Gives the name of the organization unit.

The value<sup>p693</sup> must be text.

Any number of properties with the name organization-unit<sup>p703</sup> may be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of the org<sup>p702</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### member

Gives a URL<sup>p48</sup> that represents a member of the group.

The value<sup>p693</sup> must be an absolute URL<sup>p48</sup>.

Any number of properties with the name member<sup>p703</sup> may be present within each item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup> if the item<sup>p689</sup> also has a property with the name kind<sup>p697</sup> whose value is "group<sup>p704</sup>".

#### related

Gives a relationship to another entity.

The value<sup>p693</sup> must be an item<sup>p689</sup> with one url<sup>p703</sup> property and one rel<sup>p703</sup> properties.

Any number of properties with the name orrelated<sup>p703</sup> may be present within each item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### url (inside related<sup>p703</sup>)

Gives the URL<sup>p48</sup> for the related entity.

The value<sup>p693</sup> must be an absolute URL<sup>p48</sup>.

Exactly one property with the name url<sup>p703</sup> must be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of a related<sup>p703</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### rel (inside related<sup>p703</sup>)

Gives the relationship between the entity and the related entity.

The value<sup>p693</sup> must be text that, when compared in a case-sensitive<sup>p58</sup> manner, is equal to one of the relationship strings<sup>p705</sup>.

Exactly one property with the name rel<sup>p703</sup> must be present within the item<sup>p689</sup> that forms the value<sup>p693</sup> of a related<sup>p703</sup> property of an item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

#### categories

Gives the name of a category or tag that the person or organization could be classified as.

The value<sup>p693</sup> must be text.

Any number of properties with the name categories<sup>p703</sup> may be present within each item<sup>p689</sup> with the type <http://microformats.org/profile/hcard><sup>p697</sup>.

### **note**

Gives supplemental information or a comment about the person or organization.

The [value<sup>p693</sup>](#) must be text.

Any number of properties with the name [note<sup>p704</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [### \*\*rev\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives the revision date and time of the contact information.

The [value<sup>p693</sup>](#) must be text that is a [valid global date and time string<sup>p72</sup>](#).

**Note** *The value distinguishes the current revision of the information from other renditions of the information.*

Any number of properties with the name [rev<sup>p704</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [### \*\*sound\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives a sound file relating to the person or organization.

The [value<sup>p693</sup>](#) must be an [absolute URL<sup>p48</sup>](#).

Any number of properties with the name [sound<sup>p704</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [### \*\*uid\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives a globally unique identifier corresponding to the person or organization.

The [value<sup>p693</sup>](#) must be text.

A single property with the name [uid<sup>p704</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [### \*\*url\*\*](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

Gives a [URL<sup>p48</sup>](#) relating to the person or organization.

The [value<sup>p693</sup>](#) must be an [absolute URL<sup>p48</sup>](#).

Any number of properties with the name [url<sup>p704</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [The \*\*kind strings\*\* are:](http://microformats.org/profile/hcard<sup>p697</sup></a>.</p></div><div data-bbox=)

#### **individual**

Indicates a single entity (e.g. a person).

#### **group**

Indicates multiple entities (e.g. a mailing list).

#### **org**

Indicates a single entity that is not a person (e.g. a company).

#### **location**

Indicates a geographical place (e.g. an office building).

The **address type strings** are:

#### **home**

Indicates a delivery address for a residence.

**work**

Indicates a delivery address for a place of work.

The **telephone type strings** are:

**home**

Indicates a residential number.

**work**

Indicates a telephone number for a place of work.

**text**

Indicates that the telephone number supports text messages (SMS).

**voice**

Indicates a voice telephone number.

**fax**

Indicates a facsimile telephone number.

**cell**

Indicates a cellular telephone number.

**video**

Indicates a video conferencing telephone number.

**pager**

Indicates a paging device telephone number.

**textphone**

Indicates a telecommunication device for people with hearing or speech difficulties.

The **relationship strings** are:

**emergency**

An emergency contact.

**agent**

Another entity that acts on behalf of this entity.

*contact*

*acquaintance*

*friend*

*met*

*worker*

*colleague*

*resident*

*neighbor*

*child*

*parent*

*sibling*

*spouse*

*kin*

*muse*

*crush*

*date*

*sweetheart*

*me*

Has the meaning defined in XFN. [\[XFN\]<sup>p1154</sup>](#)

#### 5.4.1.1 Conversion to vCard

Given a list of nodes *nodes* in a [Document<sup>p102</sup>](#), a user agent must run the following algorithm to **extract any vCard data represented by those nodes** (only the first vCard is returned):

1. If none of the nodes in *nodes* are [items<sup>p689</sup>](#) with the [item type<sup>p689</sup> `http://microformats.org/profile/hcardp697`](#), then there is no vCard. Abort the algorithm, returning nothing.
2. Let *node* be the first node in *nodes* that is an [item<sup>p689</sup>](#) with the [item type<sup>p689</sup> `http://microformats.org/profile/hcardp697`](#).
3. Let *output* be an empty string.
4. [Add a vCard line<sup>p709</sup>](#) with the type "BEGIN" and the value "VCARD" to *output*.
5. [Add a vCard line<sup>p709</sup>](#) with the type "PROFILE" and the value "VCARD" to *output*.
6. [Add a vCard line<sup>p709</sup>](#) with the type "VERSION" and the value "4.0" to *output*.
7. [Add a vCard line<sup>p709</sup>](#) with the type "SOURCE" and the result of [escaping the vCard text string<sup>p709</sup>](#) that is [the document's address](#) as the value to *output*.
8. If [the title element<sup>p105</sup>](#) is not null, [add a vCard line<sup>p709</sup>](#) with the type "NAME" and with the result of [escaping the vCard text string<sup>p709</sup>](#) obtained from the [textContent<sup>p51</sup>](#) of [the title element<sup>p105</sup>](#) as the value to *output*.
9. Let *sex* be the empty string.
10. Let *gender-identity* be the empty string.
11. For each element *element* that is [a property of the item<sup>p694</sup>](#) *node*: for each name *name* in *element*'s [property names<sup>p692</sup>](#), run the following substeps:
  1. Let *parameters* be an empty set of name-value pairs.
  2. Run the appropriate set of substeps from the following list. The steps will set a variable *value*, which is used in the next step.

If the property's [value<sup>p693</sup>](#) is an [item<sup>p689</sup>](#) *subitem* and *name* is [n<sup>p697</sup>](#)

    1. Let *value* be the empty string.

2. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [family-name<sup>p697</sup>](#) in *subitem*.
3. Append a U+003B SEMICOLON character (;) to *value*.
4. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [given-name<sup>p698</sup>](#) in *subitem*.
5. Append a U+003B SEMICOLON character (;) to *value*.
6. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [additional-name<sup>p698</sup>](#) in *subitem*.
7. Append a U+003B SEMICOLON character (;) to *value*.
8. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [honorific-prefix<sup>p698</sup>](#) in *subitem*.
9. Append a U+003B SEMICOLON character (;) to *value*.
10. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [honorific-suffix<sup>p698</sup>](#) in *subitem*.

If the property's [value<sup>p693</sup>](#) is an [item<sup>p689</sup>](#) *subitem* and name is [adr<sup>p699</sup>](#)

1. Let *value* be the empty string.
2. Append to *value* the result of [collecting vCard subproperties<sup>p709</sup>](#) named [post-office-box<sup>p699</sup>](#) in *subitem*.
3. Append a U+003B SEMICOLON character (;) to *value*.
4. Append to *value* the result of [collecting vCard subproperties<sup>p709</sup>](#) named [extended-address<sup>p700</sup>](#) in *subitem*.
5. Append a U+003B SEMICOLON character (;) to *value*.
6. Append to *value* the result of [collecting vCard subproperties<sup>p709</sup>](#) named [street-address<sup>p700</sup>](#) in *subitem*.
7. Append a U+003B SEMICOLON character (;) to *value*.
8. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [locality<sup>p700</sup>](#) in *subitem*.
9. Append a U+003B SEMICOLON character (;) to *value*.
10. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [region<sup>p700</sup>](#) in *subitem*.
11. Append a U+003B SEMICOLON character (;) to *value*.
12. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [postal-code<sup>p700</sup>](#) in *subitem*.
13. Append a U+003B SEMICOLON character (;) to *value*.
14. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [country-name<sup>p700</sup>](#) in *subitem*.
15. If there is a property named [type<sup>p699</sup>](#) in *subitem*, and the first such property has a [value<sup>p693</sup>](#) that is not an [item<sup>p689</sup>](#) and whose value consists only of [alphanumeric ASCII characters<sup>p59</sup>](#), then add a parameter named "TYPE" whose value is the [value<sup>p693</sup>](#) of that property to *parameters*.

If the property's [value<sup>p693</sup>](#) is an [item<sup>p689</sup>](#) *subitem* and name is [org<sup>p702</sup>](#)

1. Let *value* be the empty string.
2. Append to *value* the result of [collecting the first vCard subproperty<sup>p709</sup>](#) named [organization-name<sup>p703</sup>](#) in *subitem*.
3. For each property named [organization-unit<sup>p703</sup>](#) in *subitem*, run the following steps:
  1. If the [value<sup>p693</sup>](#) of the property is an [item<sup>p689</sup>](#), then skip this property.

2. Append a U+003B SEMICOLON character (;) to *value*.
3. Append the result of [escaping the vCard text string](#) given by the *value* of the property to *value*.

If the property's *value* is an [item](#) *subitem* with the [item type](#) <http://microformats.org/profile/vcard> and *name* is [related](#)

1. Let *value* be the empty string.
2. If there is a property named *url* in *subitem*, and its element is a [URL property element](#), then append the result of [escaping the vCard text string](#) given by the *value* of the first such property to *value*, and add a parameter with the name "VALUE" and the value "URI" to *parameters*.
3. If there is a property named *rel* in *subitem*, and the first such property has a *value* that is not an [item](#) and whose value consists only of [alphanumeric ASCII characters](#), then add a parameter named "RELATION" whose value is the *value* of that property to *parameters*.

If the property's *value* is an [item](#) and *name* is none of the above

1. Let *value* be the result of [collecting the first vCard subproperty](#) named *value* in *subitem*.
2. If there is a property named *type* in *subitem*, and the first such property has a *value* that is not an [item](#) and whose value consists only of [alphanumeric ASCII characters](#), then add a parameter named "TYPE" whose value is the *value* of that property to *parameters*.

If the property's *value* is not an [item](#) and its *name* is [sex](#)

If this is the first such property to be found, set *sex* to the property's *value*.

If the property's *value* is not an [item](#) and its *name* is [gender-identity](#)

If this is the first such property to be found, set *gender-identity* to the property's *value*.

Otherwise (the property's *value* is not an [item](#))

1. Let *value* be the property's *value*.
2. If *element* is one of the [URL property elements](#), add a parameter with the name "VALUE" and the value "URI" to *parameters*.
3. Otherwise, if *name* is [today](#) or [anniversary](#) and the *value* is a [valid date string](#), add a parameter with the name "VALUE" and the value "DATE" to *parameters*.
4. Otherwise, if *name* is [rev](#) and the *value* is a [valid global date and time string](#), add a parameter with the name "VALUE" and the value "DATE-TIME" to *parameters*.
5. Prefix every U+005C REVERSE SOLIDUS character (\) in *value* with another U+005C REVERSE SOLIDUS character (\).
6. Prefix every U+002C COMMA character (,) in *value* with a U+005C REVERSE SOLIDUS character (\).
7. Unless *name* is [geo](#), prefix every U+003B SEMICOLON character (;) in *value* with a U+005C REVERSE SOLIDUS character (\).
8. Replace every U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF) in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
9. Replace every remaining U+000D CARRIAGE RETURN (CR) or U+000A LINE FEED (LF) character in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
3. Add a [vCard line](#) with the type *name*, the parameters *parameters*, and the value *value* to *output*.

12. If either *sex* or *gender-identity* has a value that is not the empty string, add a [vCard line](#) with the type "GENDER" and the value consisting of the concatenation of *sex*, a U+003B SEMICOLON character (;), and *gender-identity* to *output*.
13. Add a [vCard line](#) with the type "END" and the value "VCARD" to *output*.

When the above algorithm says that the user agent is to **add a vCard line** consisting of a type *type*, optionally some parameters, and a value *value* to a string *output*, it must run the following steps:

1. Let *line* be an empty string.
2. Append *type*, [converted to ASCII uppercase<sup>p58</sup>](#), to *line*.
3. If there are any parameters, then for each parameter, in the order that they were added, run these substeps:
  1. Append a U+003B SEMICOLON character (;) to *line*.
  2. Append the parameter's name to *line*.
  3. Append a U+003D EQUALS SIGN character (=) to *line*.
  4. Append the parameter's value to *line*.
4. Append a U+003A COLON character (:) to *line*.
5. Append *value* to *line*.
6. Let *maximum length* be 75.
7. If and while *line* is longer than *maximum length* Unicode code points long, run the following substeps:
  1. Append the first *maximum length* Unicode code points of *line* to *output*.
  2. Remove the first *maximum length* Unicode code points from *line*.
  3. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
  4. Append a U+000A LINE FEED character (LF) to *output*.
  5. Append a U+0020 SPACE character to *output*.
  6. Let *maximum length* be 74.
8. Append (what remains of) *line* to *output*.
9. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
10. Append a U+000A LINE FEED character (LF) to *output*.

When the steps above require the user agent to obtain the result of **collecting vCard subproperties** named *subname* in *subitem*, the user agent must run the following steps:

1. Let *value* be the empty string.
2. For each property named *subname* in the item *subitem*, run the following substeps:
  1. If the [value<sup>p693</sup>](#) of the property is itself an [item<sup>p689</sup>](#), then skip this property.
  2. If this is not the first property named *subname* in *subitem* (ignoring any that were skipped by the previous step), then append a U+002C COMMA character (,) to *value*.
  3. Append the result of [escaping the vCard text string<sup>p709</sup>](#) given by the [value<sup>p693</sup>](#) of the property to *value*.
3. Return *value*.

When the steps above require the user agent to obtain the result of **collecting the first vCard subproperty** named *subname* in *subitem*, the user agent must run the following steps:

1. If there are no properties named *subname* in *subitem*, then abort these substeps, returning the empty string.
2. If the [value<sup>p693</sup>](#) of the first property named *subname* in *subitem* is an [item<sup>p689</sup>](#), then abort these substeps, returning the empty string.
3. Return the result of [escaping the vCard text string<sup>p709</sup>](#) given by the [value<sup>p693</sup>](#) of the first property named *subname* in *subitem*.

When the above algorithms say the user agent is to **escape the vCard text string** *value*, the user agent must use the following steps:

1. Prefix every U+005C REVERSE SOLIDUS character (\) in *value* with another U+005C REVERSE SOLIDUS character (\).
2. Prefix every U+002C COMMA character (,) in *value* with a U+005C REVERSE SOLIDUS character (\).
3. Prefix every U+003B SEMICOLON character (;) in *value* with a U+005C REVERSE SOLIDUS character (\).
4. Replace every U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF) in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
5. Replace every remaining U+000D CARRIAGE RETURN (CR) or U+000A LINE FEED (LF) character in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
6. Return the mutated *value*.

**Note** This algorithm can generate invalid vCard output, if the input does not conform to the rules described for the [http://microformats.org/profile/hcard<sup>p697</sup>](http://microformats.org/profile/hcard) item type<sup>p689</sup> and defined property names<sup>b692</sup>.

#### 5.4.1.2 Examples

This section is non-normative.

##### Example

Here is a long example vCard for a fictional character called "Jack Bauer":

```
<section id="jack" itemscope itemtype="http://microformats.org/profile/hcard">
 <h1 itemprop="fn">

 Jack
 Bauer

 </h1>

 <p itemprop="org" itemscope>
 Counter-Terrorist Unit
 (Los Angeles Division)
 </p>

</ins>
</section>

```

The odd line wrapping is needed because newlines are meaningful in microdata: newlines would be preserved in a conversion to, for example, the vCard format.

### Example

This example shows a site's contact details (using the [address<sup>p175</sup>](#) element) containing an address with two street components:

```

<address itemscope itemtype="http://microformats.org/profile/hcard">
 <strong itemprop="fn">Alfred
 Person

 1600 Amphitheatre Parkway

 Building 43, Second Floor

 Mountain View,
 CA 94043

</address>

```

### Example

The vCard vocabulary can be used to just mark up people's names:

```

<span itemscope itemtype="http://microformats.org/profile/hcard"
 ><span itemprop="given-name"
 >George Washington

```

This creates a single item with a two name-value pairs, one with the name "fn" and the value "George Washington", and the other with the name "n" and a second item as its value, the second item having the two name-value pairs "given-name" and "family-name" with the values "George" and "Washington" respectively. This is defined to map to the following vCard:

```

BEGIN:VCARD
PROFILE:VCARD
VERSION:4.0
SOURCE:document's address
FN:George Washington
N:Washington;George;;
END:VCARD

```

## 5.4.2 vEvent

An item with the [item type<sup>p689</sup>](#) <http://microformats.org/profile/hcalendar#vevent> represents an event.

This vocabulary does not [support global identifiers for items<sup>p690</sup>](#).

The following are the type's [defined property names<sup>p692</sup>](#). They are based on the vocabulary defined in the iCalendar specification, where more information on how to interpret the values can be found. [\[RFC2445\]<sup>p1152</sup>](#)

**Note** Only the parts of the iCalendar vocabulary relating to events are used here; this vocabulary cannot express a complete iCalendar instance.

### attach

Gives the address of an associated document for the event.

The [value](#)<sup>p693</sup> must be an [absolute URL](#)<sup>p48</sup>.

Any number of properties with the name [attach](#)<sup>p711</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p711</sup>.

#### categories

Gives the name of a category or tag that the event could be classified as.

The [value](#)<sup>p693</sup> must be text.

Any number of properties with the name [categories](#)<sup>p712</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p711</sup>.

#### class

Gives the access classification of the information regarding the event.

The [value](#)<sup>p693</sup> must be text with one of the following values:

- public
- private
- confidential

**⚠Warning!** *This is merely advisory and cannot be considered a confidentiality measure.*

A single property with the name [class](#)<sup>b712</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p711</sup>.

#### comment

Gives a comment regarding the event.

The [value](#)<sup>p693</sup> must be text.

Any number of properties with the name [comment](#)<sup>p712</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p711</sup>.

#### description

Gives a detailed description of the event.

The [value](#)<sup>p693</sup> must be text.

A single property with the name [description](#)<sup>p712</sup> may be present within each [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p711</sup>.

#### geo

Gives the geographical position of the event.

The [value](#)<sup>p693</sup> must be text and must match the following syntax:

1. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
2. One or more [ASCII digits](#)<sup>p58</sup>.
3. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits](#)<sup>p58</sup>.
4. A U+003B SEMICOLON character (;).
5. Optionally, either a U+002B PLUS SIGN character (+) or a U+002D HYPHEN-MINUS character (-).
6. One or more [ASCII digits](#)<sup>p58</sup>.
7. Optionally\*, a U+002E FULL STOP character (.) followed by one or more [ASCII digits](#)<sup>p58</sup>.

The optional components marked with an asterisk (\*) should be included, and should have six digits each.

**Note** The value specifies latitude and longitude, in that order (i.e., "LAT LON" ordering), in decimal degrees. The longitude represents the location east and west of the prime meridian as a positive or negative real number, respectively. The latitude represents the location north and south of the equator as a positive or negative real number, respectively.

A single property with the name [geo<sup>p712</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **location**

Gives the location of the event.

The [value<sup>p693</sup>](#) must be text.

A single property with the name [location<sup>p713</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **resources**

Gives a resource that will be needed for the event.

The [value<sup>p693</sup>](#) must be text.

Any number of properties with the name [resources<sup>p713</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **status**

Gives the confirmation status of the event.

The [value<sup>p693</sup>](#) must be text with one of the following values:

- tentative
- confirmed
- cancelled

A single property with the name [status<sup>p713</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **summary**

Gives a short summary of the event.

The [value<sup>p693</sup>](#) must be text.

User agents should replace U+000A LINE FEED (LF) characters in the [value<sup>p693</sup>](#) by U+0020 SPACE characters when using the value.

A single property with the name [summary<sup>p713</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **dtend**

Gives the date and time by which the event ends.

If the property with the name [dtend<sup>p713</sup>](#) is present within an [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>> that has a property with the name [dtstart<sup>p714</sup>](#) whose value is a [valid date string<sup>p67</sup>](#), then the [value<sup>p693</sup>](#) of the property with the name [dtend<sup>p713</sup>](#) must be text that is a [valid date string<sup>p67</sup>](#) also. Otherwise, the [value<sup>p693</sup>](#) of the property must be text that is a [valid global date and time string<sup>p72</sup>](#).

In either case, the [value<sup>p693</sup>](#) be later in time than the value of the [dtstart<sup>p714</sup>](#) property of the same [item<sup>p689</sup>](#).

**Note** The time given by the [dtend<sup>p713</sup>](#) property is not inclusive. For day-long events, therefore, the [dtend<sup>p713</sup>](#) property's [value<sup>p693</sup>](#) will be the day after the end of the event.

A single property with the name [dtend<sup>p713</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>, so long as that <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>> does not have a property with the name [duration<sup>p714</sup>](#).

## **dtstart**

Gives the date and time at which the event starts.

The [value<sup>p693</sup>](#) must be text that is either a [valid date string<sup>p67</sup>](#) or a [valid global date and time string<sup>p72</sup>](#).

Exactly one property with the name [dtstart<sup>p714</sup>](#) must be present within each [item<sup>p689</sup>](#) with the type [## \*\*duration\*\*](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup></a>.</p></div><div data-bbox=)

Gives the duration of the event.

The [value<sup>p693</sup>](#) must be text that is a [valid vevent duration string<sup>p715</sup>](#).

The duration represented is the sum of all the durations represented by integers in the value.

A single property with the name [duration<sup>p714</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [p711](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup></a>, so long as that <a href=) does not have a property with the name [dtend<sup>p713</sup>](#).

## **transp**

Gives whether the event is to be considered as consuming time on a calendar, for the purpose of free-busy time searches.

The [value<sup>p693</sup>](#) must be text with one of the following values:

- opaque
- transparent

A single property with the name [transp<sup>p714</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*contact\*\*](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup></a>.</p></div><div data-bbox=)

Gives the contact information for the event.

The [value<sup>p693</sup>](#) must be text.

Any number of properties with the name [contact<sup>p714</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*url\*\*](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup></a>.</p></div><div data-bbox=)

Gives a [URL<sup>p48</sup>](#) for the event.

The [value<sup>p693</sup>](#) must be an [absolute URL<sup>p48</sup>](#).

A single property with the name [url<sup>p714</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*uid\*\*](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup></a>.</p></div><div data-bbox=)

Gives a globally unique identifier corresponding to the event.

The [value<sup>p693</sup>](#) must be text.

A single property with the name [uid<sup>p714</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [## \*\*exdate\*\*](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup></a>.</p></div><div data-bbox=)

Gives a date and time at which the event does not occur despite the recurrence rules.

The [value<sup>p693</sup>](#) must be text that is either a [valid date string<sup>p67</sup>](#) or a [valid global date and time string<sup>p72</sup>](#).

Any number of properties with the name [exdate<sup>p714</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [714](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup></a>.</p></div><div data-bbox=)

#### **exrule**

Gives a rule for finding dates and times at which the event does not occur despite the recurrence rules.

The [value<sup>p693</sup>](#) must be text that matches the RECUR value type defined in the iCalendar specification. [[RFC2445](#)]<sup>p1152</sup>

Any number of properties with the name [exrule<sup>p715</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **rdate**

Gives a date and time at which the event recurs.

The [value<sup>p693</sup>](#) must be text that is one of the following:

- A [valid date string<sup>p67</sup>](#).
- A [valid global date and time string<sup>p72</sup>](#).
- A [valid global date and time string<sup>p72</sup>](#) followed by a U+002F SOLIDUS character (/) followed by a second [valid global date and time string<sup>p72</sup>](#) representing a later time.
- A [valid global date and time string<sup>p72</sup>](#) followed by a U+002F SOLIDUS character (/) followed by a [valid vevent duration string<sup>p715</sup>](#).

Any number of properties with the name [rdate<sup>p715</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **rrule**

Gives a rule for finding dates and times at which the event occurs.

The [value<sup>p693</sup>](#) must be text that matches the RECUR value type defined in the iCalendar specification. [[RFC2445](#)]<sup>p1152</sup>

Any number of properties with the name [rrule<sup>p715</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **created**

Gives the date and time at which the event information was first created in a calendaring system.

The [value<sup>p693</sup>](#) must be text that is a [valid global date and time string<sup>p72</sup>](#).

A single property with the name [created<sup>p715</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **last-modified**

Gives the date and time at which the event information was last modified in a calendaring system.

The [value<sup>p693</sup>](#) must be text that is a [valid global date and time string<sup>p72</sup>](#).

A single property with the name [last-modified<sup>p715</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

#### **sequence**

Gives a revision number for the event information.

The [value<sup>p693</sup>](#) must be text that is a [valid non-negative integer<sup>p61</sup>](#).

A single property with the name [sequence<sup>p715</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type <http://microformats.org/profile/hcalendar#vevent<sup>p711</sup>>.

A string is a **valid vevent duration string** if it matches the following pattern:

1. A U+0050 LATIN CAPITAL LETTER P character (P).
2. One of the following:

- A [valid non-negative integer](#)<sup>p61</sup> followed by a U+0057 LATIN CAPITAL LETTER W character (W). The integer represents a duration of that number of weeks.
- At least one, and possibly both in this order, of the following:
  1. A [valid non-negative integer](#)<sup>p61</sup> followed by a U+0044 LATIN CAPITAL LETTER D character (D). The integer represents a duration of that number of days.
  2. A U+0054 LATIN CAPITAL LETTER T character (T) followed by any one of the following, or the first and second of the following in that order, or the second and third of the following in that order, or all three of the following in this order:
    1. A [valid non-negative integer](#)<sup>p61</sup> followed by a U+0048 LATIN CAPITAL LETTER H character (H). The integer represents a duration of that number of hours.
    2. A [valid non-negative integer](#)<sup>p61</sup> followed by a U+004D LATIN CAPITAL LETTER M character (M). The integer represents a duration of that number of minutes.
    3. A [valid non-negative integer](#)<sup>p61</sup> followed by a U+0053 LATIN CAPITAL LETTER S character (S). The integer represents a duration of that number of seconds.

#### 5.4.2.1 Conversion to iCalendar

Given a list of nodes *nodes* in a [Document](#)<sup>p102</sup>, a user agent must run the following algorithm to **extract any vEvent data represented by those nodes**:

1. If none of the nodes in *nodes* are [items](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p711</sup>, then there is no vEvent data. Abort the algorithm, returning nothing.
2. Let *output* be an empty string.
3. [Add an iCalendar line](#)<sup>p717</sup> with the type "BEGIN" and the value "VCALENDAR" to *output*.
4. [Add an iCalendar line](#)<sup>p717</sup> with the type "PRODID" and the value equal to a user-agent-specific string representing the user agent to *output*.
5. [Add an iCalendar line](#)<sup>p717</sup> with the type "VERSION" and the value "2.0" to *output*.
6. For each node *node* in *nodes* that is an [item](#)<sup>p689</sup> with the type <http://microformats.org/profile/hcalendar#vevent><sup>p711</sup>, run the following steps:
  1. [Add an iCalendar line](#)<sup>p717</sup> with the type "BEGIN" and the value "VEVENT" to *output*.
  2. [Add an iCalendar line](#)<sup>p717</sup> with the type "DTSTAMP" and a value consisting of an iCalendar DATE-TIME string representing the current date and time, with the annotation "VALUE=DATE-TIME", to *output*. [\[RFC2445\]](#)<sup>p1152</sup>
  3. For each element *element* that is [a property of the item](#)<sup>p694</sup> *node*: for each name *name* in *element's* [property names](#)<sup>p692</sup>, run the appropriate set of substeps from the following list:

**If the property's [value](#)<sup>p693</sup> is an [item](#)<sup>p689</sup>**

Skip the property.

**If the property is [dtend](#)<sup>p713</sup>**

**If the property is [dtstart](#)<sup>p714</sup>**

**If the property is [exdate](#)<sup>p714</sup>**

**If the property is [rdate](#)<sup>p715</sup>**

**If the property is [created](#)<sup>p715</sup>**

**If the property is [last-modified](#)<sup>p715</sup>**

Let *value* be the result of stripping all U+002D HYPHEN-MINUS (-) and U+003A COLON (:) characters from the property's [value](#)<sup>p693</sup>.

If the property's [value](#)<sup>p693</sup> is a [valid date string](#)<sup>p67</sup> then [add an iCalendar line](#)<sup>p717</sup> with the type *name* and the value *value* to *output*, with the annotation "VALUE=DATE".

Otherwise, if the property's [value](#)<sup>p693</sup> is a [valid global date and time string](#)<sup>p72</sup> then [add an iCalendar line](#)<sup>p717</sup> with the type *name* and the value *value* to *output*, with the annotation "VALUE=DATE-TIME".

Otherwise skip the property.

#### Otherwise

[Add an iCalendar line<sup>p717</sup>](#) with the type *name* and the property's [value<sup>p693</sup>](#) to *output*.

4. [Add an iCalendar line<sup>p717</sup>](#) with the type "END" and the value "VEVENT" to *output*.
7. [Add an iCalendar line<sup>p717</sup>](#) with the type "END" and the value "VCALENDAR" to *output*.

When the above algorithm says that the user agent is to **add an iCalendar line** consisting of a type *type*, a value *value*, and optionally an annotation, to a string *output*, it must run the following steps:

1. Let *line* be an empty string.
2. Append *type*, [converted to ASCII uppercase<sup>p58</sup>](#), to *line*.
3. If there is an annotation:
  1. Append a U+003B SEMICOLON character (;) to *line*.
  2. Append the annotation to *line*.
4. Append a U+003A COLON character (:) to *line*.
5. Prefix every U+005C REVERSE SOLIDUS character (\) in *value* with another U+005C REVERSE SOLIDUS character (\).
6. Prefix every U+002C COMMA character (,) in *value* with a U+005C REVERSE SOLIDUS character (\).
7. Prefix every U+003B SEMICOLON character (;) in *value* with a U+005C REVERSE SOLIDUS character (\).
8. Replace every U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF) in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
9. Replace every remaining U+000D CARRIAGE RETURN (CR) or U+000A LINE FEED (LF) character in *value* with a U+005C REVERSE SOLIDUS character (\) followed by a U+006E LATIN SMALL LETTER N character (n).
10. Append *value* to *line*.
11. Let *maximum length* be 75.
12. If and while *line* is longer than *maximum length* Unicode code points long, run the following substeps:
  1. Append the first *maximum length* Unicode code points of *line* to *output*.
  2. Remove the first *maximum length* Unicode code points from *line*.
  3. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
  4. Append a U+000A LINE FEED character (LF) to *output*.
  5. Append a U+0020 SPACE character to *output*.
  6. Let *maximum length* be 74.
13. Append (what remains of) *line* to *output*.
14. Append a U+000D CARRIAGE RETURN character (CR) to *output*.
15. Append a U+000A LINE FEED character (LF) to *output*.

**Note** This algorithm can generate invalid iCalendar output, if the input does not conform to the rules described for the [#### 5.4.2.2 Examples](http://microformats.org/profile/hcalendar#vevent<sup>p711</sup> item type<sup>p689</sup> and defined property names<sup>p692</sup></a>.</p></div><div data-bbox=)

This section is non-normative.

##### Example

Here is an example of a page that uses the vEvent vocabulary to mark up an event:

```
<body itemscope itemtype="http://microformats.org/profile/hcalendar#vevent">
...
<h1 itemprop="summary">Bluesday Tuesday: Money Road</h1>
...
<time itemprop="dtstart" datetime="2009-05-05T19:00:00Z">May 5th @ 7pm</time>
(until <time itemprop="dtend" datetime="2009-05-05T21:00:00Z">9pm</time>)
...
<a href="http://livebrum.co.uk/2009/05/bluesday-tuesday-money-road"
 rel="bookmark" itemprop="url">Link to this page
...
<p>Location: The RoadHouse</p>
...
<p><input type=button value="Add to Calendar"
 onclick="location = getCalendar(this)"></p>
...
<meta itemprop="description" content="via livebrum.co.uk">
</body>
```

The "getCalendar()" method could look like this:

```
function getCalendar(node) {
 // This function assumes the content is valid.
 // It is not a compliant implementation of the algorithm for extracting vEvent data.
 while (node && (!node.itemScope || !node.itemType.contains('http://microformats.org/profile/hcalendar#vevent')))
 node = node.parentNode;
 if (!node) {
 alert('No event data found.');
 return;
 }
 var stamp = new Date();
 var stampString = '' + stamp.getUTCFullYear() + (stamp.getUTCMonth() + 1) + stamp.getUTCDate()
+ 'T' +
 stamp.getUTCHours() + stamp.getUTCMinutes() + stamp.getUTCSeconds() +
'Z';
 var calendar = 'BEGIN:VCALENDAR\r\nPRODID:HTML\r\nVERSION:2.0\r\nBEGIN:VEVENT\r\nDTSTAMP:' +
stampString + '\r\n';
 for (var propIndex = 0; propIndex < node.properties.length; propIndex += 1) {
 var prop = node.properties[propIndex];
 var value = prop.itemValue;
 var parameters = '';
 if (prop.localName == 'time') {
 value = value.replace(/[:-]/g, '');
 if (value.match(/T/))
 parameters = ';VALUE=DATE';
 else
 parameters = ';VALUE=DATE-TIME';
 } else {
 value = value.replace(/\//g, '\n');
 value = value.replace(/;/g, '\\;');
 value = value.replace(,/g, '\\,');
 value = value.replace(/\n/g, '\n');
 }
 for (var nameIndex = 0; nameIndex < prop.itemProp.length; nameIndex += 1) {
 var name = prop.itemProp[nameIndex];
 if (!name.match(/:/) && !name.match(/\./))
 calendar += name.toUpperCase() + parameters + ':' + value + '\r\n';
 }
 }
}
```

```

 calendar += 'END:VEVENT\r\nEND:VCALENDAR\r\n';
 return 'data:text/calendar;component=event,' + encodeURI(calendar);
 }

```

The same page could offer some markup, such as the following, for copy-and-pasting into blogs:

```

<div itemscope itemtype="http://microformats.org/profile/hcalendar#event">
 <p>I'm going to
 <strong itemprop="summary">Bluesday Tuesday: Money Road,
 <time itemprop="dtstart" datetime="2009-05-05T19:00:00Z">May 5th at 7pm</time>
 to <time itemprop="dtend" datetime="2009-05-05T21:00:00Z">9pm</time>,
 at The RoadHouse!</p>
 <p><a href="http://livebrum.co.uk/2009/05/05/bluesday-tuesday-money-road"
 itemprop="url">See this event on livebrum.co.uk.</p>
 <meta itemprop="description" content="via livebrum.co.uk">
</div>

```

### 5.4.3 Licensing works

An item with the [item type<sup>p689</sup>](#) <http://n.whatwg.org/work> represents a work (e.g. an article, an image, a video, a song, etc). This type is primarily intended to allow authors to include licensing information for works.

The following are the type's [defined property names<sup>p692</sup>](#).

#### **work**

Identifies the work being described.

The [value<sup>p693</sup>](#) must be an [absolute URL<sup>p48</sup>](#).

Exactly one property with the name [work<sup>p719</sup>](#) must be present within each [item<sup>p689</sup>](#) with the type [#### \*\*title\*\*](http://n.whatwg.org/work<sup>p719</sup></a>.</p>
</div>
<div data-bbox=)

Gives the name of the work.

A single property with the name [title<sup>p719</sup>](#) may be present within each [item<sup>p689</sup>](#) with the type [#### \*\*author\*\*](http://n.whatwg.org/work<sup>p719</sup></a>.</p>
</div>
<div data-bbox=)

Gives the name or contact information of one of the authors or creators of the work.

The [value<sup>p693</sup>](#) must be either an [item<sup>p689</sup>](#) with the type [Any number of properties with the name \[author<sup>p719</sup>\]\(#\) may be present within each \[item<sup>p689</sup>\]\(#\) with the type \[#### \\*\\*license\\*\\*\]\(http://n.whatwg.org/work<sup>p719</sup></a>.</p>
</div>
<div data-bbox=\)](http://microformats.org/profile/hcard<sup>p697</sup></a>, or text.</p>
</div>

## 5.5 Converting HTML to other formats

### 5.5.1 JSON

Given a list of nodes *nodes* in a [Document](#)<sup>p102</sup>, a user agent must run the following algorithm to **extract the microdata from those nodes into a JSON form**:

1. Let *result* be an empty object.
2. Let *items* be an empty array.
3. For each *node* in *nodes*, check if the element is a [top-level microdata item](#)<sup>p694</sup>, and if it is then [get the object](#)<sup>p720</sup> for that element and add it to *items*.
4. Add an entry to *result* called "*items*" whose value is the array *items*.
5. Return the result of serialising *result* to JSON in the shortest possible way (meaning no whitespace between tokens, no unnecessary zero digits in numbers, and only using Unicode escapes in strings for characters that do not have a dedicated escape sequence), and with a lowercase "e" used, when appropriate, in the representation of any numbers. [\[JSON\]](#)<sup>p1150</sup>

**Note** This algorithm returns an object with a single property that is an array, instead of just returning an array, so that it is possible to extend the algorithm in the future if necessary.

When the user agent is to **get the object** for an item *item*, optionally with a list of elements *memory*, it must run the following substeps:

1. Let *result* be an empty object.
2. If no *memory* was passed to the algorithm, let *memory* be an empty list.
3. Add *item* to *memory*.
4. If the *item* has any [item types](#)<sup>p689</sup>, add an entry to *result* called "*type*" whose value is an array listing the [item types](#)<sup>p689</sup> of *item*, in the order they were specified on the [itemtype](#)<sup>p689</sup> attribute.
5. If the *item* has a [global identifier](#)<sup>p690</sup>, add an entry to *result* called "*id*" whose value is the [global identifier](#)<sup>p690</sup> of *item*.
6. Let *properties* be an empty object.
7. For each element *element* that has one or more [property names](#)<sup>p692</sup> and is one of [the properties of the item](#)<sup>p694</sup> *item*, in the order those elements are given by the algorithm that returns [the properties of an item](#)<sup>p694</sup>, run the following substeps:
  1. Let *value* be the [property value](#)<sup>p693</sup> of *element*.
  2. If *value* is an [item](#)<sup>p689</sup>, then: If *value* is in *memory*, then let *value* be the string "ERROR". Otherwise, [get the object](#)<sup>p720</sup> for *value*, passing a copy of *memory*, and then replace *value* with the object returned from those steps.
  3. For each name *name* in *element*'s [property names](#)<sup>p692</sup>, run the following substeps:
    1. If there is no entry named *name* in *properties*, then add an entry named *name* to *properties* whose value is an empty array.

2. Append *value* to the entry named *name* in *properties*.
8. Add an entry to *result* called "properties" whose value is the object *properties*.
9. Return *result*.

### Example

For example, take this markup:

```
<!DOCTYPE HTML>
<title>My Blog</title>
<article itemscope itemtype="http://schema.org/BlogPosting">
 <header>
 <h1 itemprop="headline">Progress report</h1>
 <p><time itemprop="datePublished" datetime="2013-08-29">today</time></p>
 <link itemprop="url" href="?comments=0">
 </header>
 <p>All in all, he's doing well with his swim lessons. The biggest thing was he had trouble putting his head in, but we got it down.</p>
 <section>
 <h1>Comments</h1>
 <article itemprop="comment" itemscope itemtype="http://schema.org/UserComments" id="c1">
 <link itemprop="url" href="#c1">
 <footer>
 <p>Posted by:
 Greg
 </p>
 <p><time itemprop="commentTime" datetime="2013-08-29">15 minutes ago</time></p>
 </footer>
 <p>Ha!</p>
 </article>
 <article itemprop="comment" itemscope itemtype="http://schema.org/UserComments" id="c2">
 <link itemprop="url" href="#c2">
 <footer>
 <p>Posted by:
 Charlotte
 </p>
 <p><time itemprop="commentTime" datetime="2013-08-29">5 minutes ago</time></p>
 </footer>
 <p>When you say "we got it down"....</p>
 </article>
 </section>
</article>
```

It would be turned into the following JSON by the algorithm above (supposing that the page's URL was <http://blog.example.com/progress-report>):

```
{
 "items": [
 {
 "type": ["http://schema.org/BlogPosting"],
 "properties": {
 "headline": ["Progress report"],
 "datePublished": ["2013-08-29"],
 "url": ["http://blog.example.com/progress-report?comments=0"],
 "comment": [
 {
 "type": ["http://schema.org/UserComments"],
 "properties": {
 "url": ["http://blog.example.com/progress-report#c1"],
 "creator": [
 {
 "name": "Greg"
 }
]
 }
 },
 {
 "type": ["http://schema.org/UserComments"],
 "properties": {
 "url": ["http://blog.example.com/progress-report#c2"],
 "creator": [
 {
 "name": "Charlotte"
 }
]
 }
 }
]
 }
 }
]
}
```

```
 "type": ["http://schema.org/Person"],
 "properties": {
 "name": ["Greg"]
 }
 },
 "commentTime": ["2013-08-29"]
},
{
 "type": ["http://schema.org/UserComments"],
 "properties": {
 "url": ["http://blog.example.com/progress-report#c2"],
 "creator": [
 {
 "type": ["http://schema.org/Person"],
 "properties": {
 "name": ["Charlotte"]
 }
 }
],
 "commentTime": ["2013-08-29"]
 }
}
]
```

## 6 User interaction

### 6.1 The `hidden` attribute

All [HTML elements](#)<sup>p42</sup> may have the [`hidden`](#)<sup>p723</sup> content attribute set. The [`hidden`](#)<sup>p723</sup> attribute is a [boolean attribute](#)<sup>p59</sup>. When set on an element, it indicates that the element is not yet, or is no longer, directly relevant to the page's current state, or that it is being used to be reused by other parts of the page as opposed to being directly accessed by the user. User agents should not render elements with the [`hidden`](#)<sup>p723</sup> attribute specified. This requirement may be implemented indirectly through the style layer. For example, an HTML+CSS author could implement these requirements [using the rules suggested in the Rendering section](#)<sup>p1059</sup>.

**Note** Because this attribute is typically implemented using CSS, it's also possible to override it using CSS. For instance, a rule like 'display: block' to all elements will cancel the effects of the [`hidden`](#)<sup>p723</sup> attribute. Authors therefore have to take care when using style sheets to make sure that the attribute is still styled as expected.

Spec bugs: 19159	
Support:	
Chrome	6+
IE	11+
Chrome for Android	40+
Firefox	4+
iOS Safari	5.0-5.1+
Android Browser	4+
UC Browser for Android	9.9+
Opera Mini	5.0-8.0+
Safari	5.1+
Opera	11.1+
IE Mobile	11+
Firefox for Android	33+

Source: [caniuse.com](#)

#### Example

In the following skeletal example, the attribute is used to hide the Web game's main screen until the user logs in:

```
<h1>The Example Game</h1>
<section id="login">
 <h2>Login</h2>
 <form>
 ...
 <!-- calls login() once the user's credentials have been checked -->
 </form>
 <script>
 function login() {
 // switch screens
 document.getElementById('login').hidden = true;
 document.getElementById('game').hidden = false;
 }
 </script>
</section>
<section id="game" hidden>
 ...
</section>
```

The [`hidden`](#)<sup>p723</sup> attribute must not be used to hide content that could legitimately be shown in another presentation. For example, it is incorrect to use [`hidden`](#)<sup>p723</sup> to hide panels in a tabbed dialog, because the tabbed interface is merely a kind of overflow presentation — one could equally well just show all the form controls in one big page with a scrollbar. It is similarly incorrect to use this attribute to hide content just from one presentation — if something is marked [`hidden`](#)<sup>p723</sup>, it is hidden from all presentations, including, for instance, screen readers.

Elements that are not themselves [`hidden`](#)<sup>p723</sup> must not [hyperlink](#)<sup>p245</sup> to elements that are [`hidden`](#)<sup>p723</sup>. The `for` attributes of [`label`](#)<sup>p451</sup> and [`output`](#)<sup>p516</sup> elements that are not themselves [`hidden`](#)<sup>p723</sup> must similarly not refer to elements that are [`hidden`](#)<sup>p723</sup>. In both cases, such references would cause user confusion.

Elements and scripts may, however, refer to elements that are [`hidden`](#)<sup>p723</sup> in other contexts.

#### Example

For example, it would be incorrect to use the [`href`](#)<sup>p245</sup> attribute to link to a section marked with the [`hidden`](#)<sup>p723</sup> attribute. If the content is not applicable or relevant, then there is no reason to link to it.

It would be fine, however, to use the ARIA [`aria-describedby`](#) attribute to refer to descriptions that are themselves [`hidden`](#)<sup>p723</sup>. While hiding the descriptions implies that they are not useful alone, they could be written in such a way that they are useful in the specific context of being referenced from the images that they describe.

Similarly, a [`canvas`](#)<sup>p607</sup> element with the [`hidden`](#)<sup>p723</sup> attribute could be used by a scripted graphics engine as an off-screen buffer, and a form control could refer to a hidden [`form`](#)<sup>p447</sup> element using its [`form`](#)<sup>p527</sup> attribute.

Elements in a section hidden by the `hidden`<sup>p723</sup> attribute are still active, e.g. scripts and form controls in such sections still execute and submit respectively. Only their presentation to the user changes.

The `hidden` IDL attribute must `reflect`<sup>p88</sup> the content attribute of the same name.

## 6.2 Inert subtrees

A node (in particular elements and text nodes) can be marked as `inert`. When a node is `inert`<sup>p724</sup>, then the user agent must act as if the node was absent for the purposes of targeting user interaction events, may ignore the node for the purposes of text search user interfaces (commonly known as "find in page"), and may prevent the user from selecting text in that node. User agents should allow the user to override the restrictions on search and text selection, however.

**Example** For example, consider a page that consists of just a single `inert`<sup>p724</sup> paragraph positioned in the middle of a `body`<sup>p157</sup>. If a user moves their pointing device from the `body`<sup>p157</sup> over to the `inert`<sup>p724</sup> paragraph and clicks on the paragraph, no `mouseover`<sup>p52</sup> event would be fired, and the `mousemove`<sup>p52</sup> and `click`<sup>p52</sup> events would be fired on the `body`<sup>p157</sup> element rather than the paragraph.

**Note** When a node is inert, it generally cannot be focused. Inert nodes that are `commands`<sup>p579</sup> will also get disabled.

While a `browsing context container`<sup>p763</sup> is marked as `inert`<sup>p724</sup>, its `nested browsing context`<sup>p763</sup>'s `active document`<sup>p762</sup>, and all nodes in that `Document`<sup>p102</sup>, must be marked as `inert`<sup>p724</sup>.

An entire `Document`<sup>p102</sup> can be marked as `blocked by a modal dialog subject`. While a `Document`<sup>p102</sup> is so marked, every node that is `in the Document`<sup>p42</sup>, with the exception of the `subject` element and its descendants, must be marked `inert`<sup>p724</sup>. (The elements excepted by this paragraph can additionally be marked `inert`<sup>p724</sup> through other means; being part of a modal dialog does not "protect" a node from being marked `inert`<sup>p724</sup>.)

Only one element at a time can mark a `Document`<sup>p102</sup> as being `blocked by a modal dialog`<sup>p724</sup>. When a new `dialog`<sup>p586</sup> is made to `block`<sup>p724</sup> a `Document`<sup>p102</sup>, the previous element, if any, stops blocking the `Document`<sup>p102</sup>.

**Note** The `dialog`<sup>p586</sup> element's `showModal()`<sup>p587</sup> method makes use of this mechanism.

## 6.3 Activation

Certain elements in HTML have an `activation behaviour`<sup>p725</sup>, which means that the user can activate them. This triggers a sequence of events dependent on the activation mechanism, and normally culminating in a `click`<sup>p52</sup> event, as described below.

The user agent should allow the user to manually trigger elements that have an `activation behaviour`<sup>p725</sup>, for instance using keyboard or voice input, or through mouse clicks. When the user triggers an element with a defined `activation behaviour`<sup>p725</sup> in a manner other than clicking it, the default action of the interaction event must be to `run synthetic click activation steps`<sup>p724</sup> on the element.

Each element has a `click in progress` flag, initially set to false.

When a user agent is to `run synthetic click activation steps` on an element, the user agent must run the following steps:

1. If the element's `click in progress` flag is set to true, then abort these steps.
2. Set the `click in progress` flag on the element to true.
3. `Run pre-click activation steps`<sup>p725</sup> on the element.
4. `Fire a click event`<sup>p846</sup> at the element. If the `run synthetic click activation steps`<sup>p724</sup> algorithm was invoked because the `click()`<sup>p725</sup> method was invoked, then the `isTrusted`<sup>p51</sup> attribute must be initialised to false.
5. If this `click`<sup>p52</sup> event is not canceled, `run post-click activation steps`<sup>p725</sup> on the element.  
If the event is canceled, the user agent must `run canceled activation steps`<sup>p725</sup> on the element instead.
6. Set the `click in progress` flag on the element to false.

When a pointing device is clicked, the user agent must [run authentic click activation steps<sup>p725</sup>](#) instead of firing the click event. When a user agent is to **run authentic click activation steps** for a given event *event*, it must follow these steps:

1. Let *target* be the element designated by the user (the target of *event*).
  2. If *target* is a [canvas<sup>b607</sup>](#) element, run the [canvas MouseEvent rerouting steps<sup>b657</sup>](#). If this changes *event*'s target, then let *target* be the new target.
  3. Set the *click in progress* flag on *target* to true.
  4. Let *e* be the [nearest activatable element<sup>p725</sup>](#) of *target* (defined below), if any.
  5. If there is an element *e*, [run pre-click activation steps<sup>p725</sup>](#) on it.
  6. [Dispatch<sup>p43</sup>](#) event (the required [click<sup>p52</sup>](#) event) at *target*.
- If there is an element *e* and the [click<sup>p52</sup>](#) event is not canceled, [run post-click activation steps<sup>p725</sup>](#) on element *e*.
- If there is an element *e* and the event is canceled, [run canceled activation steps<sup>p725</sup>](#) on element *e*.
7. Set the *click in progress* flag on *target* to false.

**Note** The algorithms above don't run for arbitrary synthetic events dispatched by author script. The [click\(\)<sup>p725</sup>](#) method can be used to make the [run synthetic click activation steps<sup>b724</sup>](#) algorithm happen programmatically.

**Note** Click-focusing behaviour (e.g. the focusing of a text field when user clicks in one) typically happens before the click, when the mouse button is first depressed, and is therefore not discussed here.

Given an element *target*, the **nearest activatable element** is the element returned by the following algorithm:

1. If *target* has a defined [activation behaviour<sup>p725</sup>](#), then return *target* and abort these steps.
2. If *target* has a parent element, then set *target* to that parent element and return to the first step.
3. Otherwise, there is no [nearest activatable element<sup>p725</sup>](#).

When a user agent is to **run pre-click activation steps** on an element, it must run the **pre-click activation steps** defined for that element, if any.

When a user agent is to **run canceled activation steps** on an element, it must run the **canceled activation steps** defined for that element, if any.

When a user agent is to **run post-click activation steps** on an element, it must run the **activation behaviour** defined for that element, if any. Activation behaviours can refer to the [click<sup>p52</sup>](#) event that was fired by the steps above leading up to this point.

**Note** `element.clickp725()`

Acts as if the element was clicked.

The [click\(\)](#) method must run the following steps:

1. If the element is a form control that is [disabled<sup>b530</sup>](#), abort these steps.
2. [Run synthetic click activation steps<sup>b724</sup>](#) on the element.

## 6.4 Focus

### 6.4.1 Introduction

This section is non-normative.

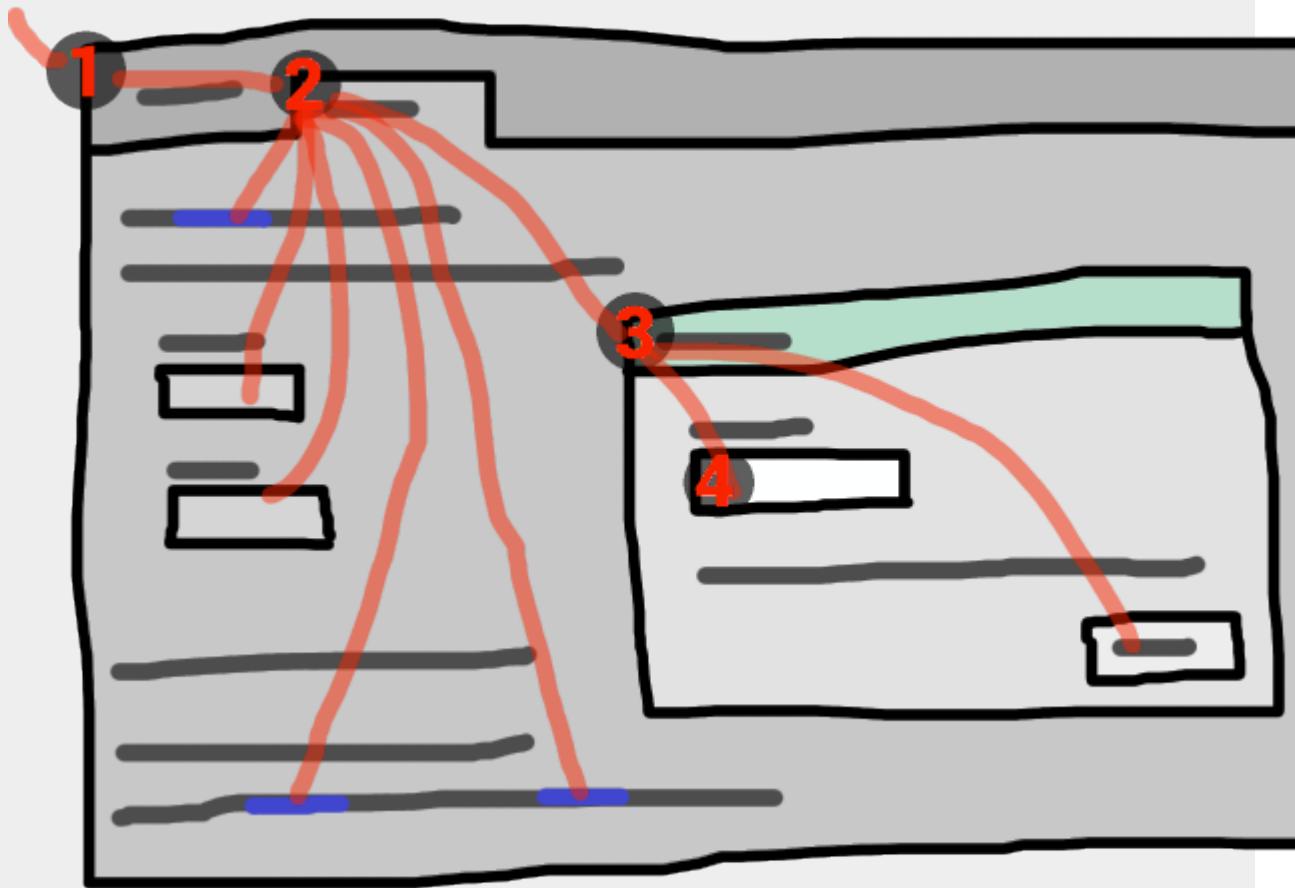

An HTML user interface typically consists of multiple interactive widgets, such as form controls, scrollable regions, links, dialog boxes, browser tabs, and so forth. These widgets form a hierarchy, with some (e.g. browser tabs, dialog boxes) containing others (e.g. links, form controls).

When interacting with an interface using a keyboard, key input is channeled from the system, through the hierarchy of interactive widgets, to an active widget, which is said to be [focused](#)<sup>p728</sup>.

#### Example

Consider an HTML application running in a browser tab running in a graphical environment. Suppose this application had a page with some text fields and links, and was currently showing a modal dialog, which itself had a text field and a button.

The hierarchy of focusable widgets, in this scenario, would include the browser window, which would have, amongst its children, the browser tab containing the HTML application. The tab itself would have as its children the various links and text fields, as well as the dialog. The dialog itself would have as its children the text field and the button.

If the widget with focus in this example was the text field in the dialog box, then key input would be channeled from the graphical system to ① the Web browser, then to ② the tab, then to ③ the dialog, and finally to ④ the text field.

Keyboard events are always targeted at this [focused](#)<sup>p728</sup> element.

#### 6.4.2 Data model

The term **focusable area** is used to refer to regions of the interface that can become the target of keyboard input. Focusable areas can be elements, parts of elements, or other regions managed by the user agent.

Each [focusable area](#)<sup>p726</sup> has a **DOM anchor**, which is a [Node](#)<sup>p51</sup> object that represents the position of the [focusable area](#)<sup>p726</sup> in the DOM. (When the [focusable area](#)<sup>p726</sup> is itself a [Node](#)<sup>p51</sup>, it is its own [DOM anchor](#)<sup>p726</sup>.) The [DOM anchor](#)<sup>p726</sup> is used in some APIs as a substitute for the [focusable area](#)<sup>p726</sup> when there is no other DOM object to represent the [focusable area](#)<sup>p726</sup>.

The following table describes what objects can be [focusable areas](#)<sup>p726</sup>. The cells in the left column describe objects that can be [focusable areas](#)<sup>p726</sup>, the cells in the right column describe the [DOM anchors](#)<sup>p726</sup> for those elements. (The cells that span both columns are non-normative examples.)

<a href="#">Focusable area</a> <sup>p726</sup>	<a href="#">DOM anchor</a> <sup>p726</sup>
<b>Examples</b>	
Elements that have their <a href="#">tabindex focus flag</a> <sup>p729</sup> set, that are not <a href="#">actually disabled</a> <sup>p678</sup> , that are not <a href="#">expressly inert</a> <sup>p727</sup> , and that are either <a href="#">being rendered</a> <sup>p1058</sup> or <a href="#">being used as relevant canvas fallback content</a> <sup>p608</sup> .	The element itself.
<a href="#">iframe</a> <sup>p299</sup> , <a href="#">input type=text</a> <sup>p458</sup> , sometimes <a href="#">a href=""</a> <sup>p208</sup> (depending on platform conventions).	
The shapes of <a href="#">area</a> <sup>p390</sup> elements in an <a href="#">image map</a> <sup>p93</sup> associated with an <a href="#">img</a> <sup>p272</sup> element that is <a href="#">being rendered</a> <sup>p1058</sup> and is not <a href="#">expressly inert</a> <sup>p727</sup> .	The <a href="#">img</a> <sup>p272</sup> element.

In the following example, the [area](#)<sup>p390</sup> element creates two shapes, one on each image. The [DOM anchor](#)<sup>p726</sup> of the first shape is the first [img](#)<sup>p272</sup> element, and the [DOM anchor](#)<sup>p726</sup> of the second shape is the second [img](#)<sup>p272</sup> element.

```
<map id=wallmap><area alt="Enter Door" coords="10,10,100,200" href="door.html"></map>
...

...

```

The user-agent provided subwidgets of elements that are <a href="#">being rendered</a> <sup>p1058</sup> and are not <a href="#">actually disabled</a> <sup>p678</sup> or <a href="#">expressly inert</a> <sup>p727</sup> .	The element for which the <a href="#">focusable area</a> <sup>p726</sup> is a subwidget.
The <a href="#">controls</a> in the user interface that is exposed to the user <sup>p382</sup> for a <a href="#">video</a> <sup>p317</sup> element, the up and down buttons in a spin-control version of <a href="#">input type=number</a> <sup>p469</sup> , the two range control widgets in a <a href="#">input type=range multiple</a> <sup>p470</sup> , the part of a <a href="#">details</a> <sup>p567</sup> element's rendering that enabled the element to be opened or closed using keyboard input.	
The scrollable regions of elements that are <a href="#">being rendered</a> <sup>p1058</sup> are not <a href="#">expressly inert</a> <sup>p727</sup> .	The element for which the box that the scrollable region scrolls was created.
The CSS 'overflow' property's 'scroll' value typically creates a scrollable region.	
The viewport of a <a href="#">Document</a> <sup>p102</sup> that is in a <a href="#">browsing context</a> <sup>p762</sup> and is not <a href="#">inert</a> <sup>p724</sup> .	The <a href="#">Document</a> <sup>p102</sup> for which the viewport was created.
The contents of an <a href="#">iframe</a> <sup>p299</sup> .	
Any other element or part of an element, especially to aid with accessibility or to better match platform conventions.	The element.

**Example** A user agent could make all list item bullets focusable, so that a user can more easily navigate lists.

**Example** Similarly, a user agent could make all elements with [title](#)<sup>p122</sup> attributes focusable, so that their advisory information can be accessed.

**Note** A [browsing context container](#)<sup>p763</sup> (e.g. an [iframe](#)<sup>p299</sup>) is a [focusable area](#)<sup>p726</sup>, but key events routed to a [browsing context container](#)<sup>p763</sup> get immediately routed to the [nested browsing context](#)<sup>p763</sup>'s [active document](#)<sup>p762</sup>. Similarly, in sequential focus navigation a [browsing context container](#)<sup>p763</sup> essentially acts merely as a placeholder for its [nested browsing context](#)<sup>p763</sup>'s [active document](#)<sup>p762</sup>.

Each [focusable area](#)<sup>p726</sup> belongs to a [control group](#). Each [control group](#)<sup>p727</sup> has an [owner](#). [Control group owners](#)<sup>p727</sup> are [control group owner objects](#). The following are [control group owner objects](#)<sup>p727</sup>:

- [Document](#)<sup>p102</sup> object in [browsing contexts](#)<sup>p762</sup>.
- [dialog](#)<sup>p586</sup> elements that have an [open](#)<sup>p586</sup> attribute specified and that are [being rendered](#)<sup>p1058</sup>.

Each [control group owner object](#)<sup>p727</sup> owns one [control group](#)<sup>p727</sup> (though that group might be empty).

If the [DOM anchor](#)<sup>p726</sup> of a [focusable area](#)<sup>p726</sup> is a [control group owner object](#)<sup>p727</sup>, then that [focusable area](#)<sup>p726</sup> belongs to that [control group owner object](#)<sup>p727</sup>'s [control group](#)<sup>p727</sup>. Otherwise, the [focusable area](#)<sup>p726</sup> belongs to its [DOM anchor](#)<sup>p726</sup>'s nearest ancestor [control group owner object](#)<sup>p727</sup>.

**Example**

Thus, a viewport always belongs to the [control group](#)<sup>p727</sup> of the [Document](#)<sup>p102</sup> for which the viewport was created, an [input](#)<sup>p452</sup> control belongs to the [control group](#)<sup>p727</sup> of its nearest ancestor [dialog](#)<sup>p586</sup> or [Document](#)<sup>p102</sup>, and an image map's shapes belong to the nearest ancestor [dialog](#)<sup>p586</sup> or [Document](#)<sup>p102</sup> of the [img](#)<sup>p272</sup> elements (not the [area](#)<sup>p390</sup> elements — this means one [area](#)<sup>p390</sup> element might create multiple shapes in different [control groups](#)<sup>p727</sup>).

An element is [expressly inert](#) if it is [inert](#)<sup>p724</sup> but it is not a [control group owner object](#)<sup>p727</sup> and its nearest ancestor [control group owner object](#)<sup>p727</sup> is not [inert](#)<sup>p724</sup>.

One [focusable area](#)<sup>p726</sup> in each non-empty [control group](#)<sup>p727</sup> is designated the **focused area of the control group**. Which control is so designated changes over time, based on algorithms in this specification. If a [control group](#)<sup>p727</sup> is empty, it has no [focusable area](#)<sup>p728</sup>.

Each [control group owner object](#)<sup>p727</sup> can also act as the **manager** of a [dialog group](#).

Each [dialog](#)<sup>p586</sup> element that has an [open](#)<sup>p586</sup> attribute specified and that is [being rendered](#)<sup>p1058</sup> (i.e. that is a [control group owner object](#)<sup>p727</sup>) and is not [expressly inert](#)<sup>p728</sup> belongs to the [dialog group](#)<sup>p728</sup> whose [manager](#)<sup>p728</sup> is the [dialog](#)<sup>p586</sup> element's nearest ancestor [control group owner object](#)<sup>p727</sup>.

A [dialog](#)<sup>p586</sup> is **expressly inert** if it is [inert](#)<sup>p724</sup> but its nearest ancestor [control group owner object](#)<sup>p727</sup> is not.

If no [dialog](#)<sup>p586</sup> element has a particular [control group owner object](#)<sup>p727</sup> as its nearest ancestor [control group owner object](#)<sup>p727</sup>, then that [control group owner object](#)<sup>p727</sup> has no [dialog group](#)<sup>p728</sup>.

Each [dialog group](#)<sup>p728</sup> can have a [dialog](#)<sup>p586</sup> designated as the **focused dialog of the dialog group**. Which [dialog](#)<sup>p586</sup> is so designated changes over time, based on algorithms in this specification.

[Focusable areas](#)<sup>p726</sup> in [control groups](#)<sup>p727</sup> are ordered relative to the [tree order](#)<sup>p42</sup> of their [DOM anchors](#)<sup>p726</sup>. [Focusable areas](#)<sup>p726</sup> with the same [DOM anchor](#)<sup>p726</sup> in a [control group](#)<sup>p727</sup> are ordered relative to their CSS box's relative positions in a pre-order, depth-first traversal of the box tree. [CSS]<sup>p1149</sup>

Elements in [dialog groups](#)<sup>p728</sup> are ordered in [tree order](#)<sup>p42</sup>.

The **currently focused area of a top-level browsing context** at any particular time is the [focusable area](#)<sup>p726</sup> or [dialog](#)<sup>p586</sup> returned by this algorithm:

1. Let *candidate* be the [Document](#)<sup>p102</sup> of the [top-level browsing context](#)<sup>p763</sup>.
2. If *candidate* has a [dialog group](#)<sup>p728</sup> with a designated [focused dialog of the dialog group](#)<sup>p728</sup>, then let *candidate* be the designated [focused dialog of the dialog group](#)<sup>p728</sup>, and redo this step.  
Otherwise, if *candidate* has a non-empty [control group](#)<sup>p727</sup>, and the designated [focused area of the control group](#)<sup>p728</sup> is a [browsing context container](#)<sup>p763</sup>, then let *candidate* be the [active document](#)<sup>p762</sup> of that [browsing context container](#)<sup>p763</sup>'s [nested browsing context](#)<sup>p763</sup>, and redo this step.  
Otherwise, if *candidate* has a non-empty [control group](#)<sup>p727</sup>, let *candidate* be the designated [focused area of the control group](#)<sup>p728</sup>.
3. Return *candidate*.

An element that is the [DOM anchor](#)<sup>p726</sup> of a [focusable area](#)<sup>p726</sup> is said to **gain focus** when that [focusable area](#)<sup>p726</sup> becomes the [currently focused area of a top-level browsing context](#)<sup>p728</sup>. When an element is the [DOM anchor](#)<sup>p726</sup> of a [focusable area](#)<sup>p726</sup> of the [currently focused area of a top-level browsing context](#)<sup>p728</sup>, it is **focused**.

The **focus chain** of a [focusable area](#)<sup>p726</sup> or [control group owner object](#)<sup>p727</sup> subject is the ordered list constructed as follows:

1. Let *current object* be *subject*.
2. Let *output* be an empty list.
3. *Loop*: Append *current object* to *output*.
4. If *current object* is an [area](#)<sup>p390</sup> element's shape, append that [area](#)<sup>p390</sup> element to *output*.  
Otherwise, if *current object* is a [focusable area](#)<sup>p726</sup> whose [DOM anchor](#)<sup>p726</sup> is an element that is not *current object* itself, append that [DOM anchor](#)<sup>p726</sup> element to *output*.
5. If *current object* is a [dialog](#)<sup>p586</sup> object in a [dialog group](#)<sup>p728</sup>, let *current object* be that [dialog group](#)<sup>p728</sup>'s [manager](#)<sup>p728</sup>, and return to the step labeled *loop*.  
Otherwise, if *current object* is a [focusable area](#)<sup>p726</sup>, let *current object* be that [focusable area](#)<sup>p726</sup>'s [control group](#)<sup>p727</sup>'s [owner](#)<sup>p727</sup>, and return to the step labeled *loop*.

Otherwise, if *current object* is a [Document](#)<sup>p102</sup> in a [nested browsing context](#)<sup>p763</sup>, let *current object* be its [browsing context container](#)<sup>p763</sup>, and return to the step labeled *loop*.

6. Return *output*.

**Note** *The chain starts with subject and (if subject is or can be the currently focused area of a top-level browsing context<sup>p728</sup>) continues up the focus hierarchy up to the Document<sup>p102</sup> of the top-level browsing context<sup>p763</sup>.*

#### 6.4.3 The [tabindex](#)<sup>p729</sup> attribute

The [tabindex](#) content attribute allows authors to indicate that an element is supposed to be [focusable](#)<sup>p726</sup>, and whether it is supposed to be reachable using [sequential focus navigation](#)<sup>p734</sup> and, if so, what is to be the relative order of the element for the purposes of sequential focus navigation. The name "tab index" comes from the common use of the "tab" key to navigate through the focusable elements. The term "tabbing" refers to moving forward through the focusable elements that can be reached using sequential focus navigation.

When the attribute is omitted, the user agent applies defaults. (There is no way to make an element that is [being rendered](#)<sup>p1058</sup> be not focusable at all without [disabling](#)<sup>p678</sup> it or making it [inert](#)<sup>p724</sup>.)

The [tabindex](#)<sup>p729</sup> attribute, if specified, must have a value that is a [valid integer](#)<sup>p60</sup>. Positive numbers specify the relative position of the element's [focusable areas](#)<sup>p726</sup> in the [sequential focus navigation order](#)<sup>p734</sup>, and negative numbers indicate that the control is to be unreachable by [sequential focus navigation](#)<sup>p734</sup>.

Each element can have a **tabindex focus flag** set, as defined below. This flag is a factor that contributes towards determining whether an element is a [focusable area](#)<sup>p726</sup>, as described in the previous section.

If the [tabindex](#)<sup>p729</sup> attribute is specified on an element, it must be parsed using the [rules for parsing integers](#)<sup>b60</sup>. The attribute's values, or lack thereof, must be interpreted as follows:

##### If the attribute is omitted or parsing the value returns an error

The user agent should follow platform conventions to determine if the element's [tabindex focus flag](#)<sup>b729</sup> is set and, if so, whether the element and any [focusable areas](#)<sup>p726</sup> that have the element as their [DOM anchor](#)<sup>p726</sup> can be reached using [sequential focus navigation](#)<sup>p734</sup>, and if so, what their relative position in the [sequential focus navigation order](#)<sup>p734</sup> is to be.

Modulo platform conventions, it is suggested that for the following elements, the [tabindex focus flag](#)<sup>p729</sup> be set:

- [a](#)<sup>p208</sup> elements that have an [href](#)<sup>p245</sup> attribute
- [link](#)<sup>p141</sup> elements that have an [href](#)<sup>p142</sup> attribute
- [button](#)<sup>p495</sup> elements
- [input](#)<sup>p452</sup> elements whose [type](#)<sup>p454</sup> attribute are not in the [Hidden](#)<sup>p458</sup> state
- [select](#)<sup>p498</sup> elements
- [textarea](#)<sup>p508</sup> elements
- [menuitem](#)<sup>p574</sup> elements
- Elements with a [draggable](#)<sup>p758</sup> attribute set, if that would enable the user agent to allow the user to begin a drag operations for those elements without the use of a pointing device
- [Editing hosts](#)<sup>p741</sup>
- [Browsing context containers](#)<sup>p763</sup>
- [Sorting interface](#) [th](#) elements<sup>p423</sup>

**Note** *One valid reason to ignore the platform conventions and always allow an element to be focused (by setting its [tabindex focus flag](#)<sup>p729</sup>) would be if the user's only mechanism for activating an element is through a keyboard action that triggers the focused element.*

#### If the value is a negative integer

The user agent must set the element's [tabindex focus flag](#), but should omit the element from the [sequential focus navigation order](#).

**Note** One valid reason to ignore the requirement that sequential focus navigation not allow the author to lead to the element would be if the user's only mechanism for moving the focus is sequential focus navigation. For instance, a keyboard-only user would be unable to click on a text field with a negative [tabindex](#), so that user's user agent would be well justified in allowing the user to tab to the control regardless.

#### If the value is a zero

The user agent must set the element's [tabindex focus flag](#), should allow the element and any [focusable areas](#) that have the element as their [DOM anchor](#) to be reached using [sequential focus navigation](#), following platform conventions to determine the element's relative position in the [sequential focus navigation order](#).

#### If the value is greater than zero

The user agent must set the element's [tabindex focus flag](#), should allow the element and any [focusable areas](#) that have the element as their [DOM anchor](#) to be reached using sequential focus navigation, and should place the element — referenced as *candidate* below — and the aforementioned [focusable areas](#) in the [sequential focus navigation](#) order so that, relative to other [focusable areas](#) in the [sequential focus navigation order](#), they are:

- before any [focusable area](#) whose [DOM anchor](#) is an element whose [tabindex](#) attribute has been omitted or whose value, when parsed, returns an error,
- before any [focusable area](#) whose [DOM anchor](#) is an element whose [tabindex](#) attribute has a value equal to or less than zero,
- after any [focusable area](#) whose [DOM anchor](#) is an element whose [tabindex](#) attribute has a value greater than zero but less than the value of the [tabindex](#) attribute on *candidate*,
- after any [focusable area](#) whose [DOM anchor](#) is an element whose [tabindex](#) attribute has a value equal to the value of the [tabindex](#) attribute on *candidate* but that is earlier in the document in [tree order](#) than *candidate*,
- before any [focusable area](#) whose [DOM anchor](#) is an element whose [tabindex](#) attribute has a value equal to the value of the [tabindex](#) attribute on *candidate* but that is later in the document in [tree order](#) than *candidate*, and
- before any [focusable area](#) whose [DOM anchor](#) is an element whose [tabindex](#) attribute has a value greater than the value of the [tabindex](#) attribute on *candidate*.

An element that has its [tabindex focus flag](#) set but does not otherwise have an [activation behaviour](#) defined has an [activation behaviour](#) that does nothing.

**Note** This means that an element that is only focusable because of its [tabindex](#) attribute will fire a [click](#) event in response to a non-mouse activation (e.g. hitting the "enter" key while the element is [focused](#)).

An element with the [tabindex](#) attribute specified is [interactive content](#).

The [tabIndex](#) IDL attribute must [reflect](#) the value of the [tabindex](#) content attribute. Its default value is 0 for elements that are focusable and -1 for elements that are not focusable.

#### 6.4.4 Processing model

The **focusing steps** for an object *new focus target* that is either a [focusable area](#), or an element that is not a [focusable area](#), or a [browsing context](#), are as follows. They can optionally be run with a *fallback target*.

1. If *new focus target* is neither a [dialog](#) element that has an [open](#) attribute specified and that is [being rendered](#) (i.e. that is a [control group owner object](#)), nor a [focusable area](#), then run the first matching set of steps from the following list:

↳ If *new focus target* is an [area](#) element with one or more shapes that are [focusable areas](#).

Let *new focus target* be the shape corresponding to the first [img](#) element in [tree order](#) that uses the image map to which the [area](#) element belongs.

↪ If *new focus target* is an element with one or more scrollable regions that are [focusable areas](#)<sup>p726</sup>

Let *new focus target* be the element's first scrollable region, according to a pre-order, depth-first traversal of the box tree.

[\[CSS\]](#)<sup>p1149</sup>

↪ If *new focus target* is the [root element](#)<sup>p42</sup> of its [Document](#)<sup>p102</sup>

Let *new focus target* be the [Document](#)<sup>p102</sup>'s viewport.

↪ If *new focus target* is a [browsing context](#)<sup>p762</sup>

Let *new focus target* be the [browsing context](#)<sup>p762</sup>'s [active document](#)<sup>p762</sup>.

↪ If *new focus target* is a [browsing context container](#)<sup>p763</sup>

Let *new focus target* be the [browsing context container](#)<sup>p763</sup>'s [nested browsing context](#)<sup>p763</sup>'s [active document](#)<sup>p762</sup>.

↪ Otherwise

If no *fallback target* was specified, abort the [focusing steps](#)<sup>p730</sup>.

Otherwise, let *new focus target* be the *fallback target*.

2. If *new focus target* is a [control group owner object](#)<sup>p727</sup> that is not a [focusable area](#)<sup>p726</sup>, but does have a [dialog group](#)<sup>p728</sup>, and that [dialog group](#)<sup>p728</sup> has a designated [focused dialog](#)<sup>p728</sup>, then let *new focus target* be the [focused dialog of the dialog group](#)<sup>p728</sup>, and redo this step.

Otherwise, if *new focus target* is a [control group owner object](#)<sup>p727</sup> that is not a [focusable area](#)<sup>p726</sup>, and its [control group](#)<sup>p727</sup> is not empty, then designate *new focus target* as the [focused area of the control group](#)<sup>p728</sup>, and redo this step.

Otherwise, if *new focus target* is a [browsing context container](#)<sup>p763</sup>, then let *new focus target* be the [nested browsing context](#)<sup>p763</sup>'s [active document](#)<sup>p762</sup>, and redo this step.

**Note** A [dialog](#)<sup>p586</sup> element can be both a [control group owner object](#)<sup>p727</sup> and a [focusable area](#)<sup>p726</sup>, if it has both an [open](#)<sup>p586</sup> attribute specified and a [tabindex](#)<sup>p729</sup> attribute specified and is being rendered<sup>p1058</sup>.

3. If *new focus target* is a [focusable area](#)<sup>p726</sup> and its [DOM anchor](#)<sup>p726</sup> is [inert](#)<sup>p724</sup>, then abort these steps.
4. If *new focus target* is the [currently focused area of a top-level browsing context](#)<sup>p728</sup>, then abort these steps.
5. Let *old chain* be the [focus chain](#)<sup>p728</sup> of the [currently focused area of the top-level browsing context](#)<sup>p728</sup> in which *new focus target* finds itself.
6. Let *new chain* be the [focus chain](#)<sup>p728</sup> of *new focus target*.
7. Run the [focus update steps](#)<sup>p732</sup> with *old chain*, *new chain*, and *new focus target* respectively.

User agents must [immediately](#)<sup>p41</sup> run the [focusing steps](#)<sup>p730</sup> for a [focusable area](#)<sup>p726</sup>, [dialog](#)<sup>p586</sup>, or [browsing context](#)<sup>p762</sup> candidate whenever the user attempts to move the focus to *candidate*.

The **unfocusing steps** for an object *old focus target* that is either a [focusable area](#)<sup>p726</sup> or an element that is not a [focusable area](#)<sup>p726</sup> are as follows:

1. If *old focus target* is [inert](#)<sup>p724</sup>, then abort these steps.
  2. If *old focus target* is an [area](#)<sup>p390</sup> element and one of its shapes is the [currently focused area of a top-level browsing context](#)<sup>p728</sup>, or, if *old focus target* is an element with one or more scrollable regions, and one of them is the [currently focused area of a top-level browsing context](#)<sup>p728</sup>, then let *old focus target* be that [currently focused area of a top-level browsing context](#)<sup>p728</sup>.
  3. Let *old chain* be the [focus chain](#)<sup>p728</sup> of the [currently focused area of a top-level browsing context](#)<sup>p728</sup>.
  4. If *old focus target* is not one of the entries in *old chain*, then abort these steps.
  5. If *old focus target* is a [dialog](#)<sup>p586</sup> in a [dialog group](#)<sup>p728</sup>, and the [dialog group manager](#)<sup>p728</sup> has a non-empty [control group](#)<sup>p727</sup>, then let *new focus target* be the designated [focused area of that focus group](#)<sup>p728</sup>.
- Otherwise, if *old focus target* is a [focusable area](#)<sup>p726</sup>, then let *new focus target* be the first [focusable area](#)<sup>p726</sup> of its [control group](#)<sup>p727</sup> (if the [control group owner](#)<sup>p727</sup> is a [Document](#)<sup>p102</sup>, this will always be a viewport).
- Otherwise, let *new focus target* be null.
6. If *new focus target* is not null, then run the [focusing steps](#)<sup>p730</sup> for *new focus target*.

When the [currently focused area of a top-level browsing context](#)<sup>p728</sup> is somehow unfocused without another element being explicitly focused in its stead, the user agent must [immediately](#)<sup>p41</sup> run the [unfocusing steps](#)<sup>p731</sup> for that object.

**Note** *The unfocusing steps<sup>p731</sup> do not always result in the focus changing, even when applied to the currently focused area of a top-level browsing context<sup>p728</sup>. For example, if the currently focused area of a top-level browsing context<sup>p728</sup> is a viewport, then it will usually keep its focus regardless until another focusable area<sup>p726</sup> is explicitly focused with the focusing steps<sup>p730</sup>.*

When a [focusable area](#)<sup>p726</sup> is added to an empty [control group](#)<sup>p727</sup>, it must be designated the [focused area of the control group](#)<sup>p728</sup>.

When a [dialog group](#)<sup>p728</sup> is formed, if the [dialog group manager](#)<sup>p728</sup> has an empty [control group](#)<sup>p727</sup>, the first non-[inert](#)<sup>p724</sup> [dialog](#)<sup>p586</sup> in the [dialog group](#)<sup>p728</sup>, if any, or else the first [dialog](#)<sup>p586</sup> in the [dialog group](#)<sup>p728</sup> regardless of [inertness](#)<sup>p724</sup>, must be designated the [focused dialog of the dialog group](#)<sup>p728</sup>.

**Focus fixup rule one:** When the designated [focused area of a control group](#)<sup>p728</sup> is removed from that [control group](#)<sup>p727</sup> in some way (e.g. it stops being a [focusable area](#)<sup>p726</sup>, it is removed from the DOM, it becomes [expressly inert](#)<sup>p727</sup>, etc), and the [control group](#)<sup>p727</sup> is still not empty: designate the first non-[inert](#)<sup>p724</sup> [focused area](#)<sup>p728</sup> in that [control group](#)<sup>p727</sup> to be the new [focused area of the control group](#)<sup>p728</sup>, if any; if they are all [inert](#)<sup>p724</sup>, then designate the first [focused area](#)<sup>p728</sup> in that [control group](#)<sup>p727</sup> to be the new [focused area of the control group](#)<sup>p728</sup> regardless of [inertness](#)<sup>p724</sup>. If such a removal instead results in the [control group](#)<sup>p727</sup> being empty, then there is simply no longer a [focused area of the control group](#)<sup>p728</sup>.

**Example** For example, this might happen because an element is removed from its [Document](#)<sup>p102</sup>, or has a [hidden](#)<sup>p723</sup> attribute added. It might also happen to an [input](#)<sup>p452</sup> element when the element gets [disabled](#)<sup>p530</sup>.

**Focus fixup rule two:** When a [dialog group](#)<sup>p728</sup> has no designated [focused dialog of the dialog group](#)<sup>p728</sup>, and its [dialog group manager](#)<sup>p728</sup>'s [control group](#)<sup>p727</sup> changes from being non-empty to being empty, the first non-[inert](#)<sup>p724</sup> [dialog](#)<sup>p586</sup> in the [dialog group](#)<sup>p728</sup>, if any, or else the first [dialog](#)<sup>p586</sup> in the [dialog group](#)<sup>p728</sup> regardless of [inertness](#)<sup>p724</sup>, must be designated the [focused dialog of the dialog group](#)<sup>p728</sup>.

**Focus fixup rule three:** When the designated [focused dialog of a dialog group](#)<sup>p728</sup> is removed from that [dialog group](#)<sup>p728</sup> in some way (e.g. it stops being [rendered](#)<sup>p1058</sup>, it loses its [open](#)<sup>p586</sup> attribute, it becomes [expressly inert](#)<sup>p728</sup>, etc), and there is still a [dialog group](#)<sup>p728</sup> (because the [dialog](#)<sup>p586</sup> in question was not the last [dialog](#)<sup>p586</sup> in that [dialog group](#)<sup>p728</sup>): if the [dialog group](#)<sup>p728</sup>'s [manager](#)<sup>p728</sup>'s [control group](#)<sup>p727</sup> is non-empty, let there be no designated [focused dialog of the dialog group](#)<sup>p728</sup> any more; otherwise (in the case that the [control group](#)<sup>p727</sup> is empty), designate the first non-[inert](#)<sup>p724</sup> [dialog](#)<sup>p586</sup> in the [dialog group](#)<sup>p728</sup> to be the [focused dialog of the dialog group](#)<sup>p728</sup>, or, if they are all [inert](#)<sup>p724</sup>, designate the first [dialog](#)<sup>p586</sup> in the [dialog group](#)<sup>p728</sup> to be the [focused dialog of the dialog group](#)<sup>p728</sup> regardless of [inertness](#)<sup>p724</sup>.

When the [currently focused area of a top-level browsing context](#)<sup>p728</sup> was a [focusable area](#)<sup>p726</sup> but stops being a [focusable area](#)<sup>p726</sup>, or when it was a [dialog](#)<sup>p586</sup> in a [dialog group](#)<sup>p728</sup> and stops being part of that [dialog group](#)<sup>p728</sup>, or when it starts being [inert](#)<sup>p724</sup>, the user agent must run the following steps:

1. Let *old focus target* be whatever the [currently focused area of the top-level browsing context](#)<sup>p728</sup> was immediately before this algorithm became applicable (e.g. before the element was disabled, or the dialog was closed, or whatever caused this algorithm to run).
2. Let *old chain* be the [focus chain](#)<sup>p728</sup> of the [currently focused area of the top-level browsing context](#)<sup>p728</sup> at the same time.
3. Make sure that the changes implied by the focus fixup rules [one](#)<sup>p732</sup>, [two](#)<sup>p732</sup>, and [three](#)<sup>p732</sup> above are applied.
4. Let *new focus target* be the [currently focused area of a top-level browsing context](#)<sup>p728</sup>.
5. If *old focus target* and *new focus target* are the same, abort these steps.
6. Let *new chain* be the [focus chain](#)<sup>p728</sup> of *new focus target*.
7. Run the [focus update steps](#)<sup>p732</sup> with *old chain*, *new chain*, and *new focus target* respectively.

The **focus update steps**, given an *old chain*, a *new chain*, and a *new focus target* respectively, are as follows:

1. Unset the [sequential focus navigation starting point](#)<sup>p734</sup>.
2. If the last entry in *old chain* and the last entry in *new chain* are the same, pop the last entry from *old chain* and the last entry from *new chain* and redo this step.
3. For each entry *entry* in *old chain*, in order, run these substeps:

1. If *entry* is an [input](#)<sup>p452</sup> element, and the [change](#)<sup>p494</sup> event applies<sup>p455</sup> to the element, and the element does not have a defined [activation behaviour](#)<sup>p725</sup>, and the user has changed the element's [value](#)<sup>p527</sup> or its list of [selected files](#)<sup>p476</sup> while the control was focused without committing that change, then [fire a simple event](#)<sup>p846</sup> that bubbles named [change](#)<sup>p1144</sup> at the element.
  2. If *entry* is an element, let *blur event target* be *entry*.
- If *entry* is a [Document](#)<sup>p102</sup> object, let *blur event target* be that [Document](#)<sup>p102</sup> object's [Window](#)<sup>p768</sup> object.
- Otherwise, let *blur event target* be null.
3. If *entry* is the last entry in *old chain*, and *entry* is an [Element](#)<sup>p51</sup>, and the last entry in *new chain* is also an [Element](#)<sup>p51</sup>, then let *related blur target* be the last entry in *new chain*. Otherwise, let *related blur target* be null.
  4. If *blur event target* is not null, [fire a focus event](#)<sup>p733</sup> named [blur](#)<sup>p1144</sup> at *blur event target*, with *related blur target* as the related target.

**Note** In some cases, e.g. if *entry* is an [area](#)<sup>p390</sup> element's shape, a scrollable region, or a viewport, no event is fired.

4. Apply any relevant platform-specific conventions for focusing *new focus target*. (For example, some platforms select the contents of a text field when that field is focused.)
5. For each entry *entry* in *new chain*, in reverse order, run these substeps:

1. If *entry* is a [dialog](#)<sup>p586</sup> element: Let *entry* be the designated [focused dialog of its dialog group](#)<sup>p728</sup>.
2. If *entry* is a [focusable area](#)<sup>p726</sup>: Designate *entry* as the [focused area of the control group](#)<sup>p728</sup>. If its [control group](#)<sup>p727</sup>'s [owner](#)<sup>p727</sup> is also a [dialog group manager](#)<sup>p728</sup>, then let there be no designated [focused dialog](#)<sup>p728</sup> in that [dialog group](#)<sup>p728</sup>.

**Note** It is possible for *entry* to be both a [dialog](#)<sup>p586</sup> element and a [focusable area](#)<sup>p726</sup>, in which case it is its own [control group owner](#)<sup>p727</sup>.

3. If *entry* is an element, let *focus event target* be *entry*.
4. If *entry* is the last entry in *new chain*, and *entry* is an [Element](#)<sup>p51</sup>, and the last entry in *old chain* is also an [Element](#)<sup>p51</sup>, then let *related focus target* be the last entry in *old chain*. Otherwise, let *related focus target* be null.
5. If *focus event target* is not null, [fire a focus event](#)<sup>p733</sup> named [focus](#)<sup>p1144</sup> at *focus event target*, with *related focus target* as the related target.

**Note** In some cases, e.g. if *entry* is an [area](#)<sup>p390</sup> element's shape, a scrollable region, or a viewport, no event is fired.

When a user agent is required to [fire a focus event](#) named *e* at an element *t* and with a given related target *r*, the user agent must create a [trusted](#)<sup>p43</sup> [FocusEvent](#)<sup>p52</sup> object, initialise it to have the given name *e*, to not bubble, to not be cancelable, and to have the [relatedTarget](#)<sup>p52</sup> attribute initialised to *r*, the [view](#)<sup>p52</sup> attribute initialised to the [Window](#)<sup>p768</sup> object of the [Document](#)<sup>p102</sup> object of *t*, and the [detail](#)<sup>p52</sup> attribute initialised to 0, and must then [dispatch](#)<sup>p43</sup> the newly created [FocusEvent](#)<sup>p52</sup> object at the specified target element *t*.

When a key event is to be routed in a [top-level browsing context](#)<sup>p763</sup>, the user agent must run the following steps:

1. Let *target area* be the [currently focused area of the top-level browsing context](#)<sup>p728</sup>.
2. If *target area* is a [focusable area](#)<sup>p726</sup>, let *target node* be *target area*'s [DOM anchor](#)<sup>p726</sup>. Otherwise, *target area* is a [dialog](#)<sup>p586</sup>; let *target node* be *target area*.
3. If *target node* is a [Document](#)<sup>p102</sup> that has a [body element](#)<sup>p106</sup>, then let *target node* be [the body element](#)<sup>p106</sup> of that [Document](#)<sup>p102</sup>. Otherwise, if *target node* is a [Document](#)<sup>p102</sup> that has a [root element](#)<sup>p42</sup>, then let *target node* be the [root element](#)<sup>p42</sup> of that [Document](#)<sup>p102</sup>.
4. If *target node* is not [inert](#)<sup>p724</sup>, fire the event at *target node*.

**Note** It is possible for the [currently focused area of a top-level browsing context<sup>p728</sup>](#) to be [inert<sup>p724</sup>](#), for example if a [modal dialog is shown<sup>p587</sup>](#), and then that [dialog<sup>p586</sup>](#) element is made [inert<sup>p724</sup>](#). It is likely to be the result of a logic error in the application, though.

5. If the event was not canceled, then let [target area](#) handle the key event. This might include [running synthetic click activation steps<sup>p724</sup>](#) for [target node](#).

#### 6.4.5 Sequential focus navigation

Each [control group<sup>p727</sup>](#) has a **sequential focus navigation order**, which orders some or all of the [focusable areas<sup>p726</sup>](#) in the [control group<sup>p727</sup>](#) relative to each other. The order in the [sequential focus navigation order<sup>p734</sup>](#) does not have to be related to the order in the [control group<sup>p727</sup>](#) itself. If a [focusable area<sup>p726</sup>](#) is omitted from the [sequential focus navigation order<sup>p734</sup>](#) of its [control group<sup>p727</sup>](#), then it is unreachable via [sequential focus navigation<sup>p734</sup>](#).

There can also be a **sequential focus navigation starting point**. It is initially unset. The user agent may set it when the user indicates that it should be moved.

**Example** For example, the user agent could set it to the position of the user's click if the user clicks on the document contents.

When the user requests that focus move from the [currently focused area of a top-level browsing context<sup>p728</sup>](#) to the next or previous [focusable area<sup>p726</sup>](#) (e.g. as the default action of pressing the `tab` key), or when the user requests that focus sequentially move to a [top-level browsing context<sup>p763</sup>](#) in the first place (e.g. from the browser's location bar), the user agent must use the following algorithm:

1. Let [starting point](#) be the [currently focused area of a top-level browsing context<sup>p728</sup>](#), if the user requested to move focus sequentially from there, or else the [top-level browsing context<sup>p763</sup>](#) itself, if the user instead requested to move focus from outside the [top-level browsing context<sup>p763</sup>](#).
2. If there is a [sequential focus navigation starting point<sup>p734</sup>](#) defined and it is inside [starting point](#), then let [starting point](#) be the [sequential focus navigation starting point<sup>p734</sup>](#) instead.
3. Let [direction](#) be *forward* if the user requested the *next* control, and *backward* if the user requested the previous control.

**Note** Typically, pressing `tab` requests the next control, and pressing `shift+tab` requests the previous control.

4. **Loop:** Let [selection mechanism](#) be *sequential* if the [starting point](#) is a [browsing context<sup>p762</sup>](#) or if [starting point](#) is in its [control group<sup>p727</sup>](#)'s [sequential focus navigation order<sup>p734</sup>](#).

Otherwise, [starting point](#) is not in its [control group<sup>p727</sup>](#)'s [sequential focus navigation order<sup>p734</sup>](#); let [selection mechanism](#) be *DOM*.

5. Let [candidate](#) be the result of running the [sequential navigation search algorithm<sup>p734</sup>](#) with [starting point](#), [direction](#), and [selection mechanism](#) as the arguments.
6. If [candidate](#) is not null, then run the [focusing steps<sup>p730</sup>](#) for [candidate](#) and abort these steps.
7. Otherwise, unset the [sequential focus navigation starting point<sup>p734</sup>](#).
8. If [starting point](#) is the [top-level browsing context<sup>p763</sup>](#), or a [focusable area<sup>p726</sup>](#) in the [top-level browsing context<sup>p763</sup>](#), the user agent should transfer focus to its own controls appropriately (if any), honouring [direction](#), and then abort these steps.

**Example** For example, if [direction](#) is *backward*, then the last focusable control before the browser's rendering area would be the control to focus.

If the user agent has no focusable controls — a kiosk-mode browser, for instance — then the user agent may instead restart these steps with the [starting point](#) being the [top-level browsing context<sup>p763</sup>](#) itself.

9. Otherwise, [starting point](#) is a [focusable area<sup>p726</sup>](#) in a [nested browsing context<sup>p763</sup>](#). Let [starting point](#) be that [nested browsing context<sup>p763</sup>](#)'s [browsing context container<sup>p763</sup>](#), and return to the step labeled *loop*.

The **sequential navigation search algorithm** consists of the following steps. This algorithm takes three arguments: [starting point](#), [direction](#), and [selection mechanism](#).

1. Pick the appropriate cell from the following table, and follow the instructions in that cell.

The appropriate cell is the one that is from the column whose header describes *direction* and from the first row whose header describes *starting point* and *selection mechanism*.

	<i>direction is forward</i>	<i>direction is backward</i>
<b>starting point is a browsing context<sup>p762</sup></b>	Let <i>candidate</i> be the first <a href="#">suitable sequentially focusable area<sup>p735</sup></a> in <i>starting point's active document<sup>p762</sup></i> 's <a href="#">primary control group<sup>p735</sup></a> , if any; or else null	Let <i>candidate</i> be the last <a href="#">suitable sequentially focusable area<sup>p735</sup></a> in <i>starting point's active document<sup>p762</sup></i> 's <a href="#">primary control group<sup>p735</sup></a> , if any; or else null
<b>selection mechanism is DOM</b>	Let <i>candidate</i> be the first <a href="#">suitable sequentially focusable area<sup>p735</sup></a> in the <a href="#">home control group<sup>p735</sup></a> following <i>starting point</i> , if any; or else null	Let <i>candidate</i> be the last <a href="#">suitable sequentially focusable area<sup>p735</sup></a> in the <a href="#">home control group<sup>p735</sup></a> preceding <i>starting point</i> , if any; or else null
<b>selection mechanism is sequential</b>	Let <i>candidate</i> be the first <a href="#">suitable sequentially focusable area<sup>p735</sup></a> in the <a href="#">home sequential focus navigation order<sup>p735</sup></a> following <i>starting point</i> , if any; or else null	Let <i>candidate</i> be the last <a href="#">suitable sequentially focusable area<sup>p735</sup></a> in the <a href="#">home sequential focus navigation order<sup>p735</sup></a> preceding <i>starting point</i> , if any; or else null

A **suitable sequentially focusable area** is a [focusable area<sup>p726</sup>](#) whose [DOM anchor<sup>p726</sup>](#) is not [inert<sup>p724</sup>](#) and that is in its [control group<sup>p727</sup>](#)'s [sequential focus navigation order<sup>p734</sup>](#).

The **primary control group** of a [control group owner object<sup>p727</sup>](#) *X* is the [control group<sup>p727</sup>](#) of *X* if *X* has no [dialog group<sup>p728</sup>](#) or if its [dialog group<sup>p728</sup>](#) has no designated [focused dialog of the dialog group<sup>p728</sup>](#), otherwise, it is the [primary control group<sup>p735</sup>](#) of *X*'s [dialog group<sup>p728</sup>](#)'s designated [focused dialog of the dialog group<sup>p728</sup>](#).

The **home control group** is the [control group<sup>p727</sup>](#) to which *starting point* belongs.

The **home sequential focus navigation order** is the [sequential focus navigation order<sup>p734</sup>](#) to which *starting point* belongs.

**Note** *The home sequential focus navigation order<sup>p735</sup> is the home control group<sup>p735</sup>'s sequential focus navigation order<sup>p734</sup>, but is only used when the starting point is in that sequential focus navigation order<sup>p734</sup> (when it's not, selection mechanism will be DOM).*

2. If *candidate* is a [browsing context container<sup>p763</sup>](#), then let *new candidate* be the result of running the [sequential navigation search algorithm<sup>p734</sup>](#) with *candidate*'s [nested browsing context<sup>p763</sup>](#) as the first argument, *direction* as the second, and *sequential* as the third.

If *new candidate* is null, then let *starting point* be *candidate*, and return to the top of this algorithm. Otherwise, let *candidate* be *new candidate*.

3. Return *candidate*.

## 6.4.6 Focus management APIs

**Note**

`document.activeElementp736`

Returns the deepest element in the document through which or to which key events are being routed. This is, roughly speaking, the focused element in the document.

For the purposes of this API, when a [child browsing context<sup>p763</sup>](#) is focused, its [browsing context container<sup>p763</sup>](#) is [focused<sup>p727</sup>](#) in the [parent browsing context<sup>p763</sup>](#). For example, if the user moves the focus to a text field in an [iframe<sup>p299</sup>](#), the [iframe<sup>p299</sup>](#) is the element returned by the [activeElement<sup>p736</sup>](#) API in the [iframe<sup>p299</sup>](#)'s [node document](#).

`document.hasFocusp736()`

Returns true if key events are being routed through or to the document; otherwise, returns false. Roughly speaking, this corresponds to the document, or a documented nested inside this one, being focused.

`window.focusp736()`

Moves the focus to the window's [browsing context<sup>p762</sup>](#), if any.

`element.focusp737()`

Moves the focus to the element.

If the element is a [browsing context container<sup>p763</sup>](#), moves the focus to the [nested browsing context<sup>p763</sup>](#) instead.

## `element.blur()p737`

Moves the focus to the viewport. Use of this method is discouraged; if you want to focus the viewport, call the [Focus \(\)<sup>p737</sup>](#) method on the [Document<sup>p102</sup>](#)'s root element.

Do not use this method to hide the focus ring if you find the focus ring unsightly. Instead, use a CSS rule to override the 'outline' property, and provide a different way to show what element is focused. Be aware that if an alternative focusing style isn't made available, the page will be significantly less usable for people who primarily navigate pages using a keyboard, or those with reduced vision who use focus outlines to help them navigate the page.

**Example** For example, to hide the outline from links and instead use a yellow background to indicate focus, you could use:

```
:link:focus, :visited:focus { outline: none; background: yellow; color: black; }
```

The [activeElement](#) attribute on [Document<sup>p102</sup>](#) objects must return the value returned by the following steps:

1. Let *candidate* be the [Document<sup>p102</sup>](#) on which the method was invoked.
2. If *candidate* has a [dialog group<sup>p728</sup>](#) with a designated [focused dialog of the dialog group<sup>p728</sup>](#), then let *candidate* be the designated [focused dialog of the dialog group<sup>p728</sup>](#), and redo this step.
3. If *candidate* has a non-empty [control group<sup>p727</sup>](#), let *candidate* be the designated [focused area of the control group<sup>p728</sup>](#).
4. If *candidate* is a [focusable area<sup>p726</sup>](#), let *candidate* be *candidate*'s [DOM anchor<sup>p726</sup>](#).
5. If *candidate* is a [Document<sup>p102</sup>](#) that has a [body element<sup>p106</sup>](#), then let *candidate* be [the body element<sup>p106</sup>](#) of that [Document<sup>p102</sup>](#).  
Otherwise, if *candidate* is a [Document<sup>p102</sup>](#) that has a [root element<sup>p42</sup>](#), then let *candidate* be the [root element<sup>p42</sup>](#) of that [Document<sup>p102</sup>](#).  
Otherwise, if *candidate* is a [Document<sup>p102</sup>](#), then let *candidate* be null.
6. Return *candidate*.

The [hasFocus \(\)](#) method on [Document<sup>p102</sup>](#) objects must return the value returned by the following steps:

1. Let *target* be the [Document<sup>p102</sup>](#) on which the method was invoked.
2. Let *candidate* be the [Document<sup>p102</sup>](#) of the [top-level browsing context<sup>p763</sup>](#).
3. If *candidate* is *target*, return true and abort these steps.
4. If *candidate* has a [dialog group<sup>p728</sup>](#) with a designated [focused dialog of the dialog group<sup>p728</sup>](#), then let *candidate* be the designated [focused dialog of the dialog group<sup>p728</sup>](#), and redo this step.  
Otherwise, if *candidate* has a non-empty [control group<sup>p727</sup>](#), and the designated [focused area of the control group<sup>p728</sup>](#) is a [browsing context container<sup>p763</sup>](#), and the [active document<sup>p762</sup>](#) of that [browsing context container<sup>p763</sup>](#)'s [nested browsing context<sup>p763</sup>](#) is *target*, then return true and abort these steps.  
Otherwise, if *candidate* has a non-empty [control group<sup>p727</sup>](#), and the designated [focused area of the control group<sup>p728</sup>](#) is a [browsing context container<sup>p763</sup>](#), then let *candidate* be the [active document<sup>p762</sup>](#) of that [browsing context container<sup>p763</sup>](#)'s [nested browsing context<sup>p763</sup>](#), and redo this step.  
Otherwise, return false and abort these steps.

The [focus \(\)](#) method on the [Window<sup>p768</sup>](#) object, when invoked, must run the [focusing steps<sup>p730</sup>](#) with the [Window<sup>p768</sup>](#) object's [browsing context<sup>p762</sup>](#). Additionally, if this [browsing context<sup>p762</sup>](#) is a [top-level browsing context<sup>p763</sup>](#), user agents are encouraged to trigger some sort of notification to indicate to the user that the page is attempting to gain focus.

The [blur \(\)](#) method on the [Window<sup>p768</sup>](#) object, when invoked, provides a hint to the user agent that the script believes the user probably is not currently interested in the contents of the [browsing context<sup>p762</sup>](#) of the [Window<sup>p768</sup>](#) object on which the method was invoked, but that the contents might become interesting again in the future.

User agents are encouraged to ignore calls to this [blur \(\)<sup>p736</sup>](#) method entirely.

**Note** Historically, the `focus()`<sup>p736</sup> and `blur()`<sup>p736</sup> methods actually affected the system-level focus of the system widget (e.g. tab or window) that contained the `browsing context`<sup>p762</sup>, but hostile sites widely abuse this behaviour to the user's detriment.

The `focus()` method on elements, when invoked, must run the following algorithm:

1. If the element is marked as `locked for focus`<sup>p737</sup>, then abort these steps.
2. Mark the element as **locked for focus**.
3. Run the `focusing steps`<sup>p730</sup> for the element.
4. Unmark the element as `locked for focus`<sup>p737</sup>.

The `blur()` method, when invoked, should run the `unfocusing steps`<sup>p731</sup> for the element on which the method was called. User agents may selectively or uniformly ignore calls to this method for usability reasons.

**Example** For example, if the `blur()`<sup>p737</sup> method is unwise being used to remove the focus ring for aesthetics reasons, the page would become unusable by keyboard users. Ignoring calls to this method would thus allow keyboard users to interact with the page.

## 6.5 Assigning keyboard shortcuts

### 6.5.1 Introduction

*This section is non-normative.*

Each element that can be activated or focused can be assigned a single key combination to activate it, using the `accesskey`<sup>p738</sup> attribute.

The exact shortcut is determined by the user agent, based on information about the user's keyboard, what keyboard shortcuts already exist on the platform, and what other shortcuts have been specified on the page, using the information provided in the `accesskey`<sup>p738</sup> attribute as a guide.

In order to ensure that a relevant keyboard shortcut is available on a wide variety of input devices, the author can provide a number of alternatives in the `accesskey`<sup>p738</sup> attribute.

Each alternative consists of a single character, such as a letter or digit.

User agents can provide users with a list of the keyboard shortcuts, but authors are encouraged to do so also. The `accessKeyLabel`<sup>p739</sup> IDL attribute returns a string representing the actual key combination assigned by the user agent.

**Example** In this example, an author has provided a button that can be invoked using a shortcut key. To support full keyboards, the author has provided "C" as a possible key. To support devices equipped only with numeric keypads, the author has provided "1" as another possibly key.

```
<input type=button value=Collect onclick="collect()" accesskey="C 1" id=c>
```

**Example** To tell the user what the shortcut key is, the author has this script here opted to explicitly add the key combination to the button's label:

```
function addShortcutKeyLabel(button) {
 if (button.accessKeyLabel != '')
 button.value += ' (' + button.accessKeyLabel + ')';
 }
addShortcutKeyLabel(document.getElementById('c'));
```

Browsers on different platforms will show different labels, even for the same key combination, based on the convention prevalent on that platform. For example, if the key combination is the Control key, the Shift key, and the letter C, a Windows browser might display "Ctrl+Shift+C", whereas a Mac browser might display "⌃ ⌘ C", while an Emacs browser might just display "C-C". Similarly, if the key combination is the Alt key and the Escape key, Windows might use "Alt+Esc", Mac might use "⌥ Esc", and an Emacs browser might use "M-ESC" or "Esc Esc".

In general, therefore, it is unwise to attempt to parse the value returned from the [accessKeyLabel<sup>p739</sup>](#) IDL attribute.

### 6.5.2 The `accesskey` attribute

All [HTML elements<sup>p42</sup>](#) may have the [accesskey<sup>p738</sup>](#) content attribute set. The [accesskey<sup>p738</sup>](#) attribute's value is used by the user agent as a guide for creating a keyboard shortcut that activates or focuses the element.

If specified, the value must be an [ordered set of unique space-separated tokens<sup>p80</sup>](#) that are [case-sensitive<sup>p58</sup>](#), each of which must be exactly one Unicode code point in length.

#### Example

In the following example, a variety of links are given with access keys so that keyboard users familiar with the site can more quickly navigate to the relevant pages:

```
<nav>
 <p>
 Activities |
 Technical
 Reports |
 Site Index |
 About Consortium |
 Contact
 </p>
</nav>
```

#### Example

In the following example, the search field is given two possible access keys, "s" and "0" (in that order). A user agent on a device with a full keyboard might pick `Ctrl+Alt+S` as the shortcut key, while a user agent on a small device with just a numeric keypad might pick just the plain unadorned key 0:

```
<form action="/search">
 <label>Search: <input type="search" name="q" accesskey="s 0"></label>
 <input type="submit">
</form>
```

#### Example

In the following example, a button has possible access keys described. A script then tries to update the button's label to advertise the key combination the user agent selected.

```
<input type=submit accesskey="N @ 1" value="Compose">
...
<script>
 function labelButton(button) {
 if (button.accessKeyLabel)
 button.value += ' (' + button.accessKeyLabel + ')';
 }
 var inputs = document.getElementsByTagName('input');
 for (var i = 0; i < inputs.length; i += 1) {
 if (inputs[i].type == "submit")
 labelButton(inputs[i]);
 }
</script>
```

On one user agent, the button's label might become "Compose (⌘N)". On another, it might become "Compose (Alt+⇧+1)". If the user agent doesn't assign a key, it will be just "Compose". The exact string depends on what the [assigned access key<sup>p739</sup>](#) is, and on how the user agent represents that key combination.

### 6.5.3 Processing model

An element's **assigned access key** is a key combination derived from the element's `accesskey` content attribute. Initially, an element must not have an [assigned access key](#).

Whenever an element's `accesskey` attribute is set, changed, or removed, the user agent must update the element's [assigned access key](#) by running the following steps:

1. If the element has no `accesskey` attribute, then skip to the *fallback* step below.
2. Otherwise, [split the attribute's value on spaces](#), and let *keys* be the resulting tokens.
3. For each value in *keys* in turn, in the order the tokens appeared in the attribute's value, run the following substeps:
  1. If the value is not a string exactly one Unicode code point in length, then skip the remainder of these steps for this value.
  2. If the value does not correspond to a key on the system's keyboard, then skip the remainder of these steps for this value.
  3. If the user agent can find a mix of zero or more modifier keys that, combined with the key that corresponds to the value given in the attribute, can be used as the access key, then the user agent may assign that combination of keys as the element's [assigned access key](#) and abort these steps.
4. *Fallback*: Optionally, the user agent may assign a key combination of its choosing as the element's [assigned access key](#) and abort these steps.
5. If this step is reached, the element has no [assigned access key](#).

Once a user agent has selected and assigned an access key for an element, the user agent should not change the element's [assigned access key](#) unless the `accesskey` content attribute is changed or the element is moved to another [Document](#).

When the user presses the key combination corresponding to the [assigned access key](#) for an element, if the element [defines a command](#), the command's [Hidden State](#) facet is false (visible), the command's [Disabled State](#) facet is also false (enabled), the element is [in a Document](#) that has an associated [browsing context](#), and neither the element nor any of its ancestors has a [hidden](#) attribute specified, then the user agent must trigger the [Action](#) of the command.

**Note** User agents [might expose](#) elements that have an `accesskey` attribute in other ways as well, e.g. in a menu displayed in response to a specific key combination.

The `accessKey` IDL attribute must [reflect](#) the `accesskey` content attribute.

The `accessKeyLabel` IDL attribute must return a string that represents the element's [assigned access key](#), if any. If the element does not have one, then the IDL attribute must return the empty string.

## 6.6 Editing

### 6.6.1 Making document regions editable: The `contenteditable` content attribute

```
IDL [NoInterfaceObject]
interface ElementContentEditable {
 attribute DOMString contentEditable;
 readonly attribute boolean isContentEditable;
};
```

Spec bugs:	<a href="#">27457</a>
Support:	
Chrome	4+
IE	5.5+
Chrome for Android	40+
Firefox	3.5+
iOS Safari	5.0-5.1+
Android Browser	3+
UC Browser for Android	9.9+
Opera Mini	None
Safari	3.1+
Opera	9+
IE Mobile	10+
Firefox for Android	33+

The `contenteditable` content attribute is an [enumerated attribute](#) whose keywords are the empty string, `true`, and `false`. The `true` keyword maps to the `true` state. The `false` keyword maps to the `false` state. In addition, there is a third state, the `inherit` state, which is the [missing value default](#) (and the [invalid value default](#)). Source: [caniuse.com](#)

The `true` state indicates that the element is editable. The `inherit` state indicates that the element is editable if its parent is. The `false` state indicates that the element is not editable.

**Note**

`element.contentEditablep740 [= value]`

Returns "true", "false", or "inherit", based on the state of the [contenteditable](#)<sup>p739</sup> attribute.

Can be set, to change that state.

Throws a [SyntaxError](#)<sup>p50</sup> exception if the new value isn't one of those strings.

`element.isContentEditablep740`

Returns true if the element is editable; otherwise, returns false.

The `contentEditable` IDL attribute, on getting, must return the string "true" if the content attribute is set to the true state, "false" if the content attribute is set to the false state, and "inherit" otherwise. On setting, if the new value is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "inherit" then the content attribute must be removed, if the new value is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "true" then the content attribute must be set to the string "true", if the new value is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "false" then the content attribute must be set to the string "false", and otherwise the attribute setter must throw a [SyntaxError](#)<sup>p50</sup> exception.

The `isContentEditable` IDL attribute, on getting, must return true if the element is either an [editing host](#)<sup>p741</sup> or [editable](#)<sup>p741</sup>, and false otherwise.

## 6.6.2 Making entire documents editable: The [designMode](#)<sup>p740</sup> IDL attribute

Spec bugs: [17743](#)

Documents have a `designMode`, which can be either enabled or disabled.

**Note**

`document.designModep740 [= value]`

Returns "on" if the document is editable, and "off" if it isn't.

Can be set, to change the document's current state. This focuses the document and resets the selection in that document.

The `designMode`<sup>p740</sup> IDL attribute on the [Document](#)<sup>p102</sup> object takes two values, "on" and "off". On setting, the new value must be compared in an [ASCII case-insensitive](#)<sup>p58</sup> manner to these two values; if it matches the "on" value, then `designMode`<sup>p740</sup> must be enabled, and if it matches the "off" value, then `designMode`<sup>p740</sup> must be disabled. Other values must be ignored.

On getting, if `designMode`<sup>p740</sup> is enabled, the IDL attribute must return the value "on"; otherwise it is disabled, and the attribute must return the value "off".

The last state set must persist until the document is destroyed or the state is changed. Initially, documents must have their `designMode`<sup>p740</sup> disabled.

When the `designMode`<sup>p740</sup> changes from being disabled to being enabled, the user agent must [immediately](#)<sup>p41</sup> reset the document's [active range](#)<sup>p741</sup>'s start and end boundary points to be at the start of the [Document](#)<sup>p102</sup> and then run the [focusing steps](#)<sup>p730</sup> for the root element of the [Document](#)<sup>p102</sup>, if any.

## 6.6.3 Best practices for in-page editors

Authors are encouraged to set the 'white-space' property on [editing hosts](#)<sup>p741</sup> and on markup that was originally created through these editing mechanisms to the value 'pre-wrap'. Default HTML whitespace handling is not well suited to WYSIWYG editing, and line wrapping will not work correctly in some corner cases if 'white-space' is left at its default value.

**Example**

As an example of problems that occur if the default 'normal' value is used instead, consider the case of the user typing "yellow\_ball", with two spaces (here represented by "\_") between the words. With the editing rules in place for the default value of 'white-space' ('normal'), the resulting markup will either consist of "yellow&ampnbsp ball" or "yellow &ampnbspball"; i.e., there will be

a non-breaking space between the two words in addition to the regular space. This is necessary because the 'normal' value for 'white-space' requires adjacent regular spaces to be collapsed together.

In the former case, "yellow\_—" might wrap to the next line ("—" being used here to represent a non-breaking space) even though "yellow" alone might fit at the end of the line; in the latter case, "\_-ball", if wrapped to the start of the line, would have visible indentation from the non-breaking space.

When 'white-space' is set to 'pre-wrap', however, the editing rules will instead simply put two regular spaces between the words, and should the two words be split at the end of a line, the spaces would be neatly removed from the rendering.

## 6.6.4 Editing APIs

The definition of the terms **active range**, **editing host**, and **editable**, the user interface requirements of elements that are [editing hosts<sup>p741</sup>](#) or [editable<sup>p741</sup>](#), the [execCommand\(\)](#), [queryCommandEnabled\(\)](#), [queryCommandIndeterm\(\)](#), [queryCommandState\(\)](#), [queryCommandSupported\(\)](#), and [queryCommandValue\(\)](#) methods, text selections, and the **delete the selection** algorithm are defined in the HTML Editing APIs specification. [\[EDITING\]<sup>p1150</sup>](#)

## 6.6.5 Spelling and grammar checking

User agents can support the checking of spelling and grammar of editable text, either in form controls (such as the value of [text](#) elements), or in elements in an [editing host<sup>p741</sup>](#) (e.g. using [contenteditable<sup>p739</sup>](#)).

For each element, user agents must establish a **default behaviour**, either through defaults or through preferences expressed by are three possible default behaviours for each element:

### true-by-default

The element will be checked for spelling and grammar if its contents are editable.

### false-by-default

The element will never be checked for spelling and grammar.

### inherit-by-default

The element's default behaviour is the same as its parent element's. Elements that have no parent element cannot have this as their default behaviour.

Support:	
	Chrome 9+
	IE 10+
	Chrome for Android 40+ (limited)
	Firefox 2+
	iOS Safari (limited) 3.2+
	Android Browser (limited) 2.1+
	UC Browser for Android 9.9+ (limited)
	Opera Mini (limited) 5.0-8.0+
	Safari 5.1+
	Opera 10.5+
	IE Mobile (limited) 10+
	Firefox for Android 33+ (limited)

Source: [caniuse.com](#)

The [spellcheck](#) attribute is an [enumerated attribute<sup>p60</sup>](#) whose keywords are the empty string, [true](#) and [false](#). The empty string and the [true](#) keyword map to the [true](#) state. The [false](#) keyword maps to the [false](#) state. In addition, there is a third state, the [default](#) state, which is the [missing value default<sup>p60</sup>](#) (and the [invalid value default<sup>p60</sup>](#)).

**Note** *The true state indicates that the element is to have its spelling and grammar checked. The default state indicates that the element is to act according to a default behaviour, possibly based on the parent element's own [spellcheck<sup>p741</sup>](#) state, as defined below. The false state indicates that the element is not to be checked.*

### Note

**`element.spellcheckp742 [= value]`**

Returns true if the element is to have its spelling and grammar checked; otherwise, returns false.

Can be set, to override the default and set the [spellcheck<sup>p741</sup>](#) content attribute.

**`element.forceSpellCheckp742()`**

Forces the user agent to report spelling and grammar errors on the element (if checking is enabled), even if the user has never focused the element. (If the method is not invoked, user agents can hide errors in text that wasn't just entered by the user.)

The `spellcheck` IDL attribute, on getting, must return true if the element's `spellcheckp741` content attribute is in the `true` state, or if the element's `spellcheckp741` content attribute is in the `default` state and the element's `default behaviourp741` is `true-by-defaultp741`, or if the element's `spellcheckp741` content attribute is in the `default` state and the element's `default behaviourp741` is `inherit-by-defaultp741` and the element's parent element's `spellcheckp742` IDL attribute would return true; otherwise, if none of those conditions applies, then the attribute must instead return false.

**Note** The `spellcheckp742` IDL attribute is not affected by user preferences that override the `spellcheckp741` content attribute, and therefore might not reflect the actual spellchecking state.

On setting, if the new value is true, then the element's `spellcheckp741` content attribute must be set to the literal string "`true`", otherwise it must be set to the literal string "`false`".

User agents must only consider the following pieces of text as checkable for the purposes of this feature:

- The `valuep527` of `inputp452` elements whose `typep454` attributes are in the `Textp458`, `Searchp458`, `URLp460`, or `E-mailp461` states and that are `mutablep527` (i.e. that do not have the `readonlyp483` attribute specified and that are not `disabledp530`).
- The `valuep527` of `textareap508` elements that do not have a `readonlyp509` attribute and that are not `disabledp530`.
- Text in `Textp51` nodes that are children of `editing hostsp741` or `editablep741` elements.
- Text in attributes of `editablep741` elements.

For text that is part of a `Textp51` node, the element with which the text is associated is the element that is the immediate parent of the first character of the word, sentence, or other piece of text. For text in attributes, it is the attribute's element. For the values of `inputp452` and `textareap508` elements, it is the element itself.

To determine if a word, sentence, or other piece of text in an applicable element (as defined above) is to have spelling- and grammar-checking enabled, the UA must use the following algorithm:

1. If the user has disabled the checking for this text, then the checking is disabled.
2. Otherwise, if the user has forced the checking for this text to always be enabled, then the checking is enabled.
3. Otherwise, if the element with which the text is associated has a `spellcheckp741` content attribute, then: if that attribute is in the `true` state, then checking is enabled; otherwise, if that attribute is in the `false` state, then checking is disabled.
4. Otherwise, if there is an ancestor element with a `spellcheckp741` content attribute that is not in the `default` state, then: if the nearest such ancestor's `spellcheckp741` content attribute is in the `true` state, then checking is enabled; otherwise, checking is disabled.
5. Otherwise, if the element's `default behaviourp741` is `true-by-defaultp741`, then checking is enabled.
6. Otherwise, if the element's `default behaviourp741` is `false-by-defaultp741`, then checking is disabled.
7. Otherwise, if the element's parent element has its checking enabled, then checking is enabled.
8. Otherwise, checking is disabled.

If the checking is enabled for a word/sentence/text, the user agent should indicate spelling and grammar errors in that text. User agents should take into account the other semantics given in the document when suggesting spelling and grammar corrections. User agents may use the language of the element to determine what spelling and grammar rules to use, or may use the user's preferred language settings. UAs should use `inputp452` element attributes such as `patternp486` to ensure that the resulting value is valid, where possible.

If checking is disabled, the user agent should not indicate spelling or grammar errors for that text.

Even when checking is enabled, user agents may opt to not report spelling or grammar errors in text that the user agent deems the user has no interest in having checked (e.g. text that was already present when the page was loaded, or that the user did not type, or text in controls that the user has not focused, or in parts of e-mail addresses that the user agent is not confident were misspelt). The `forceSpellCheck()` method, when invoked on an element, must override this behaviour, forcing the user agent to consider all spelling and grammar errors in text in that element for which checking is enabled to be of interest to the user.

**Example**

The element with ID "a" in the following example would be the one used to determine if the word "Hello" is checked for spelling errors. In this example, it would not be.

```
<div contenteditable="true">
 Hello!
</div>
```

The element with ID "b" in the following example would have checking enabled (the leading space character in the attribute's value on the [input](#)<sup>p452</sup> element causes the attribute to be ignored, so the ancestor's value is used instead, regardless of the default).

```
<p spellcheck="true">
 <label>Name: <input spellcheck=" false" id="b"></label>
</p>
```

**Note** This specification does not define the user interface for spelling and grammar checkers. A user agent could offer on-demand checking, could perform continuous checking while the checking is enabled, or could use other interfaces.

## 6.7 Drag and drop

This section defines an event-based drag-and-drop mechanism.

This specification does not define exactly what a *drag-and-drop operation* actually is.

On a visual medium with a pointing device, a drag operation could be the default action of a [mousedown](#)<sup>p52</sup> event that is followed by [mousemove](#)<sup>p52</sup> events, and the drop could be triggered by the mouse being released.

When using an input modality other than a pointing device, users would probably have to explicitly indicate their intention to perform a drop operation, stating what they wish to drag and where they wish to drop it, respectively.

Support:	
Chrome	4+
IE (limited)	5.5+
Chrome for Android	None
Firefox	3.5+
iOS Safari	None
Android Browser	None
UC Browser for Android	None
Opera Mini	None
Safari	3.1+
Opera	12+
IE Mobile	10+
Firefox for Android	None

Source: [caniuse.com](http://caniuse.com)

However it is implemented, drag-and-drop operations must have a starting point (e.g. where the mouse was clicked, or the start of the selection or element that was selected for the drag), may have any number of intermediate steps (elements that the mouse moves over during a drag, or elements that the user picks as possible drop points as he cycles through possibilities), and must either have an end point (the element above which the mouse button was released, or the element that was finally selected), or be canceled. The end point must be the last element selected as a possible drop point before the drop occurs (so if the operation is not canceled, there must be at least one element in the middle step).

### 6.7.1 Introduction

This section is non-normative.

To make an element draggable is simple: give the element a [draggable](#)<sup>p758</sup> attribute, and set an event listener for [dragstart](#)<sup>p758</sup> that stores the data being dragged.

The event handler typically needs to check that it's not a text selection that is being dragged, and then needs to store data into the [DataTransfer](#)<sup>p746</sup> object and set the allowed effects (copy, move, link, or some combination).

For example:

```
<p>What fruits do you like?</p>
<ol ondragstart="dragStartHandler(event)">
 <li draggable="true" data-value="fruit-apple">Apples
 <li draggable="true" data-value="fruit-orange">Oranges
 <li draggable="true" data-value="fruit-pear">Pears

<script>
 var internalDNDType = 'text/x-example'; // set this to something specific to your site
 function dragStartHandler(event) {
 if (event.target instanceof HTMLLIElement) {
```

```

 // use the element's data-value="" attribute as the value to be moving:
 event.dataTransfer.setData(internalDNDType, event.target.dataset.value);
 event.dataTransfer.effectAllowed = 'move'; // only allow moves
} else {
 event.preventDefault(); // don't allow selection to be dragged
}
}
</script>

```

To accept a drop, the drop target has to have a [dropzone<sup>p759</sup>](#) attribute and listen to the [drop<sup>p758</sup>](#) event.

The value of the [dropzone<sup>p759</sup>](#) attribute specifies what kind of data to accept (e.g. "string:text/plain" to accept any text strings, or "file:image/png" to accept a PNG image file) and what kind of feedback to give (e.g. "move" to indicate that the data will be moved).

**Note** *Instead of using the [dropzone<sup>p759</sup>](#) attribute, a drop target can handle the [dragenter<sup>p758</sup>](#) event (to report whether or not the drop target is to accept the drop) and the [dragover<sup>p758</sup>](#) event (to specify what feedback is to be shown to the user).*

The [drop<sup>p758</sup>](#) event allows the actual drop to be performed. This event needs to be canceled, so that the [dropEffect<sup>p747</sup>](#) attribute's value can be used by the source (otherwise it's reset).

For example:

```

<p>Drop your favorite fruits below:</p>
<ol dropzone="move string:text/x-example" ondrop="dropHandler(event)">
 <!-- don't forget to change the "text/x-example" type to something
 specific to your site -->

<script>
 var internalDNDType = 'text/x-example'; // set this to something specific to your site
 function dropHandler(event) {
 var li = document.createElement('li');
 var data = event.dataTransfer.getData(internalDNDType);
 if (data == 'fruit-apple') {
 li.textContent = 'Apples';
 } else if (data == 'fruit-orange') {
 li.textContent = 'Oranges';
 } else if (data == 'fruit-pear') {
 li.textContent = 'Pears';
 } else {
 li.textContent = 'Unknown Fruit';
 }
 event.target.appendChild(li);
 }
</script>

```

To remove the original element (the one that was dragged) from the display, the [dragend<sup>p758</sup>](#) event can be used.

For our example here, that means updating the original markup to handle that event:

```

<p>What fruits do you like?</p>
<ol ondragstart="dragStartHandler(event)" ondragend="dragEndHandler(event)">
 ...as before...

<script>
 function dragStartHandler(event) {
 // ...as before...
 }
 function dragEndHandler(event) {
 if (event.dataTransfer.dropEffect == 'move') {

```

```

 // remove the dragged element
 event.target.parentNode.removeChild(event.target);
 }
}
</script>

```

## 6.7.2 The drag data store

The data that underlies a drag-and-drop operation, known as the **drag data store**, consists of the following information:

- A **drag data store item list**, which is a list of items representing the dragged data, each consisting of the following information:

### **The drag data item kind**

The kind of data:

#### **Plain Unicode string**

Text.

#### **File**

Binary data with a file name.

### **The drag data item type string**

A Unicode string giving the type or format of the data, generally given by a [MIME type<sup>p42</sup>](#). Some values that are not [MIME types<sup>p42</sup>](#) are special-cased for legacy reasons. The API does not enforce the use of [MIME types<sup>p42</sup>](#); other values can be used as well. In all cases, however, the values are all [converted to ASCII lowercase<sup>p58</sup>](#) by the API.

**Note** *Strings that contain space characters<sup>p58</sup> cannot be used with the [dropzone<sup>p759</sup>](#) attribute, so authors are encouraged to use only [MIME types<sup>p42</sup>](#) or custom strings (without spaces).*

There is a limit of one *Plain Unicode string* item per [item type string<sup>p745</sup>](#).

### **The actual data**

A Unicode or binary string, in some cases with a file name (itself a Unicode string), as per [the drag data item kind<sup>p745</sup>](#).

The [drag data store item list<sup>p745</sup>](#) is ordered in the order that the items were added to the list; most recently added last.

- The following information, used to generate the UI feedback during the drag:
  - User-agent-defined default feedback information, known as the **drag data store default feedback**.
  - Optionally, a bitmap image and the coordinate of a point within that image, known as the **drag data store bitmap** and **drag data store hot spot coordinate**.
- A **drag data store mode**, which is one of the following:

#### **Read/write mode**

For the [dragstart<sup>p758</sup>](#) event. New data can be added to the [drag data store<sup>p745</sup>](#).

#### **Read-only mode**

For the [drop<sup>p758</sup>](#) event. The list of items representing dragged data can be read, including the data. No new data can be added.

#### **Protected mode**

For all other events. The formats and kinds in the [drag data store<sup>p745</sup>](#) list of items representing dragged data can be enumerated, but the data itself is unavailable and no new data can be added.

- A **drag data store allowed effects state**, which is a string.

When a [drag data store<sup>p745</sup>](#) is **created**, it must be initialised such that its [drag data store item list<sup>p745</sup>](#) is empty, it has no [drag data store default feedback<sup>p745</sup>](#), it has no [drag data store bitmap<sup>p745</sup>](#) and [drag data store hot spot coordinate<sup>p745</sup>](#), its [drag data store mode<sup>p745</sup>](#) is [protected mode<sup>p745</sup>](#), and its [drag data store allowed effects state<sup>p745</sup>](#) is the string "[uninitialized<sup>p747</sup>](#)".

### 6.7.3 The DataTransfer<sup>p746</sup> interface

DataTransfer<sup>p746</sup> objects are used to expose the drag data store<sup>p745</sup> that underlies a drag-and-drop operation.

IDL

```
interface DataTransfer {
 attribute DOMString dropEffect;
 attribute DOMString effectAllowed;

 [SameObject] readonly attribute DataTransferItemList items;

 void setDragImage(Element image, long x, long y);

 /* old interface */
 [SameObject] readonly attribute DOMString[] types;
 DOMString getData(DOMString format);
 void setData(DOMString format, DOMString data);
 void clearData(optional DOMString format);
 [SameObject] readonly attribute FileList files;
};
```

Note

**dataTransfer . dropEffect<sup>p747</sup> [= value]**

Returns the kind of operation that is currently selected. If the kind of operation isn't one of those that is allowed by the effectAllowed<sup>p747</sup> attribute, then the operation will fail.

Can be set, to change the selected operation.

The possible values are "none<sup>p747</sup>", "copy<sup>p747</sup>", "link<sup>p747</sup>", and "move<sup>p747</sup>".

**dataTransfer . effectAllowed<sup>p747</sup> [= value]**

Returns the kinds of operations that are to be allowed.

Can be set (during the dragstart<sup>p758</sup> event), to change the allowed operations.

The possible values are "none<sup>p747</sup>", "copy<sup>p747</sup>", "copyLink<sup>p747</sup>", "copyMove<sup>p747</sup>", "link<sup>p747</sup>", "linkMove<sup>p747</sup>", "move<sup>p747</sup>", "all<sup>p747</sup>", and "uninitialized<sup>p747</sup>",

**dataTransfer . items<sup>p747</sup>**

Returns a DataTransferItemList<sup>p749</sup> object, with the drag data.

**dataTransfer . setDragImage<sup>p747</sup>(element, x, y)**

Uses the given element to update the drag feedback, replacing any previously specified feedback.

**dataTransfer . types<sup>p747</sup>**

Returns an array listing the formats that were set in the dragstart<sup>p758</sup> event. In addition, if any files are being dragged, then one of the types will be the string "Files".

**data = dataTransfer . getData<sup>p747</sup>(format)**

Returns the specified data. If there is no such data, returns the empty string.

**dataTransfer . setData<sup>p748</sup>(format, data)**

Adds the specified data.

**dataTransfer . clearData<sup>p748</sup>([ format ])**

Removes the data of the specified formats. Removes all data if the argument is omitted.

**dataTransfer . files<sup>p748</sup>**

Returns a FileList<sup>p52</sup> of the files being dragged, if any.

[DataTransfer](#)<sup>p746</sup> objects are used during the [drag-and-drop events](#)<sup>p758</sup>, and are only valid while those events are being fired.

A [DataTransfer](#)<sup>p746</sup> object is associated with a [drag data store](#)<sup>p745</sup> while it is valid.

The [dropEffect](#) attribute controls the drag-and-drop feedback that the user is given during a drag-and-drop operation. When the [DataTransfer](#)<sup>p746</sup> object is created, the [dropEffect](#)<sup>p747</sup> attribute is set to a string value. On getting, it must return its current value. On setting, if the new value is one of "none", "copy", "link", or "move", then the attribute's current value must be set to the new value. Other values must be ignored.

The [effectAllowed](#) attribute is used in the drag-and-drop processing model to initialise the [dropEffect](#)<sup>p747</sup> attribute during the [dragenter](#)<sup>p758</sup> and [dragover](#)<sup>p758</sup> events. When the [DataTransfer](#)<sup>p746</sup> object is created, the [effectAllowed](#)<sup>p747</sup> attribute is set to a string value. On getting, it must return its current value. On setting, if [drag data store](#)<sup>p745</sup>'s [mode](#)<sup>p745</sup> is the [read/write mode](#)<sup>p745</sup> and the new value is one of "none", "copy", "copyLink", "copyMove", "link", "linkMove", "move", "all", or "uninitialized", then the attribute's current value must be set to the new value. Otherwise it must be left unchanged.

The [items](#) attribute must return a [DataTransferItemList](#)<sup>p749</sup> object associated with the [DataTransfer](#)<sup>p746</sup> object.

The [setDragImage\(element, x, y\)](#) method must run the following steps:

1. If the [DataTransfer](#)<sup>p746</sup> object is no longer associated with a [drag data store](#)<sup>p745</sup>, abort these steps. Nothing happens.
2. If the [drag data store](#)<sup>p745</sup>'s [mode](#)<sup>p745</sup> is not the [read/write mode](#)<sup>p745</sup>, abort these steps. Nothing happens.
3. If the [element](#) argument is an [img](#)<sup>b272</sup> element, then set the [drag data store bitmap](#)<sup>p745</sup> to the element's image (at its intrinsic size); otherwise, set the [drag data store bitmap](#)<sup>p745</sup> to an image generated from the given element (the exact mechanism for doing so is not currently specified).
4. Set the [drag data store hot spot coordinate](#)<sup>p745</sup> to the given [x, y](#) coordinate.

The [types](#) attribute must return a [live](#)<sup>b43</sup> [read only](#)<sup>p49</sup> array giving the strings that the following steps would produce.

1. Start with an empty list  $L$ .
2. If the [DataTransfer](#)<sup>p746</sup> object is no longer associated with a [drag data store](#)<sup>p745</sup>, the array is empty. Abort these steps; return the empty list  $L$ .
3. For each item in the [drag data store item list](#)<sup>p745</sup> whose [kind](#)<sup>p745</sup> is *Plain Unicode string*, add an entry to the list  $L$  consisting of the item's [type string](#)<sup>p745</sup>.
4. If there are any items in the [drag data store item list](#)<sup>p745</sup> whose [kind](#)<sup>p745</sup> is *File*, then add an entry to the list  $L$  consisting of the string "Files". (This value can be distinguished from the other values because it is not lowercase.)
5. The strings produced by these steps are those in the list  $L$ .

The [getData\(format\)](#) method must run the following steps:

1. If the [DataTransfer](#)<sup>p746</sup> object is no longer associated with a [drag data store](#)<sup>p745</sup>, return the empty string and abort these steps.
2. If the [drag data store](#)<sup>p745</sup>'s [mode](#)<sup>p745</sup> is the [protected mode](#)<sup>p745</sup>, return the empty string and abort these steps.
3. Let  $format$  be the first argument, [converted to ASCII lowercase](#)<sup>b58</sup>.
4. Let [convert-to-URL](#) be false.
5. If  $format$  equals "text", change it to "text/plain".
6. If  $format$  equals "url", change it to "text/uri-list" and set [convert-to-URL](#) to true.
7. If there is no item in the [drag data store item list](#)<sup>p745</sup> whose [kind](#)<sup>p745</sup> is *Plain Unicode string* and whose [type string](#)<sup>p745</sup> is equal to  $format$ , return the empty string and abort these steps.
8. Let  $result$  be the data of the item in the [drag data store item list](#)<sup>p745</sup> whose [kind](#)<sup>p745</sup> is *Plain Unicode string* and whose [type string](#)<sup>p745</sup> is equal to  $format$ .

9. If `convert-to-URL` is true, then parse `result` as appropriate for `text/uri-list` data, and then set `result` to the first URL from the list, if any, or the empty string otherwise. [RFC2483]<sup>b1152</sup>
10. Return `result`.

The `setData(format, data)` method must run the following steps:

1. If the `DataTransfer`<sup>p746</sup> object is no longer associated with a `drag data store`<sup>p745</sup>, abort these steps. Nothing happens.
2. If the `drag data store`<sup>p745</sup>'s `mode`<sup>p745</sup> is not the `read/write mode`<sup>p745</sup>, abort these steps. Nothing happens.
3. Let `format` be the first argument, `converted to ASCII lowercase`<sup>p58</sup>.
4. If `format` equals "text", change it to "text/plain".  
If `format` equals "url", change it to "text/uri-list".
5. Remove the item in the `drag data store item list`<sup>p745</sup> whose `kind`<sup>p745</sup> is `Plain Unicode string` and whose `type string`<sup>p745</sup> is equal to `format`, if there is one.
6. Add an item to the `drag data store item list`<sup>p745</sup> whose `kind`<sup>p745</sup> is `Plain Unicode string`, whose `type string`<sup>p745</sup> is equal to `format`, and whose data is the string given by the method's second argument.

The `clearData()` method must run the following steps:

1. If the `DataTransfer`<sup>p746</sup> object is no longer associated with a `drag data store`<sup>p745</sup>, abort these steps. Nothing happens.
2. If the `drag data store`<sup>p745</sup>'s `mode`<sup>p745</sup> is not the `read/write mode`<sup>p745</sup>, abort these steps. Nothing happens.
3. If the method was called with no arguments, remove each item in the `drag data store item list`<sup>p745</sup> whose `kind`<sup>p745</sup> is `Plain Unicode string`, and abort these steps.
4. Let `format` be the first argument, `converted to ASCII lowercase`<sup>p58</sup>.
5. If `format` equals "text", change it to "text/plain".  
If `format` equals "url", change it to "text/uri-list".
6. Remove the item in the `drag data store item list`<sup>p745</sup> whose `kind`<sup>p745</sup> is `Plain Unicode string` and whose `type string`<sup>p745</sup> is equal to `format`, if there is one.

**Note** The `clearData()`<sup>p748</sup> method does not affect whether any files were included in the drag, so the `types`<sup>p747</sup> attribute's list might still not be empty after calling `clearData()`<sup>p748</sup> (it would still contain the "Files" string if any files were included in the drag).

The `files` attribute must return a `live`<sup>p43</sup> `FileList`<sup>p52</sup> sequence consisting of `File`<sup>p52</sup> objects representing the files found by the following steps. Furthermore, for a given `FileList`<sup>p52</sup> object and a given underlying file, the same `File`<sup>p52</sup> object must be used each time.

1. Start with an empty list  $L$ .
2. If the `DataTransfer`<sup>p746</sup> object is no longer associated with a `drag data store`<sup>p745</sup>, the `FileList`<sup>p52</sup> is empty. Abort these steps; return the empty list  $L$ .
3. If the `drag data store`<sup>p745</sup>'s `mode`<sup>p745</sup> is the `protected mode`<sup>p745</sup>, abort these steps; return the empty list  $L$ .
4. For each item in the `drag data store item list`<sup>p745</sup> whose `kind`<sup>p745</sup> is `File`, add the item's data (the file, in particular its name and contents, as well as its `type`<sup>p745</sup>) to the list  $L$ .
5. The files found by these steps are those in the list  $L$ .

**Note** This version of the API does not expose the types of the files during the drag.

### 6.7.3.1 The `DataTransferItemList`<sup>p749</sup> interface

Each `DataTransfer`<sup>p746</sup> object is associated with a `DataTransferItemList`<sup>p749</sup> object.

```
interface DataTransferItemList {
 readonly attribute unsigned long length;
 getter DataTransferItem (unsigned long index);
 DataTransferItem? add(DOMString data, DOMString type);
 DataTransferItem? add(File data);
 void remove (unsigned long index);
 void clear();
};
```

## Note

*items* . length<sup>p749</sup>Returns the number of items in the drag data store<sup>p745</sup>.*items*[*index*]Returns the DataTransferItem<sup>p750</sup> object representing the *index*th entry in the drag data store<sup>p745</sup>.*items* . remove<sup>p750</sup>(*index*)Removes the *index*th entry in the drag data store<sup>p745</sup>.*items* . clear<sup>p750</sup>()Removes all the entries in the drag data store<sup>p745</sup>.*items* . add<sup>p749</sup>(*data*)*items* . add<sup>p749</sup>(*data*, *type*)Adds a new entry for the given data to the drag data store<sup>p745</sup>. If the data is plain text then a *type* string has to be provided also.

While the DataTransferItemList<sup>p749</sup> object's DataTransfer<sup>p746</sup> object is associated with a drag data store<sup>p745</sup>, the DataTransferItemList<sup>p749</sup> object's *mode* is the same as the drag data store mode<sup>p745</sup>. When the DataTransferItemList<sup>p749</sup> object's DataTransfer<sup>p746</sup> object is *not* associated with a drag data store<sup>p745</sup>, the DataTransferItemList<sup>p749</sup> object's *mode* is the *disabled mode*. The drag data store<sup>p745</sup> referenced in this section (which is used only when the DataTransferItemList<sup>p749</sup> object is not in the *disabled mode*) is the drag data store<sup>p745</sup> with which the DataTransferItemList<sup>p749</sup> object's DataTransfer<sup>p746</sup> object is associated.

The length attribute must return zero if the object is in the *disabled mode*; otherwise it must return the number of items in the drag data store item list<sup>p745</sup>.

When a DataTransferItemList<sup>p749</sup> object is not in the *disabled mode*, its supported property indices<sup>p49</sup> are the numbers in the range 0 .. *n*-1, where *n* is the number of items in the drag data store item list<sup>p745</sup>.

To determine the value of an indexed property *i* of a DataTransferItemList<sup>p749</sup> object, the user agent must return a DataTransferItem<sup>p750</sup> object representing the *i*th item in the drag data store<sup>p745</sup>. The same object must be returned each time a particular item is obtained from this DataTransferItemList<sup>p749</sup> object. The DataTransferItem<sup>p750</sup> object must be associated with the same DataTransfer<sup>p746</sup> object as the DataTransferItemList<sup>p749</sup> object when it is first created.

The add() method must run the following steps:

1. If the DataTransferItemList<sup>p749</sup> object is not in the read/write mode<sup>p745</sup>, return null and abort these steps.
2. Jump to the appropriate set of steps from the following list:

## ↳ If the first argument to the method is a string

If there is already an item in the drag data store item list<sup>p745</sup> whose kind<sup>b745</sup> is *Plain Unicode string* and whose type string<sup>p745</sup> is equal to the value of the method's second argument, converted to ASCII lowercase<sup>p58</sup>, then throw a NotSupportedError<sup>b50</sup> exception and abort these steps.

Otherwise, add an item to the drag data store item list<sup>p745</sup> whose kind<sup>p745</sup> is *Plain Unicode string*, whose type string<sup>p745</sup> is equal to the value of the method's second argument, converted to ASCII lowercase<sup>p58</sup>, and whose data is the string given by the method's first argument.

↪ If the first argument to the method is a [File](#)<sup>p52</sup>

Add an item to the [drag data store item list](#)<sup>p745</sup> whose [kind](#)<sup>p745</sup> is [File](#), whose [type string](#)<sup>p745</sup> is the [type](#)<sup>p52</sup> of the [File](#)<sup>p52</sup>, converted to ASCII lowercase<sup>p58</sup>, and whose data is the same as the [File](#)<sup>p52</sup>'s data.

3. Determine the value of the indexed property<sup>p749</sup> corresponding to the newly added item, and return that value (a newly created [DataTransferItem](#)<sup>p750</sup> object).

The [remove \(\)](#) method, when invoked with the argument *i*, must run these steps:

1. If the [DataTransferItemList](#)<sup>p749</sup> object is not in the [read/write mode](#)<sup>p745</sup>, throw an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
2. Remove the *i*th item from the [drag data store](#)<sup>p745</sup>.

The [clear](#) method, if the [DataTransferItemList](#)<sup>p749</sup> object is in the [read/write mode](#)<sup>p745</sup>, must remove all the items from the [drag data store](#)<sup>p745</sup>. Otherwise, it must do nothing.

#### 6.7.3.2 The [DataTransferItem](#)<sup>p750</sup> interface

Each [DataTransferItem](#)<sup>p750</sup> object is associated with a [DataTransfer](#)<sup>p746</sup> object.

IDL

```
interface DataTransferItem {
 readonly attribute DOMString kind;
 readonly attribute DOMString type;
 void getAsString(FunctionStringCallback? _callback);
 File? getAsFile();
};

callback FunctionStringCallback = void (DOMString data);
```

##### Note

[item . kind](#)<sup>p750</sup>

Returns [the drag data item kind](#)<sup>p745</sup>, one of: "string", "file".

[item . type](#)<sup>p751</sup>

Returns [the drag data item type string](#)<sup>p745</sup>.

[item . getAsString](#)<sup>p751</sup>([callback](#))

Invokes the callback with the string data as the argument, if [the drag data item kind](#)<sup>p745</sup> is *Plain Unicode string*.

[file = item . getAsFile](#)<sup>p751</sup>()

Returns a [File](#)<sup>p52</sup> object, if [the drag data item kind](#)<sup>p745</sup> is [File](#).

While the [DataTransferItem](#)<sup>p750</sup> object's [DataTransfer](#)<sup>p746</sup> object is associated with a [drag data store](#)<sup>p745</sup> and that [drag data store](#)<sup>p745</sup>'s [drag data store item list](#)<sup>p745</sup> still contains the item that the [DataTransferItem](#)<sup>p750</sup> object represents, the [DataTransferItem](#)<sup>p750</sup> object's *mode* is the same as the [drag data store mode](#)<sup>p745</sup>. When the [DataTransferItem](#)<sup>p750</sup> object's [DataTransfer](#)<sup>p746</sup> object is *not* associated with a [drag data store](#)<sup>p745</sup>, or if the item that the [DataTransferItem](#)<sup>p750</sup> object represents has been removed from the relevant [drag data store item list](#)<sup>p745</sup>, the [DataTransferItem](#)<sup>p750</sup> object's *mode* is the *disabled mode*. The [drag data store](#)<sup>p745</sup> referenced in this section (which is used only when the [DataTransferItem](#)<sup>p750</sup> object is not in the *disabled mode*) is the [drag data store](#)<sup>p745</sup> with which the [DataTransferItem](#)<sup>p750</sup> object's [DataTransfer](#)<sup>p746</sup> object is associated.

The [kind](#) attribute must return the empty string if the [DataTransferItem](#)<sup>p750</sup> object is in the *disabled mode*; otherwise it must return the string given in the cell from the second column of the following table from the row whose cell in the first column contains [the drag data item kind](#)<sup>p745</sup> of the item represented by the [DataTransferItem](#)<sup>p750</sup> object:

Kind	String
Plain Unicode string	"string"
File	"file"

The `type` attribute must return the empty string if the `DataTransferItem`<sup>p750</sup> object is in the *disabled mode*; otherwise it must return [the drag data item type string](#)<sup>p745</sup> of the item represented by the `DataTransferItem`<sup>p750</sup> object.

The `getAsString(callback)` method must run the following steps:

1. If the `callback` is null, abort these steps.
2. If the `DataTransferItem`<sup>p750</sup> object is not in the [read/write mode](#)<sup>p745</sup> or the [read-only mode](#)<sup>p745</sup>, abort these steps. The callback is never invoked.
3. If [the drag data item kind](#)<sup>p745</sup> is not *Plain Unicode string*, abort these steps. The callback is never invoked.
4. Otherwise, [queue a task](#)<sup>p635</sup> to invoke `callback`, passing the actual data of the item represented by the `DataTransferItem`<sup>p750</sup> object as the argument.

The `getAsFile()` method must run the following steps:

1. If the `DataTransferItem`<sup>p750</sup> object is not in the [read/write mode](#)<sup>p745</sup> or the [read-only mode](#)<sup>p745</sup>, return null and abort these steps.
2. If [the drag data item kind](#)<sup>p745</sup> is not *File*, then return null and abort these steps.
3. Return a new `File`<sup>p52</sup> object representing the actual data of the item represented by the `DataTransferItem`<sup>p750</sup> object.

#### 6.7.4 The `DragEvent`<sup>p751</sup> interface

The drag-and-drop processing model involves several events. They all use the `DragEvent`<sup>p751</sup> interface.

**IDL**

```
[Constructor(DOMString type, optional DragEventInit eventInitDict)]
interface DragEvent : MouseEvent {
 readonly attribute DataTransfer? dataTransfer;
};

dictionary DragEventInit : MouseEventInit {
 DataTransfer? dataTransfer;
};
```

**Note**

`event.dataTransfer`<sup>p751</sup>  
Returns the `DataTransfer`<sup>p746</sup> object for the event.

**Note** Although, for consistency with other event interfaces, the `DragEvent`<sup>p751</sup> interface has a constructor, it is not particularly useful. In particular, there's no way to create a useful `DataTransfer`<sup>p746</sup> object from script, as `DataTransfer`<sup>p746</sup> objects have a processing and security model that is coordinated by the browser during drag-and-drops.

The `dataTransfer` attribute of the `DragEvent`<sup>p751</sup> interface must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the context information for the event.

When a user agent is required to fire a DND event named `e` at an element, using a particular `drag data store`<sup>p745</sup>, and optionally with a specific `related target`, the user agent must run the following steps:

1. If no specific `related target` was provided, set `related target` to null.
2. Let `window` be the `Window`<sup>p768</sup> object of the `Document`<sup>p102</sup> object of the specified target element.

3. If e is dragstart<sup>p758</sup>, set the drag data store mode<sup>p745</sup> to the read/write mode<sup>p745</sup>.  
If e is drop<sup>p758</sup>, set the drag data store mode<sup>p745</sup> to the read-only mode<sup>p745</sup>.
4. Let dataTransfer be a newly created DataTransfer<sup>p746</sup> object associated with the given drag data store<sup>p745</sup>.
5. Set the effectAllowed<sup>p747</sup> attribute to the drag data store<sup>p745</sup>'s drag data store allowed effects state<sup>p745</sup>.
6. Set the dropEffect<sup>p747</sup> attribute to "none"<sup>p747</sup> if e is dragstart<sup>p758</sup>, drag<sup>p758</sup>, dragexit<sup>p758</sup>, or dragleave<sup>p758</sup>; to the value corresponding to the current drag operation<sup>p755</sup> if e is drop<sup>p758</sup> or dragend<sup>p758</sup>; and to a value based on the effectAllowed<sup>p747</sup> attribute's value and the drag-and-drop source, as given by the following table, otherwise (i.e. if e is dragenter<sup>p758</sup> or dragover<sup>b758</sup>):

<u>effectAllowed</u> <sup>p747</sup>	<u>dropEffect</u> <sup>p747</sup>
"none" <sup>p747</sup>	"none" <sup>p747</sup>
"copy" <sup>p747</sup>	"copy" <sup>p747</sup>
"copyLink" <sup>p747</sup>	"copy" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , " <u>link</u> <sup>p747</sup> "
"copyMove" <sup>p747</sup>	"copy" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , " <u>move</u> <sup>p747</sup> "
"all" <sup>p747</sup>	"copy" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , either " <u>link</u> <sup>p747</sup> " or " <u>move</u> <sup>p747</sup> "
"link" <sup>p747</sup>	"link" <sup>p747</sup>
"linkMove" <sup>p747</sup>	"link" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , " <u>move</u> <sup>p747</sup> "
"move" <sup>p747</sup>	"move" <sup>p747</sup>
"uninitialized" <sup>p747</sup> when what is being dragged is a selection from a text field	"move" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , either " <u>copy</u> <sup>p747</sup> " or " <u>link</u> <sup>p747</sup> "
"uninitialized" <sup>p747</sup> when what is being dragged is a selection	"copy" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , either " <u>link</u> <sup>p747</sup> " or " <u>move</u> <sup>p747</sup> "
"uninitialized" <sup>p747</sup> when what is being dragged is an <u>a</u> <sup>p208</sup> element with an <u>href</u> <sup>p245</sup> attribute	"link" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , either " <u>copy</u> <sup>p747</sup> " or " <u>move</u> <sup>p747</sup> "
Any other case	"copy" <sup>p747</sup> , or, <u>if appropriate</u> <sup>p752</sup> , either " <u>link</u> <sup>p747</sup> " or " <u>move</u> <sup>p747</sup> "

Where the table above provides **possibly appropriate alternatives**, user agents may instead use the listed alternative values if platform conventions dictate that the user has requested those alternate effects.

**Example** For example, Windows platform conventions are such that dragging while holding the "alt" key indicates a preference for linking the data, rather than moving or copying it. Therefore, on a Windows system, if "link<sup>p747</sup>" is an option according to the table above while the "alt" key is depressed, the user agent could select that instead of "copy<sup>p747</sup>" or "move<sup>p747</sup>".

7. Create a trusted<sup>p43</sup> DragEvent<sup>p751</sup> object and initialise it to have the given name e, to bubble, to be cancelable unless e is dragexit<sup>p758</sup>, dragleave<sup>p758</sup>, or dragend<sup>p758</sup>, and to have the view<sup>p52</sup> attribute initialised to window, the detail<sup>p52</sup> attribute initialised to zero, the mouse and key attributes initialised according to the state of the input devices as they would be for user interaction events, the relatedTarget<sup>p51</sup> attribute initialised to related target, and the dataTransfer<sup>p751</sup> attribute initialised to dataTransfer, the DataTransfer<sup>p746</sup> object created above.

If there is no relevant pointing device, the object must have its screenX, screenY, clientX, clientY, and button attributes set to 0.

8. Dispatch<sup>p43</sup> the newly created DragEvent<sup>p751</sup> object at the specified target element.
9. Set the drag data store allowed effects state<sup>p745</sup> to the current value of dataTransfer's effectAllowed<sup>p747</sup> attribute. (It can only have changed value if e is dragstart<sup>p758</sup>.)
10. Set the drag data store mode<sup>p745</sup> back to the protected mode<sup>p745</sup> if it was changed in the first step.
11. Break the association between dataTransfer and the drag data store<sup>p745</sup>.

## 6.7.5 Drag-and-drop processing model

When the user attempts to begin a drag operation, the user agent must run the following steps. User agents must act as if these steps were run even if the drag actually started in another document or application and the user agent was not aware that the drag was occurring until it intersected with a document under the user agent's purview.

1. Determine what is being dragged, as follows:

If the drag operation was invoked on a selection, then it is the selection that is being dragged.

Otherwise, if the drag operation was invoked on a [Document](#), it is the first element, going up the ancestor chain, starting at the node that the user tried to drag, that has the IDL attribute [draggable](#) set to true. If there is no such element, then nothing is being dragged; abort these steps, the drag-and-drop operation is never started.

Otherwise, the drag operation was invoked outside the user agent's purview. What is being dragged is defined by the document or application where the drag was started.

**Note** *img* elements and [a](#) elements with an [href](#) attribute have their [draggable](#) attribute set to true by default.

2. [Create a drag data store](#). All the DND events fired subsequently by the steps in this section must use this [drag data store](#).
3. Establish which DOM node is the **source node**, as follows:

If it is a selection that is being dragged, then the [source node](#) is the [Text](#) node that the user started the drag on (typically the [Text](#) node that the user originally clicked). If the user did not specify a particular node, for example if the user just told the user agent to begin a drag of "the selection", then the [source node](#) is the first [Text](#) node containing a part of the selection.

Otherwise, if it is an element that is being dragged, then the [source node](#) is the element that is being dragged.

Otherwise, the [source node](#) is part of another document or application. When this specification requires that an event be dispatched at the [source node](#) in this case, the user agent must instead follow the platform-specific conventions relevant to that situation.

**Note** *Multiple events are fired on the source node during the course of the drag-and-drop operation.*

4. Determine the **list of dragged nodes**, as follows:

If it is a selection that is being dragged, then the [list of dragged nodes](#) contains, in [tree order](#), every node that is partially or completely included in the selection (including all their ancestors).

Otherwise, the [list of dragged nodes](#) contains only the [source node](#), if any.

5. If it is a selection that is being dragged, then add an item to the [drag data store item list](#), with its properties set as follows:

[The drag data item type string](#)

"[text/plain](#)"

[The drag data item kind](#)

*Plain Unicode string*

**The actual data**

The text of the selection

Otherwise, if any files are being dragged, then add one item per file to the [drag data store item list](#), with their properties set as follows:

[The drag data item type string](#)

The MIME type of the file, if known, or "[application/octet-stream](#)" otherwise.

[The drag data item kind](#)

*File*

**The actual data**

The file's contents and name.

**Note** *Dragging files can currently only happen from outside a [browsing context](#), for example from a file system manager application.*

If the drag initiated outside of the application, the user agent must add items to the [drag data store item list](#)<sup>p745</sup> as appropriate for the data being dragged, honoring platform conventions where appropriate; however, if the platform conventions do not use [MIME types](#)<sup>b42</sup> to label dragged data, the user agent must make a best-effort attempt to map the types to MIME types, and, in any case, all the [drag data item type strings](#)<sup>p745</sup> must be [converted to ASCII lowercase](#)<sup>p58</sup>.

User agents may also add one or more items representing the selection or dragged element(s) in other forms, e.g. as HTML.

6. If the [list of dragged nodes](#)<sup>p753</sup> is not empty, then [extract the microdata from those nodes into a JSON form](#)<sup>p720</sup>, and add one item to the [drag data store item list](#)<sup>p745</sup>, with its properties set as follows:

[The drag data item type string](#)<sup>p745</sup>

[application/microdata+json](#)<sup>p1122</sup>

[The drag data item kind](#)<sup>p745</sup>

*Plain Unicode string*

**The actual data**

The resulting JSON string.

7. Run the following substeps:

1. Let *urls* be an empty list of [absolute URLs](#)<sup>p48</sup>.

2. For each *node* in the [list of dragged nodes](#)<sup>p753</sup>:

If the node is an [a](#)<sup>p208</sup> element with an [href](#)<sup>p245</sup> attribute

Add to *urls* the result of [resolving](#)<sup>b82</sup> the element's [href](#)<sup>p245</sup> content attribute relative to the element.

If the node is an [img](#)<sup>p272</sup> element with a [src](#)<sup>p273</sup> attribute

Add to *urls* the result of [resolving](#)<sup>b82</sup> the element's [src](#)<sup>p273</sup> content attribute relative to the element.

3. If *urls* is still empty, abort these substeps.

4. Let *url string* be the result of concatenating the strings in *urls*, in the order they were added, separated by a U+000D CARRIAGE RETURN U+000A LINE FEED character pair (CRLF).

5. Add one item to the [drag data store item list](#)<sup>p745</sup>, with its properties set as follows:

[The drag data item type string](#)<sup>p745</sup>

[text/uri-list](#)<sup>p1147</sup>

[The drag data item kind](#)<sup>p745</sup>

*Plain Unicode string*

**The actual data**

*url string*

8. Update the [drag data store default feedback](#)<sup>p745</sup> as appropriate for the user agent (if the user is dragging the selection, then the selection would likely be the basis for this feedback; if the user is dragging an element, then that element's rendering would be used; if the drag began outside the user agent, then the platform conventions for determining the drag feedback should be used).
9. [Fire a DND event](#)<sup>p751</sup> named [dragstart](#)<sup>p758</sup> at the [source node](#)<sup>p753</sup>.

If the event is canceled, then the drag-and-drop operation should not occur; abort these steps.

**Note** Since events with no event listeners registered are, almost by definition, never canceled, drag-and-drop is always available to the user if the author does not specifically prevent it.

10. [Initiate the drag-and-drop operation](#)<sup>p755</sup> in a manner consistent with platform conventions, and as described below.

The drag-and-drop feedback must be generated from the first of the following sources that is available:

1. The [drag data store bitmap](#)<sup>p745</sup>, if any. In this case, the [drag data store hot spot coordinate](#)<sup>p745</sup> should be used as hints for where to put the cursor relative to the resulting image. The values are expressed as distances in CSS pixels from the left side and from the top side of the image respectively. [\[CSS\]](#)<sup>p1149</sup>
2. The [drag data store default feedback](#)<sup>p745</sup>.

From the moment that the user agent is to **initiate the drag-and-drop operation**, until the end of the drag-and-drop operation, device input events (e.g. mouse and keyboard events) must be suppressed.

During the drag operation, the element directly indicated by the user as the drop target is called the **immediate user selection**. (Only elements can be selected by the user; other nodes must not be made available as drop targets.) However, the [immediate user selection<sup>b755</sup>](#) is not necessarily the **current target element**, which is the element currently selected for the drop part of the drag-and-drop operation.

The [immediate user selection<sup>b755</sup>](#) changes as the user selects different elements (either by pointing at them with a pointing device, or by selecting them in some other way). The [current target element<sup>b755</sup>](#) changes when the [immediate user selection<sup>b755</sup>](#) changes, based on the results of event listeners in the document, as described below.

Both the [current target element<sup>b755</sup>](#) and the [immediate user selection<sup>b755</sup>](#) can be null, which means no target element is selected. They can also both be elements in other (DOM-based) documents, or other (non-Web) programs altogether. (For example, a user could drag text to a word-processor.) The [current target element<sup>b755</sup>](#) is initially null.

In addition, there is also a **current drag operation**, which can take on the values "none", "copy", "link", and "move". Initially, it has the value "none<sup>b755</sup>". It is updated by the user agent as described in the steps below.

User agents must, as soon as the drag operation is [initiated<sup>b755</sup>](#) and every 350ms ( $\pm 200\text{ms}$ ) thereafter for as long as the drag operation is ongoing, [queue a task<sup>p835</sup>](#) to perform the following steps in sequence:

1. If the user agent is still performing the previous iteration of the sequence (if any) when the next iteration becomes due, abort these steps for this iteration (effectively "skipping missed frames" of the drag-and-drop operation).
2. [Fire a DND event<sup>b751</sup>](#) named [drag<sup>p758</sup>](#) at the [source node<sup>b753</sup>](#). If this event is canceled, the user agent must set the [current drag operation<sup>b755</sup>](#) to "none<sup>b755</sup>" (no drag operation).
3. If the [drag<sup>p758</sup>](#) event was not canceled and the user has not ended the drag-and-drop operation, check the state of the drag-and-drop operation, as follows:
  1. If the user is indicating a different [immediate user selection<sup>b755</sup>](#) than during the last iteration (or if this is the first iteration), and if this [immediate user selection<sup>b755</sup>](#) is not the same as the [current target element<sup>b755</sup>](#), then [fire a DND event<sup>b751</sup>](#) named [dragexit<sup>b758</sup>](#) at the [current target element<sup>b755</sup>](#), and then update the [current target element<sup>b755</sup>](#) as follows:
    - ↪ If the new [immediate user selection<sup>b755</sup>](#) is null  
Set the [current target element<sup>b755</sup>](#) to null also.
    - ↪ If the new [immediate user selection<sup>b755</sup>](#) is in a non-DOM document or application  
Set the [current target element<sup>b755</sup>](#) to the [immediate user selection<sup>b755</sup>](#).
    - ↪ Otherwise  
[Fire a DND event<sup>b751</sup>](#) named [dragenter<sup>p758</sup>](#) at the [immediate user selection<sup>b755</sup>](#).  
If the event is canceled, then set the [current target element<sup>b755</sup>](#) to the [immediate user selection<sup>b755</sup>](#).  
Otherwise, run the appropriate step from the following list:
      - ↪ If the [immediate user selection<sup>b755</sup>](#) is a text field (e.g. [textarea<sup>p508</sup>](#), or an [input<sup>p452</sup>](#) element whose [type<sup>p454</sup>](#) attribute is in the [Text<sup>p458</sup>](#) state) or an [editing host<sup>p741</sup>](#) or [editable<sup>p741</sup>](#) element, and the [drag data store item list<sup>p745</sup>](#) has an item with the [drag data item type string<sup>p745</sup>](#) "[text/plain](#)" and the [drag data item kind<sup>p745</sup>](#) [Plain Unicode string](#)  
Set the [current target element<sup>b755</sup>](#) to the [immediate user selection<sup>b755</sup>](#) anyway.
      - ↪ If the [immediate user selection<sup>b755</sup>](#) is an element with a [dropzone<sup>p759</sup>](#) attribute that [matches<sup>p759</sup>](#) the [drag data store<sup>p745</sup>](#)  
Set the [current target element<sup>b755</sup>](#) to the [immediate user selection<sup>b755</sup>](#) anyway.
      - ↪ If the [immediate user selection<sup>b755</sup>](#) is an element that itself has an ancestor element with a [dropzone<sup>p759</sup>](#) attribute that [matches<sup>p759</sup>](#) the [drag data store<sup>p745</sup>](#)  
Let *new target* be the nearest (deepest) such ancestor element.  
If the [immediate user selection<sup>b755</sup>](#) is *new target*, then leave the [current target element<sup>b755</sup>](#) unchanged.

Otherwise, fire a DND event<sup>p751</sup> named `dragenter`<sup>p758</sup> at `new target`, with the current `current target element`<sup>p755</sup> as the specific `related target`. Then, set the `current target element`<sup>p755</sup> to `new target`, regardless of whether that event was canceled or not.

↪ If the `immediate user selection`<sup>p755</sup> is `the body element`<sup>p106</sup>

Leave the `current target element`<sup>p755</sup> unchanged.

↪ Otherwise

Fire a DND event<sup>p751</sup> named `dragenter`<sup>p758</sup> at `the body element`<sup>p106</sup>, if there is one, or at the `Document`<sup>p102</sup> object, if not. Then, set the `current target element`<sup>p755</sup> to `the body element`<sup>p106</sup>, regardless of whether that event was canceled or not.

2. If the previous step caused the `current target element`<sup>p755</sup> to change, and if the previous target element was not null or a part of a non-DOM document, then fire a DND event<sup>p751</sup> named `dragleave`<sup>p758</sup> at the previous target element, with the new `current target element`<sup>p755</sup> as the specific `related target`.

3. If the `current target element`<sup>p755</sup> is a DOM element, then fire a DND event<sup>p751</sup> named `dragover`<sup>p758</sup> at this `current target element`<sup>p755</sup>.

If the `dragover`<sup>p758</sup> event is not canceled, run the appropriate step from the following list:

↪ If the `current target element`<sup>p755</sup> is a text field (e.g. `textarea`<sup>p508</sup>, or an `input`<sup>p452</sup> element whose `type`<sup>p454</sup> attribute is in the `Text`<sup>p458</sup> state) or an `editing host`<sup>p741</sup> or `editable`<sup>p741</sup> element, and the `drag data store item list`<sup>p745</sup> has an item with `the drag data item type string`<sup>p745</sup> "`text/plain`" and `the drag data item kind`<sup>p745</sup> `Plain Unicode string`

Set the `current drag operation`<sup>p755</sup> to either "`copy`<sup>p755</sup>" or "`move`<sup>p755</sup>", as appropriate given the platform conventions.

↪ If the `current target element`<sup>p755</sup> is an element with a `dropzone`<sup>p759</sup> attribute that `matches`<sup>p759</sup> the `drag data store`<sup>p745</sup> and `specifies an operation`<sup>p759</sup>

Set the `current drag operation`<sup>p755</sup> to the operation `specified`<sup>p759</sup> by the `dropzone`<sup>p759</sup> attribute of the `current target element`<sup>p755</sup>.

↪ If the `current target element`<sup>p755</sup> is an element with a `dropzone`<sup>p759</sup> attribute that `matches`<sup>p759</sup> the `drag data store`<sup>p745</sup> and does not `specify an operation`<sup>p759</sup>

Set the `current drag operation`<sup>p755</sup> to "`copy`<sup>p755</sup>".

↪ Otherwise

Reset the `current drag operation`<sup>p755</sup> to "`none`<sup>p755</sup>".

Otherwise (if the `dragover`<sup>p758</sup> event is canceled), set the `current drag operation`<sup>p755</sup> based on the values of the `effectAllowed`<sup>p747</sup> and `dropEffect`<sup>p747</sup> attributes of the `DragEvent`<sup>p751</sup> object's `dataTransfer`<sup>p751</sup> object as they stood after the event `dispatch`<sup>p43</sup> finished, as per the following table:

<code>effectAllowed</code> <sup>p747</sup>	<code>dropEffect</code> <sup>p747</sup>	Drag operation
" <code>uninitialized</code> <sup>p747</sup> ", " <code>copy</code> <sup>p747</sup> ", " <code>copyLink</code> <sup>p747</sup> ", " <code>copyMove</code> <sup>p747</sup> ", or " <code>all</code> <sup>p747</sup> "	" <code>copy</code> <sup>p747</sup> "	" <code>copy</code> <sup>p755</sup> "
" <code>uninitialized</code> <sup>p747</sup> ", " <code>link</code> <sup>p747</sup> ", " <code>copyLink</code> <sup>p747</sup> ", " <code>linkMove</code> <sup>p747</sup> ", or " <code>all</code> <sup>p747</sup> "	" <code>link</code> <sup>p747</sup> "	" <code>link</code> <sup>p755</sup> "
" <code>uninitialized</code> <sup>p747</sup> ", " <code>move</code> <sup>p747</sup> ", " <code>copyMove</code> <sup>p747</sup> ", " <code>linkMove</code> <sup>p747</sup> ", or " <code>all</code> <sup>p747</sup> "	" <code>move</code> <sup>p747</sup> "	" <code>move</code> <sup>p755</sup> "
Any other case		" <code>none</code> <sup>p755</sup> "

4. Otherwise, if the `current target element`<sup>p755</sup> is not a DOM element, use platform-specific mechanisms to determine what drag operation is being performed (none, copy, link, or move), and set the `current drag operation`<sup>p755</sup> accordingly.
5. Update the drag feedback (e.g. the mouse cursor) to match the `current drag operation`<sup>p755</sup>, as follows:

Drag operation	Feedback
" <code>copy</code> <sup>p755</sup> "	Data will be copied if dropped here.
" <code>link</code> <sup>p755</sup> "	Data will be linked if dropped here.
" <code>move</code> <sup>p755</sup> "	Data will be moved if dropped here.
" <code>none</code> <sup>p755</sup> "	No operation allowed, dropping here will cancel the drag-and-drop operation.

4. Otherwise, if the user ended the drag-and-drop operation (e.g. by releasing the mouse button in a mouse-driven drag-and-drop interface), or if the [drag](#)<sup>p758</sup> event was canceled, then this will be the last iteration. Run the following steps, then stop the drag-and-drop operation:

1. If the [current drag operation](#)<sup>p755</sup> is "[none](#)<sup>p755</sup>" (no drag operation), or, if the user ended the drag-and-drop operation by canceling it (e.g. by hitting the `Escape` key), or if the [current target element](#)<sup>p755</sup> is null, then the drag operation failed. Run these substeps:

1. Let *dropped* be false.
2. If the [current target element](#)<sup>p755</sup> is a DOM element, [fire a DND event](#)<sup>p751</sup> named [dragleave](#)<sup>p758</sup> at it; otherwise, if it is not null, use platform-specific conventions for drag cancellation.
3. Set the [current drag operation](#)<sup>p755</sup> to "[none](#)<sup>p755</sup>".

Otherwise, the drag operation might be a success; run these substeps:

1. Let *dropped* be true.
2. If the [current target element](#)<sup>p755</sup> is a DOM element, [fire a DND event](#)<sup>p751</sup> named [drop](#)<sup>p758</sup> at it; otherwise, use platform-specific conventions for indicating a drop.
3. If the event is canceled, set the [current drag operation](#)<sup>p755</sup> to the value of the [dropEffect](#)<sup>p747</sup> attribute of the [DragEvent](#)<sup>p751</sup> object's [dataTransfer](#)<sup>p751</sup> object as it stood after the event [dispatch](#)<sup>p43</sup> finished.

Otherwise, the event is not canceled; perform the event's default action, which depends on the exact target as follows:

↪ If the [current target element](#)<sup>p755</sup> is a text field (e.g. [textarea](#)<sup>p508</sup>, or an [input](#)<sup>p452</sup> element whose [type](#)<sup>p454</sup> attribute is in the [Text](#)<sup>p458</sup> state) or an [editing host](#)<sup>p741</sup> or [editable](#)<sup>p741</sup> element, and the [drag data store item list](#)<sup>p745</sup> has an item with [the drag data item type string](#)<sup>p745</sup> "[text/plain](#)" and [the drag data item kind](#)<sup>p745</sup> [Plain Unicode string](#)

Insert the actual data of the first item in the [drag data store item list](#)<sup>p745</sup> to have [a drag data item type string](#)<sup>p745</sup> of "[text/plain](#)" and [a drag data item kind](#)<sup>p745</sup> that is [Plain Unicode string](#) into the text field or [editing host](#)<sup>p741</sup> or [editable](#)<sup>p741</sup> element in a manner consistent with platform-specific conventions (e.g. inserting it at the current mouse cursor position, or inserting it at the end of the field).

↪ Otherwise

Reset the [current drag operation](#)<sup>p755</sup> to "[none](#)<sup>p755</sup>".

2. [Fire a DND event](#)<sup>p751</sup> named [dragend](#)<sup>p758</sup> at the [source node](#)<sup>p753</sup>.

3. Run the appropriate steps from the following list as the default action of the [dragend](#)<sup>p758</sup> event:

↪ If *dropped* is true, the [current target element](#)<sup>p755</sup> is a text field (see below), the [current drag operation](#)<sup>p755</sup> is "[move](#)<sup>p755</sup>", and the source of the drag-and-drop operation is a selection in the DOM that is entirely contained within an [editing host](#)<sup>p741</sup>

[Delete the selection](#)<sup>p741</sup>.

↪ If *dropped* is true, the [current target element](#)<sup>p755</sup> is a text field (see below), the [current drag operation](#)<sup>p755</sup> is "[move](#)<sup>p755</sup>", and the source of the drag-and-drop operation is a selection in a text field

The user agent should delete the dragged selection from the relevant text field.

↪ If *dropped* is false or if the [current drag operation](#)<sup>p755</sup> is "[none](#)<sup>p755</sup>"

The drag was canceled. If the platform conventions dictate that this be represented to the user (e.g. by animating the dragged selection going back to the source of the drag-and-drop operation), then do so.

↪ Otherwise

The event has no default action.

For the purposes of this step, a [text field](#) is a [textarea](#)<sup>p508</sup> element or an [input](#)<sup>p452</sup> element whose [type](#)<sup>p454</sup> attribute is in one of the [Text](#)<sup>p458</sup>, [Search](#)<sup>p458</sup>, [Tel](#)<sup>p459</sup>, [URL](#)<sup>p460</sup>, [E-mail](#)<sup>p461</sup>, [Password](#)<sup>p462</sup>, or [Number](#)<sup>p469</sup> states.

**Note** User agents are encouraged to consider how to react to drags near the edge of scrollable regions. For example, if a user drags a link to the bottom of the viewport on a long page, it might make sense to scroll the page so that the user can drop the link lower on the page.

**Note** This model is independent of which [Document](#)<sup>p102</sup> object the nodes involved are from; the events are fired as described above and the rest of the processing model runs as described above, irrespective of how many documents are involved in the operation.

## 6.7.6 Events summary

This section is non-normative.

The following events are involved in the drag-and-drop model.

Event Name	Target	Cancelable?	<a href="#">Drag data store mode</a> <sup>p745</sup>	<a href="#">dropEffect</a> <sup>p747</sup>	Default Action
<a href="#">dragstart</a>	<a href="#">Source node</a> <sup>p753</sup>	✓ Cancelable	<a href="#">Read/write mode</a> <sup>p745</sup>	" <a href="#">none</a> <sup>p747</sup> "	Initiate the drag-and-drop operation
<a href="#">drag</a>	<a href="#">Source node</a> <sup>p753</sup>	✓ Cancelable	<a href="#">Protected mode</a> <sup>p745</sup>	" <a href="#">none</a> <sup>p747</sup> "	Continue the drag-and-drop operation
<a href="#">dragenter</a>	<a href="#">Immediate user selection</a> <sup>p755</sup> or <a href="#">the body element</a> <sup>p106</sup>	✓ Cancelable	<a href="#">Protected mode</a> <sup>p745</sup>	<a href="#">Based on effectAllowed value</a> <sup>p752</sup>	Reject <a href="#">immediate user selection</a> <sup>p755</sup> as potential target element <sup>p755</sup>
<a href="#">dragexit</a>	<a href="#">Previous target element</a> <sup>p755</sup>	—	<a href="#">Protected mode</a> <sup>p745</sup>	" <a href="#">none</a> <sup>p747</sup> "	None
<a href="#">dragleave</a>	<a href="#">Previous target element</a> <sup>p755</sup>	—	<a href="#">Protected mode</a> <sup>p745</sup>	" <a href="#">none</a> <sup>p747</sup> "	None
<a href="#">dragover</a>	<a href="#">Current target element</a> <sup>p755</sup>	✓ Cancelable	<a href="#">Protected mode</a> <sup>p745</sup>	<a href="#">Based on effectAllowed value</a> <sup>p752</sup>	Reset the <a href="#">current drag operation</a> <sup>p755</sup> to "none"
<a href="#">drop</a>	<a href="#">Current target element</a> <sup>p755</sup>	✓ Cancelable	<a href="#">Read-only mode</a> <sup>p745</sup>	<a href="#">Current drag operation</a> <sup>p755</sup>	Varies
<a href="#">dragend</a>	<a href="#">Source node</a> <sup>p753</sup>	—	<a href="#">Protected mode</a> <sup>p745</sup>	<a href="#">Current drag operation</a> <sup>p755</sup>	Varies

Not shown in the above table: all these events bubble, and the [effectAllowed](#)<sup>p747</sup> attribute always has the value it had after the [dragstart](#)<sup>p758</sup> event, defaulting to "[uninitialized](#)<sup>p747</sup>" in the [dragstart](#)<sup>p758</sup> event.

## 6.7.7 The [draggable](#) attribute

Spec bugs: [26024](#)

All [HTML elements](#)<sup>p42</sup> may have the [draggable](#)<sup>p758</sup> content attribute set. The [draggable](#)<sup>p758</sup> attribute is an [enumerated attribute](#)<sup>p60</sup>. It has three states. The first state is *true* and it has the keyword *true*. The second state is *false* and it has the keyword *false*. The third state is *auto*; it has no keywords but it is the [missing value default](#)<sup>p60</sup>.

The *true* state means the element is draggable; the *false* state means that it is not. The *auto* state uses the default behaviour of the user agent.

An element with a [draggable](#)<sup>p758</sup> attribute should also have a [title](#)<sup>p122</sup> attribute that names the element for the purpose of non-visual interactions.

**Note**

`element.draggablep758 [= value]`

Returns true if the element is draggable; otherwise, returns false.

Can be set, to override the default and set the [draggable](#)<sup>p758</sup> content attribute.

The [draggable](#) IDL attribute, whose value depends on the content attribute's in the way described below, controls whether or not the element is draggable. Generally, only text selections are draggable, but elements whose [draggable](#)<sup>p758</sup> IDL attribute is *true* become draggable as well.

If an element's [draggable](#)<sup>p758</sup> content attribute has the state *true*, the [draggable](#)<sup>p758</sup> IDL attribute must return *true*.

Otherwise, if the element's [draggable](#)<sup>p758</sup> content attribute has the state *false*, the [draggable](#)<sup>p758</sup> IDL attribute must return *false*.

Otherwise, the element's `draggable`<sup>p758</sup> content attribute has the state `auto`. If the element is an `img`<sup>p272</sup> element, an `object`<sup>p310</sup> element that `represents`<sup>p111</sup> an image, or an `a`<sup>p208</sup> element with an `href`<sup>p245</sup> content attribute, the `draggable`<sup>p758</sup> IDL attribute must return true; otherwise, the `draggable`<sup>p758</sup> IDL attribute must return false.

If the `draggable`<sup>p758</sup> IDL attribute is set to the value false, the `draggable`<sup>p758</sup> content attribute must be set to the literal value "false". If the `draggable`<sup>p758</sup> IDL attribute is set to the value true, the `draggable`<sup>p758</sup> content attribute must be set to the literal value "true".

## 6.7.8 The `dropzone` attribute

All [HTML elements](#)<sup>p42</sup> may have the `dropzone`<sup>p759</sup> content attribute set. When specified, its value must be an [unordered set of unique space-separated tokens](#)<sup>p80</sup> that are [ASCII case-insensitive](#)<sup>p58</sup>. The allowed values are the following:

### `copy`

Indicates that dropping an accepted item on the element will result in a copy of the dragged data.

### `move`

Indicates that dropping an accepted item on the element will result in the dragged data being moved to the new location.

### `link`

Indicates that dropping an accepted item on the element will result in a link to the original data.

**Any keyword with eight characters or more, beginning with the an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "string":**

Indicates that items with [the drag data item kind](#)<sup>p745</sup> Plain Unicode string and [the drag data item type string](#)<sup>p745</sup> set to a value that matches the remainder of the keyword are accepted.

**Any keyword with six characters or more, beginning with an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "file":**

Indicates that items with [the drag data item kind](#)<sup>p745</sup> File and [the drag data item type string](#)<sup>p745</sup> set to a value that matches the remainder of the keyword are accepted.

The `dropzone`<sup>p759</sup> content attribute's values must not have more than one of the three feedback values (`copy`<sup>p759</sup>, `move`<sup>p759</sup>, and `link`<sup>p759</sup>) specified. If none are specified, the `copy`<sup>p759</sup> value is implied.

An element with a `dropzone`<sup>p759</sup> attribute should also have a `title`<sup>p122</sup> attribute that names the element for the purpose of non-visual interactions.

A `dropzone`<sup>p759</sup> attribute **matches a drag data store** if the `dropzone processing steps`<sup>p759</sup> result in a match.

A `dropzone`<sup>p759</sup> attribute **specifies an operation** if the `dropzone processing steps`<sup>p759</sup> result in a specified operation. The specified operation is as given by those steps.

The **dropzone processing steps** are as follows. They either result in a match or not, and separate from this result either in a specified operation or not, as defined below.

1. Let `value` be the value of the `dropzone`<sup>p759</sup> attribute.
2. Let `keywords` be the result of [splitting value on spaces](#)<sup>p80</sup>.
3. Let `matched` be false.
4. Let `operation` be unspecified.
5. For each value in `keywords`, if any, in the order that they were found in `value`, run the following steps.

1. Let `keyword` be the keyword.
2. If `keyword` is one of "`copy`<sup>p759</sup>", "`move`<sup>p759</sup>", or "`link`<sup>p759</sup>", then: run the following substeps:
  1. If `operation` is still unspecified, then let `operation` be the string given by `keyword`.
  2. Skip to the step labeled `end of keyword` below.

3. If *keyword* does not contain a U+003A COLON character (:), or if the first such character in *keyword* is either the first character or the last character in the string, then skip to the step labeled *end of keyword* below.
  4. Let *kind code* be the substring of *keyword* from the first character in the string to the last character in the string that is before the first U+003A COLON character (:) in the string, [converted to ASCII lowercase](#)<sup>p58</sup>.
  5. Jump to the appropriate step from the list below, based on the value of *kind code*:
    - ↪ If *kind code* is the string "string"  
Let *kind* be *Plain Unicode string*.
    - ↪ If *kind code* is the string "file"  
Let *kind* be *File*.
    - ↪ Otherwise  
Skip to the step labeled *end of keyword* below.
6. Let *type* be the substring of *keyword* from the first character after the first U+003A COLON character (:) in the string, to the last character in the string, [converted to ASCII lowercase](#)<sup>p58</sup>.
  7. If there exist any items in the [drag data store item list](#)<sup>p745</sup> whose [drag data item kind](#)<sup>p745</sup> is the kind given in *kind* and whose [drag data item type string](#)<sup>p745</sup> is *type*, then let *matched* be true.
  8. *End of keyword*: Go on to the next keyword, if any, or the next step in the overall algorithm, if there are no more.

6. The algorithm results in a match if *matched* is true, and does not otherwise.

The algorithm results in a specified operation if *operation* is not unspecified. The specified operation, if one is specified, is the one given by *operation*.

The **dropzone** IDL attribute must [reflect](#)<sup>p88</sup> the content attribute of the same name.

### Example

In this example, a [div](#)<sup>p207</sup> element is made into a drop target for image files using the [dropzone](#)<sup>p759</sup> attribute. Images dropped into the target are then displayed.

```
<div dropzone="copy file:image/png file:image/gif file:image/jpeg" ondrop="receive(event, this)">
<p>Drop an image here to have it displayed.</p>
</div>
<script>
function receive(event, element) {
 var data = event.dataTransfer.items;
 for (var i = 0; i < data.length; i += 1) {
 if ((data[i].kind == 'file') && (data[i].type.match('image/'))) {
 var img = new Image();
 img.src = window.createObjectURL(data[i].getAsFile());
 element.appendChild(img);
 }
 }
}
</script>
```

### 6.7.9 Security risks in the drag-and-drop model

User agents must not make the data added to the [DataTransfer](#)<sup>p746</sup> object during the [dragstart](#)<sup>p758</sup> event available to scripts until the [drop](#)<sup>p758</sup> event, because otherwise, if a user were to drag sensitive information from one document to a second document, crossing a hostile third document in the process, the hostile document could intercept the data.

For the same reason, user agents must consider a drop to be successful only if the user specifically ended the drag operation — if any scripts end the drag operation, it must be considered unsuccessful (canceled) and the [drop](#)<sup>p758</sup> event must not be fired.

User agents should take care to not start drag-and-drop operations in response to script actions. For example, in a mouse-and-window environment, if a script moves a window while the user has his mouse button depressed, the UA would not consider that to start a drag. This is important because otherwise UAs could cause data to be dragged from sensitive sources and dropped into hostile documents without the user's consent.

User agents should filter potentially active (scripted) content (e.g. HTML) when it is dragged and when it is dropped, using a whitelist of known-safe features. Similarly, [relative URLs<sup>¶48</sup>](#) should be turned into absolute URLs to avoid references changing in unexpected ways. This specification does not specify how this is performed.

**Example**

Consider a hostile page providing some content and getting the user to select and drag and drop (or indeed, copy and paste) that content to a victim page's [contenteditable<sup>¶739</sup>](#) region. If the browser does not ensure that only safe content is dragged, potentially unsafe content such as scripts and event handlers in the selection, once dropped (or pasted) into the victim site, get the privileges of the victim site. This would thus enable a cross-site scripting attack.

## 7 Loading Web pages

This section describes features that apply most directly to Web browsers. Having said that, except where specified otherwise, the requirements defined in this section *do* apply to all user agents, whether they are Web browsers or not.

### 7.1 Browsing contexts

A **browsing context** is an environment in which [Document](#) objects are presented to the user.

**Note** A tab or window in a Web browser typically contains a [browsing context](#), as does an [iframe](#) or [frame](#)s in a [frameset](#).

Each [browsing context](#) has a corresponding [WindowProxy](#) object.

A [browsing context](#) has a [session history](#), which lists the [Document](#) objects that that [browsing context](#) has presented, is presenting, or will present. At any time, one [Document](#) in each [browsing context](#) is designated the **active document**. A [Document](#)'s [browsing context](#) is that [browsing context](#) whose [session history](#) contains the [Document](#), if any. (A [Document](#) created using an API such as `createDocument()` has no [browsing context](#).)

Each [Document](#) in a [browsing context](#) is **associated** with a [Window](#) object. A [browsing context](#)'s [WindowProxy](#) object forwards everything to the [browsing context](#)'s [active document](#)'s [Window](#) object.

**Note** In general, there is a 1-to-1 mapping from the [Window](#) object to the [Document](#) object. There are two exceptions. First, a [Window](#) can be reused for the presentation of a second [Document](#) in the same [browsing context](#), such that the mapping is then 1-to-2. This occurs when a [browsing context](#) is navigated from the initial `about:blank` [Document](#) to another, with [replacement enabled](#). Second, a [Document](#) can end up being reused for several [Window](#) objects when the `document.open()` method is used, such that the mapping is then many-to-1.

**Note** A [Document](#) does not necessarily have a [browsing context](#) associated with it. In particular, data mining tools are likely to never instantiate [browsing contexts](#).

A [browsing context](#) can have a **creator browsing context**, the [browsing context](#) that was responsible for its creation. If a [browsing context](#) has a [parent browsing context](#), then that is its [creator browsing context](#). Otherwise, if the [browsing context](#) has an [opener browsing context](#), then that is its [creator browsing context](#). Otherwise, the [browsing context](#) has no [creator browsing context](#).

If a [browsing context](#) A has a [creator browsing context](#), then the [Document](#) that was the [active document](#) of that [creator browsing context](#) at the time A was created is the **creator Document**.

**Creating a browsing context:** When a [browsing context](#) is first created, it must be created with a single [Document](#) in its session history, whose [address](#) is `about:blank`, which is marked as being an [HTML document](#), whose [character encoding](#) is UTF-8, and which is both [ready for post-load tasks](#) and [completely loaded](#) immediately, along with a new [Window](#) object that the [Document](#) is associated with. The [Document](#) must have a single child `html` node, which itself has two empty child nodes: a `head` element, and a `body` element. As soon as this [Document](#) is created, the user agent must [implement the sandboxing](#) for it. If the [browsing context](#) has a [creator Document](#), then the [browsing context](#)'s [Document](#)'s [referrer](#) must be set to [the address](#) of that [creator Document](#) at the time of the [browsing context](#)'s creation.

**Note** If the [browsing context](#) is created specifically to be immediately navigated, then that initial navigation will have [replacement enabled](#).

The [origin](#) and [effective script origin](#) of the `about:blank` [Document](#) are set when the [Document](#) is created. If the new [browsing context](#) has a [creator browsing context](#), then the [origin](#) of the `about:blank` [Document](#) is an [alias](#) to the [origin](#) of the [creator Document](#) and the [effective script origin](#) of the `about:blank` [Document](#) is initially an [alias](#) to the [effective script origin](#) of the [creator Document](#). Otherwise, the [origin](#) of the `about:blank` [Document](#) is a globally unique identifier assigned when the new [browsing context](#) is created and the [effective script origin](#) of the `about:blank` [Document](#) is initially an [alias](#) to its [origin](#).

## 7.1.1 Nested browsing contexts

Certain elements (for example, `iframe`<sup>p299</sup> elements) can instantiate further [browsing contexts](#)<sup>p762</sup>. These are called **nested browsing contexts**. If a browsing context  $P$  has a [Document](#)<sup>p102</sup>  $D$  with an element  $E$  that nests another browsing context  $C$  inside it, then  $C$  is said to be **nested through**  $D$ , and  $E$  is said to be the **browsing context container** of  $C$ . If the [browsing context container](#)<sup>p763</sup> element  $E$  is [in](#)<sup>p42</sup> the [Document](#)<sup>p102</sup>  $D$ , then  $P$  is said to be the **parent browsing context** of  $C$  and  $C$  is said to be a **child browsing context** of  $P$ . Otherwise, the [nested browsing context](#)<sup>p763</sup>  $C$  has no [parent browsing context](#)<sup>p763</sup>.

A browsing context  $A$  is said to be an **ancestor** of a browsing context  $B$  if there exists a browsing context  $A'$  that is a [child browsing context](#)<sup>p763</sup> of  $A$  and that is itself an [ancestor](#)<sup>p763</sup> of  $B$ , or if the browsing context  $A$  is the [parent browsing context](#)<sup>p763</sup> of  $B$ .

A browsing context that is not a [nested browsing context](#)<sup>p763</sup> has no [parent browsing context](#)<sup>p763</sup>, and is the **top-level browsing context** of all the browsing contexts for which it is an [ancestor browsing context](#)<sup>p763</sup>.

The transitive closure of [parent browsing contexts](#)<sup>p763</sup> for a [nested browsing context](#)<sup>p763</sup> gives the list of [ancestor browsing contexts](#)<sup>p763</sup>.

The **list of the descendant browsing contexts** of a [Document](#)<sup>p102</sup>  $d$  is the (ordered) list returned by the following algorithm:

1. Let  $list$  be an empty list.
2. For each [child browsing context](#)<sup>p763</sup> of  $d$  that is [nested through](#)<sup>p763</sup> an element that is [in the Document](#)<sup>p42</sup>  $d$ , in the [tree order](#)<sup>p42</sup> of the elements nesting those [browsing contexts](#)<sup>p762</sup>, run these substeps:
  1. Append that [child browsing context](#)<sup>p763</sup> to the list  $list$ .
  2. Append the [list of the descendant browsing contexts](#)<sup>p763</sup> of the [active document](#)<sup>p762</sup> of that [child browsing context](#)<sup>p763</sup> to the list  $list$ .
3. Return the constructed  $list$ .

A [Document](#)<sup>p102</sup> is said to be **fully active** when it is the [active document](#)<sup>p762</sup> of its [browsing context](#)<sup>p762</sup>, and either its browsing context is a [top-level browsing context](#)<sup>p763</sup>, or it has a [parent browsing context](#)<sup>p763</sup> and the [Document](#)<sup>p102</sup> [through which](#)<sup>p763</sup> it is [nested](#)<sup>p763</sup> is itself [fully active](#)<sup>p763</sup>.

Because they are nested through an element, [child browsing contexts](#)<sup>p763</sup> are always tied to a specific [Document](#)<sup>p102</sup> in their [parent browsing context](#)<sup>p763</sup>. User agents must not allow the user to interact with [child browsing contexts](#)<sup>p763</sup> of elements that are in [Document](#)<sup>p102</sup>s that are not themselves [fully active](#)<sup>p763</sup>.

A [nested browsing context](#)<sup>p763</sup> can have a [seamless browsing context flag](#)<sup>p305</sup> set, if it is embedded through an `iframe`<sup>p299</sup> element with a [seamless](#)<sup>p304</sup> attribute.

A [nested browsing context](#)<sup>p763</sup> can be put into a **delaying load events mode**. This is used when it is [navigated](#)<sup>p791</sup>, to [delay the load event](#)<sup>p1033</sup> of the [browsing context container](#)<sup>p763</sup> before the new [Document](#)<sup>p102</sup> is created.

The **document family** of a [browsing context](#)<sup>p762</sup> consists of the union of all the [Document](#)<sup>p102</sup> objects in that [browsing context](#)<sup>p762</sup>'s [session history](#)<sup>p782</sup> and the [document families](#)<sup>p763</sup> of all those [Document](#)<sup>p102</sup> objects. The [document family](#)<sup>p763</sup> of a [Document](#)<sup>p102</sup> object consists of the union of all the [document families](#)<sup>p763</sup> of the [browsing contexts](#)<sup>p762</sup> that are [nested through](#)<sup>p763</sup> the [Document](#)<sup>p102</sup> object.

### 7.1.1.1 Navigating nested browsing contexts in the DOM

Spec bugs: 27520

**Note**

```
window.topp764
 Returns the WindowProxyp775 for the top-level browsing contextp763.
window.parentp764
 Returns the WindowProxyp775 for the parent browsing contextp763.
window.frameElementp764
 Returns the Elementp51 for the browsing context containerp763.
```

⋮

Returns null if there isn't one.

Throws a [SecurityError](#)<sup>b50</sup> exception in cross-origin situations.

The **top** IDL attribute on the [Window](#)<sup>p768</sup> object of a [Document](#)<sup>p102</sup> in a [browsing context](#)<sup>b762</sup> *b* must return the [WindowProxy](#)<sup>p775</sup> object of its [top-level browsing context](#)<sup>p763</sup> (which would be its own [WindowProxy](#)<sup>p775</sup> object if it was a [top-level browsing context](#)<sup>p763</sup> itself), if it has one, or its own [WindowProxy](#)<sup>p775</sup> object otherwise (e.g. if it was a detached [nested browsing context](#)<sup>p763</sup>).

The **parent** IDL attribute on the [Window](#)<sup>p768</sup> object of a [Document](#)<sup>p102</sup> in a [browsing context](#)<sup>b762</sup> *b* must return the [WindowProxy](#)<sup>p775</sup> object of the [parent browsing context](#)<sup>p763</sup>, if there is one (i.e. if *b* is a [child browsing context](#)<sup>p763</sup>), or the [WindowProxy](#)<sup>p775</sup> object of the [browsing context](#)<sup>b762</sup> *b* itself, otherwise (i.e. if it is a [top-level browsing context](#)<sup>p763</sup> or a detached [nested browsing context](#)<sup>p763</sup>).

The **frameElement** IDL attribute on the [Window](#)<sup>p768</sup> object of a [Document](#)<sup>p102</sup> *d*, on getting, must run the following algorithm:

1. If *d* is not a [Document](#)<sup>p102</sup> in a [nested browsing context](#)<sup>p763</sup>, return null and abort these steps.
2. If the [browsing context container](#)<sup>p763</sup>'s [node document](#) does not have the [same](#)<sup>p778</sup> [effective script origin](#)<sup>p776</sup> as the [effective script origin](#)<sup>p776</sup> specified by the [entry settings object](#)<sup>b831</sup>, then throw a [SecurityError](#)<sup>p50</sup> exception and abort these steps.
3. Return the [browsing context container](#)<sup>p763</sup> for *b*.

### 7.1.2 Auxiliary browsing contexts

It is possible to create new browsing contexts that are related to a [top-level browsing context](#)<sup>p763</sup> without being nested through an element. Such browsing contexts are called **auxiliary browsing contexts**. Auxiliary browsing contexts are always [top-level browsing contexts](#)<sup>p763</sup>.

An [auxiliary browsing context](#)<sup>p764</sup> has an **opener browsing context**, which is the [browsing context](#)<sup>p762</sup> from which the [auxiliary browsing context](#)<sup>p764</sup> was created.

#### 7.1.2.1 Navigating auxiliary browsing contexts in the DOM

The **opener** IDL attribute on the [Window](#)<sup>p768</sup> object, on getting, must return the [WindowProxy](#)<sup>p775</sup> object of the [browsing context](#)<sup>b762</sup> from which the current [browsing context](#)<sup>b762</sup> was created (its [opener browsing context](#)<sup>p764</sup>), if there is one, if it is still available, and if the current [browsing context](#)<sup>b762</sup> has not [disowned its opener](#)<sup>p764</sup>; otherwise, it must return null. On setting, if the new value is null then the current [browsing context](#)<sup>b762</sup> must [disown its opener](#); if the new value is anything else then the user agent must call the `[[DefineOwnProperty]]` internal method of the [Window](#)<sup>p768</sup> object, passing the property name "opener" as the property key, and the Property Descriptor { `[[Value]]`: *value*, `[[Writable]]`: true, `[[Enumerable]]`: true, `[[Configurable]]`: true } as the property descriptor, where *value* is the new value.

### 7.1.3 Secondary browsing contexts

User agents may support **secondary browsing contexts**, which are [browsing contexts](#)<sup>p762</sup> that form part of the user agent's interface, apart from the main content area.

**Note** The [sidebar](#)<sup>p256</sup> link type uses [secondary browsing contexts](#)<sup>p764</sup>.

### 7.1.4 Security

A [browsing context](#)<sup>p762</sup> *A* is **familiar with** a second [browsing context](#)<sup>p762</sup> *B* if one of the following conditions is true:

- Either the [origin](#)<sup>p776</sup> of the [active document](#)<sup>p762</sup> of *A* is the [same](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> of the [active document](#)<sup>p762</sup> of *B*, or

- The browsing context A is a [nested browsing context](#)<sup>p763</sup> with a [top-level browsing context](#)<sup>p763</sup>, and its [top-level browsing context](#)<sup>p763</sup> is B, or
- The browsing context B is an [auxiliary browsing context](#)<sup>p764</sup> and A is [familiar with](#)<sup>p764</sup> B's [opener browsing context](#)<sup>p764</sup>, or
- The browsing context B is not a [top-level browsing context](#)<sup>p763</sup>, but there exists an [ancestor browsing context](#)<sup>p763</sup> of B whose [active document](#)<sup>p762</sup> has the [same origin](#)<sup>p778</sup> as the [active document](#)<sup>p762</sup> of A (possibly in fact being A itself).

A [browsing context](#)<sup>p762</sup> A is **allowed to navigate** a second [browsing context](#)<sup>p762</sup> B if the following algorithm terminates positively:

1. If A is not the same [browsing context](#)<sup>p762</sup> as B, and A is not one of the [ancestor browsing contexts](#)<sup>p763</sup> of B, and B is not a [top-level browsing context](#)<sup>p763</sup>, and A's [active document](#)<sup>p762</sup>'s [active sandboxing flag set](#)<sup>p782</sup> has its [sandboxed navigation browsing context flag](#)<sup>p780</sup> set, then abort these steps negatively.
2. Otherwise, if B is a [top-level browsing context](#)<sup>p763</sup>, and is one of the [ancestor browsing contexts](#)<sup>p763</sup> of A, and A's [node document](#)'s [active sandboxing flag set](#)<sup>p782</sup> has its [sandboxed top-level navigation browsing context flag](#)<sup>p780</sup> set, then abort these steps negatively.
3. Otherwise, if B is a [top-level browsing context](#)<sup>p763</sup>, and is neither A nor one of the [ancestor browsing contexts](#)<sup>p763</sup> of A, and A's [Document](#)<sup>p102</sup>'s [active sandboxing flag set](#)<sup>p782</sup> has its [sandboxed navigation browsing context flag](#)<sup>p780</sup> set, and A is not the [one permitted sandboxed navigator](#)<sup>p780</sup> of B, then abort these steps negatively.
4. Otherwise, terminate positively!

An element has a **browsing context scope origin** if its [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup> is a [top-level browsing context](#)<sup>p763</sup> or if all of its [Document](#)<sup>p102</sup>'s [ancestor browsing contexts](#)<sup>p763</sup> all have [active documents](#)<sup>p762</sup> whose [origin](#)<sup>p776</sup> are the [same origin](#)<sup>p778</sup> as the element's [node document](#)'s [origin](#)<sup>p776</sup>. If an element has a [browsing context scope origin](#)<sup>p765</sup>, then its value is the [origin](#)<sup>p776</sup> of the element's [node document](#).

### 7.1.5 Groupings of browsing contexts

Each [browsing context](#)<sup>p762</sup> is defined as having a list of one or more **directly reachable browsing contexts**. These are:

- The [browsing context](#)<sup>p762</sup> itself.
- All the [browsing context](#)<sup>p762</sup>'s [child browsing contexts](#)<sup>p763</sup>.
- The [browsing context](#)<sup>p762</sup>'s [parent browsing context](#)<sup>p763</sup>.
- All the [browsing contexts](#)<sup>p762</sup> that have the [browsing context](#)<sup>p762</sup> as their [opener browsing context](#)<sup>p764</sup>.
- The [browsing context](#)<sup>p762</sup>'s [opener browsing context](#)<sup>p764</sup>.

The transitive closure of all the [browsing contexts](#)<sup>p762</sup> that are [directly reachable browsing contexts](#)<sup>p765</sup> forms a **unit of related browsing contexts**.

Each [unit of related browsing contexts](#)<sup>p765</sup> is then further divided into the smallest number of groups such that every member of each group has an [active document](#)<sup>p762</sup> with an [effective script origin](#)<sup>p776</sup> that, through appropriate manipulation of the [document.domain](#)<sup>p779</sup> attribute, could be made to be the same as other members of the group, but could not be made the same as members of any other group. Each such group is a **unit of related similar-origin browsing contexts**.

**Note** There is also at most one [event loop](#)<sup>p834</sup> per [unit of related similar-origin browsing contexts](#)<sup>p765</sup> (though several [units of related similar-origin browsing contexts](#)<sup>p765</sup> can have a shared [event loop](#)<sup>p834</sup>).

### 7.1.6 Browsing context names

Browsing contexts can have a **browsing context name**. By default, a browsing context has no name (its name is not set).

A **valid browsing context name** is any string with at least one character that does not start with a U+005F LOW LINE character. (Names starting with an underscore are reserved for special keywords.)

A valid browsing context name or keyword is any string that is either a [valid browsing context name](#)<sup>p765</sup> or that is an ASCII case-insensitive<sup>p58</sup> match for one of: `_blank`, `_self`, `_parent`, or `_top`.

These values have different meanings based on whether the page is sandboxed or not, as summarised in the following (non-normative) table. In this table, "current" means the [browsing context](#)<sup>p762</sup> that the link or script is in, "parent" means the [parent browsing context](#)<sup>p763</sup> of the one the link or script is in, "master" means the nearest [ancestor browsing context](#)<sup>p763</sup> of the one the link or script is in that is not itself in a [seamless iframe](#)<sup>p304</sup>, "top" means the [top-level browsing context](#)<sup>p763</sup> of the one the link or script is in, "new" means a new [top-level browsing context](#)<sup>p763</sup> or [auxiliary browsing context](#)<sup>p764</sup> is to be created, subject to various user preferences and user agent policies, "none" means that nothing will happen, and "maybe new" means the same as "new" if the [allow-popups](#)<sup>p781</sup> keyword is also specified on the [sandbox](#)<sup>p303</sup> attribute (or if the user overrode the sandboxing), and the same as "none" otherwise.

Keyword	Ordinary effect	Effect in an <a href="#">iframe</a> <sup>p299</sup> with...				
		<code>seamless=""</code>	<code>sandbox=""</code>	<code>sandbox="" seamless=""</code>	<code>sandbox="allow-top-navigation"</code>	<code>sandbox="allow-top-navigation" seamless=""</code>
none specified, for links and form submissions	current	master	current	master	current	master
empty string	current	master	current	master	current	master
<code>_blank</code>	new	new	maybe new	maybe new	maybe new	maybe new
<code>_self</code>	current	current	current	current	current	current
<code>_parent</code> if there isn't a parent	current	current	current	current	current	current
<code>_parent</code> if parent is also top	parent/top	parent/top	none	none	parent/top	parent/top
<code>_parent</code> if there is one and it's not top	parent	parent	none	none	none	none
<code>_top</code> if top is current	current	current	current	current	current	current
<code>_top</code> if top is not current	top	top	none	none	top	top
name that doesn't exist	new	new	maybe new	maybe new	maybe new	maybe new
name that exists and is a descendant	specified descendant	specified descendant	specified descendant	specified descendant	specified descendant	specified descendant
name that exists and is current	current	current	current	current	current	current
name that exists and is an ancestor that is top	specified ancestor	specified ancestor	none	none	specified ancestor/top	specified ancestor/top
name that exists and is an ancestor that is not top	specified ancestor	specified ancestor	none	none	none	none
other name that exists with common top	specified	specified	none	none	none	none
name that exists with different top, if <a href="#">familiar</a> <sup>p764</sup> and <a href="#">one permitted sandboxed navigator</a> <sup>p780</sup>	specified	specified	specified	specified	specified	specified
name that exists with different top, if <a href="#">familiar</a> <sup>p764</sup> but not <a href="#">one permitted sandboxed navigator</a> <sup>p780</sup>	specified	specified	none	none	none	none
name that exists with different top, not <a href="#">familiar</a> <sup>p764</sup>	new	new	maybe new	maybe new	maybe new	maybe new

Most of the restrictions on sandboxed browsing contexts are applied by other algorithms, e.g. the [navigation](#)<sup>p791</sup> algorithm, not [the rules for choosing a browsing context given a browsing context name](#)<sup>p767</sup> given below.

An algorithm is allowed to show a popup if any of the following conditions is true:

- The [task](#)<sup>p834</sup> in which the algorithm is running is currently processing an [activation behaviour](#)<sup>p725</sup> whose [click](#)<sup>p52</sup> event was [trusted](#)<sup>p43</sup>.
- The [task](#)<sup>p834</sup> in which the algorithm is running is currently running the event listener for a [trusted](#)<sup>p43</sup> event whose type is in the following list:
  - [change](#)<sup>p1144</sup>
  - [click](#)<sup>p52</sup>
  - [dblclick](#)<sup>p52</sup>
  - [mouseup](#)<sup>p52</sup>
  - [reset](#)<sup>p1144</sup>
  - [submit](#)<sup>p1145</sup>
- The [task](#)<sup>p834</sup> in which the algorithm is running was [queued](#)<sup>p835</sup> by an algorithm that was [allowed to show a popup](#)<sup>p766</sup>, and the chain of such algorithms started within a user-agent defined timeframe.

**Example** For example, if a user clicked a button, it might be acceptable for a popup to result from that after 4 seconds, but it would likely not be acceptable for a popup to result from that after 4 hours.

The rules for choosing a browsing context given a browsing context name are as follows. The rules assume that they are being applied in the context of a [browsing context](#)<sup>p782</sup>, as part of the execution of a [task](#)<sup>p834</sup>.

1. If the given browsing context name is the empty string or `_self`, then the chosen browsing context must be the current one.  
If the given browsing context name is `_self`, then this is an [explicit self-navigation override](#)<sup>p791</sup>, which overrides the behaviour of the [seamless browsing context flag](#)<sup>p305</sup> set by the [seamless](#)<sup>p304</sup> attribute on [iframe](#)<sup>p299</sup> elements.
2. If the given browsing context name is `_parent`, then the chosen browsing context must be the [parent browsing context](#)<sup>p763</sup> of the current one, unless there isn't one, in which case the chosen browsing context must be the current browsing context.
3. If the given browsing context name is `_top`, then the chosen browsing context must be the [top-level browsing context](#)<sup>p763</sup> of the current one, if there is one, or else the current browsing context.
4. If the given browsing context name is not `_blank` and there exists a browsing context whose [name](#)<sup>p765</sup> is the same as the given browsing context name, and the current browsing context is [familiar with](#)<sup>p764</sup> that browsing context, and the user agent determines that the two browsing contexts are related enough that it is ok if they reach each other, then that browsing context must be the chosen one. If there are multiple matching browsing contexts, the user agent should select one in some arbitrary consistent manner, such as the most recently opened, most recently focused, or more closely related.  
If the browsing context is chosen by this step to be the current browsing context, then this is also an [explicit self-navigation override](#)<sup>p791</sup>.
5. Otherwise, a new browsing context is being requested, and what happens depends on the user agent's configuration and abilities — it is determined by the rules given for the first applicable option from the following list:
  - ↪ If the algorithm is not [allowed to show a popup](#)<sup>p766</sup> and the user agent has been configured to not show popups (i.e. the user agent has a "popup blocker" enabled)  
There is no chosen browsing context. The user agent may inform the user that a popup has been blocked.
  - ↪ If the current browsing context's [active document](#)<sup>p762</sup>'s [active sandboxing flag set](#)<sup>p782</sup> has the [sandboxed auxiliary navigation browsing context flag](#)<sup>p780</sup> set.  
Typically, there is no chosen browsing context.  
The user agent may offer to [create](#)<sup>p762</sup> a new [top-level browsing context](#)<sup>p763</sup> or reuse an existing [top-level browsing context](#)<sup>p763</sup>. If the user picks one of those options, then the designated browsing context must be the chosen one (the browsing context's name isn't set to the given browsing context name). The default behaviour (if the user agent doesn't offer the option to the user, or if the user declines to allow a browsing context to be used) must be that there must not be a chosen browsing context.  
**⚠ Warning!** *If this case occurs, it means that an author has explicitly sandboxed the document that is trying to open a link.*
  - ↪ If the user agent has been configured such that in this instance it will create a new browsing context, and the browsing context is being requested as part of [following a hyperlink](#)<sup>p246</sup> whose [link types](#)<sup>p250</sup> include the [noreferrer](#)<sup>p255</sup> keyword  
A new [top-level browsing context](#)<sup>p763</sup> must be [created](#)<sup>p762</sup>. If the given browsing context name is not `_blank`, then the new top-level browsing context's name must be the given browsing context name (otherwise, it has no name). The chosen browsing context must be this new browsing context. The creation of such a [browsing context](#)<sup>p762</sup> is a [new start for session storage](#).
  - ↪ Note *If it is immediately navigated*<sup>p791</sup>, then the navigation will be done with [replacement enabled](#)<sup>p802</sup>.  
↪ If the user agent has been configured such that in this instance it will create a new browsing context, and the [noreferrer](#)<sup>p255</sup> keyword doesn't apply  
A new [auxiliary browsing context](#)<sup>p764</sup> must be created, with the [opener browsing context](#)<sup>p764</sup> being the current one. If the given browsing context name is not `_blank`, then the new auxiliary browsing context's name must be the given browsing context name (otherwise, it has no name). The chosen browsing context must be this new browsing context.  
**Note** *If it is immediately navigated*<sup>p791</sup>, then the navigation will be done with [replacement enabled](#)<sup>p802</sup>.
  - ↪ If the user agent has been configured such that in this instance it will reuse the current browsing context  
The chosen browsing context is the current browsing context.

↪ If the user agent has been configured such that in this instance it will not find a browsing context

There must not be a chosen browsing context.

User agent implementors are encouraged to provide a way for users to configure the user agent to always reuse the current browsing context.

If the current browsing context's [active document](#)<sup>p762</sup>'s [active sandboxing flag set](#)<sup>p782</sup> has the [sandboxed navigation browsing context flag](#)<sup>p780</sup> set and the chosen browsing context picked above, if any, is a new browsing context (whether top-level or auxiliary), then all the flags that are set in the current browsing context's [active document](#)<sup>p762</sup>'s [active sandboxing flag set](#)<sup>p782</sup> when the new browsing context is created must be set in the new browsing context's [popup sandboxing flag set](#)<sup>p781</sup>, and the current browsing context must be set as the new browsing context's [one permitted sandboxed navigator](#)<sup>p780</sup>.

## 7.2 The [Window](#)<sup>p768</sup> object

Spec bugs: [10694](#) [25685](#)

IDL

```
[PrimaryGlobal]
/*sealed*/ interface Window : EventTarget {
 // the current browsing context
 [Unforgeable] readonly attribute WindowProxy window;
 [Replaceable] readonly attribute WindowProxy self;
 [Unforgeable] readonly attribute Document document;
 attribute DOMString name;
 [PutForwards=href, Unforgeable] readonly attribute Location location;
 readonly attribute History history;
 [Replaceable] readonly attribute BarProp locationbar;
 [Replaceable] readonly attribute BarProp menubar;
 [Replaceable] readonly attribute BarProp personalbar;
 [Replaceable] readonly attribute BarProp scrollbars;
 [Replaceable] readonly attribute BarProp statusbar;
 [Replaceable] readonly attribute BarProp toolbar;
 attribute DOMString status;
 void close();
 readonly attribute boolean closed;
 void stop();
 void focus();
 void blur();

 // other browsing contexts
 [Replaceable] readonly attribute WindowProxy frames;
 [Replaceable] readonly attribute unsigned long length;
 [Unforgeable] readonly attribute WindowProxy top;
 attribute any opener;
 [Replaceable] readonly attribute WindowProxy parent;
 readonly attribute Element? frameElement;

void print();
any showModalDialog(DOMString url, optional any argument); // deprecated

long requestAnimationFrame(FrameRequestCallback callback);
void cancelAnimationFrame(long handle);

void postMessage(any message, DOMString targetOrigin, optional sequence<Transferable> transfer);

// also has obsolete members
};

Window implements GlobalEventHandlers;
Window implements WindowEventHandlers;

```

### Note

window.window<sup>p769</sup>

window.frames<sup>p769</sup>

window.self<sup>p769</sup>

These attributes all return window.

window.document<sup>p769</sup>

Returns the Document<sup>p102</sup> associated with window.

document.defaultView<sup>p769</sup>

Returns the Window<sup>p768</sup> object of the active document<sup>p762</sup>.

The window, frames, and self IDL attributes must all return the Window<sup>p768</sup> object's browsing context<sup>p762</sup>'s WindowProxy<sup>p775</sup> object.

The document IDL attribute must return the Window object's newest Document object<sup>p762</sup>.

**Note** The Document<sup>p102</sup> object associated with a Window<sup>p768</sup> object can change in exactly one case: when the navigate<sup>p791</sup> algorithm initialises a new Document object<sup>p795</sup> for the first page loaded in a browsing context<sup>p762</sup>. In that specific case, the Window<sup>p768</sup> object of the original about:blank<sup>p84</sup> page is reused and gets a new Document<sup>p102</sup> object.

The defaultView IDL attribute of the Document<sup>p102</sup> interface must return the Document<sup>p102</sup>'s browsing context<sup>p762</sup>'s WindowProxy<sup>p775</sup> object, if there is one, or null otherwise.

For historical reasons, Window<sup>p768</sup> objects must also have a writable, configurable, non-enumerable property named HTMLDocument whose value is the Document<sup>p102</sup> interface object.

## 7.2.1 Security

This section describes a security model that is underdefined, imperfect, and does not match implementations. Work is ongoing to attempt to resolve this, but in the meantime, please do not rely on this section for precision. Implementors are urged to send their feedback on how cross-origin cross-global access to Window<sup>p768</sup> and Location<sup>p788</sup> objects should work. See [bug 20701](#).

User agents must throw a SecurityError<sup>p50</sup> exception whenever any properties of a Window<sup>p768</sup> object are accessed when the incumbent settings object<sup>p831</sup> specifies an effective script origin<sup>p776</sup> that is not the same<sup>p778</sup> as the Window object's Document<sup>p762</sup>'s effective script origin<sup>p776</sup>, with the following exceptions:

- The location<sup>p788</sup> attribute

- The [postMessage \(\)<sup>p900</sup>](#) method
- The [window<sup>p769</sup>](#) attribute
- The [frames<sup>p769</sup>](#) attribute
- The [self<sup>p769</sup>](#) attribute
- The [top<sup>p764</sup>](#) attribute
- The [parent<sup>p764</sup>](#) attribute
- The [opener<sup>p764</sup>](#) attribute
- The [closed<sup>p772</sup>](#) attribute
- The [close \(\)<sup>p772</sup>](#) method
- The [blur \(\)<sup>p736</sup>](#) method
- The [focus \(\)<sup>p736</sup>](#) method
- The [dynamic nested browsing context properties<sup>p772</sup>](#)

When the [incumbent settings object<sup>p831</sup>](#) specifies an [effective script origin<sup>p776</sup>](#) that is different than a [Window object's Document<sup>p762</sup>](#)'s [effective script origin<sup>p776</sup>](#), the user agent must act as if any changes to that [Window<sup>p768</sup>](#) object's properties, getters, setters, etc, were not present, and as if all the properties of that [Window<sup>p768</sup>](#) object had their [[Enumerable]] attribute set to false.

For members that return objects (including function objects), each distinct [effective script origin<sup>p776</sup>](#) that is not the same as the [Window<sup>p768</sup>](#) object's [Document<sup>p102</sup>](#)'s [effective script origin<sup>p776</sup>](#) must be provided with a separate set of objects. These objects must have the prototype chain appropriate for the script for which the objects are created (not those that would be appropriate for scripts whose [global object<sup>p829</sup>](#), as specified by their [settings object<sup>p829</sup>](#), is the [Window<sup>p768</sup>](#) object in question).

#### Example

For instance, if two frames containing [Document<sup>p102</sup>](#)s from different [origins<sup>p776</sup>](#) access the same [Window<sup>p768</sup>](#) object's [postMessage \(\)<sup>p900</sup>](#) method, they will get distinct objects that are not equal.

## 7.2.2 APIs for creating and navigating browsing contexts by name

Spec bugs: [27916](#)

#### Note

**window = window . open<sup>p771</sup>( [ url [, target [, features [, replace ]]]])**

Opens a window to show [url](#) (defaults to [about:blank<sup>p84</sup>](#)), and returns it. The [target](#) argument gives the name of the new window. If a window exists with that name already, it is reused. The [replace](#) attribute, if true, means that whatever page is currently open in that window will be removed from the window's session history. The [features](#) argument can be used to influence the rendering of the new window.

**window . name<sup>p772</sup> [ = value ]**

Returns the name of the window.

Can be set, to change the name.

**window . close<sup>p772</sup>()**

Closes the window.

**window . closed<sup>p772</sup>**

Returns true if the window has been closed, false otherwise.

**window . stop<sup>p772</sup>()**

Cancels the document load.

The `open()` method on `Window`<sup>p768</sup> objects provides a mechanism for `navigating`<sup>p791</sup> an existing `browsing context`<sup>p762</sup> or opening and navigating an `auxiliary browsing context`<sup>p764</sup>.

When the method is invoked, the user agent must run the following steps:

1. Let `entry settings` be the `entry settings object`<sup>p831</sup> when the method was invoked.
2. Let `url` be the first argument.
3. Let `target` be the second argument.
4. Let `features` be the third argument.
5. Let `replace` be the fourth argument.
6. Let `source browsing context` be the `responsible browsing context`<sup>p829</sup> specified by `entry settings`.
7. If `target` is the empty string, let it be the string "`_blank`" instead.
8. If the user has indicated a preference for which `browsing context`<sup>p762</sup> to navigate, follow these substeps:
  1. Let `target browsing context` be the `browsing context`<sup>p762</sup> indicated by the user.
  2. If `target browsing context` is a new `top-level browsing context`<sup>p763</sup>, let the `source browsing context` be set as `target browsing context`'s `one permitted sandboxed navigator`<sup>p780</sup>.

**Example** For example, suppose there is a user agent that supports control-clicking a link to open it in a new tab. If a user clicks in that user agent on an element whose `onclick`<sup>p843</sup> handler uses the `window.open()`<sup>p771</sup> API to open a page in an iframe, but, while doing so, holds the control key down, the user agent could override the selection of the target browsing context to instead target a new tab.

- Otherwise, apply `the rules for choosing a browsing context given a browsing context name`<sup>p767</sup> using `target` as the name and `source browsing context` as the context in which the algorithm is executed. If this results in there not being a chosen browsing context, then throw an `InvalidAccessError`<sup>p50</sup> exception and abort these steps. Otherwise, let `target browsing context` be the `browsing context`<sup>p762</sup> so obtained.
9. If `target browsing context` was just created, either as part of `the rules for choosing a browsing context given a browsing context name`<sup>p767</sup> or due to the user indicating a preference for navigating a new `top-level browsing context`<sup>p763</sup>, then let `new` be true. Otherwise, let it be false.
  10. Interpret `features` as defined in the CSSOM View specification. [\[CSSOMVIEW\]](#)<sup>p1149</sup>
  11. If `url` is the empty string, run the appropriate steps from the following list:

**If `new` is false**  
Jump to the step labeled `end`.

**If `new` is true**  
Let `resource` be the `URL`<sup>p48</sup> "`about:blank`<sup>p84</sup>".

Otherwise, `resolve`<sup>p82</sup> `url` relative to the `API base URL`<sup>p829</sup> specified by `entry settings`, and let `resource` be the `resulting absolute URL`<sup>p83</sup>, if any. If the `resolve a URL`<sup>p82</sup> algorithm failed, then run one of the following two steps instead:
    - Let `resource` be a resource representing an inline error page.
    - If `new` is false, jump to the step labeled `end`, otherwise, let `resource` be the `URL`<sup>p48</sup> "`about:blank`<sup>p84</sup>".
  12. If `resource` is "`about:blank`<sup>p84</sup>" and `new` is true, `queue a task`<sup>p835</sup> to `fire a simple event`<sup>p846</sup> named `load`<sup>p1144</sup> at `target browsing context`'s `Window`<sup>p768</sup> object, with `target override`<sup>p51</sup> set to `target browsing context`'s `Window` object's `Document`<sup>p762</sup> object.

Otherwise, `navigate`<sup>p791</sup> `target browsing context` to `resource`, with `exceptions enabled`<sup>p791</sup>. If `new` is true, then `replacement must be enabled`<sup>p802</sup> also. The `source browsing context`<sup>p791</sup> is `source browsing context`.

  13. **End:** Return the `WindowProxy`<sup>p775</sup> object of `target browsing context`.

The `name` attribute of the `Window`<sup>p768</sup> object must, on getting, return the current `name`<sup>p765</sup> of the `browsing context`<sup>p762</sup>, if one is set, or the empty string otherwise; and, on setting, set the `name`<sup>p765</sup> of the `browsing context`<sup>p762</sup> to the new value.

**Note** *The name gets reset<sup>p801</sup> when the browsing context is navigated to another domain.*

The `close()` method on `Window`<sup>p768</sup> objects should, if all the following conditions are met, `close`<sup>p774</sup> the `browsing context`<sup>p762</sup> A:

- The corresponding `browsing context`<sup>p762</sup> A is `script-closable`<sup>p772</sup>.
- The `responsible browsing context`<sup>p829</sup> specified by the `incumbent settings object`<sup>p831</sup> is `familiar with`<sup>p764</sup> the `browsing context`<sup>p762</sup> A.
- The `responsible browsing context`<sup>p829</sup> specified by the `incumbent settings object`<sup>p831</sup> is `allowed to navigate`<sup>p765</sup> the `browsing context`<sup>p762</sup> A.

A `browsing context`<sup>p762</sup> is `script-closable` if it is an `auxiliary browsing context`<sup>p764</sup> that was created by a script (as opposed to by an action of the user), or if it is a `top-level browsing context`<sup>p763</sup> whose `session history`<sup>p782</sup> contains only one `Document`<sup>p102</sup>.

The `closed` attribute on `Window`<sup>p768</sup> objects must return true if the `Window`<sup>p768</sup> object's `browsing context`<sup>p762</sup> has been `discarded`<sup>p774</sup>, and false otherwise.

The `stop()` method on `Window`<sup>p768</sup> objects should, if there is an existing attempt to `navigate`<sup>p791</sup> the `browsing context`<sup>p762</sup> and that attempt is not currently running the `unload a document`<sup>p805</sup> algorithm, cancel that `navigation`<sup>p791</sup>; then, it must `abort`<sup>p806</sup> the `active document`<sup>p762</sup> of the `browsing context`<sup>p762</sup> of the `Window`<sup>p768</sup> object on which it was invoked.

### 7.2.3 Accessing other browsing contexts

**Note**

`window.length`<sup>p772</sup>

Returns the number of `child browsing contexts`<sup>p763</sup>.

`window[index]`

Returns the indicated `child browsing context`<sup>p763</sup>.

The `length` IDL attribute on the `Window`<sup>p768</sup> interface must return the number of `child browsing contexts`<sup>p763</sup> that are `nested through`<sup>p763</sup> elements that are `in the Document`<sup>p42</sup> that is the `active document`<sup>p762</sup> of that `Window`<sup>p768</sup> object, if that `Window`<sup>p768</sup>'s `browsing context`<sup>p762</sup> shares the same `event loop`<sup>p834</sup> as the `responsible document`<sup>p829</sup> specified by the `entry settings object`<sup>p831</sup> accessing the IDL attribute; otherwise, it must return zero.

The `supported property indices`<sup>p49</sup> on the `Window`<sup>p768</sup> object at any instant are the numbers in the range 0 ..  $n-1$ , where  $n$  is the number returned by the `length`<sup>p772</sup> IDL attribute. If  $n$  is zero then there are no `supported property indices`<sup>p49</sup>.

To determine the value of an indexed property `index` of a `Window`<sup>p768</sup> object, the user agent must return the `WindowProxy`<sup>p775</sup> object of the index of the `child browsing context`<sup>p763</sup> of the `Document`<sup>p102</sup> that is `nested through`<sup>p763</sup> an element that is `in the Document`<sup>p42</sup>, sorted in the order that the elements nesting those `browsing contexts`<sup>p762</sup> were most recently inserted into the `Document`<sup>p102</sup>, the `WindowProxy`<sup>p775</sup> object of the most recently inserted `browsing context container`<sup>p763</sup>'s `nested browsing context`<sup>p763</sup> being last.

These properties are the **dynamic nested browsing context properties**.

### 7.2.4 Named access on the `Window`<sup>p768</sup> object

**Note**

`window[name]`

Returns the indicated element or collection of elements.

As a general rule, relying on this will lead to brittle code. Which IDs end up mapping to this API can vary over time, as new features are added to the Web platform, for example. Instead of this, use `document.getElementById()` or `document.querySelector()`.

The [Window](#)<sup>p768</sup> interface [supports named properties](#)<sup>p49</sup>. The [supported property names](#)<sup>p49</sup> at any moment consist of the following, in [tree order](#)<sup>p42</sup>, ignoring later duplicates:

- the [browsing context name](#)<sup>p765</sup> of any [child browsing context](#)<sup>p763</sup> of the [active document](#)<sup>p762</sup> whose name is not the empty string,
- the value of the `name` content attribute for all [a](#)<sup>p208</sup>, [applet](#)<sup>p1101</sup>, [area](#)<sup>p390</sup>, [embed](#)<sup>p307</sup>, [form](#)<sup>p447</sup>, [frameset](#)<sup>p1104</sup>, [img](#)<sup>p272</sup>, and [object](#)<sup>p310</sup> elements in the [active document](#)<sup>p762</sup> that have a non-empty `name` content attribute, and
- the value of the [id](#)<sup>p122</sup> content attribute of any [HTML element](#)<sup>p42</sup> in the [active document](#)<sup>p762</sup> with a non-empty [id](#)<sup>p122</sup> content attribute.

To [determine the value of a named property](#)<sup>p49</sup> `name` when the [Window](#) object is indexed for property retrieval, the user agent must return the value obtained using the following steps:

1. Let `objects` be the list of [named objects](#)<sup>p773</sup> with the name `name` in the [active document](#)<sup>p762</sup>.

**Note** *There will be at least one such object, by definition.*
2. If `objects` contains a [nested browsing context](#)<sup>p763</sup>, then return the [WindowProxy](#)<sup>p775</sup> object of the [nested browsing context](#)<sup>p763</sup> corresponding to the first [browsing context container](#)<sup>p763</sup> in [tree order](#)<sup>p42</sup> whose [browsing context](#)<sup>p762</sup> is in `objects`, and abort these steps.
3. Otherwise, if `objects` has only one element, return that element and abort these steps.
4. Otherwise return an [HTMLCollection](#)<sup>p51</sup> rooted at the [Document](#)<sup>p102</sup> node, whose filter matches only [named objects](#)<sup>p773</sup> with the name `name`. (By definition, these will all be elements.)

**Named objects** with the name `name`, for the purposes of the above algorithm, are those that are either:

- [child browsing contexts](#)<sup>p763</sup> of the [active document](#)<sup>p762</sup> whose name is `name`,
- [a](#)<sup>p208</sup>, [applet](#)<sup>p1101</sup>, [area](#)<sup>p390</sup>, [embed](#)<sup>p307</sup>, [form](#)<sup>p447</sup>, [frameset](#)<sup>p1104</sup>, [img](#)<sup>p272</sup>, or [object](#)<sup>p310</sup> elements that have a `name` content attribute whose value is `name`, or
- [HTML elements](#)<sup>p42</sup> that have an [id](#)<sup>p122</sup> content attribute whose value is `name`.

## 7.2.5 Garbage collection and browsing contexts

A [browsing context](#)<sup>p762</sup> has a strong reference to each of its [Document](#)<sup>p102</sup>s and its [WindowProxy](#)<sup>p775</sup> object, and the user agent itself has a strong reference to its [top-level browsing contexts](#)<sup>p763</sup>.

A [Document](#)<sup>p102</sup> has a strong reference to its [Window](#)<sup>p768</sup> object.

**Note** A [Window](#)<sup>p768</sup> object [has a strong reference](#)<sup>p101</sup> to its [Document](#)<sup>p102</sup> object through its [document](#)<sup>p769</sup> attribute. Thus, references from other scripts to either of those objects will keep both alive. Similarly, both [Document](#)<sup>p102</sup> and [Window](#)<sup>p768</sup> objects have [implied strong references](#)<sup>p101</sup> to the [WindowProxy](#)<sup>p775</sup> object.

Each [script](#)<sup>p828</sup> has a strong reference to its [settings object](#)<sup>p829</sup>, and each [environment settings object](#)<sup>p829</sup> has strong references to its [global object](#)<sup>p829</sup>, [responsible browsing context](#)<sup>p829</sup>, and [responsible document](#)<sup>p829</sup> (if any).

When a [browsing context](#)<sup>p762</sup> is to [discard a Document](#), the user agent must run the following steps:

1. Set the [Document](#)<sup>p102</sup>'s [salvageable](#)<sup>p804</sup> state to false.
2. Run any [unloading document cleanup steps](#)<sup>p805</sup> for the [Document](#)<sup>p102</sup> that are defined by this specification and [other applicable specifications](#)<sup>p56</sup>.
3. [Abort the Document](#)<sup>p806</sup>.
4. Remove any [tasks](#)<sup>p834</sup> associated with the [Document](#)<sup>p102</sup> in any [task source](#)<sup>p835</sup>, without running those tasks.
5. [Discard](#)<sup>p774</sup> all the [child browsing contexts](#)<sup>p763</sup> of the [Document](#)<sup>p102</sup>.
6. Lose the strong reference from the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup> to the [Document](#)<sup>p102</sup>.

**Note** Whenever a [Document](#)<sup>p102</sup> object is [discarded](#)<sup>p773</sup>, it is also removed from the list of the worker's [Document](#)s<sup>p925</sup> of each worker whose list contains that [Document](#)<sup>b102</sup>.

When a **browsing context** is discarded, the strong reference from the user agent itself to the [browsing context](#)<sup>p762</sup> must be severed, and all the [Document](#)<sup>p102</sup> objects for all the entries in the [browsing context](#)<sup>b762</sup>'s session history must be [discarded](#)<sup>p773</sup> as well.

User agents may [discard](#)<sup>p774</sup> [top-level browsing contexts](#)<sup>p763</sup> at any time (typically, in response to user requests, e.g. when a user force-closes a window containing one or more [top-level browsing contexts](#)<sup>p763</sup>). Other [browsing contexts](#)<sup>p762</sup> must be discarded once their [WindowProxy](#)<sup>p775</sup> object is eligible for garbage collection.

## 7.2.6 Closing browsing contexts

When the user agent is required to **close a browsing context**, it must run the following steps:

1. Let *specified browsing context* be the [browsing context](#)<sup>p762</sup> being closed.
2. [Prompt to unload](#)<sup>p804</sup> the [active document](#)<sup>p762</sup> of the *specified browsing context*. If the user [refused to allow the document to be unloaded](#)<sup>p804</sup>, then abort these steps.
3. [Unload](#)<sup>p805</sup> the [active document](#)<sup>p762</sup> of the *specified browsing context* with the *recycle* parameter set to false.
4. Remove the *specified browsing context* from the user interface (e.g. close or hide its tab in a tabbed browser).
5. [Discard](#)<sup>p774</sup> the *specified browsing context*.

User agents should offer users the ability to arbitrarily [close](#)<sup>p774</sup> any [top-level browsing context](#)<sup>p763</sup>.

## 7.2.7 Browser interface elements

To allow Web pages to integrate with Web browsers, certain Web browser interface elements are exposed in a limited way to scripts in Web pages.

Each interface element is represented by a [BarProp](#)<sup>p774</sup> object:

**IDL**

```
interface BarProp {
 attribute boolean visible;
};
```

**Note** `window.locationbar`<sup>p775</sup>.`visible`<sup>p775</sup>

Returns true if the location bar is visible; otherwise, returns false.

`window.menubar`<sup>p775</sup>.`visible`<sup>p775</sup>

Returns true if the menu bar is visible; otherwise, returns false.

`window.personalbar`<sup>p775</sup>.`visible`<sup>p775</sup>

Returns true if the personal bar is visible; otherwise, returns false.

`window.scrollbars`<sup>p775</sup>.`visible`<sup>p775</sup>

Returns true if the scroll bars are visible; otherwise, returns false.

`window.statusbar`<sup>p775</sup>.`visible`<sup>p775</sup>

Returns true if the status bar is visible; otherwise, returns false.

`window.toolbarp775.visiblep775`

Returns true if the toolbar is visible; otherwise, returns false.

The **visible** attribute, on getting, must return either true or a value determined by the user agent to most accurately represent the visibility state of the user interface element that the object represents, as described below. On setting, the new value must be discarded.

The following [BarProp<sup>p774</sup>](#) objects exist for each [Document<sup>p102</sup>](#) object in a [browsing context<sup>p762</sup>](#). Some of the user interface elements represented by these objects might have no equivalent in some user agents; for those user agents, except when otherwise specified, the object must act as if it was present and visible (i.e. its [visible<sup>p775</sup>](#) attribute must return true).

#### **The location bar BarProp object**

Represents the user interface element that contains a control that displays the [URL<sup>p48</sup>](#) of the [active document<sup>p762</sup>](#), or some similar interface concept.

#### **The menu bar BarProp object**

Represents the user interface element that contains a list of commands in menu form, or some similar interface concept.

#### **The personal bar BarProp object**

Represents the user interface element that contains links to the user's favorite pages, or some similar interface concept.

#### **The scrollbar BarProp object**

Represents the user interface element that contains a scrolling mechanism, or some similar interface concept.

#### **The status bar BarProp object**

Represents a user interface element found immediately below or after the document, as appropriate for the user's media, which typically provides information about ongoing network activity or information about elements that the user's pointing device is current indicating. If the user agent has no such user interface element, then the object may act as if the corresponding user interface element was absent (i.e. its [visible<sup>p775</sup>](#) attribute may return false).

#### **The toolbar BarProp object**

Represents the user interface element found immediately above or before the document, as appropriate for the user's media, which typically provides [session history<sup>p762</sup>](#) traversal controls (back and forward buttons, reload buttons, etc). If the user agent has no such user interface element, then the object may act as if the corresponding user interface element was absent (i.e. its [visible<sup>p775</sup>](#) attribute may return false).

The **locationbar** attribute must return [the location bar BarProp object<sup>p775</sup>](#).

The **menubar** attribute must return [the menu bar BarProp object<sup>p775</sup>](#).

The **personalbar** attribute must return [the personal bar BarProp object<sup>p775</sup>](#).

The **scrollbars** attribute must return [the scrollbar BarProp object<sup>p775</sup>](#).

The **statusbar** attribute must return [the status bar BarProp object<sup>p775</sup>](#).

The **toolbar** attribute must return [the toolbar BarProp object<sup>p775</sup>](#).

For historical reasons, the **status** attribute on the [Window<sup>p768</sup>](#) object must, on getting, return the last string it was set to, and on setting, must set itself to the new value. When the [Window<sup>p768</sup>](#) object is created, the attribute must be set to the empty string. It does not do anything else.

## **7.2.8 The [WindowProxy<sup>p775</sup>](#) object**

As mentioned earlier, each [browsing context<sup>p762</sup>](#) has a [WindowProxy](#) object. This object is unusual in that all operations that would be performed on it must be performed on the [Window<sup>p768</sup>](#) object of the [browsing context<sup>p762</sup>](#)'s [active document<sup>p762</sup>](#) instead. It is thus indistinguishable from that [Window<sup>p768</sup>](#) object in every way until the [browsing context<sup>p762</sup>](#) is navigated.

There is no [WindowProxy<sup>p775</sup>](#) interface object.

**Note** The [WindowProxy](#)<sup>p775</sup> object allows scripts to act as if each [browsing context](#)<sup>p762</sup> had a single [Window](#)<sup>p768</sup> object, while still keeping separate [Window](#)<sup>p768</sup> objects for each [Document](#)<sup>p102</sup>.

**Example**

In the following example, the variable `x` is set to the [WindowProxy](#)<sup>p775</sup> object returned by the `window`<sup>p769</sup> accessor on the global object. All of the expressions following the assignment return true, because in every respect, the [WindowProxy](#)<sup>p775</sup> object acts like the underlying [Window](#)<sup>p768</sup> object.

```
var x = window;
x instanceof Window; // true
x === this; // true
```

## 7.3 Origin

Origins are the fundamental currency of the Web's security model. Two actors in the Web platform that share an origin are assumed to trust each other and to have the same authority. Actors with differing origins are considered potentially hostile versus each other, and are isolated from each other to varying degrees.

**Example** For example, if Example Bank's Web site, hosted at `bank.example.com`, tries to examine the DOM of Example Charity's Web site, hosted at `charity.example.org`, a [SecurityError](#)<sup>b50</sup> exception will be raised.

The **origin** of a resource and the **effective script origin** of a resource are each one of the following:

Spec bugs: [27378](#)

### Opaque identifiers

Internal values, with no serialisation, for which the only meaningful operation is testing for equality.

### Tuples

Tuples consisting of a scheme component, a host component, a port component, and optionally extra data.

**Note** The extra data could include the certificate of the site when using encrypted connections, to ensure that if the site's secure certificate changes, the origin is considered to change as well.

### Aliases

A reference to another [origin](#)<sup>p776</sup> or [effective script origin](#)<sup>p776</sup>.

An [origin](#)<sup>p776</sup> or [effective script origin](#)<sup>p776</sup> can be defined as an **alias** to another [origin](#)<sup>p776</sup> or [effective script origin](#)<sup>p776</sup>. The value of the [origin](#)<sup>p776</sup> or [effective script origin](#)<sup>p776</sup> is then the value of the [origin](#)<sup>p776</sup> or [effective script origin](#)<sup>p776</sup> to which it is an alias.

These characteristics are defined as follows:

#### For URLs

The [origin](#)<sup>p776</sup> and [effective script origin](#)<sup>p776</sup> of the [URL](#)<sup>p48</sup> are the [URL origin](#) defined in the WHATWG URL standard. [\[URL\]](#)<sup>b1153</sup>

#### For [Document](#)<sup>p102</sup> objects

↪ If a [Document](#)<sup>p102</sup>'s [active sandboxing flag set](#)<sup>p782</sup> has its [sandboxed origin browsing context flag](#)<sup>p780</sup> set  
The [origin](#)<sup>p776</sup> is a globally unique identifier assigned when the [Document](#)<sup>p102</sup> is created.

The [effective script origin](#)<sup>p776</sup> is initially an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup>.

↪ If a [Document](#)<sup>p102</sup> was served over the network and has an address that uses a URL scheme with a server-based naming authority

The [origin](#)<sup>p776</sup> is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [Document](#)'s address.

The [effective script origin](#)<sup>p776</sup> is initially an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup>.

- ↪ If a [Document](#)<sup>p102</sup> was generated from a [data: URL](#) found in another [Document](#)<sup>p102</sup> or in a script
 

The [origin](#)<sup>p776</sup> is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> specified by the [incumbent settings object](#)<sup>p831</sup> when the [navigate](#)<sup>p791</sup> algorithm was invoked, or, if no [script](#)<sup>p828</sup> was involved, of the [node document](#) of the element that initiated the [navigation](#)<sup>p791</sup> to that [URL](#)<sup>p48</sup>.

The [effective script origin](#)<sup>p776</sup> is initially an [alias](#)<sup>p776</sup> to the [effective script origin](#)<sup>p776</sup> of that same [environment settings object](#)<sup>p829</sup> or [Document](#)<sup>p102</sup>.
- ↪ If a [Document](#)<sup>p102</sup> is the initial "about:blank"<sup>p84</sup> document
 

The [origin](#)<sup>p776</sup> and [effective script origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup> are [those it was assigned when its browsing context was created](#)<sup>p762</sup>.
- ↪ If a [Document](#)<sup>p102</sup> was created as part of the processing for [javascript: URLs](#)<sup>p792</sup>

The [origin](#)<sup>p776</sup> is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [active document](#)<sup>p762</sup> of the [browsing context](#)<sup>p762</sup> being navigated when the [navigate](#)<sup>p791</sup> algorithm was invoked.

The [effective script origin](#)<sup>p776</sup> is initially an [alias](#)<sup>p776</sup> to the [effective script origin](#)<sup>p776</sup> of that same [Document](#)<sup>p102</sup>.
- ↪ If a [Document](#)<sup>p102</sup> is an [iframe srcdoc document](#)<sup>p300</sup>

The [origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup> is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup>'s [browsing context container](#)<sup>p763</sup>'s [node document](#).

The [effective script origin](#)<sup>p776</sup> is initially an [alias](#)<sup>p776</sup> to the [effective script origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup>'s [browsing context container](#)<sup>p763</sup>'s [node document](#).
- ↪ If a [Document](#)<sup>p102</sup> was obtained in some other manner (e.g. a [data: URL](#) typed in by the user or that was returned as the location of an HTTP redirect ([or equivalent](#)<sup>p83</sup> in other protocols), a [Document](#)<sup>p102</sup> created using the [createDocument\(\)](#)<sup>p51</sup> API, etc)
 

The default behaviour as defined in the DOM standard applies. [\[DOM\]](#)<sup>p1149</sup>.

**Note** The [origin](#)<sup>p776</sup> is a globally unique identifier assigned when the [Document](#)<sup>p102</sup> is created, and the [effective script origin](#)<sup>p776</sup> is initially an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup>.

**Note** The [effective script origin](#)<sup>p776</sup> of a [Document](#)<sup>p102</sup> can be manipulated using the [document.domain](#)<sup>p779</sup> IDL attribute.

## For images of [img](#)<sup>p272</sup> elements

- ↪ If the image data is [CORS-cross-origin](#)<sup>p87</sup>

The [origin](#)<sup>p776</sup> is a globally unique identifier assigned when the image is created.
- ↪ If the image data is [CORS-same-origin](#)<sup>p87</sup>

The [origin](#)<sup>p776</sup> is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [img](#)<sup>p272</sup> element's [node document](#).

Images do not have an [effective script origin](#)<sup>p776</sup>.

## For [audio](#)<sup>p321</sup> and [video](#)<sup>p317</sup> elements

- ↪ If the [media data](#)<sup>p328</sup> is [CORS-cross-origin](#)<sup>p87</sup>

The [origin](#)<sup>p776</sup> is a globally unique identifier assigned when the [media data](#)<sup>p328</sup> is [fetched](#)<sup>p84</sup>.
- ↪ If the [media data](#)<sup>p328</sup> is [CORS-same-origin](#)<sup>p87</sup>

The [origin](#)<sup>p776</sup> is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [media element](#)<sup>p326</sup>'s [node document](#).

Media elements<sup>p326</sup> do not have an [effective script origin](#)<sup>p776</sup>.

## For fonts

The [origin](#)<sup>p776</sup> of a downloadable Web font is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [absolute URL](#)<sup>p48</sup> used to obtain the font (after any redirects). [\[CSSFONTS\]](#)<sup>p1149</sup> [\[CSSFONTLOAD\]](#)<sup>p1149</sup>

The [origin](#)<sup>p776</sup> of a locally installed system font is an [alias](#)<sup>p776</sup> to the [origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup> in which that font is being used.

Fonts do not have an [effective script origin](#)<sup>p776</sup>.

Other specifications can override the above definitions by themselves specifying the origin of a particular [URL](#)<sup>p48</sup>, [Document](#)<sup>p102</sup>, image, [media element](#)<sup>p326</sup>, or font.

The **Unicode serialisation of an origin** is the string obtained by applying the following algorithm to the given [origin<sup>p776</sup>](#):

1. If the [origin<sup>p776</sup>](#) in question is not a scheme/host/port tuple, then return the literal string "null" and abort these steps.
2. Otherwise, let *result* be the scheme part of the [origin<sup>p776</sup>](#) tuple.
3. Append the string ": // " to *result*.
4. Apply the [domain to Unicode<sup>p48</sup>](#) algorithm to each component of the host part of the [origin<sup>p776</sup>](#) tuple, and append the results — each component, in the same order, separated by U+002E FULL STOP characters (.) — to *result*. [\[URL\]<sup>p1153</sup>](#)
5. If the port part of the [origin<sup>p776</sup>](#) tuple gives a port that is different from the default port for the protocol given by the scheme part of the [origin<sup>p776</sup>](#) tuple, then append a U+003A COLON character (:) and the given port, in base ten, to *result*.
6. Return *result*.

The **ASCII serialisation of an origin** is the string obtained by applying the following algorithm to the given [origin<sup>p776</sup>](#):

1. If the [origin<sup>p776</sup>](#) in question is not a scheme/host/port tuple, then return the literal string "null" and abort these steps.
2. Otherwise, let *result* be the scheme part of the [origin<sup>p776</sup>](#) tuple.
3. Append the string ": // " to *result*.
4. Apply the [domain to ASCII<sup>p48</sup>](#) algorithm to each component of the host part of the [origin<sup>p776</sup>](#) tuple, and append the results — each component, in the same order, separated by U+002E FULL STOP characters (.) — to *result*. [\[URL\]<sup>p1153</sup>](#)  
If the [domain to ASCII<sup>p48</sup>](#) algorithm returns failure, e.g. because a component is too long or because it contains invalid characters, then throw a [SecurityError<sup>p50</sup>](#) exception and abort these steps.
5. If the port part of the [origin<sup>p776</sup>](#) tuple gives a port that is different from the default port for the protocol given by the scheme part of the [origin<sup>p776</sup>](#) tuple, then append a U+003A COLON character (:) and the given port, in base ten, to *result*.
6. Return *result*.

Two [origins<sup>p776</sup>](#) are said to be the **same origin** if the following algorithm returns true:

1. Let *A* be the first [origin<sup>p776</sup>](#) being compared, and *B* be the second [origin<sup>p776</sup>](#) being compared.
2. If *A* and *B* are both opaque identifiers, and their value is equal, then return true.
3. Otherwise, if either *A* or *B* or both are opaque identifiers, return false.
4. If *A* and *B* have scheme components that are not identical, return false.
5. If *A* and *B* have host components that are not identical, return false.
6. If *A* and *B* have port components that are not identical, return false.
7. If either *A* or *B* have additional data, but that data is not identical for both, return false.
8. Return true.

### 7.3.1 Relaxing the same-origin restriction

Note

`document.domainp779 [= domain]`

Returns the current domain used for security checks.

Can be set to a value that removes subdomains, to change the [effective script origin<sup>b776</sup>](#) to allow pages on other subdomains of the same domain (if they do the same thing) to access each other. (Can't be set in sandboxed [iframe<sup>p299</sup>](#)s.)

The `domain` attribute on `Document`<sup>p102</sup> objects must be initialised to `the document's domain`<sup>p779</sup>, if it has one, and the empty string otherwise. If `the document's domain`<sup>p779</sup> starts with a U+005B LEFT SQUARE BRACKET character (`[`) and ends with a U+005D RIGHT SQUARE BRACKET character (`]`), it is an IPv6 address; these square brackets must be omitted when initialising the attribute's value.

On getting, the attribute must return its current value, unless the `Document`<sup>p102</sup> has no `browsing context`<sup>p762</sup>, in which case it must return the empty string.

On setting, the user agent must run the following algorithm:

1. If the `Document`<sup>p102</sup> has no `browsing context`<sup>p762</sup>, throw a `SecurityError`<sup>p50</sup> exception and abort these steps.
2. If the `Document`<sup>p102</sup>'s `active sandboxing flag set`<sup>p782</sup> has its `sandboxed document.domain browsing context flag`<sup>p781</sup> set, throw a `SecurityError`<sup>p50</sup> exception and abort these steps.
3. If the new value is an IPv4 or IPv6 address, let `new value` be the new value.  
Otherwise, `strictly split`<sup>p59</sup> the new value on U+002E FULL STOP characters `(.)`, apply the `domain to ASCII`<sup>p48</sup> algorithm to each returned token, and let `new value` be the result of concatenating the results of applying that algorithm to each token, in the same order, separated by U+002E FULL STOP characters `(.)`. [\[URL\]](#)<sup>p1153</sup>  
If the `domain to ASCII`<sup>p48</sup> algorithm returns failure, e.g. because a component is too long or because it contains invalid characters, then throw a `SecurityError`<sup>p50</sup> exception and abort these steps.
4. If `new value` is not exactly equal to the current value of the `document.domain`<sup>p779</sup> attribute, then run these substeps:
  1. If the current value is an IPv4 or IPv6 address, throw a `SecurityError`<sup>p50</sup> exception and abort these steps.
  2. If `new value`, prefixed by a U+002E FULL STOP `(.)`, does not exactly match the end of the current value, throw a `SecurityError`<sup>p50</sup> exception and abort these steps.

**Note** *If the new value is an IPv4 or IPv6 address, it cannot match the new value in this way and thus an exception will be thrown here.*

- 3. If `new value` matches a suffix in the Public Suffix List, or, if `new value`, prefixed by a U+002E FULL STOP `(.)`, matches the end of a suffix in the Public Suffix List, then throw a `SecurityError`<sup>p50</sup> exception and abort these steps. [\[PSL\]](#)<sup>p1151</sup>  
Suffixes must be compared in an `ASCII case-insensitive`<sup>p58</sup> manner, after applying the `domain to ASCII`<sup>p48</sup> algorithm to their individual components. [\[URL\]](#)<sup>p1153</sup>
- 5. Release the `storage mutex`<sup>p835</sup>.
- 6. Set the attribute's value to `new value`.
- 7. If the `effective script origin`<sup>p776</sup> of the `Document`<sup>p102</sup> is an `alias`<sup>p776</sup>, set it to the value of the `effective script origin`<sup>p776</sup> (essentially de-aliasing the `effective script origin`<sup>p776</sup>).  
8. If `new value` is not the empty string, then run these substeps:
  1. Set the host part of the `effective script origin`<sup>p776</sup> tuple of the `Document`<sup>p102</sup> to `new value`.
  2. Set the port part of the `effective script origin`<sup>p776</sup> tuple of the `Document`<sup>p102</sup> to "manual override" (a value that, for the purposes of `comparing origins`<sup>p778</sup>, is identical to "manual override" but not identical to any other value).

The `domain` of a `Document`<sup>p102</sup> is the host part of the document's `origin`<sup>p776</sup>, if the value of that `origin`<sup>p776</sup> is a scheme/host/port tuple. If it isn't, then the document does not have a domain.

**Note** *The `domain`<sup>p779</sup> attribute is used to enable pages on different hosts of a domain to access each others' DOMs.*

**⚠️Warning!** *Do not use the `document.domain`<sup>p779</sup> attribute when using shared hosting. If an untrusted third party is able to host an HTTP server at the same IP address but on a different port, then the same-origin protection that normally protects two different sites on the same host will fail, as the ports are ignored when comparing origins after the `document.domain`<sup>p779</sup> attribute has been used.*

## 7.4 Sandboxing

A **sandboxing flag set** is a set of zero or more of the following flags, which are used to restrict the abilities that potentially untrusted resources have:

### The *sandboxed navigation browsing context flag*

This flag [prevents content from navigating browsing contexts other than the sandboxed browsing context itself](#)<sup>p791</sup> (or browsing contexts further nested inside it), [auxiliary browsing contexts](#)<sup>p764</sup> (which are protected by the [sandboxed auxiliary navigation browsing context flag](#)<sup>p780</sup> defined next), and the [top-level browsing context](#)<sup>p763</sup> (which is protected by the [sandboxed top-level navigation browsing context flag](#)<sup>p780</sup> defined below).

If the [sandboxed auxiliary navigation browsing context flag](#)<sup>p780</sup> is not set, then in certain cases the restrictions nonetheless allow popups (new [top-level browsing contexts](#)<sup>p763</sup>) to be opened. These [browsing contexts](#)<sup>p762</sup> always have **one permitted sandboxed navigator**, set when the browsing context is created, which allows the [browsing context](#)<sup>p762</sup> that created them to actually navigate them. (Otherwise, the [sandboxed navigation browsing context flag](#)<sup>p780</sup> would prevent them from being navigated even if they were opened.)

### The *sandboxed auxiliary navigation browsing context flag*

This flag [prevents content from creating new auxiliary browsing contexts](#)<sup>p767</sup>, e.g. using the [target](#)<sup>p245</sup> attribute, the [window.open\(\)](#)<sup>p771</sup> method, or the [showModalDialog\(\)](#)<sup>p856</sup> method.

### The *sandboxed top-level navigation browsing context flag*

This flag [prevents content from navigating their top-level browsing context](#)<sup>p791</sup> and [prevents content from closing their top-level browsing context](#)<sup>p772</sup>.

When the [sandboxed top-level navigation browsing context flag](#)<sup>p780</sup> is *not* set, content can navigate its [top-level browsing context](#)<sup>p763</sup>, but other [browsing contexts](#)<sup>p762</sup> are still protected by the [sandboxed navigation browsing context flag](#)<sup>p780</sup> and possibly the [sandboxed auxiliary navigation browsing context flag](#)<sup>p780</sup>.

### The *sandboxed plugins browsing context flag*

This flag prevents content from instantiating [plugins](#)<sup>p43</sup>, whether using the [embed element](#)<sup>p309</sup>, the [object element](#)<sup>p314</sup>, the [applet element](#)<sup>p1102</sup>, or through [navigation](#)<sup>p799</sup> of a [nested browsing context](#)<sup>p763</sup>, unless those [plugins](#)<sup>p43</sup> can be [secured](#)<sup>p43</sup>.

### The *sandboxed seamless iframes flag*

This flag prevents content from using the [seamless](#)<sup>p304</sup> attribute on descendant [iframe](#)<sup>p299</sup> elements.

**Note** This prevents a page inserted using the [allow-same-origin](#)<sup>p781</sup> keyword from using a CSS-selector-based method of probing the DOM of other pages on the same site (in particular, pages that contain user-sensitive information).

### The *sandboxed origin browsing context flag*

This flag [forces content into a unique origin](#)<sup>p776</sup>, thus preventing it from accessing other content from the same [origin](#)<sup>p776</sup>.

This flag also [prevents script from reading from or writing to the document.cookie IDL attribute](#)<sup>p104</sup>, and blocks access to [localStorage](#)<sup>p936</sup>.

### The *sandboxed forms browsing context flag*

This flag [blocks form submission](#)<sup>p558</sup>.

### The *sandboxed pointer lock browsing context flag*

This flag disables the Pointer Lock API. [\[POINTERLOCK\]](#)<sup>p1151</sup>

### The *sandboxed scripts browsing context flag*

This flag [blocks script execution](#)<sup>p828</sup>.

### The *sandboxed automatic features browsing context flag*

This flag blocks features that trigger automatically, such as [automatically playing a video](#)<sup>p345</sup> or [automatically focusing a form control](#)<sup>p533</sup>.

### The *sandboxed storage area URLs flag*

This flag prevents URL schemes that use storage areas from being able to access the origin's data.

## The **sandboxed fullscreen browsing context flag**

This flag prevents content from using the [requestFullscreen\(\)](#) method.

## The **sandboxed document.domain browsing context flag**

This flag prevents content from using the [document.domain](#) feature to change the [effective script origin](#).

When the user agent is to **parse a sandboxing directive**, given a string *input*, a [sandboxing flag set](#) *output*, and optionally an *allow fullscreen flag*, it must run the following steps:

1. [Split \*input\* on spaces](#), to obtain *tokens*.
2. Let *output* be empty.
3. Add the following flags to *output*:
  - The [sandboxed navigation browsing context flag](#).
  - The [sandboxed auxiliary navigation browsing context flag](#), unless *tokens* contains the [allow-popups](#) keyword.
  - The [sandboxed top-level navigation browsing context flag](#), unless *tokens* contains the [allow-top-navigation](#) keyword.
  - The [sandboxed plugins browsing context flag](#).
  - The [sandboxed seamless iframes flag](#).
  - The [sandboxed origin browsing context flag](#), unless the *tokens* contains the [allow-same-origin](#) keyword.

**Note** *The [allow-same-origin](#) keyword is intended for two cases.*

*First, it can be used to allow content from the same site to be sandboxed to disable scripting, while still allowing access to the DOM of the sandboxed content.*

*Second, it can be used to embed content from a third-party site, sandboxed to prevent that site from opening pop-up windows, etc, without preventing the embedded page from communicating back to its originating site, using the database APIs to store data, etc.*

- The [sandboxed forms browsing context flag](#), unless *tokens* contains the [allow-forms](#) keyword.
- The [sandboxed pointer lock browsing context flag](#), unless *tokens* contains the [allow-pointer-lock](#) keyword.
- The [sandboxed scripts browsing context flag](#), unless *tokens* contains the [allow-scripts](#) keyword.
- The [sandboxed automatic features browsing context flag](#), unless *tokens* contains the [allow-scripts](#) keyword (defined above).

**Note** *This flag is relaxed by the same keyword as scripts, because when scripts are enabled these features are trivially possible anyway, and it would be unfortunate to force authors to use script to do them when sandboxed rather than allowing them to use the declarative features.*

- The [sandboxed storage area URLs flag](#).
- The [sandboxed fullscreen browsing context flag](#), unless the *allow fullscreen flag* was passed to the [parse a sandboxing directive](#) flag.
- The [sandboxed document.domain browsing context flag](#).

Every [top-level browsing context](#) has a **popup sandboxing flag set**, which is a [sandboxing flag set](#). When a [browsing context](#) is created, its [popup sandboxing flag set](#) must be empty. It is populated by [the rules for choosing a browsing context given a browsing context name](#).

Every [nested browsing context](#) has an **iframe sandboxing flag set**, which is a [sandboxing flag set](#). Which flags in a [nested browsing context](#)'s [iframe sandboxing flag set](#) are set at any particular time is determined by the [iframe](#) element's [sandbox](#) attribute.

Every [Document](#)<sup>p102</sup> has an **active sandboxing flag set**, which is a [sandboxing flag set](#)<sup>p780</sup>. When the [Document](#)<sup>p102</sup> is created, its [active sandboxing flag set](#)<sup>p782</sup> must be empty. It is populated by the [navigation algorithm](#)<sup>p791</sup>.

Every resource that is obtained by the [navigation algorithm](#)<sup>p791</sup> has a **forced sandboxing flag set**, which is a [sandboxing flag set](#)<sup>p780</sup>. A resource by default has no flags set in its [forced sandboxing flag set](#)<sup>p782</sup>, but other specifications can define that certain flags are set.

**Note** In particular, the [forced sandboxing flag set](#)<sup>p782</sup> is used by the Content Security Policy specification. [CSP]<sup>p1148</sup>

When a user agent is to **implement the sandboxing** for a [Document](#)<sup>p102</sup>, it must populate [Document](#)<sup>p102</sup>'s [active sandboxing flag set](#)<sup>p782</sup> with the union of the flags that are present in the following [sandboxing flag sets](#)<sup>p780</sup> at the time the [Document](#)<sup>p102</sup> object is created:

- If the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup> is a [top-level browsing context](#)<sup>p763</sup>, then: the flags set on the [browsing context](#)<sup>p762</sup>'s [popup sandboxing flag set](#)<sup>p781</sup>.
- If the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup> is a [nested browsing context](#)<sup>p763</sup>, then: the flags set on the [browsing context](#)<sup>p762</sup>'s [iframe sandboxing flag set](#)<sup>p781</sup>.
- If the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup> is a [nested browsing context](#)<sup>p763</sup>, then: the flags set on the [browsing context](#)<sup>p762</sup>'s [parent browsing context](#)<sup>p763</sup>'s [active document](#)<sup>p762</sup>'s [active sandboxing flag set](#)<sup>p782</sup>.
- The flags set on the [Document](#)<sup>p102</sup>'s resource's [forced sandboxing flag set](#)<sup>p782</sup>, if it has one.

## 7.5 Session history and navigation

### 7.5.1 The session history of browsing contexts

The sequence of [Document](#)<sup>p102</sup>s in a [browsing context](#)<sup>p762</sup> is its **session history**. Each [browsing context](#)<sup>p762</sup>, including [nested browsing contexts](#)<sup>p763</sup>, has a distinct session history. A [browsing context](#)<sup>p762</sup>'s session history consists of a flat list of [session history entries](#)<sup>p782</sup>. Each **session history entry** consists, at a minimum, of a [URL](#)<sup>p48</sup>, and each entry may in addition have a [state object](#)<sup>p782</sup>, a title, a [Document](#)<sup>p102</sup> object, form data, a scroll position, and other information associated with it.

**Note** Each entry, when first created, has a [Document](#)<sup>p102</sup>. However, when a [Document](#)<sup>p102</sup> is not [active](#)<sup>p763</sup>, it's possible for it to be [discarded](#)<sup>p773</sup> to free resources. The [URL](#)<sup>p48</sup> and other data in a [session history entry](#)<sup>p782</sup> is then used to bring a new [Document](#)<sup>p102</sup> into being to take the place of the original, should the user agent find itself having to reactivate that [Document](#)<sup>p102</sup>.

**Note** Titles associated with [session history entries](#)<sup>p782</sup> need not have any relation with the current [title](#)<sup>p1139</sup> of the [Document](#)<sup>p102</sup>. The title of a [session history entry](#)<sup>p782</sup> is intended to explain the state of the document at that point, so that the user can navigate the document's history.

URLs without associated [state objects](#)<sup>p782</sup> are added to the session history as the user (or script) navigates from page to page.

Each [Document](#)<sup>p102</sup> object in a [browsing context](#)<sup>p762</sup>'s [session history](#)<sup>p782</sup> is associated with a unique [History](#)<sup>p783</sup> object which must all model the same underlying [session history](#)<sup>p782</sup>.

The **history** attribute of the [Window](#)<sup>p768</sup> interface must return the object implementing the [History](#)<sup>p783</sup> interface for that [Window](#) object's newest [Document](#)<sup>p762</sup>.

A **state object** is an object representing a user interface state.

Pages can [add](#)<sup>p785</sup> [state objects](#)<sup>p782</sup> to the session history. These are then [returned to the script](#)<sup>p1144</sup> when the user (or script) goes back in the history, thus enabling authors to use the "navigation" metaphor even in one-page applications.

**Note** [State objects](#)<sup>p782</sup> are intended to be used for two main purposes: first, storing a prepared description of the state in the [URL](#)<sup>p48</sup> so that in the simple case an author doesn't have to do the parsing (though one would still need the parsing for handling [URLs](#)<sup>p48</sup> passed around by users, so it's only a minor optimization), and second, so that the author can store state that one wouldn't store in the URL because it only applies to the current [Document](#)<sup>p102</sup> instance and it would have to be reconstructed if a new [Document](#)<sup>p102</sup> were opened.

An example of the latter would be something like keeping track of the precise coordinate from which a pop-up [div<sup>p207</sup>](#) was made to animate, so that if the user goes back, it can be made to animate to the same location. Or alternatively, it could be used to keep a pointer into a cache of data that would be fetched from the server based on the information in the [URL<sup>p48</sup>](#), so that when going back and forward, the information doesn't have to be fetched again.

At any point, one of the entries in the session history is the **current entry**. This is the entry representing the [active document<sup>p762</sup>](#) of the [browsing context<sup>p762</sup>](#). Which entry is the [current entry<sup>p783</sup>](#) is changed by the algorithms defined in this specification, e.g. during [session history traversal<sup>p801</sup>](#).

**Note** The [current entry<sup>p783</sup>](#) is usually an entry for the [address](#) of the [Document<sup>p102</sup>](#). However, it can also be one of the entries for [state objects<sup>p782</sup>](#) added to the history by that document.

**An entry with persisted user state** is one that also has user-agent defined state. This specification does not specify what kind of state can be stored.

**Example** For example, some user agents might want to persist the scroll position, or the values of form controls.

**Note** User agents that persist the value of form controls are encouraged to also persist their directionality (the value of the element's [dir<sup>p125</sup>](#) attribute). This prevents values from being displayed incorrectly after a history traversal when the user had originally entered the values with an explicit, non-default directionality.

Entries that consist of [state objects<sup>p782</sup>](#) share the same [Document<sup>p102</sup>](#) as the entry for the page that was active when they were added.

Contiguous entries that differ just by fragment identifier also share the same [Document<sup>p102</sup>](#).

**Note** All entries that share the same [Document<sup>p102</sup>](#) (and that are therefore merely different states of one particular document) are contiguous by definition.

Each [Document<sup>p102</sup>](#) in a [browsing context<sup>p762</sup>](#) can also have a **latest entry**. This is the entry for that [Document<sup>p102</sup>](#) to which the [browsing context<sup>p762</sup>](#)'s [session history<sup>p782</sup>](#) was most recently traversed. When a [Document<sup>p102</sup>](#) is created, it initially has no [latest entry<sup>p783</sup>](#).

User agents may [discard<sup>p773</sup>](#) the [Document<sup>p102</sup>](#) objects of entries other than the [current entry<sup>p783</sup>](#) that are not referenced from any script, reloading the pages afresh when the user or script navigates back to such pages. This specification does not specify when user agents should discard [Document<sup>p102</sup>](#) objects and when they should cache them.

Entries that have had their [Document<sup>p102</sup>](#) objects discarded must, for the purposes of the algorithms given below, act as if they had not. When the user or script navigates back or forwards to a page which has no in-memory DOM objects, any other entries that shared the same [Document<sup>p102</sup>](#) object with it must share the new object as well.

## 7.5.2 The [History<sup>p783</sup>](#) interface

Spec bugs: [26584](#)

**IDL**

```
interface History {
 readonly attribute long length;
 readonly attribute any state;
 void go(optional long delta);
 void back();
 void forward();
 void pushState(any data, DOMString title, optional DOMString? url = null);
 void replaceState(any data, DOMString title, optional DOMString? url = null);
};
```

**Note**

`window.historyp782.lengthp784`

Returns the number of entries in the [joint session history<sup>p784</sup>](#).

```
window.historyp782.statep784
 Returns the current state objectp782.
```

`window.historyp782.gop784( [ delta ] )`

Goes back or forward the specified number of steps in the [joint session history](#)<sup>p784</sup>.

A zero delta will reload the current page.

If the delta is out of range, does nothing.

`window.historyp782.backp784()`

Goes back one step in the [joint session history](#)<sup>p784</sup>.

If there is no previous page, does nothing.

`window.historyp782.forwardp784()`

Goes forward one step in the [joint session history](#)<sup>p784</sup>.

If there is no next page, does nothing.

`window.historyp782.pushStatep785(data, title [, url] )`

Pushes the given data onto the session history, with the given title, and, if provided and not null, the given URL.

`window.historyp782.replaceStatep785(data, title [, url] )`

Updates the current entry in the session history to have the given data, title, and, if provided and not null, URL.

The **joint session history** of a [top-level browsing context](#)<sup>p763</sup> is the union of all the [session histories](#)<sup>p782</sup> of all the [browsing contexts](#)<sup>p762</sup> of all the [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> objects that share that [top-level browsing context](#)<sup>p763</sup>, with all the entries that are [current entries](#)<sup>p783</sup> in their respective [session histories](#)<sup>p782</sup> removed except for the [current entry of the joint session history](#)<sup>p784</sup>.

The **current entry of the joint session history** is the entry that most recently became a [current entry](#)<sup>p783</sup> in its [session history](#)<sup>p782</sup>.

Entries in the [joint session history](#)<sup>p784</sup> are ordered chronologically by the time they were added to their respective [session histories](#)<sup>p782</sup>. Each entry has an index; the earliest entry has index 0, and the subsequent entries are numbered with consecutively increasing integers (1, 2, 3, etc).

**Note** Since each [Document](#)<sup>p102</sup> in a [browsing context](#)<sup>p762</sup> might have a different [event loop](#)<sup>p834</sup>, the actual state of the [joint session history](#)<sup>p784</sup> can be somewhat nebulous. For example, two sibling [iframe](#)<sup>p299</sup> elements could both [traverse](#)<sup>p801</sup> from one unique origin to another at the same time, so their precise order might not be well-defined; similarly, since they might only find out about each other later, they might disagree about the length of the [joint session history](#)<sup>p784</sup>.

All the getters and setters for attributes, and all the methods, defined on the [History](#)<sup>p783</sup> interface, when invoked on a [History](#)<sup>p783</sup> object associated with a [Document](#)<sup>p102</sup> that is not [fully active](#)<sup>p763</sup>, must throw a [SecurityError](#)<sup>p50</sup> exception instead of operating as described below.

The **length** attribute of the [History](#)<sup>p783</sup> interface must return the number of entries in the [top-level browsing context](#)<sup>p763</sup>'s [joint session history](#)<sup>p784</sup>.

The actual entries are not accessible from script.

The **state** attribute of the [History](#)<sup>p783</sup> interface must return the last value it was set to by the user agent. Initially, its value must be null.

When the **go(delta)** method is invoked, if the argument to the method was omitted or has the value zero, the user agent must act as if the [location.reload\(\)](#)<sup>p789</sup> method was called instead. Otherwise, the user agent must [traverse the history by a delta](#)<sup>p785</sup> whose value is the value of the method's argument.

When the **back()** method is invoked, the user agent must [traverse the history by a delta](#)<sup>p785</sup> -1.

When the **forward()** method is invoked, the user agent must [traverse the history by a delta](#)<sup>p785</sup> +1.

Each [top-level browsing context](#)<sup>p763</sup> has a **session history traversal queue**, initially empty, to which [tasks](#)<sup>p834</sup> can be added.

Each [top-level browsing context](#)<sup>p763</sup>, when created, must begin running the following algorithm, known as the **session history event loop** for that [top-level browsing context](#)<sup>p763</sup>, in parallel<sup>p41</sup>:

1. Wait until this [top-level browsing context](#)<sup>p763</sup>'s [session history traversal queue](#)<sup>p784</sup> is not empty.
2. Pull the first [task](#)<sup>p834</sup> from this [top-level browsing context](#)<sup>p763</sup>'s [session history traversal queue](#)<sup>p784</sup>, and execute it.
3. Return to the first step of this algorithm.

The [session history event loop](#)<sup>p785</sup> helps coordinate cross-browsing-context transitions of the [joint session history](#)<sup>p784</sup>: since each [browsing context](#)<sup>p762</sup> might, at any particular time, have a different [event loop](#)<sup>p834</sup> (this can happen if the user agent has more than one [event loop](#)<sup>p834</sup> per [unit of related browsing contexts](#)<sup>p765</sup>), transitions would otherwise have to involve cross-event-loop synchronisation.

To [traverse the history by a delta](#) *delta*, the user agent must append a [task](#)<sup>p834</sup> to this [top-level browsing context](#)<sup>p763</sup>'s [session history traversal queue](#)<sup>p784</sup>, the [task](#)<sup>p834</sup> consisting of running the following steps:

1. Let *delta* be the argument to the method.
2. If the index of the [current entry of the joint session history](#)<sup>p784</sup> plus *delta* is less than zero or greater than or equal to the number of items in the [joint session history](#)<sup>p784</sup>, then abort these steps.
3. Let *specified entry* be the entry in the [joint session history](#)<sup>p784</sup> whose index is the sum of *delta* and the index of the [current entry of the joint session history](#)<sup>p784</sup>.
4. Let *specified browsing context* be the [browsing context](#)<sup>p762</sup> of the *specified entry*.
5. If the *specified browsing context*'s [active document](#)<sup>p762</sup>'s [unload a document](#)<sup>p805</sup> algorithm is currently running, abort these steps.
6. [Queue a task](#)<sup>p835</sup> that consists of running the following substeps. The relevant [event loop](#)<sup>p834</sup> is that of the *specified browsing context*'s [active document](#)<sup>p762</sup>. The [task source](#)<sup>p835</sup> for the queued task is the [history traversal task source](#)<sup>p839</sup>.
  1. If there is an ongoing attempt to navigate *specified browsing context* that has not yet [matured](#)<sup>p796</sup> (i.e. it has not passed the point of making its [Document](#)<sup>p102</sup> the [active document](#)<sup>p762</sup>), then cancel that attempt to navigate the [browsing context](#)<sup>p762</sup>.
  2. If the *specified browsing context*'s [active document](#)<sup>p762</sup> is not the same [Document](#)<sup>p102</sup> as the [Document](#)<sup>p102</sup> of the *specified entry*, then run these substeps:
    1. [Fully exit fullscreen](#)<sup>p52</sup>.
    2. [Prompt to unload](#)<sup>p804</sup> the [active document](#)<sup>p762</sup> of the *specified browsing context*. If the user [refused to allow the document to be unloaded](#)<sup>p804</sup>, then abort these steps.
    3. [Unload](#)<sup>p805</sup> the [active document](#)<sup>p762</sup> of the *specified browsing context* with the *recycle* parameter set to false.
  3. [Traverse the history](#)<sup>p801</sup> of the *specified browsing context* to the *specified entry*.

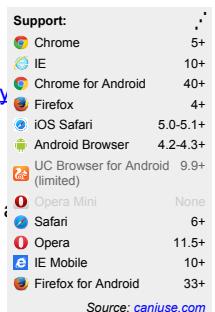

When the user navigates through a [browsing context](#)<sup>p762</sup>, e.g. using a browser's back and forward buttons, the user agent must [traverse the history by a delta](#)<sup>p785</sup> equivalent to the action specified by the user.

The [pushState](#)(*data*, *title*, *url*) method adds a state object entry to the history.

The [replaceState](#)(*data*, *title*, *url*) method updates the state object, title, and optionally the [URL](#)<sup>p48</sup> of the [current entry](#).

When either of these methods is invoked, the user agent must run the following steps:

1. Let *cloned data* be a [structured clone](#)<sup>p98</sup> of the specified *data*. If this throws an exception, then rethrow that exception and abort these steps.
2. If the third argument is not null, run these substeps:
  1. [Resolve](#)<sup>p82</sup> the value of the third argument, relative to the [API base URL](#)<sup>p829</sup> specified by the [entry settings object](#)<sup>p831</sup>.
  2. If that fails, throw a [SecurityError](#)<sup>p50</sup> exception and abort these steps.

3. Compare the resulting [parsed URL](#)<sup>p48</sup> to the result of applying the [URL parser](#)<sup>p48</sup> algorithm to [the document's address](#). If any component of these two [URLs](#)<sup>p48</sup> differ other than the [path](#)<sup>p48</sup>, [query](#)<sup>p48</sup>, and [fragment](#)<sup>p48</sup> components, then throw a [SecurityError](#)<sup>p50</sup> exception and abort these steps.
4. If the [origin](#)<sup>p776</sup> of the resulting [absolute URL](#)<sup>p48</sup> is not the same as the [origin](#)<sup>p776</sup> of the [responsible document](#)<sup>p829</sup> specified by the [entry settings object](#)<sup>p831</sup>, and either the [path](#)<sup>p48</sup> or [query](#)<sup>p48</sup> components of the two [parsed URLs](#)<sup>p48</sup> compared in the previous step differ, throw a [SecurityError](#)<sup>p50</sup> exception and abort these steps. (This prevents sandboxed content from spoofing other pages on the same origin.)
5. Let *new URL* be the resulting [absolute URL](#)<sup>p48</sup>.

For the purposes of the comparisons in the above substeps, the [path](#)<sup>p48</sup> and [query](#)<sup>p48</sup> components can only be the same if the [scheme](#)<sup>p48</sup> component of both [parsed URLs](#)<sup>p48</sup> are [relative schemes](#)<sup>p48</sup>.

3. If the third argument is null, then let *new URL* be the [URL](#)<sup>p48</sup> of the [current entry](#)<sup>p783</sup>.
4. If the method invoked was the [pushState\(\)](#)<sup>p785</sup> method:

1. Remove all the entries in the [browsing context](#)<sup>p762</sup>'s [session history](#)<sup>p782</sup> after the [current entry](#)<sup>p783</sup>. If the [current entry](#)<sup>p783</sup> is the last entry in the session history, then no entries are removed.
- Note** *This doesn't necessarily have to affect*<sup>p790</sup> *the user agent's user interface.*
2. Remove any [tasks](#)<sup>p834</sup> queued by the [history traversal task source](#)<sup>p839</sup> that are associated with any [Document](#)<sup>p102</sup> objects in the [top-level browsing context](#)<sup>p763</sup>'s [document family](#)<sup>p763</sup>.
3. If appropriate, update the [current entry](#)<sup>p783</sup> to reflect any state that the user agent wishes to persist. The entry is then said to be [an entry with persisted user state](#)<sup>p783</sup>.
4. Add a [state object](#)<sup>p782</sup> entry to the session history, after the [current entry](#)<sup>p783</sup>, with [cloned data](#) as the [state object](#)<sup>p782</sup>, the given [title](#) as the title, and *new URL* as the [URL](#)<sup>p48</sup> of the entry.
5. Update the [current entry](#)<sup>p783</sup> to be this newly added entry.

Otherwise, if the method invoked was the [replaceState\(\)](#)<sup>p785</sup> method:

1. Update the [current entry](#)<sup>p783</sup> in the session history so that [cloned data](#) is the entry's new state object, the given [title](#) is the new title, and *new URL* is the entry's new [URL](#)<sup>p48</sup>.
5. If the [current entry](#)<sup>p783</sup> in the session history represents a non-GET request (e.g. it was the result of a POST submission) then update it to instead represent a GET request ([or equivalent](#)<sup>p83</sup>).
6. Set [the document's address](#) to *new URL*.

**Note** *Since this is neither a navigation*<sup>p791</sup> *of the browsing context*<sup>p762</sup> *nor a history traversal*<sup>p801</sup>, *it does not cause a hashchange*<sup>p1144</sup> *event to be fired.*

7. Set [history.state](#)<sup>p784</sup> to a [structured clone](#)<sup>p98</sup> of [cloned data](#).
8. Let the [latest entry](#)<sup>p783</sup> of the [Document](#)<sup>p102</sup> of the [current entry](#)<sup>p783</sup> be the [current entry](#)<sup>p783</sup>.

**Note** *The title is purely advisory. User agents might use the title in the user interface.*

User agents may limit the number of state objects added to the session history per page. If a page hits the UA-defined limit, user agents must remove the entry immediately after the first entry for that [Document](#)<sup>p102</sup> object in the session history after having added the new entry. (Thus the state history acts as a FIFO buffer for eviction, but as a LIFO buffer for navigation.)

#### Example

Consider a game where the user can navigate along a line, such that the user is always at some coordinate, and such that the user can bookmark the page corresponding to a particular coordinate, to return to it later.

A static page implementing the x=5 position in such a game could look like the following:

```
<!DOCTYPE HTML>
<!-- this is http://example.com/line?x=5 -->
<title>Line Game - 5</title>
```

```

<p>You are at coordinate 5 on the line.</p>
<p>
Advance to 6 or
retreat to 4?
</p>

```

The problem with such a system is that each time the user clicks, the whole page has to be reloaded. Here instead is another way of doing it, using script:

```

<!DOCTYPE HTML>
<!-- this starts off as http://example.com/line?x=5 -->
<title>Line Game - 5</title>
<p>You are at coordinate 5 on the line.</p>
<p>
Advance to 6 or
retreat to 4?
</p>
<script>
var currentPage = 5; // prefilled by server
function go(d) {
 setupPage(currentPage + d);
 history.pushState(currentPage, document.title, '?x=' + currentPage);
}
onpopstate = function(event) {
 setupPage(event.state);
}
function setupPage(page) {
 currentPage = page;
 document.title = 'Line Game - ' + currentPage;
 document.getElementById('coord').textContent = currentPage;
 document.links[0].href = '?x=' + (currentPage+1);
 document.links[0].textContent = 'Advance to ' + (currentPage+1);
 document.links[1].href = '?x=' + (currentPage-1);
 document.links[1].textContent = 'retreat to ' + (currentPage-1);
}
</script>

```

In systems without script, this still works like the previous example. However, users that *do* have script support can now navigate much faster, since there is no network access for the same experience. Furthermore, contrary to the experience the user would have with just a naïve script-based approach, bookmarking and navigating the session history still work.

In the example above, the *data* argument to the [pushState\(\)](#)<sup>p785</sup> method is the same information as would be sent to the server, but in a more convenient form, so that the script doesn't have to parse the URL each time the user navigates.

### Example

Applications might not use the same title for a [session history entry](#)<sup>p782</sup> as the value of the document's [title](#)<sup>p139</sup> element at that time. For example, here is a simple page that shows a block in the [title](#)<sup>p139</sup> element. Clearly, when navigating backwards to a previous state the user does not go back in time, and therefore it would be inappropriate to put the time in the session history title.

```

<!DOCTYPE HTML>
<TITLE>Line</TITLE>
<SCRIPT>
setInterval(function () { document.title = 'Line - ' + new Date(); }, 1000);
var i = 1;
function inc() {
 set(i+1);
 history.pushState(i, 'Line - ' + i);
}
function set(newI) {
 i = newI;
 document.forms.F.I.value = newI;
}

```

```

</SCRIPT>
<BODY ONPOPSTATE="set(event.state)">
<FORM NAME=F>
State: <OUTPUT NAME=I>1</OUTPUT> <INPUT VALUE="Increment" TYPE=BUTTON ONCLICK="inc()">
</FORM>

```

### 7.5.3 The [Location](#)<sup>p788</sup> interface

Spec bugs: [18152](#)

Each [Document](#)<sup>p102</sup> object in a [browsing context](#)<sup>p762</sup>'s session history is associated with a unique instance of a [Location](#)<sup>p788</sup> object.

#### Note

```

document.locationp788 [= value]
window.locationp788 [= value]

Returns a Locationp788 object with the current page's location.

Can be set, to navigate to another page.

```

The [location](#) attribute of the [Document](#)<sup>p102</sup> interface must return the [Location](#)<sup>p788</sup> object for that [Document](#)<sup>p102</sup> object, if it is in a [browsing context](#)<sup>p762</sup>, and null otherwise.

The [location](#) attribute of the [Window](#)<sup>p768</sup> interface must return the [Location](#)<sup>p788</sup> object for that [Window](#)<sup>p768</sup> object's [Document](#)<sup>p102</sup>.

[Location](#)<sup>p788</sup> objects provide a representation of [the address](#) of the [active document](#)<sup>p762</sup> of their [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup>, and allow the [current entry](#)<sup>p783</sup> of the [browsing context](#)<sup>p762</sup>'s session history to be changed, by adding or replacing entries in the [history](#)<sup>p782</sup> object.

#### IDL

```

[Unforgeable] interface Location {
 void assign(DOMString url);
 void replace(DOMString url);
 void reload();

 [SameObject] readonly attribute DOMString[] ancestorOrigins;
};

Location implements URLUtils;

```

#### Note

[location.assign\(url\)](#)

Navigates to the given page.

[location.replace\(url\)](#)

Removes the current page from the session history and navigates to the given page.

[location.reload\(\)](#)

Reloads the current page.

[location.ancestorOrigins](#)

Returns an array values are the origins of the ancestor [browsing contexts](#)<sup>p762</sup>, from the [parent browsing context](#)<sup>p763</sup> to the [top-level browsing context](#)<sup>p763</sup>.

The [relevant Document](#)<sup>p102</sup> is the [Location](#)<sup>p788</sup> object's associated [Document](#)<sup>p102</sup> object's [browsing context](#)<sup>p762</sup>'s [active document](#)<sup>p762</sup>.

When the [assign\(url\)](#) method is invoked, the UA must [resolve](#)<sup>p82</sup> the argument, relative to the [API base URL](#)<sup>p829</sup> specified by the [entry settings object](#)<sup>p831</sup>, and if that is successful, must [navigate](#)<sup>p791</sup> the [browsing context](#)<sup>p762</sup> to the specified [url](#), with [exceptions enabled](#)<sup>p791</sup>. If the [browsing](#)

context<sup>p762</sup>'s session history<sup>p782</sup> contains only one Document<sup>p102</sup>, and that was the about:blank<sup>p84</sup> Document<sup>p102</sup> created when the browsing context<sup>p762</sup> was created, then the navigation must be done with replacement enabled<sup>p802</sup>.

When the replace (url) method is invoked, the UA must resolve<sup>p82</sup> the argument, relative to the API base URL<sup>p829</sup> specified by the entry settings object<sup>p831</sup>, and if that is successful, navigate<sup>p791</sup> the browsing context<sup>p762</sup> to the specified url with replacement enabled<sup>p802</sup> and exceptions enabled<sup>p791</sup>.

Navigation for the assign ()<sup>p788</sup> and replace ()<sup>p789</sup> methods must be done with the responsible browsing context<sup>p829</sup> specified by the incumbent settings object<sup>p831</sup> as the source browsing context<sup>p791</sup>.

If the resolving<sup>p82</sup> step of the assign ()<sup>p788</sup> and replace ()<sup>p789</sup> methods is not successful, then the user agent must instead throw a SyntaxError<sup>p50</sup> exception.

When the reload() method is invoked, the user agent must run the appropriate steps from the following list:

- ↪ If the currently executing task<sup>p834</sup> is the dispatch of a resize<sup>p53</sup> event in response to the user resizing the browsing context<sup>p762</sup>  
Repaint the browsing context<sup>p762</sup> and abort these steps.
- ↪ If the browsing context<sup>p762</sup>'s active document<sup>p762</sup> is an iframe srcdoc document<sup>p300</sup>  
Reprocess the iframe attributes<sup>p301</sup> of the browsing context<sup>p762</sup>'s browsing context container<sup>p763</sup>.
- ↪ If the browsing context<sup>p762</sup>'s active document<sup>p762</sup> has its reload override flag<sup>p102</sup> set  
Perform an overridden reload<sup>p102</sup>, with the browsing context<sup>p762</sup> being navigated as the responsible browsing context<sup>p829</sup>.
- ↪ Otherwise
  - Navigate<sup>p791</sup> the browsing context<sup>p762</sup> to the document's address with replacement enabled<sup>p802</sup> and exceptions enabled<sup>p791</sup>. The source browsing context<sup>p791</sup> must be the browsing context<sup>p762</sup> being navigated. This is a reload-triggered navigation<sup>p792</sup>.

When a user requests that the active document<sup>p762</sup> of a browsing context<sup>p762</sup> be reloaded through a user interface element, the user agent should navigate<sup>p791</sup> the browsing context<sup>p762</sup> to the same resource as that Document<sup>p102</sup>, with replacement enabled<sup>p802</sup>. In the case of non-idempotent methods (e.g. HTTP POST), the user agent should prompt the user to confirm the operation first, since otherwise transactions (e.g. purchases or database modifications) could be repeated. User agents may allow the user to explicitly override any caches when reloading. If browsing context<sup>p762</sup>'s active document<sup>p762</sup>'s reload override flag<sup>p102</sup> is set, then the user agent may instead perform an overridden reload<sup>p102</sup> rather than the navigation described in this paragraph (with the browsing context<sup>p762</sup> being reloaded as the source browsing context<sup>p791</sup>).

The Location<sup>p788</sup> interface also supports the URLUtils<sup>p48</sup> interface. [URL]<sup>p1153</sup>

When the object is created, and whenever the the address of the relevant Document<sup>p102</sup> changes, the user agent must invoke the object's URLUtils<sup>p48</sup> interface's set the input<sup>p48</sup> algorithm with the address of the relevant Document<sup>p102</sup> as the given value.

The object's URLUtils<sup>p48</sup> interface's get the base<sup>p48</sup> algorithm must return the API base URL<sup>p829</sup> specified by the entry settings object<sup>p831</sup>, if there is one, or null otherwise.

The object's URLUtils<sup>p48</sup> interface's query encoding<sup>p48</sup> is the document's character encoding<sup>p51</sup>.

When the object's URLUtils<sup>p48</sup> interface invokes its update steps<sup>p48</sup> with the string value, the user agent must run the following steps:

1. If any of the following conditions are met, let mode be *normal navigation*; otherwise, let it be *replace navigation*:
  - The Location<sup>p788</sup> object's relevant Document<sup>p102</sup> has completely loaded<sup>p1033</sup>, or
  - In the task<sup>p834</sup> in which the algorithm is running, an activation behaviour<sup>p725</sup> is currently being processed whose click<sup>p52</sup> event was trusted<sup>p43</sup>, or
  - In the task<sup>p834</sup> in which the algorithm is running, the event listener for a trusted<sup>p43</sup> click<sup>p52</sup> event is being handled.
2. If mode is *normal navigation*, then act as if the assign ()<sup>p788</sup> method had been called with value as its argument. Otherwise, act as if the replace ()<sup>p789</sup> method had been called with value as its argument.

The ancestorOrigins attribute, on getting, must return a read only<sup>p49</sup> array whose values are determined as follows. The same object must be returned each time the attribute's value is obtained for any particular Location<sup>p788</sup> object.

1. Let *output* be an empty ordered list of strings.
2. Let *current* be the [browsing context](#)<sup>p762</sup> of the [Document](#)<sup>p102</sup> with which the [Location](#)<sup>p788</sup> object is associated.
3. *Loop*: If *current* has no [parent browsing context](#)<sup>p763</sup>, jump to the step labeled *end*.
4. Let *current* be *current*'s [parent browsing context](#)<sup>p763</sup>.
5. Append the [Unicode serialisation](#)<sup>p778</sup> of *current*'s [active document](#)<sup>p762</sup>'s [origin](#)<sup>p776</sup> to *output* as a new value.
6. Return to the step labeled *loop*.
7. *End*: Let *output* be the values of the array, in the same order.

#### 7.5.3.1 Security

This section describes a security model that is underdefined, imperfect, and does not match implementations. Work is ongoing to attempt to resolve this, but in the meantime, please do not rely on this section for precision. Implementors are urged to send their feedback on how cross-origin cross-global access to [Window](#)<sup>p768</sup> and [Location](#)<sup>p788</sup> objects should work. See [bug 20701](#).

User agents must throw a [SecurityError](#)<sup>p50</sup> exception whenever any properties of a [Location](#)<sup>p788</sup> object are accessed when the [entry settings object](#)<sup>p831</sup> specifies an [effective script origin](#)<sup>p776</sup> that is not the [same](#)<sup>p778</sup> as the [Location](#)<sup>p788</sup> object's associated [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup>'s [active document](#)<sup>p762</sup>'s [effective script origin](#)<sup>p776</sup>, with the following exceptions:

- The [href](#)<sup>p48</sup> setter, if the [responsible browsing context](#)<sup>p829</sup> specified by the [entry settings object](#)<sup>p831</sup> is [familiar with](#)<sup>p764</sup> the [browsing context](#)<sup>p762</sup> with which the [Location](#)<sup>p788</sup> object is associated
- The [replace\(\)](#)<sup>p789</sup> method, if the [responsible browsing context](#)<sup>p829</sup> specified by the [entry settings object](#)<sup>p831</sup> is [familiar with](#)<sup>p764</sup> the [browsing context](#)<sup>p762</sup> with which the [Location](#)<sup>p788</sup> object is associated
- Any properties not defined in the IDL for the [Location](#)<sup>p788</sup> object or indirectly via one of those properties (e.g. [toString\(\)](#), which is defined via the [stringifier](#) keyword), if the [effective script origin](#)<sup>p776</sup> specified by the [entry settings object](#)<sup>p831</sup> is the [same origin](#)<sup>p778</sup> as the [Location](#)<sup>p788</sup> object's associated [Document](#)<sup>p102</sup>'s [effective script origin](#)<sup>p776</sup>

When the [effective script origin](#)<sup>p776</sup> specified by the [entry settings object](#)<sup>p831</sup> is different than a [Location](#)<sup>p788</sup> object's associated [Document](#)<sup>p102</sup>'s [effective script origin](#)<sup>p776</sup>, the user agent must act as if any changes to that [Location](#)<sup>p788</sup> object's properties, getters, setters, etc, were not present, and as if all the properties of that [Location](#)<sup>p788</sup> object had their `[[Enumerable]]` attribute set to false.

For members that return objects (including function objects), each distinct [effective script origin](#)<sup>p776</sup> that is not the [same origin](#)<sup>p778</sup> as the [Location](#)<sup>p788</sup> object's [Document](#)<sup>p102</sup>'s [effective script origin](#)<sup>p776</sup> must be provided with a separate set of objects. These objects must have the prototype chain appropriate for the script for which the objects are created (not those that would be appropriate for scripts whose [settings object](#)<sup>p829</sup> specifies a [global object](#)<sup>p829</sup> that is the [Location](#)<sup>p788</sup> object's [Document](#)<sup>p102</sup>'s [Window](#)<sup>p768</sup> object).

#### 7.5.4 Implementation notes for session history

*This section is non-normative.*

The [History](#)<sup>p783</sup> interface is not meant to place restrictions on how implementations represent the session history to the user.

For example, session history could be implemented in a tree-like manner, with each page having multiple "forward" pages. This specification doesn't define how the linear list of pages in the [history](#)<sup>p782</sup> object are derived from the actual session history as seen from the user's perspective.

Similarly, a page containing two [iframe](#)<sup>p299</sup>s has a [history](#)<sup>p782</sup> object distinct from the [iframe](#)<sup>p299</sup>s' [history](#)<sup>p782</sup> objects, despite the fact that typical Web browsers present the user with just one "Back" button, with a session history that interleaves the navigation of the two inner frames and the outer page.

**Security:** It is suggested that to avoid letting a page "hijack" the history navigation facilities of a UA by abusing `pushState()`<sup>p785</sup>, the UA provide the user with a way to jump back to the previous page (rather than just going back to the previous state). For example, the back button could have a drop down showing just the pages in the session history, and not showing any of the states. Similarly, an aural browser could have two "back" commands, one that goes back to the previous state, and one that jumps straight back to the previous page.

In addition, a user agent could ignore calls to `pushState()`<sup>p785</sup> that are invoked on a timer, or from event listeners that are not triggered in response to a clear user action, or that are invoked in rapid succession.

## 7.6 Browsing the Web

### 7.6.1 Navigating across documents

Certain actions cause the `browsing context`<sup>p762</sup> to `navigate`<sup>p791</sup> to a new resource. A user agent may provide various ways for the user to explicitly cause a browsing context to navigate, in addition to those defined in this specification.

**Example** For example, `following a hyperlink`<sup>b246</sup>, `form submission`<sup>p558</sup>, and the `window.open()`<sup>p771</sup> and `location.assign()`<sup>p788</sup> methods can all cause a browsing context to navigate.

**Note** A resource has a URL, but that might not be the only information necessary to identify it. For example, a form submission that uses HTTP POST would also have the HTTP method and payload. Similarly, an `iframe srcdoc` document<sup>b300</sup> needs to know the data it is to use.

Navigation always involves **source browsing context**, which is the browsing context which was responsible for starting the navigation.

When a browsing context is **navigated** to a new resource, the user agent must run the following steps:

1. Release the `storage mutex`<sup>p835</sup>.
2. If the `source browsing context`<sup>p791</sup> is not `allowed to navigate`<sup>p765</sup> the `browsing context`<sup>p762</sup> being navigated, then abort these steps.

If these steps are aborted here, the user agent may instead offer to open the new resource in a new `top-level browsing context`<sup>p763</sup> or in the `top-level browsing context`<sup>p763</sup> of the `source browsing context`<sup>p791</sup>, at the user's option, in which case the user agent must `navigate`<sup>p791</sup> that designated `top-level browsing context`<sup>p763</sup> to the new resource as if the user had requested it independently.

**Note** Doing so, however, can be dangerous, as it means that the user is overriding the author's explicit request to sandbox the content.

If the `navigate`<sup>p791</sup> algorithm was invoked with **exceptions enabled**, and it is aborted on this step, then in addition to aborting this algorithm, the user agent must also throw a `SecurityError`<sup>p50</sup> exception.

3. If the `source browsing context`<sup>p791</sup> is the same as the `browsing context`<sup>p762</sup> being navigated, and this browsing context has its `seamless browsing context flag`<sup>p305</sup> set, and the `browsing context`<sup>p762</sup> being navigated was not chosen using an **explicit self-navigation override**, then find the nearest `ancestor browsing context`<sup>p763</sup> that does not have its `seamless browsing context flag`<sup>p305</sup> set, and continue these steps as if that `browsing context`<sup>p762</sup> was the one that was going to be `navigated`<sup>p791</sup> instead.
4. If there is a preexisting attempt to navigate the `browsing context`<sup>p762</sup>, and the `source browsing context`<sup>p791</sup> is the same as the `browsing context`<sup>p762</sup> being navigated, and that attempt is currently running the `unload a document`<sup>p805</sup> algorithm, and the `origin`<sup>p776</sup> of the `URL`<sup>p48</sup> of the resource being loaded in that navigation is not the `same origin`<sup>p778</sup> as the `origin`<sup>p776</sup> of the `URL`<sup>p48</sup> of the resource being loaded in *this* navigation, then abort these steps without affecting the preexisting attempt to navigate the `browsing context`<sup>p762</sup>.
5. If a `task`<sup>p834</sup> queued by the `traverse the history by a delta`<sup>p785</sup> algorithm is running the `unload a document`<sup>p805</sup> algorithm for the `active document`<sup>p762</sup> of the `browsing context`<sup>p762</sup> being navigated, then abort these steps without affecting the `unload a document`<sup>p805</sup> algorithm or the aforementioned history traversal task.
6. If the `prompt to unload a document`<sup>p804</sup> algorithm is being run for the `active document`<sup>p762</sup> of the `browsing context`<sup>p762</sup> being navigated, then abort these steps without affecting the `prompt to unload a document`<sup>p804</sup> algorithm.
7. Let `gone async` be false.

**Note** The `handle redirects`<sup>p794</sup> step later in this algorithm can in certain cases jump back to the step labeled `fragment identifiers`<sup>p792</sup>. Since, between those two steps, this algorithm goes from operating synchronously in the context of the calling `task`<sup>p834</sup> to operating `in parallel`<sup>p41</sup> independent of the `event loop`<sup>p834</sup>, some of the intervening steps need to be able to handle both being

*run as part of a task<sup>p834</sup> and running in parallel<sup>p41</sup>. The gone async flag is thus used to make these steps aware of which mode they are operating in.*

8. *Fragment identifiers:* If this is not a reload-triggered navigation: apply the [URL parser<sup>p48</sup>](#) algorithm to the [absolute URL<sup>p48</sup>](#) of the new resource and the [address](#) of the [active document<sup>p762</sup>](#) of the [browsing context<sup>p762</sup>](#) being navigated; if all the components of the resulting [parsed URLs<sup>p48</sup>](#), ignoring any [fragment<sup>p48</sup>](#) components, are identical, and the new resource is to be fetched using HTTP GET or equivalent<sup>p83</sup>, and the [parsed URL<sup>p48</sup>](#) of the new resource has a [fragment<sup>p48</sup>](#) component that is not null (even if it is empty), then [navigate to that fragment identifier<sup>p800</sup>](#) and abort these steps.
9. If [gone async](#) is false, cancel any preexisting but not yet [mature<sup>p796</sup>](#) attempt to navigate the [browsing context<sup>p762</sup>](#), including canceling any instances of the [fetch<sup>p84</sup>](#) algorithm started by those attempts. If one of those attempts has already created and [initialised a new Document object<sup>p795</sup>](#), [abort<sup>p806</sup>](#) that [Document<sup>p102</sup>](#) also. (Navigation attempts that have [matured<sup>p796</sup>](#) already have session history entries, and are therefore handled during the [update the session history with the new page<sup>p796</sup>](#) algorithm, later.)
10. If the new resource is to be handled using a mechanism that does not affect the browsing context, e.g. ignoring the navigation request altogether because the specified scheme is not one of the supported protocols, then abort these steps and [proceed with that mechanism instead<sup>p796</sup>](#).
11. If [gone async](#) is false, [prompt to unload<sup>p804</sup>](#) the [Document<sup>b102</sup>](#) object. If the user [refused to allow the document to be unloaded<sup>p804</sup>](#), then abort these steps.  
If this instance of the [navigation<sup>p791</sup>](#) algorithm gets canceled while this step is running, the [prompt to unload a document<sup>p804</sup>](#) algorithm must nonetheless be run to completion.
12. If [gone async](#) is false, [abort<sup>p806</sup>](#) the [active document<sup>p762</sup>](#) of the [browsing context<sup>p762</sup>](#).
13. If the new resource is to be handled by displaying some sort of inline content, e.g. an error message because the specified scheme is not one of the supported protocols, or an inline prompt to allow the user to select [a registered handler<sup>p861</sup>](#) for the given scheme, then [display the inline content<sup>p799</sup>](#) and abort these steps.

**Note** *In the case of a registered handler being used, the algorithm will be reinvoked with a new URL to handle the request.*

14. If the [browsing context<sup>p762</sup>](#) being navigated is a [nested browsing context<sup>p763</sup>](#), then put it in the [delaying load events mode<sup>p763</sup>](#).

The user agent must take this [nested browsing context<sup>p763</sup>](#) out of the [delaying load events mode<sup>p763</sup>](#) when this [navigation<sup>p791</sup>](#) algorithm later [matures<sup>p796</sup>](#), or when it terminates (whether due to having run all the steps, or being canceled, or being aborted), whichever happens first.

15. This is the step that attempts to obtain the resource, if necessary. Jump to the first appropriate substep:

**If the resource has already been obtained (e.g. because it is being used to populate an [object<sup>p310</sup>](#) element's new [child browsing context<sup>p763</sup>](#))**

Skip this step. The data is already available.

**If the new resource is a [URL<sup>p48</sup>](#) whose [scheme<sup>p48</sup>](#) is [javascript<sup>p792</sup>](#)**

[Queue a task<sup>p835</sup>](#) to run **these "javascript: URL" steps**, associated with the [active document<sup>p762</sup>](#) of the [browsing context<sup>p762</sup>](#) being navigated:

1. If the [origin<sup>p776</sup>](#) of the [source browsing context<sup>p791</sup>](#) is not the [same origin<sup>p778</sup>](#) as the [origin<sup>p776</sup>](#) of the [active document<sup>p762</sup>](#) of the [browsing context<sup>p762</sup>](#) being navigated, then act as if the result of evaluating the script was the void value, and jump to the step labeled *process results* below.
2. Apply the [URL parser<sup>p48</sup>](#) to the [URL<sup>p48</sup>](#) being navigated.
3. Let [parsed URL](#) be the result of the [URL parser<sup>p48</sup>](#).
4. Let *script source* be the empty string.
5. Append [parsed URL's scheme data<sup>p48</sup>](#) component to *script source*.
6. If [parsed URL's query<sup>p48</sup>](#) component is not null, then first append a U+003F QUESTION MARK character (?) to *script source*, and then append [parsed URL's query<sup>p48</sup>](#) component to *script source*.
7. If [parsed URL's fragment<sup>p48</sup>](#) component is not null, then first append a U+0023 NUMBER SIGN character (#) to *script source*, and then append [parsed URL's fragment<sup>p48</sup>](#) component to *script source*.

8. Replace *script source* with the result of applying the [percent decode](#)<sup>p48</sup> algorithm to *script source*.
9. Replace *script source* with the result of applying the [UTF-8 decode](#)<sup>p47</sup> algorithm to *script source*.
10. Let *address* be the [address](#) of the [active document](#)<sup>b762</sup> of the [browsing context](#)<sup>b762</sup> being navigated.
11. [Create a script](#)<sup>p832</sup>, using *script source* as the script source, *address* as the script source URL, JavaScript as the scripting language, and the [environment settings object](#)<sup>b829</sup> of the [Window](#)<sup>p768</sup> object of the [active document](#)<sup>b762</sup> of the [browsing context](#)<sup>b762</sup> being navigated.

Let *result* be the return value of the [code entry-point](#)<sup>p828</sup> of this [script](#)<sup>p828</sup>. If an exception was thrown, let *result* be void instead. (The result will be void also if [scripting is disabled](#)<sup>p828</sup>.)

12. *Process results*: If the result of executing the script is void (there is no return value), then the result of obtaining the resource for the URL is [equivalent to](#)<sup>p83</sup> an HTTP resource with an HTTP 204 No Content response.

Otherwise, the result of obtaining the resource for the URL is [equivalent](#)<sup>p83</sup> to an HTTP resource with a 200 OK response whose [Content-Type metadata](#)<sup>p86</sup> is [text/html](#)<sup>p116</sup> and whose response body is the return value converted to a string value.

When it comes time to [set the document's address](#)<sup>p795</sup> in the [navigation algorithm](#)<sup>p791</sup>, use *address* as the [override URL](#)<sup>p795</sup>.

The [task source](#)<sup>p835</sup> for this [task](#)<sup>p834</sup> is the [DOM manipulation task source](#)<sup>p838</sup>.

**Example** So for example a [javascript: URL](#)<sup>p792</sup> in an [href](#)<sup>p245</sup> attribute of an [a](#)<sup>p208</sup> element would only be evaluated when the link was [followed](#)<sup>p246</sup>, while such a URL in the [src](#)<sup>b300</sup> attribute of an [iframe](#)<sup>p299</sup> element would be evaluated in the context of the [iframe](#)<sup>p299</sup>'s own [nested browsing context](#)<sup>b763</sup> when the [iframe](#)<sup>p299</sup> is being set up; once evaluated, its return value (if it was not void) would replace that [browsing context](#)<sup>b762</sup>'s [Document](#)<sup>p102</sup>, thus also changing the [Window](#)<sup>p768</sup> object of that [browsing context](#)<sup>b762</sup>.

If the new resource is to be fetched using HTTP GET [or equivalent](#)<sup>p83</sup>, and there are [relevant application caches](#)<sup>p810</sup> that are identified by a URL with the [same origin](#)<sup>p778</sup> as the URL in question, and that have this URL as one of their entries, excluding entries marked as [foreign](#)<sup>p809</sup>, and whose [mode](#)<sup>p809</sup> is [fast](#)<sup>p809</sup>, and the user agent is not in a mode where it will avoid using [application caches](#)<sup>p809</sup>

[Fetch](#)<sup>p84</sup> the resource from the [most appropriate application cache](#)<sup>p810</sup> of those that match.

**Example** For example, imagine an HTML page with an associated application cache displaying an image and a form, where the image is also used by several other application caches. If the user right-clicks on the image and chooses "View Image", then the user agent could decide to show the image from any of those caches, but it is likely that the most useful cache for the user would be the one that was used for the aforementioned HTML page. On the other hand, if the user submits the form, and the form does a POST submission, then the user agent will not use an application cache at all; the submission will be made to the network.

#### Otherwise

[Fetch](#)<sup>p84</sup> the new resource, with the *manual redirect flag* set.

If the steps above invoked the [fetch](#)<sup>p84</sup> algorithm, the following requirements also apply:

If the resource is being fetched using a method other than one [equivalent to](#)<sup>p83</sup> HTTP's GET, or, if the [navigation algorithm](#)<sup>p791</sup> was invoked as a result of the [form submission algorithm](#)<sup>p558</sup>, then the [fetching algorithm](#)<sup>p84</sup> must be invoked from the [origin](#)<sup>p776</sup> of the [active document](#)<sup>b762</sup> of the [source browsing context](#)<sup>b791</sup>, if any.

Otherwise, if the [browsing context](#)<sup>b762</sup> being navigated is a [child browsing context](#)<sup>b763</sup>, then the [fetching algorithm](#)<sup>p84</sup> must be invoked from the [browsing context scope origin](#)<sup>b765</sup> of the [browsing context container](#)<sup>b763</sup> of the [browsing context](#)<sup>b762</sup> being navigated, if it has one.

16. If *gone async* is false, return to whatever algorithm invoked the navigation steps and continue running these steps asynchronously.
17. Let *gone async* be true.
18. Wait for one or more bytes to be available or for the user agent to establish that the resource in question is empty. During this time, the user agent may allow the user to cancel this navigation attempt or start other navigation attempts.

19. **Handle redirects:** If fetching the resource results in a redirect, and either the [URL<sup>p48</sup>](#) of the target of the redirect has the [same origin<sup>p778</sup>](#) as the original resource, or the resource is being obtained using the POST method or a safe method (in HTTP terms), return to [the step labeled fragment identifiers<sup>p792</sup>](#) with the new resource, except that if the [URL<sup>p48</sup>](#) of the target of the redirect does not have a fragment identifier and the [URL<sup>p48</sup>](#) of the resource that led to the redirect does, then the fragment identifier of the resource that led to the redirect must be propagated to the [URL<sup>p48</sup>](#) of the target of the redirect.

**Example** So for instance, if the original URL was "http://example.com/#!sample" and "http://example.com/" is found to redirect to "https://example.com/", the URL of the new resource will be "https://example.com/#!sample".

Otherwise, if fetching the resource results in a redirect but the [URL<sup>p48</sup>](#) of the target of the redirect does not have the [same origin<sup>p778</sup>](#) as the original resource and the resource is being obtained using a method that is neither the POST method nor a safe method (in HTTP terms), then abort these steps. The user agent may indicate to the user that the navigation has been aborted for security reasons.

20. **Fallback in prefer-online mode:** If the resource was not fetched from an [application cache<sup>p809</sup>](#), and was to be fetched using HTTP GET [or equivalent<sup>p83</sup>](#), and there are [relevant application caches<sup>p810</sup>](#) that are identified by a URL with the [same origin<sup>p778</sup>](#) as the URL in question, and that have this URL as one of their entries, excluding entries marked as [foreign<sup>p809</sup>](#), and whose [mode<sup>p809</sup>](#) is [prefer-online<sup>p809</sup>](#), and the user didn't cancel the navigation attempt during the earlier step, and the navigation attempt failed (e.g. the server returned a 4xx or 5xx status code [or equivalent<sup>p83</sup>](#), or there was a DNS error), then:

Let [candidate](#) be the resource identified by the URL in question from the [most appropriate application cache<sup>p810</sup>](#) of those that match.

If [candidate](#) is not marked as [foreign<sup>p809</sup>](#), then the user agent must discard the failed load and instead continue along these steps using [candidate](#) as the resource. The user agent may indicate to the user that the original page load failed, and that the page used was a previously cached resource.

**Note** This does not affect the address of the resource from which Request-URIs are obtained, as used to set [the document's referrer<sup>p102</sup>](#) in the [initialise the Document object<sup>p795</sup>](#) steps below; they still use the value as computed by the original [fetch<sup>p84</sup>](#) algorithm.

21. **Fallback for fallback entries:** If the resource was not fetched from an [application cache<sup>p809</sup>](#), and was to be fetched using HTTP GET [or equivalent<sup>p83</sup>](#), and its URL [matches the fallback namespace<sup>p810</sup>](#) of one or more [relevant application caches<sup>p810</sup>](#), and the [most appropriate application cache<sup>p810</sup>](#) of those that match does not have an entry in its [online whitelist<sup>p809</sup>](#) that has the [same origin<sup>p778</sup>](#) as the resource's URL and that is a [prefix match<sup>p58</sup>](#) for the resource's URL, and the user didn't cancel the navigation attempt during the earlier step, and the navigation attempt failed (e.g. the server returned a 4xx or 5xx status code [or equivalent<sup>p83</sup>](#), or there was a DNS error), then:

Let [candidate](#) be the [fallback resource<sup>p809</sup>](#) specified for the [fallback namespace<sup>p809</sup>](#) in question. If multiple application caches match, the user agent must use the fallback of the [most appropriate application cache<sup>p810</sup>](#) of those that match.

If [candidate](#) is not marked as [foreign<sup>p809</sup>](#), then the user agent must discard the failed load and instead continue along these steps using [candidate](#) as the resource. [The document's address](#), if appropriate, will still be the originally requested URL, not the fallback URL, but the user agent may indicate to the user that the original page load failed, that the page used was a fallback resource, and what the URL of the fallback resource actually is.

**Note** This does not affect the address of the resource from which Request-URIs are obtained, as used to set [the document's referrer<sup>p102</sup>](#) in the [initialise the Document object<sup>p795</sup>](#) steps below; they still use the value as computed by the original [fetch<sup>p84</sup>](#) algorithm.

22. **Resource handling:** If the resource's out-of-band metadata (e.g. HTTP headers), not counting any [type information<sup>p86</sup>](#) (such as the Content-Type HTTP header), requires some sort of processing that will not affect the browsing context, then perform that processing and abort these steps.

**Note** Such processing might be triggered by, amongst other things, the following:

- [HTTP status codes](#) (e.g. 204 No Content or 205 Reset Content)
- [Network errors](#) (e.g. the network interface being unavailable)
- [Cryptographic protocol failures](#) (e.g. an incorrect TLS certificate)

Responses with HTTP [Content-Disposition<sup>p49</sup>](#) headers specifying the [attachment](#) disposition type must be handled [as a download<sup>p247</sup>](#).

HTTP 401 responses that do not include a challenge recognised by the user agent must be processed as if they had no challenge, e.g. rendering the entity body as if the response had been 200 OK.

User agents may show the entity body of an HTTP 401 response even when the response does include a recognised challenge, with the option to login being included in a non-modal fashion, to enable the information provided by the server to be used by the user before authenticating. Similarly, user agents should allow the user to authenticate (in a non-modal fashion) against authentication challenges

included in other responses such as HTTP 200 OK responses, effectively allowing resources to present HTTP login forms without requiring their use.

23. Let `type` be [the sniffed type of the resource](#).
24. If the user agent has been configured to process resources of the given `type` using some mechanism other than rendering the content in a [browsing context](#)<sup>p762</sup>, then skip this step. Otherwise, if the `type` is one of the following types, jump to the appropriate entry in the following list, and process the resource as described there:

↪ "text/html"<sup>p1116</sup>

Follow the steps given in the [HTML document](#)<sup>p797</sup> section, and then, once they have completed, abort this [navigate](#)<sup>p791</sup> algorithm.

↪ "application/xml"<sup>p1145</sup>

↪ "text/xml"<sup>p1147</sup>

↪ "image/svg+xml"<sup>p1146</sup>

↪ "application/xhtml+xml"<sup>p1118</sup>

↪ Any other type ending in "+xml" that is not an [explicitly supported XML type](#)<sup>p795</sup>

Follow the steps given in the [XML document](#)<sup>p797</sup> section. If that section determines that the content is *not* to be displayed as a generic XML document, then proceed to the next step in this overall set of steps. Otherwise, once the steps given in the [XML document](#)<sup>p797</sup> section have completed, abort this [navigate](#)<sup>p791</sup> algorithm.

↪ "text/plain"

Follow the steps given in the [plain text file](#)<sup>p798</sup> section, and then, once they have completed, abort this [navigate](#)<sup>p791</sup> algorithm.

↪ "multipart/x-mixed-replace"<sup>p1117</sup>

Follow the steps given in the [multipart/x-mixed-replace](#)<sup>p798</sup> section, and then, once they have completed, abort this [navigate](#)<sup>p791</sup> algorithm.

↪ A supported image, video, or audio type

Follow the steps given in the [media](#)<sup>p799</sup> section, and then, once they have completed, abort this [navigate](#)<sup>p791</sup> algorithm.

↪ A type that will use an external application to render the content in the [browsing context](#)<sup>p762</sup>

Follow the steps given in the [plugin](#)<sup>p799</sup> section, and then, once they have completed, abort this [navigate](#)<sup>p791</sup> algorithm.

An **explicitly supported XML type** is one for which the user agent is configured to use an external application to render the content (either a [plugin](#)<sup>p43</sup> rendering directly in the [browsing context](#)<sup>p762</sup>, or a separate application), or one for which the user agent has dedicated processing rules (e.g. a Web browser with a built-in Atom feed viewer would be said to explicitly support the [application/atom+xml](#)<sup>p1145</sup> MIME type), or one for which the user agent has a dedicated handler (e.g. one registered using [registerContentHandler\(\)](#)<sup>p861</sup>).

**Setting the document's address:** If there is no **override URL**, then any [Document](#)<sup>p102</sup> created by these steps must have its [address](#) set to the [URL](#)<sup>p48</sup> that was originally to be [fetched](#)<sup>p84</sup>, ignoring any other data that was used to obtain the resource (e.g. the entity body in the case of a POST submission is not part of [the document's address](#), nor is the URL of the fallback resource in the case of the original load having failed and that URL having been found to match a [fallback namespace](#)<sup>p809</sup>). However, if there *is* an [override URL](#)<sup>p795</sup>, then any [Document](#)<sup>p102</sup> created by these steps must have its [address](#) set to that [URL](#)<sup>p48</sup> instead.

**Note** An [override URL](#)<sup>p795</sup> is set when [dereferencing a javascript: URL](#)<sup>p792</sup> and when performing an [overridden reload](#)<sup>p102</sup>.

**Initialising a new Document object:** when a [Document](#)<sup>p102</sup> is created as part of the above steps, the user agent will be required to additionally run the following algorithm after creating the new object:

1. Create a new [Window](#)<sup>p768</sup> object, and associate it with the [Document](#)<sup>p102</sup>, with one exception: if the [browsing context](#)<sup>p762</sup>'s only entry in its [session history](#)<sup>p782</sup> is the [about:blank](#)<sup>p84</sup> [Document](#)<sup>p102</sup> that was added when the [browsing context](#)<sup>p762</sup> was created, and navigation is occurring with [replacement enabled](#)<sup>p802</sup>, and that [Document](#)<sup>p102</sup> has the [same origin](#)<sup>p778</sup> as the new [Document](#)<sup>p102</sup>, then use the [Window](#)<sup>p768</sup> object of that [Document](#)<sup>p102</sup> instead, and change the [document](#)<sup>p769</sup> attribute of the [Window](#)<sup>p768</sup> object to point to the new [Document](#)<sup>p102</sup>.
2. Set [the document's referrer](#)<sup>p102</sup> to the *address of the resource from which Request-URIs are obtained* as determined when the [fetch](#)<sup>p84</sup> algorithm obtained the resource, if that algorithm was used and determined such a value; otherwise, set it to the empty string.
3. [Implement the sandboxing](#)<sup>p782</sup> for the [Document](#)<sup>p102</sup>.

4. If the [active sandboxing flag set](#)<sup>p782</sup> of the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup> or any of its [ancestor browsing contexts](#)<sup>p763</sup> (if any) have the [sandboxed fullscreen browsing context flag](#)<sup>p781</sup> set, then skip this step.

If the [Document](#)<sup>p102</sup>'s [browsing context](#)<sup>p762</sup> has a [browsing context container](#)<sup>p763</sup> and either it is not an [iframe](#)<sup>p299</sup> element, or it does not have the [allowfullscreen](#)<sup>p306</sup> attribute specified, or its [Document](#)<sup>p102</sup> does not have the [fullscreen enabled flag](#)<sup>p52</sup> set, then also skip this step.

Otherwise, set the [Document](#)<sup>p102</sup>'s [fullscreen enabled flag](#)<sup>p52</sup>.

25. *Non-document content*: If, given [type](#), the new resource is to be handled by displaying some sort of inline content, e.g. a native rendering of the content, an error message because the specified type is not supported, or an inline prompt to allow the user to select [a registered handler](#)<sup>p861</sup> for the given type, then [display the inline content](#)<sup>p799</sup>, and then abort these steps.

**Note** *In the case of a registered handler being used, the algorithm will be reinvoked with a new URL to handle the request.*

26. Otherwise, the document's [type](#) is such that the resource will not affect the browsing context, e.g. because the resource is to be handed to an external application or because it is an unknown type that will be processed [as a download](#)<sup>p247</sup>. [Process the resource appropriately](#)<sup>p796</sup>.

When a resource is handled by [passing its URL or data to an external software package](#) separate from the user agent (e.g. handing a [mailto:](#) URL to a mail client, or a Word document to a word processor), user agents should attempt to mitigate the risk that this is an attempt to exploit the target software, e.g. by prompting the user to confirm that the [source browsing context](#)<sup>p791</sup>'s [active document](#)<sup>p762</sup>'s [origin](#)<sup>p776</sup> is to be allowed to invoke the specified software. In particular, if the [navigate](#)<sup>p791</sup> algorithm, when it was invoked, was not [allowed to show a popup](#)<sup>p766</sup>, the user agent should not invoke the external software package without prior user confirmation.

**Example** For example, there could be a vulnerability in the target software's URL handler which a hostile page would attempt to exploit by tricking a user into clicking a link.

Some of the sections below, to which the above algorithm defers in certain cases, require the user agent to [update the session history with the new page](#). When a user agent is required to do this, it must [queue a task](#)<sup>p835</sup> (associated with the [Document](#)<sup>p102</sup> object of the [current entry](#)<sup>p783</sup>, not the new one) to run the following steps:

1. [Unload](#)<sup>p805</sup> the [Document](#)<sup>p102</sup> object of the [current entry](#)<sup>p783</sup>, with the [recycle](#) parameter set to false.

If this instance of the [navigation](#)<sup>p791</sup> algorithm is canceled while this step is running the [unload a document](#)<sup>p805</sup> algorithm, then the [unload a document](#)<sup>p805</sup> algorithm must be allowed to run to completion, but this instance of the [navigation](#)<sup>p791</sup> algorithm must not run beyond this step. (In particular, for instance, the cancelation of this algorithm does not abort any event dispatch or script execution occurring as part of unloading the document or its descendants.)

2. **If the navigation was initiated for entry update of an entry**

1. Replace the [Document](#)<sup>p102</sup> of the entry being updated, and any other entries that referenced the same document as that entry, with the new [Document](#)<sup>p102</sup>.

2. [Traverse the history](#)<sup>p801</sup> to the new entry.

**Note** *This can only happen if the entry being updated is not the current entry*<sup>p783</sup>, and can never happen with replacement enabled<sup>p802</sup>. (It happens when the user tried to traverse to a session history entry that no longer had a [Document](#)<sup>p102</sup> object.)

Otherwise

1. Remove all the entries in the [browsing context](#)<sup>p762</sup>'s [session history](#)<sup>p782</sup> after the [current entry](#)<sup>p783</sup>. If the [current entry](#)<sup>p783</sup> is the last entry in the session history, then no entries are removed.

**Note** *This doesn't necessarily have to affect*<sup>p790</sup> the user agent's user interface.

2. Append a new entry at the end of the [History](#)<sup>p783</sup> object representing the new resource and its [Document](#)<sup>p102</sup> object and related state.

3. [Traverse the history](#)<sup>p801</sup> to the new entry. If the navigation was initiated with [replacement enabled](#)<sup>p802</sup>, then the traversal must itself be initiated with [replacement enabled](#)<sup>p802</sup>.

3. The [navigation algorithm](#)<sup>p791</sup> has now **matured**.

4. *Fragment identifier loop*: Spin the event loop<sup>p838</sup> for a user-agent-defined amount of time, as desired by the user agent implementor. (This is intended to allow the user agent to optimise the user experience in the face of performance concerns.)
5. If the [Document](#)<sup>p102</sup> object has no parser, or its parser has [stopped parsing](#)<sup>p1033</sup>, or the user agent has reason to believe the user is no longer interested in scrolling to the fragment identifier, then abort these steps.
6. [Scroll to the fragment identifier](#)<sup>p800</sup> given in [the document's address](#). If this fails to find [an indicated part of the document](#)<sup>p800</sup>, then return to the *fragment identifier loop* step.

The [task source](#)<sup>p835</sup> for this [task](#)<sup>p834</sup> is the [networking task source](#)<sup>p839</sup>.

## 7.6.2 Page load processing model for HTML files

When an HTML document is to be loaded in a [browsing context](#)<sup>p762</sup>, the user agent must [queue a task](#)<sup>p835</sup> to create a [Document](#)<sup>p102</sup> object, mark it as being an [HTML document](#)<sup>p51</sup>, set its [content type](#)<sup>p51</sup> to "text/html", [initialise the Document object](#)<sup>p795</sup>, and finally create an [HTML parser](#)<sup>p952</sup> and associate it with the [Document](#)<sup>p102</sup>. Each [task](#)<sup>p834</sup> that the [networking task source](#)<sup>p839</sup> places on the [task queue](#)<sup>p834</sup> while the [fetching algorithm](#)<sup>p84</sup> runs must then fill the parser's [input byte stream](#)<sup>p954</sup> with the fetched bytes and cause the [HTML parser](#)<sup>p952</sup> to perform the appropriate processing of the input stream.

**Note** *The [input byte stream](#)<sup>p954</sup> converts bytes into characters for use in the [tokenizer](#)<sup>p965</sup>. This process relies, in part, on character encoding information found in the real [Content-Type metadata](#)<sup>p86</sup> of the resource; the "sniffed type" is not used for this purpose.*

When no more bytes are available, the user agent must [queue a task](#)<sup>p835</sup> for the parser to process the implied EOF character, which eventually causes a [load](#)<sup>p1144</sup> event to be fired.

After creating the [Document](#)<sup>p102</sup> object, but before any script execution, certainly before the parser [stops](#)<sup>p1033</sup>, the user agent must [update the session history with the new page](#)<sup>p796</sup>.

**Note** *[Application cache selection](#)<sup>p822</sup> happens in the [HTML parser](#)<sup>p1001</sup>.*

The [task source](#)<sup>p835</sup> for the two tasks mentioned in this section must be the [networking task source](#)<sup>p839</sup>.

Spec bugs: [17976](#)

## 7.6.3 Page load processing model for XML files

When faced with displaying an XML file inline, user agents must follow the requirements defined in the XML and Namespaces in XML recommendations, RFC 7303, DOM, and other relevant specifications to create a [Document](#)<sup>p102</sup> object and a corresponding [XML parser](#)<sup>p1054</sup>.  
[\[XML\]](#)<sup>p1154</sup> [\[XMLNS\]](#)<sup>p1154</sup> [\[RFC7303\]](#)<sup>p1153</sup> [\[DOM\]](#)<sup>p1149</sup>

**Note** *At the time of writing, the XML specification community had not actually yet specified how XML and the DOM interact.*

After the [Document](#)<sup>p102</sup> is created, the user agent must [initialise the Document object](#)<sup>p795</sup>.

The actual HTTP headers and other metadata, not the headers as mutated or implied by the algorithms given in this specification, are the ones that must be used when determining the character encoding according to the rules given in the above specifications. Once the character encoding is established, the [document's character encoding](#)<sup>p51</sup> must be set to that character encoding.

If the root element, as parsed according to the XML specifications cited above, is found to be an [html](#)<sup>p137</sup> element with an attribute [manifest](#)<sup>p137</sup> whose value is not the empty string, then, as soon as the element is [inserted into the document](#)<sup>p42</sup>, the user agent must [resolve](#)<sup>p82</sup> the value of that attribute relative to that element, and if that is successful, must apply the [URL serialiser](#)<sup>p48</sup> algorithm to the resulting [parsed URL](#)<sup>p48</sup> with the [exclude fragment flag](#) set to obtain [manifest URL](#), and then run the [application cache selection algorithm](#)<sup>p822</sup> with [manifest URL](#) as the manifest URL, passing in the newly-created [Document](#)<sup>p102</sup>. Otherwise, if the attribute is absent, its value is the empty string, or resolving its value fails, then as soon as the root element is [inserted into the document](#)<sup>p42</sup>, the user agent must run the [application cache selection algorithm](#)<sup>p822</sup> with no manifest, and passing in the [Document](#)<sup>p102</sup>.

**Note** *Because the processing of the [manifest](#)<sup>p137</sup> attribute happens only once the root element is parsed, any URLs referenced by processing instructions before the root element (such as <?xml-stylesheet?>) will be fetched from the network and cannot be cached.*

User agents may examine the namespace of the root [Element](#)<sup>p51</sup> node of this [Document](#)<sup>p102</sup> object to perform namespace-based dispatch to alternative processing tools, e.g. determining that the content is actually a syndication feed and passing it to a feed handler. If such processing is to take place, abort the steps in this section, and jump to [the next step](#)<sup>p796</sup> (labeled *non-document content*) in the [navigate](#)<sup>p791</sup> steps above.

Otherwise, then, with the newly created [Document](#)<sup>p102</sup>, the user agent must [update the session history with the new page](#)<sup>p796</sup>. User agents may do this before the complete document has been parsed (thus achieving *incremental rendering*), and must do this before any scripts are to be executed.

Error messages from the parse process (e.g. XML namespace well-formedness errors) may be reported inline by mutating the [Document](#)<sup>p102</sup>.

#### 7.6.4 Page load processing model for text files

When a plain text document is to be loaded in a [browsing context](#)<sup>p762</sup>, the user agent must [queue a task](#)<sup>p835</sup> to create a [Document](#)<sup>p102</sup> object, mark it as being an [HTML document](#)<sup>p51</sup>, set its [content type](#)<sup>p51</sup> to "text/plain", [initialise the Document object](#)<sup>p795</sup>, create an [HTML parser](#)<sup>p952</sup>, associate it with the [Document](#)<sup>p102</sup>, act as if the tokenizer had emitted a start tag token with the tag name "pre" followed by a single U+000A LINE FEED (LF) character, and switch the [HTML parser](#)<sup>p952</sup>'s tokenizer to the [PLAINTEXT state](#)<sup>p968</sup>. Each [task](#)<sup>p834</sup> that the [networking task source](#)<sup>p839</sup> places on the [task queue](#)<sup>p834</sup> while the [fetching algorithm](#)<sup>p84</sup> runs must then fill the parser's [input byte stream](#)<sup>p954</sup> with the fetched bytes and cause the [HTML parser](#)<sup>p952</sup> to perform the appropriate processing of the input stream.

The rules for how to convert the bytes of the plain text document into actual characters, and the rules for actually rendering the text to the user, are defined in RFC 2046, RFC 3676, and subsequent versions thereof. [\[RFC2046\]](#)<sup>p1152</sup> [\[RFC3676\]](#)<sup>p1152</sup>

The [document's character encoding](#)<sup>p51</sup> must be set to the character encoding used to decode the document.

Upon creation of the [Document](#)<sup>p102</sup> object, the user agent must run the [application cache selection algorithm](#)<sup>p822</sup> with no manifest, and passing in the newly-created [Document](#)<sup>p102</sup>.

When no more bytes are available, the user agent must [queue a task](#)<sup>p835</sup> for the parser to process the implied EOF character, which eventually causes a [load](#)<sup>p1144</sup> event to be fired.

After creating the [Document](#)<sup>p102</sup> object, but potentially before the page has finished parsing, the user agent must [update the session history with the new page](#)<sup>p796</sup>.

User agents may add content to the [head](#)<sup>p138</sup> element of the [Document](#)<sup>p102</sup>, e.g. linking to a style sheet or a binding, providing script, giving the document a [title](#)<sup>p139</sup>, etc.

**Note** *In particular, if the user agent supports the Format=Flowed feature of RFC 3676 then the user agent would need to apply extra styling to cause the text to wrap correctly and to handle the quoting feature. This could be performed using, e.g., a binding or a CSS extension.*

The [task source](#)<sup>p835</sup> for the two tasks mentioned in this section must be the [networking task source](#)<sup>p839</sup>.

#### 7.6.5 Page load processing model for `multipart/x-mixed-replace` resources

When a resource with the type [multipart/x-mixed-replace](#)<sup>p1117</sup> is to be loaded in a [browsing context](#)<sup>p762</sup>, the user agent must parse the resource using the rules for multipart types. [\[RFC2046\]](#)<sup>p1152</sup>

For each body part obtained from the resource, the user agent must run a new instance of the [navigate](#)<sup>p791</sup> algorithm, starting from the *resource handling* step, using the new body part as the resource being navigated, with [replacement enabled](#)<sup>p802</sup> if a previous body part from the same resource resulted in a [Document](#)<sup>p102</sup> object being created and [initialised](#)<sup>p795</sup>, and otherwise using the same setup as the [navigate](#)<sup>p791</sup> attempt that caused this section to be invoked in the first place.

For the purposes of algorithms processing these body parts as if they were complete stand-alone resources, the user agent must act as if there were no more bytes for those resources whenever the boundary following the body part is reached.

**Note** *Thus, [load](#)<sup>p1144</sup> events (and for that matter [unload](#)<sup>p1145</sup> events) do fire for each body part loaded.*

## 7.6.6 Page load processing model for media

When an image, video, or audio resource is to be loaded in a [browsing context](#)<sup>p762</sup>, the user agent should create a [Document](#)<sup>p102</sup> object, mark it as being an [HTML document](#)<sup>p51</sup>, set its [content type](#)<sup>p51</sup> to the sniffed MIME type of the resource (type in the [navigate](#)<sup>p791</sup> algorithm), [initialise the Document object](#)<sup>p795</sup>, append an [html](#)<sup>p137</sup> element to the [Document](#)<sup>p102</sup>, append a [head](#)<sup>p138</sup> element and a [body](#)<sup>p157</sup> element to the [html](#)<sup>p137</sup> element, append an element *host element* for the media, as described below, to the [body](#)<sup>p157</sup> element, and set the appropriate attribute of the element *host element*, as described below, to the address of the image, video, or audio resource.

The element *host element* to create for the media is the element given in the table below in the second cell of the row whose first cell describes the media. The appropriate attribute to set is the one given by the third cell in that same row.

Type of media	Element for the media	Appropriate attribute
Image	<a href="#">img</a> <sup>p272</sup>	<a href="#">src</a> <sup>p273</sup>
Video	<a href="#">video</a> <sup>p317</sup>	<a href="#">src</a> <sup>p329</sup>
Audio	<a href="#">audio</a> <sup>p321</sup>	<a href="#">src</a> <sup>p329</sup>

Then, the user agent must act as if it had [stopped parsing](#)<sup>p1033</sup>.

Upon creation of the [Document](#)<sup>p102</sup> object, the user agent must run the [application cache selection algorithm](#)<sup>p822</sup> with no manifest, and passing in the newly-created [Document](#)<sup>p102</sup>.

After creating the [Document](#)<sup>p102</sup> object, but potentially before the page has finished fully loading, the user agent must [update the session history with the new page](#)<sup>p796</sup>.

User agents may add content to the [head](#)<sup>p138</sup> element of the [Document](#)<sup>p102</sup>, or attributes to the element *host element*, e.g. to link to a style sheet or a binding, to provide a script, to give the document a [title](#)<sup>p139</sup>, to make the media [autoplay](#)<sup>p345</sup>, etc.

## 7.6.7 Page load processing model for content that uses plugins

When a resource that requires an external resource to be rendered is to be loaded in a [browsing context](#)<sup>p762</sup>, the user agent should create a [Document](#)<sup>p102</sup> object, mark it as being an [HTML document](#)<sup>p51</sup> and mark it as being a [plugin document](#), set its [content type](#)<sup>p51</sup> to the sniffed MIME type of the resource (type in the [navigate](#)<sup>p791</sup> algorithm), [initialise the Document object](#)<sup>p795</sup>, append an [html](#)<sup>p137</sup> element to the [Document](#)<sup>p102</sup>, append a [head](#)<sup>p138</sup> element and a [body](#)<sup>p157</sup> element to the [html](#)<sup>p137</sup> element, append an [embed](#)<sup>p307</sup> to the [body](#)<sup>p157</sup> element, and set the [src](#)<sup>p307</sup> attribute of the [embed](#)<sup>p307</sup> element to the address of the resource.

**Note** The term [plugin document](#)<sup>p799</sup> is used by the Content Security Policy specification as part of the mechanism that ensures [iframe](#)<sup>p299</sup>'s can't be used to evade plugin-types directives. [\[CSP\]](#)<sup>p1148</sup>

Then, the user agent must act as if it had [stopped parsing](#)<sup>p1033</sup>.

Upon creation of the [Document](#)<sup>p102</sup> object, the user agent must run the [application cache selection algorithm](#)<sup>p822</sup> with no manifest, and passing in the newly-created [Document](#)<sup>p102</sup>.

After creating the [Document](#)<sup>p102</sup> object, but potentially before the page has finished fully loading, the user agent must [update the session history with the new page](#)<sup>p796</sup>.

User agents may add content to the [head](#)<sup>p138</sup> element of the [Document](#)<sup>p102</sup>, or attributes to the [embed](#)<sup>p307</sup> element, e.g. to link to a style sheet or a binding, or to give the document a [title](#)<sup>p139</sup>.

**Note** If the [Document](#)<sup>p102</sup>'s [active sandboxing flag set](#)<sup>p782</sup> has its [sandboxed plugins browsing context flag](#)<sup>p780</sup> set, the synthesized [embed](#)<sup>p307</sup> element will fail to render the content<sup>p309</sup> if the relevant [plugin](#)<sup>p43</sup> cannot be secured<sup>p43</sup>.

## 7.6.8 Page load processing model for inline content that doesn't have a DOM

When the user agent is to display a user agent page inline in a [browsing context](#)<sup>p762</sup>, the user agent should create a [Document](#)<sup>p102</sup> object, mark it as being an [HTML document](#)<sup>p51</sup>, set its [content type](#)<sup>p51</sup> to "text/html", [initialise the Document object](#)<sup>p795</sup>, and then either associate that

[Document](#)<sup>p102</sup> with a custom rendering that is not rendered using the normal [Document](#)<sup>p102</sup> rendering rules, or mutate that [Document](#)<sup>p102</sup> until it represents the content the user agent wants to render.

Once the page has been set up, the user agent must act as if it had [stopped parsing](#)<sup>p1033</sup>.

Upon creation of the [Document](#)<sup>p102</sup> object, the user agent must run the [application cache selection algorithm](#)<sup>p822</sup> with no manifest, passing in the newly-created [Document](#)<sup>p102</sup>.

After creating the [Document](#)<sup>p102</sup> object, but potentially before the page has been completely set up, the user agent must [update the session history with the new page](#)<sup>p796</sup>.

## 7.6.9 Navigating to a fragment identifier

When a user agent is supposed to navigate to a fragment identifier, then the user agent must run the following steps:

1. Remove all the entries in the [browsing context](#)<sup>p762</sup>'s [session history](#)<sup>p782</sup> after the [current entry](#)<sup>p783</sup>. If the [current entry](#)<sup>p783</sup> is the last entry in the session history, then no entries are removed.  
**Note** *This doesn't necessarily have to affect*<sup>p790</sup> *the user agent's user interface.*
2. Remove any [tasks](#)<sup>p834</sup> queued by the [history traversal task source](#)<sup>p839</sup> that are associated with any [Document](#)<sup>p102</sup> objects in the [top-level browsing context](#)<sup>p763</sup>'s [document family](#)<sup>p763</sup>.
3. Append a new entry at the end of the [History](#)<sup>p783</sup> object representing the new resource and its [Document](#)<sup>p102</sup> object and related state. Its [URL](#)<sup>p48</sup> must be set to the address to which the user agent was [navigating](#)<sup>p791</sup>. The title must be left unset.
4. [Traverse the history](#)<sup>p801</sup> to the new entry, with the *non-blocking events* flag set. This will [scroll to the fragment identifier](#)<sup>p800</sup> given in what is now [the document's address](#).

**Note** *If the scrolling fails because the relevant ID*<sup>p51</sup> *has not yet been parsed, then the original navigation*<sup>p791</sup> *algorithm will take care of the scrolling instead, as the last few steps of its update the session history with the new page*<sup>p796</sup> *algorithm.*

When the user agent is required to [scroll to the fragment identifier](#) and [the indicated part of the document](#)<sup>p800</sup>, if any, is [being rendered](#)<sup>p1058</sup>, the user agent must either change the scrolling position of the document using the following algorithm, or perform some other action such that [the indicated part of the document](#)<sup>p800</sup> is brought to the user's attention. If there is no indicated part, or if the indicated part is not [being rendered](#)<sup>p1058</sup>, then the user agent must do nothing. The aforementioned algorithm is as follows:

1. Let *target* be [the indicated part of the document](#)<sup>p800</sup>, as defined below.
2. If *target* is the top of the document, then [scroll to the beginning of the document](#)<sup>p53</sup> for the [Document](#)<sup>p102</sup>, and abort these steps. [\[CSSOMVIEW\]](#)<sup>p1149</sup>
3. Use the [scroll an element into view](#)<sup>p53</sup> algorithm to scroll *target* into view, with the *align to top* flag set. [\[CSSOMVIEW\]](#)<sup>p1149</sup>
4. Run the [focusing steps](#)<sup>p730</sup> for that element, with the [Document](#)<sup>p102</sup>'s viewport as the *fallback target*.
5. Optionally, move the [sequential focus navigation starting point](#)<sup>p734</sup> to *target*.

The [indicated part of the document](#) is the one that the fragment identifier, if any, identifies. The semantics of the fragment identifier in terms of mapping it to a specific DOM Node is defined by the specification that defines the [MIME type](#)<sup>p42</sup> used by the [Document](#)<sup>p102</sup> (for example, the processing of fragment identifiers for [XML MIME types](#)<sup>p42</sup> is the responsibility of RFC7303). [\[RFC7303\]](#)<sup>p1153</sup>

For HTML documents (and [HTML MIME types](#)<sup>p42</sup>), the following processing model must be followed to determine what [the indicated part of the document](#)<sup>p800</sup> is.

1. Apply the [URL parser](#)<sup>p48</sup> algorithm to the [URL](#)<sup>p48</sup>, and let *fragid* be the [fragment](#)<sup>p48</sup> component of the resulting [parsed URL](#)<sup>p48</sup>.
2. If *fragid* is the empty string, then [the indicated part of the document](#)<sup>p800</sup> is the top of the document; stop the algorithm here.
3. Let *fragid bytes* be the result of [percent-decoding](#)<sup>p48</sup> *fragid*.

4. Let *decoded fragid* be the result of applying the [UTF-8 decoder](#)<sup>p47</sup> algorithm to *fragid bytes*. If the [UTF-8 decoder](#)<sup>p47</sup> emits a [decoder error](#)<sup>p48</sup>, abort the decoder and instead jump to the step labeled *no decoded fragid*.
5. If there is an element in the DOM that has an [ID](#)<sup>p51</sup> exactly equal to *decoded fragid*, then the first such element in [tree order](#)<sup>p42</sup> is [the indicated part of the document](#)<sup>p800</sup>; stop the algorithm here.
6. *No decoded fragid*: If there is an [a](#)<sup>b208</sup> element in the DOM that has a [name](#)<sup>p1097</sup> attribute whose value is exactly equal to *fragid* (*not decoded fragid*), then the first such element in [tree order](#)<sup>p42</sup> is [the indicated part of the document](#)<sup>p800</sup>; stop the algorithm here.
7. If *fragid* is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string [top](#), then [the indicated part of the document](#)<sup>p800</sup> is the top of the document; stop the algorithm here.
8. Otherwise, there is no [indicated part of the document](#)<sup>p800</sup>.

For the purposes of the interaction of HTML with Selectors' `:target` pseudo-class, the **target element** is [the indicated part of the document](#)<sup>p800</sup>, if that is an element; otherwise there is no [target element](#)<sup>p801</sup>. [\[SELECTORS\]](#)<sup>p1153</sup>

The [task source](#)<sup>p835</sup> for the task mentioned in this section must be the [DOM manipulation task source](#)<sup>p838</sup>.

## 7.6.10 History traversal

When a user agent is required to **traverse the history** to a *specified entry*, optionally with [replacement enabled](#)<sup>p802</sup>, and optionally with the *non-blocking events* flag set, the user agent must act as follows.

**Note** *This algorithm is not just invoked when explicitly going back or forwards in the session history*<sup>p785</sup> — it is also invoked in other situations, for example when [navigating a browsing context](#)<sup>b791</sup>, as part of [updating the session history with the new page](#)<sup>p796</sup>.

1. If there is no longer a [Document](#)<sup>b102</sup> object for the entry in question, [navigate](#)<sup>p791</sup> the [browsing context](#)<sup>p762</sup> to the resource for that entry to perform an [entry update](#)<sup>p796</sup> of that entry, and abort these steps. The "[navigate](#)<sup>p791</sup>" algorithm reinvokes this "traverse" algorithm to complete the traversal, at which point there is a [Document](#)<sup>b102</sup> object and so this step gets skipped. The navigation must be done using the same [source browsing context](#)<sup>b791</sup> as was used the first time this entry was created. (This can never happen with [replacement enabled](#)<sup>p802</sup>.)

**Note** *If the resource was obtained using a non-idempotent action, for example a POST form submission, or if the resource is no longer available, for example because the computer is now offline and the page wasn't cached, navigating to it again might not be possible. In this case, the navigation will result in a different page than previously; for example, it might be an error message explaining the problem or offering to resubmit the form.*

2. If the [current entry](#)<sup>p783</sup>'s title was not set by the [pushState\(\)](#)<sup>p785</sup> or [replaceState\(\)](#)<sup>p785</sup> methods, then set its title to the value returned by the [document.title](#)<sup>p105</sup> IDL attribute.
3. If appropriate, update the [current entry](#)<sup>p783</sup> in the [browsing context](#)<sup>p762</sup>'s [Document](#)<sup>b102</sup> object's [History](#)<sup>b783</sup> object to reflect any state that the user agent wishes to persist. The entry is then said to be [an entry with persisted user state](#)<sup>p783</sup>.
4. If the *specified entry* has a different [Document](#)<sup>b102</sup> object than the [current entry](#)<sup>p783</sup>, then run the following substeps:
  1. Remove any [tasks](#)<sup>p834</sup> queued by the [history traversal task source](#)<sup>p839</sup> that are associated with any [Document](#)<sup>b102</sup> objects in the [top-level browsing context](#)<sup>p763</sup>'s [document family](#)<sup>p763</sup>.
  2. If the [origin](#)<sup>p776</sup> of the [Document](#)<sup>b102</sup> of the *specified entry* is not the [same](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> of the [Document](#)<sup>b102</sup> of the [current entry](#)<sup>p783</sup>, then run the following sub-sub-steps:
    1. The current [browsing context name](#)<sup>b765</sup> must be stored with all the entries in the history that are associated with [Document](#)<sup>b102</sup> objects with the [same origin](#)<sup>p778</sup> as the [active document](#)<sup>p762</sup> and that are contiguous with the [current entry](#)<sup>p783</sup>.
    2. If the browsing context is a [top-level browsing context](#)<sup>p763</sup>, but not an [auxiliary browsing context](#)<sup>p764</sup>, then the browsing context's [browsing context name](#)<sup>p765</sup> must be unset.
  3. Make the *specified entry*'s [Document](#)<sup>b102</sup> object the [active document](#)<sup>p762</sup> of the [browsing context](#)<sup>p762</sup>.
  4. If the *specified entry* has a [browsing context name](#)<sup>p765</sup> stored with it, then run the following sub-sub-steps:

1. Set the browsing context's [browsing context name](#)<sup>p765</sup> to the name stored with the specified entry.
2. Clear any [browsing context names](#)<sup>p765</sup> stored with all entries in the history that are associated with [Document](#)<sup>p102</sup> objects with the [same origin](#)<sup>p778</sup> as the new [active document](#)<sup>p762</sup> and that are contiguous with the specified entry.
5. If the [specified entry's Document](#)<sup>p102</sup> has any form controls whose [autofill field name](#)<sup>p540</sup> is "[off](#)"<sup>p536</sup>, invoke the [reset algorithm](#)<sup>p567</sup> of each of those elements.
6. If the [current document readiness](#)<sup>p105</sup> of the [specified entry's Document](#)<sup>p102</sup> is "complete", [queue a task](#)<sup>p835</sup> to run the following sub-sub-steps:

1. If the [Document](#)<sup>p102</sup>'s [page showing](#)<sup>p804</sup> flag is true, then abort this task (i.e. don't fire the event below).

2. Set the [Document](#)<sup>p102</sup>'s [page showing](#)<sup>p804</sup> flag to true.

3. Run any **session history document visibility change steps** for [Document](#)<sup>p102</sup> that are defined by [other applicable specifications](#)<sup>p56</sup>.

**Note** This is specifically intended for use by the Page Visibility specification. [\[PAGEVIS\]](#)<sup>p1151</sup>

4. [Fire](#)<sup>p43</sup> a [trusted](#)<sup>p43</sup> event with the name [pageshow](#)<sup>p1144</sup> at the [Window](#)<sup>p768</sup> object of that [Document](#)<sup>p102</sup>, with [target override](#)<sup>p51</sup> set to the [Document](#)<sup>p102</sup> object, using the [PageTransitionEvent](#)<sup>p803</sup> interface, with the [persisted](#)<sup>p804</sup> attribute initialised to true. This event must not bubble, must not be cancelable, and has no default action.

5. Set [the document's address](#) to the URL of the [specified entry](#).
6. If the [specified entry](#) has a URL whose fragment identifier differs from that of the [current entry](#)<sup>p783</sup>'s when compared in a [case-sensitive](#)<sup>p58</sup> manner, and the two share the same [Document](#)<sup>p102</sup> object, then let [hash changed](#) be true, and let [old URL](#) be the URL of the [current entry](#)<sup>p783</sup> and [new URL](#) be the URL of the [specified entry](#). Otherwise, let [hash changed](#) be false.
7. If the traversal was initiated with **replacement enabled**, remove the entry immediately before the [specified entry](#) in the session history.
8. If the [specified entry](#) is not [an entry with persisted user state](#)<sup>p783</sup>, but its URL has a fragment identifier, [scroll to the fragment identifier](#)<sup>p800</sup>.
9. If the entry is [an entry with persisted user state](#)<sup>p783</sup>, the user agent may update aspects of the document and its rendering, for instance the scroll position or values of form fields, that it had previously recorded.

**Note** This can even include updating the [dir](#)<sup>p125</sup> attribute of [textarea](#)<sup>p508</sup> elements or [input](#)<sup>p452</sup> elements whose [type](#)<sup>p454</sup> attribute is in either the [Text](#)<sup>p458</sup> state or the [Search](#)<sup>p458</sup> state, if the persisted state includes the directionality of user input in such controls.

10. If the entry is a [state object](#)<sup>p782</sup> entry, let [state](#) be a [structured clone](#)<sup>p98</sup> of that state object. Otherwise, let [state](#) be null.
11. Set [history.state](#)<sup>p784</sup> to [state](#).

12. Let [state changed](#) be true if the [Document](#)<sup>p102</sup> of the [specified entry](#) has a [latest entry](#)<sup>p783</sup>, and that entry is not the [specified entry](#); otherwise let it be false.

13. Let the [latest entry](#)<sup>p783</sup> of the [Document](#)<sup>p102</sup> of the [specified entry](#) be the [specified entry](#).

14. If the [non-blocking events](#) flag is not set, then run the following steps [immediately](#)<sup>p41</sup>. Otherwise, the [non-blocking events](#) flag is set; [queue a task](#)<sup>p835</sup> to run the following substeps instead.

1. If [state changed](#) is true, [fire](#)<sup>p43</sup> a [trusted](#)<sup>p43</sup> event with the name [popstate](#)<sup>p1144</sup> at the [Window](#)<sup>p768</sup> object of the [Document](#)<sup>p102</sup>, using the [PopStateEvent](#)<sup>p803</sup> interface, with the [state](#)<sup>p803</sup> attribute initialised to the value of [state](#). This event must bubble but not be cancelable and has no default action.
2. If [hash changed](#) is true, then [fire](#)<sup>p43</sup> a [trusted](#)<sup>p43</sup> event with the name [hashchange](#)<sup>p1144</sup> at the [browsing context](#)<sup>p762</sup>'s [Window](#)<sup>p768</sup> object, using the [HashChangeEvent](#)<sup>p803</sup> interface, with the [oldURL](#)<sup>p803</sup> attribute initialised to [old URL](#) and the [newURL](#)<sup>p803</sup> attribute initialised to [new URL](#). This event must bubble but not be cancelable and has no default action.

15. The [current entry](#)<sup>p783</sup> is now the [specified entry](#).

The [task source](#)<sup>p835</sup> for the tasks mentioned above is the [DOM manipulation task source](#)<sup>p838</sup>.

### 7.6.10.1 The [PopStateEvent](#)<sup>p803</sup> interface

IDL

```
[Constructor(DOMString type, optional PopStateEventInit eventInitDict), Exposed=(Window,Worker)]
interface PopStateEvent : Event {
 readonly attribute any state;
};

dictionary PopStateEventInit : EventInit {
 any state;
};
```

Note

**event.state**<sup>p803</sup>

Returns a copy of the information that was provided to [pushState\(\)](#)<sup>p785</sup> or [replaceState\(\)](#)<sup>p785</sup>.

The **state** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the context information for the event, or null, if the state represented is the initial state of the [Document](#)<sup>p102</sup>.

### 7.6.10.2 The [HashChangeEvent](#)<sup>p803</sup> interface

IDL

```
[Constructor(DOMString type, optional HashChangeEventInit eventInitDict), Exposed=(Window,
interface HashChangeEvent : Event {
 readonly attribute DOMString oldURL;
 readonly attribute DOMString newURL;
};

dictionary HashChangeEventInit : EventInit {
 DOMString oldURL;
 DOMString newURL;
};
```

	2.2+
	9.9+
	None
	5+
	10.6+
	10+
	33+

Source: [caniuse.com](#)

Note

**event.oldURL**<sup>p803</sup>

Returns the [URL](#)<sup>p48</sup> of the [session history entry](#)<sup>p782</sup> that was previously current.

**event.newURL**<sup>p803</sup>

Returns the [URL](#)<sup>p48</sup> of the [session history entry](#)<sup>p782</sup> that is now current.

The **oldURL** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents context information for the event, specifically the URL of the [session history entry](#)<sup>p782</sup> that was traversed from.

The **newURL** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents context information for the event, specifically the URL of the [session history entry](#)<sup>p782</sup> that was traversed to.

### 7.6.10.3 The [PageTransitionEvent](#)<sup>p803</sup> interface

IDL

```
[Constructor(DOMString type, optional PageTransitionEventInit eventInitDict), Exposed=(Window,Worker)]
interface PageTransitionEvent : Event {
 readonly attribute boolean persisted;
};
```

```
dictionary PageTransitionEventInit : EventInit {
 boolean persisted;
};
```

### Note

**event.persisted<sup>p804</sup>**

For the [pageshow<sup>p1144</sup>](#) event, returns false if the page is newly being loaded (and the [load<sup>p1144</sup>](#) event will fire). Otherwise, returns true.

For the [pagehide<sup>p1144</sup>](#) event, returns false if the page is going away for the last time. Otherwise, returns true, meaning that (if nothing conspires to make the page unsalvageable) the page might be reused if the user navigates back to this page.

Things that can cause the page to be unsalvageable include:

- [document.open\(\)<sup>p848</sup>](#)
- Listening for [beforeunload<sup>p1144</sup>](#) events
- Listening for [unload<sup>p1145</sup>](#) events
- Having [iframe<sup>p299</sup>](#)s that are not salvageable
- Active [WebSocket<sup>p891</sup>](#) objects
- [Aborting a Document<sup>p806</sup>](#)

The **persisted** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to false. It represents the context information for the event.

### 7.6.11 Unloading documents

A [Document<sup>p102</sup>](#) has a **salvageable** state, which must initially be true, a **fired unload** flag, which must initially be false, and a **page showing** flag, which must initially be false. The [page showing<sup>p804</sup>](#) flag is used to ensure that scripts receive [pageshow<sup>p1144</sup>](#) and [pagehide<sup>p1144</sup>](#) events in a consistent manner (e.g. that they never receive two [pagehide<sup>p1144</sup>](#) events in a row without an intervening [pageshow<sup>p1144</sup>](#), or vice versa).

[Event loops<sup>p834</sup>](#) have a **termination nesting level** counter, which must initially be zero.

When a user agent is to **prompt to unload a document**, it must run the following steps.

1. Increase the [event loop<sup>p834</sup>](#)'s [termination nesting level<sup>p804</sup>](#) by one.
2. Increase the [Document<sup>p102</sup>](#)'s [ignore-opens-during-unload counter<sup>p848</sup>](#) by one.
3. Let **event** be a new [trusted<sup>p43</sup>](#) [BeforeUnloadEvent<sup>p806</sup>](#) event object with the name [beforeunload<sup>p1144</sup>](#), which does not bubble but is cancelable.
4. *Dispatch: Dispatch<sup>p43</sup> event at the [Document<sup>p102</sup>](#)'s [Window<sup>p768</sup>](#) object.*
5. Decrease the [event loop<sup>p834</sup>](#)'s [termination nesting level<sup>p804</sup>](#) by one.
6. Release the [storage mutex<sup>p835</sup>](#).
7. If any event listeners were triggered by the earlier *dispatch* step, then set the [Document<sup>p102</sup>](#)'s [salvageable<sup>p804</sup>](#) state to false.
8. If the [returnValue<sup>p806</sup>](#) attribute of the **event** object is not the empty string, or if the event was canceled, then the user agent should ask the user to confirm that they wish to unload the document.

The prompt shown by the user agent may include the string of the [returnValue<sup>p806</sup>](#) attribute, or some leading subset thereof. (A user agent may want to truncate the string to 1024 characters for display, for instance.)

The user agent must [pause<sup>p838</sup>](#) while waiting for the user's response.

If the user did not confirm the page navigation, then the user agent **refused to allow the document to be unloaded**.

9. If this algorithm was invoked by another instance of the "prompt to unload a document" algorithm (i.e. through the steps below that invoke this algorithm for all descendant browsing contexts), then jump to the step labeled *end*.
10. Let **descendants** be the [list of the descendant browsing contexts<sup>p763</sup>](#) of the [Document<sup>p102</sup>](#).

11. If `descendants` is not an empty list, then for each `browsing context`<sup>p762</sup>  $b$  in `descendants` run the following substeps:
  1. Prompt to unload<sup>p804</sup> the `active document`<sup>p762</sup> of the `browsing context`<sup>p762</sup>  $b$ . If the user refused to allow the document to be unloaded<sup>p804</sup>, then the user implicitly also refused to allow this document to be unloaded<sup>p804</sup>; jump to the step labeled `end`.
  2. If the `salvageable`<sup>p804</sup> state of the `active document`<sup>p762</sup> of the `browsing context`<sup>p762</sup>  $b$  is false, then set the `salvageable`<sup>p804</sup> state of *this* document to false also.
12. *End:* Decrease the `Document`<sup>p102</sup>'s `ignore-opens-during-unload counter`<sup>p848</sup> by one.

When a user agent is to **unload a document**, it must run the following steps. These steps are passed an argument, `recycle`, which is either true or false, indicating whether the `Document`<sup>p102</sup> object is going to be re-used. (This is set by the `document.open()`<sup>p848</sup> method.)

1. Increase the `event loop`<sup>p834</sup>'s `termination nesting level`<sup>p804</sup> by one.
2. Increase the `Document`<sup>p102</sup>'s `ignore-opens-during-unload counter`<sup>p848</sup> by one.
3. If the `Document`<sup>p102</sup>'s `page showing`<sup>p804</sup> flag is false, then jump to the step labeled `unload event` below (i.e. skip firing the `pagehide`<sup>p1144</sup> event and don't rerun the `unloading document visibility change steps`<sup>p805</sup>).
4. Set the `Document`<sup>p102</sup>'s `page showing`<sup>p804</sup> flag to false.
5. Fire<sup>p43</sup> a trusted<sup>p43</sup> event with the name `pagehide`<sup>p1144</sup> at the `Window`<sup>p768</sup> object of the `Document`<sup>p102</sup>, with `target override`<sup>p51</sup> set to the `Document`<sup>p102</sup> object, using the `PageTransitionEvent`<sup>b803</sup> interface, with the `persisted`<sup>p804</sup> attribute initialised to true if the `Document`<sup>p102</sup> object's `salvageable`<sup>p804</sup> state is true, and false otherwise. This event must not bubble, must not be cancelable, and has no default action.
6. Run any `unloading document visibility change steps` for `Document`<sup>p102</sup> that are defined by other applicable specifications<sup>p56</sup>.

**Note** *This is specifically intended for use by the Page Visibility specification. [PAGEVIS]<sup>p1151</sup>*

7. *Unload event:* If the `Document`<sup>p102</sup>'s `fired unload`<sup>p804</sup> flag is false, fire a simple event<sup>p846</sup> named `unload`<sup>p1145</sup> at the `Document`<sup>p102</sup>'s `Window`<sup>p768</sup> object, with `target override`<sup>p51</sup> set to the `Document`<sup>p102</sup> object.
8. Decrease the `event loop`<sup>p834</sup>'s `termination nesting level`<sup>p804</sup> by one.
9. Release the `storage mutex`<sup>p835</sup>.
10. If any event listeners were triggered by the earlier `unload event` step, then set the `Document`<sup>p102</sup> object's `salvageable`<sup>p804</sup> state to false and set the `Document`<sup>p102</sup>'s `fired unload`<sup>p804</sup> flag to true.
11. Run any `unloading document cleanup steps`<sup>p805</sup> for `Document`<sup>p102</sup> that are defined by this specification and other applicable specifications<sup>p56</sup>.
12. If this algorithm was invoked by another instance of the "unload a document" algorithm (i.e. by the steps below that invoke this algorithm for all descendant browsing contexts), then jump to the step labeled `end`.
13. Let `descendants` be the `list of the descendant browsing contexts`<sup>p763</sup> of the `Document`<sup>p102</sup>.
14. If `descendants` is not an empty list, then for each `browsing context`<sup>p762</sup>  $b$  in `descendants` run the following substeps:
  1. Unload<sup>p805</sup> the `active document`<sup>p762</sup> of the `browsing context`<sup>p762</sup>  $b$  with the `recycle` parameter set to false.
  2. If the `salvageable`<sup>p804</sup> state of the `active document`<sup>p762</sup> of the `browsing context`<sup>p762</sup>  $b$  is false, then set the `salvageable`<sup>p804</sup> state of *this* document to false also.

15. If both the `Document`<sup>p102</sup>'s `salvageable`<sup>p804</sup> state and `recycle` are false, then the `Document`<sup>p102</sup>'s `browsing context`<sup>p762</sup> must discard the Document<sup>p773</sup>.
16. *End:* Decrease the `Document`<sup>p102</sup>'s `ignore-opens-during-unload counter`<sup>p848</sup> by one.

This specification defines the following `unloading document cleanup steps`. Other specifications can define more.

1. Make disappear<sup>p898</sup> any `WebSocket`<sup>p891</sup> objects that were created by the `WebSocket()`<sup>p891</sup> constructor from the `Document`<sup>p102</sup>'s `Window`<sup>p768</sup> object.

If this affected any `WebSocket`<sup>p891</sup> objects, then set `Document`<sup>p102</sup>'s `salvageable`<sup>p804</sup> state to false.

2. If the [Document](#)'s [salvageable](#) state is false, [forcibly close](#) any [EventSource](#) objects that whose constructor was invoked from the [Document](#)'s [Window](#) object.
3. If the [Document](#)'s [salvageable](#) state is false, empty the [Document](#)'s [Window](#)'s [list of active timers](#).

### 7.6.11.1 The [BeforeUnloadEvent](#) interface

IDL

```
interface BeforeUnloadEvent : Event {
 attribute DOMString returnValue;
};
```

Note

`event.returnValue` [= value]

Returns the current return value of the event (the message to show the user).

Can be set, to update the message.

Note There are no [BeforeUnloadEvent](#)-specific initialisation methods.

The `returnValue` attribute represents the message to show the user. When the event is created, the attribute must be set to the empty string. On getting, it must return the last value it was set to. On setting, the attribute must be set to the new value.

### 7.6.12 Aborting a document load

If a [Document](#) is [aborted](#), the user agent must run the following steps:

1. [Abort](#) the [active documents](#) of every [child browsing context](#). If this results in any of those [Document](#) objects having their [salvageable](#) state set to false, then set this [Document](#)'s [salvageable](#) state to false also.
2. Cancel any instances of the [fetch](#) algorithm in the context of this [Document](#), discarding any [tasks](#) [queued](#) for them, and discarding any further data received from the network for them. If this resulted in any instances of the [fetch](#) algorithm being canceled or any [queued tasks](#) or any network data getting discarded, then set the [Document](#)'s [salvageable](#) state to false.
3. If the [Document](#) has an [active parser](#), then [abort that parser](#) and set the [Document](#)'s [salvageable](#) state to false.

User agents may allow users to explicitly invoke the [abort a document](#) algorithm for a [Document](#). If the user does so, then, if that [Document](#) is an [active document](#), the user agent should [queue a task](#) to [fire a simple event](#) named [abort](#) at that [Document](#)'s [Window](#) object before invoking the [abort](#) algorithm.

## 7.7 Offline Web applications

### 7.7.1 Introduction

This section is non-normative.

In order to enable users to continue interacting with Web applications and documents even when their network connection is unavailable, for instance, because they are traveling outside of their ISP's coverage area — authors can provide a manifest which lists the files that the Web application needs to work offline and which causes the user's browser to keep a copy of the files for use offline.

Support:	
Chrome	4+
IE	10+
Chrome for Android	40+
Firefox	3.5+
iOS Safari	3.2+
Android Browser	2.1+
UC Browser for Android	9.9+
Opera Mini	None
Safari	4+
Opera	10.6+
IE Mobile	10+
Firefox for Android	33+

Source: [caniuse.com](http://caniuse.com)

To illustrate this, consider a simple clock applet consisting of an HTML page "`clock.html`", a CSS style sheet "`clock.css`", and a JavaScript script "`clock.js`".

Before adding the manifest, these three files might look like this:

```

<!-- clock.html -->
<!DOCTYPE HTML>
<html>
 <head>
 <title>Clock</title>
 <script src="clock.js"></script>
 <link rel="stylesheet" href="clock.css">
 </head>
 <body>
 <p>The time is: <output id="clock"></output></p>
 </body>
</html>

/* clock.css */
output { font: 2em sans-serif; }

/* clock.js */
setInterval(function () {
 document.getElementById('clock').value = new Date();
}, 1000);

```

If the user tries to open the "clock.html" page while offline, though, the user agent (unless it happens to have it still in the local cache) will fail with an error.

The author can instead provide a manifest of the three files, say "clock.appcache":

```
CACHE MANIFEST
clock.html
clock.css
clock.js
```

With a small change to the HTML file, the manifest (served as [text/cache-manifest<sup>p1120</sup>](#)) is linked to the application:

```

<!-- clock.html -->
<!DOCTYPE HTML>
<html manifest="clock.appcache">
 <head>
 <title>Clock</title>
 <script src="clock.js"></script>
 <link rel="stylesheet" href="clock.css">
 </head>
 <body>
 <p>The time is: <output id="clock"></output></p>
 </body>
</html>
```

Now, if the user goes to the page, the browser will cache the files and make them available even when the user is offline.

**Note** Authors are encouraged to include the main page in the manifest also, but in practice the page that referenced the manifest is automatically cached even if it isn't explicitly mentioned.

**Note** With the exception of "no-store" directive, HTTP cache headers and restrictions on caching pages served over TLS (encrypted, using [https:](#)) are overridden by manifests. Thus, pages will not expire from an application cache before the user agent has updated it, and even applications served over TLS can be made to work offline.

[View this example online.](#)

### 7.7.1.1 Supporting offline caching for legacy applications

This section is non-normative.

The application cache feature works best if the application logic is separate from the application and user data, with the logic (markup, scripts, style sheets, images, etc) listed in the manifest and stored in the application cache, with a finite number of static HTML pages for the application, and with the application and user data stored in Web Storage or a client-side Indexed Database, updated dynamically using Web Sockets, [XMLHttpRequest](#)<sup>p52</sup>, server-sent events, or some other similar mechanism.

This model results in a fast experience for the user: the application immediately loads, and fresh data is obtained as fast as the network will allow it (possibly while stale data shows).

Legacy applications, however, tend to be designed so that the user data and the logic are mixed together in the HTML, with each operation resulting in a new HTML page from the server.

### Example

For example, consider a news application. The typical architecture of such an application, when not using the application cache feature, is that the user fetches the main page, and the server returns a dynamically-generated page with the current headlines and the user interface logic mixed together.

A news application designed for the application cache feature, however, would instead have the main page just consist of the logic, and would then have the main page fetch the data separately from the server, e.g. using [XMLHttpRequest](#)<sup>p52</sup>.

The mixed-content model does not work well with the application cache feature: since the content is cached, it would result in the user always seeing the stale data from the previous time the cache was updated.

While there is no way to make the legacy model work as fast as the separated model, it *can* at least be retrofitted for offline use using the [prefer-online](#)<sup>p809</sup> [application cache mode](#)<sup>p809</sup>. To do so, list all the static resources used by the HTML page you want to have work offline in an [application cache manifest](#)<sup>p809</sup>, use the [manifest](#)<sup>p137</sup> attribute to select that manifest from the HTML file, and then add the following line at the bottom of the manifest:

```
SETTINGS:
prefer-online
NETWORK:
*
```

This causes the [application cache](#)<sup>p809</sup> to only be used for [master entries](#)<sup>p809</sup> when the user is offline, and causes the application cache to be used as an atomic HTTP cache (essentially pinning resources listed in the manifest), while allowing all resources not listed in the manifest to be accessed normally when the user is online.

#### 7.7.1.2 Event summary

*This section is non-normative.*

When the user visits a page that declares a manifest, the browser will try to update the cache. It does this by fetching a copy of the manifest and, if the manifest has changed since the user agent last saw it, redownloading all the resources it mentions and caching them anew.

As this is going on, a number of events get fired on the [ApplicationCache](#)<sup>p824</sup> object to keep the script updated as to the state of the cache update, so that the user can be notified appropriately. The events are as follows:

Event name	Interface	Fired when...	Next events
<code>checking</code>	<a href="#">Event</a> <sup>p51</sup>	The user agent is checking for an update, or attempting to download the manifest for the first time. <b>This is always the first event in the sequence.</b>	<a href="#">noupdate</a> <sup>p808</sup> , <a href="#">downloading</a> <sup>p808</sup> , <a href="#">obsolete</a> <sup>p808</sup> , <a href="#">error</a> <sup>p809</sup>
<code>noupdate</code>	<a href="#">Event</a> <sup>p51</sup>	The manifest hadn't changed.	Last event in sequence.
<code>downloading</code>	<a href="#">Event</a> <sup>p51</sup>	The user agent has found an update and is fetching it, or is downloading the resources listed by the manifest for the first time.	<a href="#">progress</a> <sup>p808</sup> , <a href="#">error</a> <sup>p809</sup> , <a href="#">cached</a> <sup>p808</sup> , <a href="#">updateready</a> <sup>p808</sup>
<code>progress</code>	<a href="#">ProgressEvent</a> <sup>p52</sup>	The user agent is downloading resources listed by the manifest. The event object's <a href="#">total</a> <sup>p53</sup> attribute returns the total number of files to be downloaded. The event object's <a href="#">loaded</a> <sup>p53</sup> attribute returns the number of files processed so far.	<a href="#">progress</a> <sup>p808</sup> , <a href="#">error</a> <sup>p809</sup> , <a href="#">cached</a> <sup>p808</sup> , <a href="#">updateready</a> <sup>p808</sup>
<code>cached</code>	<a href="#">Event</a> <sup>p51</sup>	The resources listed in the manifest have been downloaded, and the application is now cached.	Last event in sequence.
<code>updateready</code>	<a href="#">Event</a> <sup>p51</sup>	The resources listed in the manifest have been newly redownloaded, and the script can use <a href="#">swapCache()</a> <sup>p826</sup> to switch to the new cache.	Last event in sequence.
<code>obsolete</code>	<a href="#">Event</a> <sup>p51</sup>	The manifest was found to have become a 404 or 410 page, so the application cache is being deleted.	Last event in sequence.

Event name	Interface	Fired when...	Next events
error	<a href="#">Event<sup>p51</sup></a>	The manifest was a 404 or 410 page, so the attempt to cache the application has been aborted.	Last event in sequence.
		The manifest hadn't changed, but the page referencing the manifest failed to download properly.	
		A fatal error occurred while fetching the resources listed in the manifest.	The user agent will try fetching the files again momentarily.
		The manifest changed while the update was being run.	

These events are cancelable; their default action is for the user agent to show download progress information. If the page shows its own update UI, canceling the events will prevent the user agent from showing redundant progress information.

## 7.7.2 Application caches

An **application cache** is a set of cached resources consisting of:

- One or more resources (including their out-of-band metadata, such as HTTP headers, if any), identified by URLs, each falling into one (or more) of the following categories:

### Master entries

**Note** These are documents that were added to the cache because a [browsing context<sup>p762</sup>](#) was [navigated<sup>p791</sup>](#) to that document and the document indicated that this was its cache, using the [manifest<sup>p137</sup>](#) attribute.

### The manifest

**Note** This is the resource corresponding to the URL that was given in a master entry's [html<sup>p137</sup>](#) element's [manifest<sup>p137</sup>](#) attribute. The manifest is fetched and processed during the [application cache download process<sup>p816</sup>](#). All the [master entries<sup>p809</sup>](#) have the [same origin<sup>p778</sup>](#) as the manifest.

### Explicit entries

**Note** These are the resources that were listed in the cache's [manifest<sup>p809</sup>](#) in an [explicit section<sup>p812</sup>](#).

### Fallback entries

**Note** These are the resources that were listed in the cache's [manifest<sup>p809</sup>](#) in a [fallback section<sup>p812</sup>](#).

[Explicit entries<sup>p809</sup>](#) and [Fallback entries<sup>p809</sup>](#) can be marked as **foreign**, which means that they have a [manifest<sup>p137</sup>](#) attribute but that it doesn't point at this cache's [manifest<sup>p809</sup>](#).

**Note** A URL in the list can be flagged with multiple different types, and thus an entry can end up being categorised as multiple entries. For example, an entry can be a manifest entry and an explicit entry at the same time, if the manifest is listed within the manifest.

- Zero or more **fallback namespaces**, each of which is mapped to a [fallback entry<sup>p809</sup>](#).

**Note** These are URLs used as [prefix match patterns<sup>p810</sup>](#) for resources that are to be fetched from the network if possible, or to be replaced by the corresponding [fallback entry<sup>p809</sup>](#) if not. Each namespace URL has the [same origin<sup>p778</sup>](#) as the [manifest<sup>p809</sup>](#).

- Zero or more URLs that form the **online whitelist namespaces**.

**Note** These are used as prefix match patterns, and declare URLs for which the user agent will ignore the application cache, instead fetching them normally (i.e. from the network or local HTTP cache as appropriate).

- An **online whitelist wildcard flag**, which is either **open** or **blocking**.

**Note** The open state indicates that any URL not listed as cached is to be implicitly treated as being in the [online whitelist namespaces<sup>p809</sup>](#); the blocking state indicates that URLs not listed explicitly in the manifest are to be treated as unavailable.

- A **cache mode flag**, which is either in the **fast** state or the **prefer-online** state.

Each [application cache<sup>p809</sup>](#) has a **completeness flag**, which is either **complete** or **incomplete**.

An **application cache group** is a group of [application caches<sup>p809</sup>](#), identified by the [absolute URL<sup>p48</sup>](#) of a resource [manifest<sup>p809</sup>](#) which is used to populate the caches in the group.

An [application cache](#)<sup>p809</sup> is **newer** than another if it was created after the other (in other words, [application caches](#)<sup>p809</sup> in an [application cache group](#)<sup>p809</sup> have a chronological order).

Only the newest [application cache](#)<sup>p809</sup> in an [application cache group](#)<sup>p809</sup> can have its [completeness flag](#)<sup>p809</sup> set to *incomplete*; the others are always all *complete*.

Each [application cache group](#)<sup>p809</sup> has an **update status**, which is one of the following: *idle*, *checking*, *downloading*.

A **relevant application cache** is an [application cache](#)<sup>p809</sup> that is the [newest](#)<sup>p810</sup> in its [group](#)<sup>p809</sup> to be *complete*.

Each [application cache group](#)<sup>p809</sup> has a **list of pending master entries**. Each entry in this list consists of a resource and a corresponding [Document](#)<sup>p102</sup> object. It is used during the [application cache download process](#)<sup>p816</sup> to ensure that new master entries are cached even if the [application cache download process](#)<sup>p816</sup> was already running for their [application cache group](#)<sup>p809</sup> when they were loaded.

An [application cache group](#)<sup>p809</sup> can be marked as **obsolete**, meaning that it must be ignored when looking at what [application cache groups](#)<sup>p809</sup> exist.

A **cache host** is a [Document](#)<sup>p102</sup> or a [SharedWorkerGlobalScope](#)<sup>p924</sup> object. A [cache host](#)<sup>p810</sup> can be associated with an [application cache](#)<sup>p809</sup>.

A [Document](#)<sup>p102</sup> initially is not associated with an [application cache](#)<sup>p809</sup>, but can become associated with one early during the page load process, when steps [in the parser](#)<sup>p1001</sup> and in the [navigation](#)<sup>p791</sup> sections cause [cache selection](#)<sup>p822</sup> to occur.

A [SharedWorkerGlobalScope](#)<sup>p924</sup> can be associated with an [application cache](#)<sup>p809</sup> when it is created.

Each [cache host](#)<sup>p810</sup> has an associated [ApplicationCache](#)<sup>p824</sup> object.

Multiple [application caches](#)<sup>p809</sup> in different [application cache groups](#)<sup>p809</sup> can contain the same resource, e.g. if the manifests all reference that resource. If the user agent is to **select an application cache** from a list of [relevant application caches](#)<sup>p810</sup> that contain a resource, the user agent must use the application cache that the user most likely wants to see the resource from, taking into account the following:

- which application cache was most recently updated,
- which application cache was being used to display the resource from which the user decided to look at the new resource, and
- which application cache the user prefers.

A URL **matches a fallback namespace** if there exists a [relevant application cache](#)<sup>p810</sup> whose [manifest](#)<sup>p809</sup>'s URL has the [same origin](#)<sup>p778</sup> as the URL in question, and that has a [fallback namespace](#)<sup>p809</sup> that is a [prefix match](#)<sup>p58</sup> for the URL being examined. If multiple fallback namespaces match the same URL, the longest one is the one that matches. A URL looking for a fallback namespace can match more than one application cache at a time, but only matches one namespace in each cache.

**Example**

If a manifest `http://example.com/app1/manifest` declares that `http://example.com/resources/images` is a fallback namespace, and the user navigates to `HTTP://EXAMPLE.COM:80/resources/images/cat.png`, then the user agent will decide that the application cache identified by `http://example.com/app1/manifest` contains a namespace with a match for that URL.

### 7.7.3 The cache manifest syntax

#### 7.7.3.1 Some sample manifests

*This section is non-normative.*

**Example**

This example manifest requires two images and a style sheet to be cached and whitelists a CGI script.

```
CACHE MANIFEST
the above line is required
```

```

this is a comment
there can be as many of these anywhere in the file
they are all ignored
comments can have spaces before them
but must be alone on the line

blank lines are ignored too

these are files that need to be cached they can either be listed
first, or a "CACHE:" header could be put before them, as is done
lower down.
images/sound-icon.png
images/background.png
note that each file has to be put on its own line

here is a file for the online whitelist -- it isn't cached, and
references to this file will bypass the cache, always hitting the
network (or trying to, if the user is offline).
NETWORK:
comm.cgi

here is another set of files to cache, this time just the CSS file.
CACHE:
style/default.css

```

It could equally well be written as follows:

```

CACHE MANIFEST
NETWORK:
comm.cgi
CACHE:
style/default.css
images/sound-icon.png
images/background.png

```

### Example

Offline application cache manifests can use absolute paths or even absolute URLs:

```

CACHE MANIFEST

/main/home
/main/app.js
/settings/home
/settings/app.js
http://img.example.com/logo.png
http://img.example.com/check.png
http://img.example.com/cross.png

```

### Example

The following manifest defines a catch-all error page that is displayed for any page on the site while the user is offline. It also specifies that the [online whitelist wildcard flag<sup>p809</sup>](#) is *open*, meaning that accesses to resources on other sites will not be blocked. (Resources on the same site are already not blocked because of the catch-all fallback namespace.)

So long as all pages on the site reference this manifest, they will get cached locally as they are fetched, so that subsequent hits to the same page will load the page immediately from the cache. Until the manifest is changed, those pages will not be fetched from the server again. When the manifest changes, then all the files will be redownloaded.

Subresources, such as style sheets, images, etc, would only be cached using the regular HTTP caching semantics, however.

```

CACHE MANIFEST
FALLBACK:
/ /offline.html

```

NETWORK :  
\*

### 7.7.3.2 Writing cache manifests

Manifests must be served using the [text/cache-manifest<sup>p1120</sup>](#) [MIME type<sup>p42</sup>](#). All resources served using the [text/cache-manifest<sup>p1120</sup>](#) [MIME type<sup>p42</sup>](#) must follow the syntax of application cache manifests, as described in this section.

An application cache manifest is a text file, whose text is encoded using UTF-8. Data in application cache manifests is line-based. Newlines must be represented by U+000A LINE FEED (LF) characters, U+000D CARRIAGE RETURN (CR) characters, or U+000D CARRIAGE RETURN (CR) U+000A LINE FEED (LF) pairs. [\[ENCODING\]<sup>p1150</sup>](#)

**Note** *This is a [willful violation<sup>p26</sup>](#) of RFC 2046, which requires all `text/*` types to only allow CRLF line breaks. This requirement, however, is outdated; the use of CR, LF, and CRLF line breaks is commonly supported and indeed sometimes CRLF is not supported by text editors. [\[RFC2046\]<sup>p1152</sup>](#)*

The first line of an application cache manifest must consist of the string "CACHE", a single U+0020 SPACE character, the string "MANIFEST", and either a U+0020 SPACE character, a U+0009 CHARACTER TABULATION (tab) character, a U+000A LINE FEED (LF) character, or a U+000D CARRIAGE RETURN (CR) character. The first line may optionally be preceded by a U+FEFF BYTE ORDER MARK (BOM) character. If any other text is found on the first line, it is ignored.

Subsequent lines, if any, must all be one of the following:

#### A blank line

Blank lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters only.

#### A comment

Comment lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, followed by a single U+0023 NUMBER SIGN character (#), followed by zero or more characters other than U+000A LINE FEED (LF) and U+000D CARRIAGE RETURN (CR) characters.

**Note** *Comments must be on a line on their own. If they were to be included on a line with a URL, the "#" would be mistaken for part of a fragment identifier.*

#### A section header

Section headers change the current section. There are four possible section headers:

CACHE :

Switches to the **explicit section**.

FALLBACK :

Switches to the **fallback section**.

NETWORK :

Switches to the **online whitelist section**.

SETTINGS :

Switches to the **settings section**.

Section header lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, followed by one of the names above (including the U+003A COLON character (:)) followed by zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

Ironically, by default, the current section is the [explicit section<sup>p812</sup>](#).

#### Data for the current section

The format that data lines must take depends on the current section.

When the current section is the [explicit section<sup>p812</sup>](#), data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, a [valid URL<sup>p81</sup>](#) identifying a resource other than the manifest itself, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

When the current section is the [fallback section](#)<sup>p812</sup>, data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, a [valid URL](#)<sup>p81</sup> identifying a resource other than the manifest itself, one or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, another [valid URL](#)<sup>p81</sup> identifying a resource other than the manifest itself, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

When the current section is the [online whitelist section](#)<sup>p812</sup>, data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, either a single U+002A ASTERISK character (\*) or a [valid URL](#)<sup>p81</sup> identifying a resource other than the manifest itself, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

When the current section is the [settings section](#)<sup>p812</sup>, data lines must consist of zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters, a [setting](#)<sup>p813</sup>, and then zero or more U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters.

Currently only one **setting** is defined:

#### The cache mode setting

This consists of the string "prefer-online". It sets the [cache mode](#)<sup>p809</sup> to [prefer-online](#)<sup>p809</sup>. (The [cache mode](#)<sup>p809</sup> defaults to [fast](#)<sup>p809</sup>.)

Within a [settings section](#)<sup>p812</sup>, each [setting](#)<sup>p813</sup> must occur no more than once.

Manifests may contain sections more than once. Sections may be empty.

URLs that are to be fallback pages associated with [fallback namespaces](#)<sup>p809</sup>, and those namespaces themselves, must be given in [fallback sections](#)<sup>p812</sup>, with the namespace being the first URL of the data line, and the corresponding fallback page being the second URL. All the other pages to be cached must be listed in [explicit sections](#)<sup>p812</sup>.

[Fallback namespaces](#)<sup>p809</sup> and [fallback entries](#)<sup>p809</sup> must have the [same origin](#)<sup>p778</sup> as the manifest itself. [Fallback namespaces](#)<sup>p809</sup> must also be in the same path as the manifest's URL.

A [fallback namespace](#)<sup>p809</sup> must not be listed more than once.

Namespaces that the user agent is to put into the [online whitelist](#)<sup>p809</sup> must all be specified in [online whitelist sections](#)<sup>p812</sup>. (This is needed for any URL that the page is intending to use to communicate back to the server.) To specify that all URLs are automatically whitelisted in this way, a U+002A ASTERISK character (\*) may be specified as one of the URLs.

Authors should not include namespaces in the [online whitelist](#)<sup>p809</sup> for which another namespace in the [online whitelist](#)<sup>p809</sup> is a [prefix match](#)<sup>p58</sup>.

[Relative URLs](#)<sup>p48</sup> must be given relative to the manifest's own URL. All URLs in the manifest must have the same [scheme](#)<sup>p48</sup> as the manifest itself (either explicitly or implicitly, through the use of [relative URLs](#)<sup>p48</sup>). [\[URL\]](#)<sup>p1153</sup>

URLs in manifests must not have fragment identifiers (i.e. the U+0023 NUMBER SIGN character isn't allowed in URLs in manifests).

[Fallback namespaces](#)<sup>p809</sup> and namespaces in the [online whitelist](#)<sup>p809</sup> are matched by [prefix match](#)<sup>p58</sup>.

### 7.7.3.3 Parsing cache manifests

When a user agent is to **parse a manifest**, it means that the user agent must run the following steps:

1. [UTF-8 decode](#)<sup>p47</sup> the byte stream corresponding with the manifest to be parsed.  
**Note** *The [UTF-8 decode](#)<sup>p47</sup> algorithm strips a leading BOM, if any.*
2. Let *base URL* be the [absolute URL](#)<sup>p48</sup> representing the manifest.
3. Apply the [URL parser](#)<sup>p48</sup> to *base URL*, and let *manifest path* be the [path](#)<sup>p48</sup> component thus obtained.
4. Remove all the characters in *manifest path* after the last U+002F SOLIDUS character (/), if any. (The first character and the last character in *manifest path* after this step will both be slashes, the URL path separator character.)
5. Apply the [URL parser](#)<sup>p48</sup> steps to the *base URL*, so that the components from its [parsed URL](#)<sup>p48</sup> can be used by the subsequent steps of this algorithm.

6. Let *explicit URLs* be an initially empty list of [absolute URLs<sup>p48</sup>](#) for [explicit entries<sup>p809</sup>](#).
7. Let *fallback URLs* be an initially empty mapping of [fallback namespaces<sup>p809</sup>](#) to [absolute URLs<sup>p48</sup>](#) for [fallback entries<sup>p809</sup>](#).
8. Let *online whitelist namespaces* be an initially empty list of [absolute URLs<sup>p48</sup>](#) for an [online whitelist<sup>p809</sup>](#).
9. Let *online whitelist wildcard flag* be *blocking*.
10. Let *cache mode flag* be *fast*.
11. Let *input* be the decoded text of the manifest's byte stream.
12. Let *position* be a pointer into *input*, initially pointing at the first character.
13. If the characters starting from *position* are "CACHE", followed by a U+0020 SPACE character, followed by "MANIFEST", then advance *position* to the next character after those. Otherwise, this isn't a cache manifest; abort this algorithm with a failure while checking for the magic signature.
14. If the character at *position* is neither a U+0020 SPACE character, a U+0009 CHARACTER TABULATION (tab) character, U+000A LINE FEED (LF) character, nor a U+000D CARRIAGE RETURN (CR) character, then this isn't a cache manifest; abort this algorithm with a failure while checking for the magic signature.
15. This is a cache manifest. The algorithm cannot fail beyond this point (though bogus lines can get ignored).
16. [Collect a sequence of characters<sup>p59</sup>](#) that are *not* U+000A LINE FEED (LF) or U+000D CARRIAGE RETURN (CR) characters, and ignore those characters. (Extra text on the first line, after the signature, is ignored.)
17. Let *mode* be "explicit".
18. *Start of line*: If *position* is past the end of *input*, then jump to the last step. Otherwise, [collect a sequence of characters<sup>p59</sup>](#) that are U+000A LINE FEED (LF), U+000D CARRIAGE RETURN (CR), U+0020 SPACE, or U+0009 CHARACTER TABULATION (tab) characters.
19. Now, [collect a sequence of characters<sup>p59</sup>](#) that are *not* U+000A LINE FEED (LF) or U+000D CARRIAGE RETURN (CR) characters, and let the result be *line*.
20. Drop any trailing U+0020 SPACE and U+0009 CHARACTER TABULATION (tab) characters at the end of *line*.
21. If *line* is the empty string, then jump back to the step labeled *start of line*.
22. If the first character in *line* is a U+0023 NUMBER SIGN character (#), then jump back to the step labeled *start of line*.
23. If *line* equals "CACHE:" (the word "CACHE" followed by a U+003A COLON character (:)), then set *mode* to "explicit" and jump back to the step labeled *start of line*.
24. If *line* equals "FALLBACK:" (the word "FALLBACK" followed by a U+003A COLON character (:)), then set *mode* to "fallback" and jump back to the step labeled *start of line*.
25. If *line* equals "NETWORK:" (the word "NETWORK" followed by a U+003A COLON character (:)), then set *mode* to "online whitelist" and jump back to the step labeled *start of line*.
26. If *line* equals "SETTINGS:" (the word "SETTINGS" followed by a U+003A COLON character (:)), then set *mode* to "settings" and jump back to the step labeled *start of line*.
27. If *line* ends with a U+003A COLON character (:), then set *mode* to "unknown" and jump back to the step labeled *start of line*.
28. This is either a data line or it is syntactically incorrect.
29. Let *position* be a pointer into *line*, initially pointing at the start of the string.
30. Let *tokens* be a list of strings, initially empty.
31. While *position* doesn't point past the end of *line*:
  1. Let *current token* be an empty string.
  2. While *position* doesn't point past the end of *line* and the character at *position* is neither a U+0020 SPACE nor a U+0009 CHARACTER TABULATION (tab) character, add the character at *position* to *current token* and advance *position* to the next character in *input*.

3. Add *current token* to the *tokens* list.
  4. While *position* doesn't point past the end of *line* and the character at *position* is either a U+0020 SPACE or a U+0009 CHARACTER TABULATION (tab) character, advance *position* to the next character in *input*.
32. Process *tokens* as follows:
- ↪ If *mode* is "explicit"
    - [Resolve<sup>p82</sup>](#) the first item in *tokens*, relative to *base URL*, with the URL character encoding set to UTF-8; ignore the rest.
    - If this fails, then jump back to the step labeled *start of line*.
    - If the resulting [parsed URL<sup>p48</sup>](#) has a different [scheme<sup>p48</sup>](#) component than *base URL* (the manifest's URL), then jump back to the step labeled *start of line*.
    - Let *new URL* be the result of applying the [URL serialiser<sup>p48</sup>](#) algorithm to the resulting [parsed URL<sup>p48</sup>](#), with the *exclude fragment flag* set.
    - Add *new URL* to the *explicit URLs*.
  - ↪ If *mode* is "fallback"
    - Let *part one* be the first token in *tokens*, and let *part two* be the second token in *tokens*.
    - [Resolve<sup>p82</sup>](#) *part one* and *part two*, relative to *base URL*, with the URL character encoding set to UTF-8.
    - If either fails, then jump back to the step labeled *start of line*.
    - If the [absolute URL<sup>p48</sup>](#) corresponding to either *part one* or *part two* does not have the [same origin<sup>p778</sup>](#) as the manifest's URL, then jump back to the step labeled *start of line*.
    - Let *part one path* be the [path<sup>p48</sup>](#) component of the [resulting parsed URL<sup>p83</sup>](#) for *part one*.
    - If *manifest path* is not a [prefix match<sup>p58</sup>](#) for *part one path*, then jump back to the step labeled *start of line*.
    - Let *part one* be the result of applying the [URL serialiser<sup>p48</sup>](#) algorithm to the first resulting [parsed URL<sup>p48</sup>](#), with the *exclude fragment flag* set.
    - Let *part two* be the result of applying the [URL serialiser<sup>p48</sup>](#) algorithm to the second resulting [parsed URL<sup>p48</sup>](#), with the *exclude fragment flag* set.
    - If *part one* is already in the *fallback URLs* mapping as a [fallback namespace<sup>p809</sup>](#), then jump back to the step labeled *start of line*.
    - Otherwise, add *part one* to the *fallback URLs* mapping as a [fallback namespace<sup>p809</sup>](#), mapped to *part two* as the [fallback entry<sup>p809</sup>](#).
  - ↪ If *mode* is "online whitelist"
    - If the first item in *tokens* is a U+002A ASTERISK character (\*), then set *online whitelist wildcard flag* to *open* and jump back to the step labeled *start of line*.
    - Otherwise, [resolve<sup>p82</sup>](#) the first item in *tokens*, relative to *base URL*, with the URL character encoding set to UTF-8; ignore the rest.
    - If this fails, then jump back to the step labeled *start of line*.
    - If the resulting [parsed URL<sup>p48</sup>](#) has a different [scheme<sup>p48</sup>](#) component than *base URL* (the manifest's URL), then jump back to the step labeled *start of line*.
    - Let *new URL* be the result of applying the [URL serialiser<sup>p48</sup>](#) algorithm to the resulting [parsed URL<sup>p48</sup>](#), with the *exclude fragment flag* set.
    - Add *new URL* to the *online whitelist namespaces*.

↪ If **mode** is "settings"

If *tokens* contains a single token, and that token is a [case-sensitive<sup>p58</sup>](#) match for the string "prefer-online", then set *cache mode flag* to *prefer-online* and jump back to the step labeled *start of line*.

Otherwise, the line is an unsupported setting: do nothing; the line is ignored.

↪ If **mode** is "unknown"

Do nothing. The line is ignored.

33. Jump back to the step labeled *start of line*. (That step jumps to the next, and last, step when the end of the file is reached.)
34. Return the *explicit URLs* list, the *fallback URLs* mapping, the *online whitelist namespaces*, the *online whitelist wildcard flag*, and the *cache mode flag*.

**Note** *The resource that declares the manifest (with the [manifest<sup>p137</sup>](#) attribute) will always get taken from the cache, whether it is listed in the cache or not, even if it is listed in an [online whitelist namespace<sup>p809</sup>](#).*

*If a resource is listed in the [explicit section<sup>p812</sup>](#) or as a [fallback entry<sup>p809</sup>](#) in the [fallback section<sup>p812</sup>](#), the resource will always be taken from the cache, regardless of any other matching entries in the [fallback namespaces<sup>p809</sup>](#) or [online whitelist namespaces<sup>p809</sup>](#).*

*When a [fallback namespace<sup>p809</sup>](#) and an [online whitelist namespace<sup>p809</sup>](#) overlap, the [online whitelist namespace<sup>p809</sup>](#) has priority.*

*The [online whitelist wildcard flag<sup>p809</sup>](#) is applied last, only for URLs that match neither the [online whitelist namespace<sup>p809</sup>](#) nor the [fallback namespace<sup>p809</sup>](#) and that are not listed in the [explicit section<sup>p812</sup>](#).*

#### 7.7.4 Downloading or updating an application cache

Spec bugs: [18279](#)

When the user agent is required (by other parts of this specification) to start the **application cache download process** for an [absolute URL<sup>p48</sup>](#) purported to identify a [manifest<sup>p809</sup>](#), or for an [application cache group<sup>p809</sup>](#), potentially given a particular [cache host<sup>p810</sup>](#), and potentially given a [master<sup>p809</sup>](#) resource, the user agent must run the steps below. These steps are always run [in parallel<sup>p41</sup>](#) with the [event loop<sup>p834</sup> tasks<sup>p834</sup>](#).

Some of these steps have requirements that only apply if the user agent **shows caching progress**. Support for this is optional. Caching progress UI could consist of a progress bar or message panel in the user agent's interface, or an overlay, or something else. Certain events fired during the [application cache download process<sup>p816</sup>](#) allow the script to override the display of such an interface. (Such events are delayed until after the [load<sup>p1144</sup>](#) event has fired.) The goal of this is to allow Web applications to provide more seamless update mechanisms, hiding from the user the mechanics of the application cache mechanism. User agents may display user interfaces independent of this, but are encouraged to not show prominent update progress notifications for applications that cancel the relevant events.

The [application cache download process<sup>p816</sup>](#) steps are as follows:

1. Optionally, wait until the permission to start the [application cache download process<sup>p816</sup>](#) has been obtained from the user and until the user agent is confident that the network is available. This could include doing nothing until the user explicitly opts-in to caching the site, or could involve prompting the user for permission. The algorithm might never get past this point. (This step is particularly intended to be used by user agents running on severely space-constrained devices or in highly privacy-sensitive environments).
2. Atomically, so as to avoid race conditions, perform the following substeps:
  1. Pick the appropriate substeps:

↪ If these steps were invoked with an [absolute URL<sup>p48</sup>](#) purported to identify a [manifest<sup>p809</sup>](#)

Let *manifest URL* be that [absolute URL<sup>p48</sup>](#).

If there is no [application cache group<sup>p809</sup>](#) identified by *manifest URL*, then create a new [application cache group<sup>p809</sup>](#) identified by *manifest URL*. Initially, it has no [application caches<sup>p809</sup>](#). One will be created later in this algorithm.

↪ If these steps were invoked with an [application cache group<sup>p809</sup>](#)

Let *manifest URL* be the [absolute URL<sup>p48</sup>](#) of the [manifest<sup>p809</sup>](#) used to identify the [application cache group<sup>p809</sup>](#) to be updated.

If that [application cache group](#)<sup>p809</sup> is [obsolete](#)<sup>p810</sup>, then abort this instance of the [application cache download process](#)<sup>p816</sup>. This can happen if another instance of this algorithm found the manifest to be 404 or 410 while this algorithm was waiting in the first step above.

2. Let *cache group* be the [application cache group](#)<sup>p809</sup> identified by *manifest URL*.
3. If these steps were invoked with a [master](#)<sup>p809</sup> resource, then add the resource, along with the resource's [Document](#)<sup>p102</sup>, to *cache group*'s [list of pending master entries](#)<sup>p810</sup>.
4. If these steps were invoked with a [cache host](#)<sup>p810</sup>, and the [status](#)<sup>p810</sup> of *cache group* is *checking* or *downloading*, then [queue a post-load task](#)<sup>p822</sup> to [fire a simple event](#)<sup>p846</sup> named [checking](#)<sup>p808</sup> that is cancelable at the [ApplicationCache](#)<sup>p824</sup> singleton of that [cache host](#)<sup>p810</sup>. The default action of this event must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that the user agent is checking to see if it can download the application.
5. If these steps were invoked with a [cache host](#)<sup>p810</sup>, and the [status](#)<sup>p810</sup> of *cache group* is *downloading*, then also [queue a post-load task](#)<sup>p822</sup> to [fire a simple event](#)<sup>p846</sup> named [downloading](#)<sup>p808</sup> that is cancelable at the [ApplicationCache](#)<sup>p824</sup> singleton of that [cache host](#)<sup>p810</sup>. The default action of this event must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that the application is being downloaded.
6. If the [status](#)<sup>p810</sup> of the *cache group* is either *checking* or *downloading*, then abort this instance of the [application cache download process](#)<sup>p816</sup>, as an update is already in progress.
7. Set the [status](#)<sup>p810</sup> of *cache group* to *checking*.
8. For each [cache host](#)<sup>p810</sup> associated with an [application cache](#)<sup>p809</sup> in *cache group*, [queue a post-load task](#)<sup>p822</sup> to [fire a simple event](#)<sup>p846</sup> that is cancelable named [checking](#)<sup>p808</sup> at the [ApplicationCache](#)<sup>p824</sup> singleton of the [cache host](#)<sup>p810</sup>. The default action of these events must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that the user agent is checking for the availability of updates.

**Note** *The remainder of the steps run in parallel*<sup>p41</sup>.

If *cache group* already has an [application cache](#)<sup>p809</sup> in it, then this is an **upgrade attempt**. Otherwise, this is a **cache attempt**.

3. If this is a [cache attempt](#)<sup>p817</sup>, then this algorithm was invoked with a [cache host](#)<sup>p810</sup>: [queue a post-load task](#)<sup>p822</sup> to [fire a simple event](#)<sup>p846</sup> named [checking](#)<sup>p808</sup> that is cancelable at the [ApplicationCache](#)<sup>p824</sup> singleton of that [cache host](#)<sup>p810</sup>. The default action of this event must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that the user agent is checking for the availability of updates.
4. *Fetching the manifest:* [Fetch](#)<sup>p84</sup> the resource from *manifest URL* with the *blocking flag* set, and let *manifest* be that resource. HTTP caching semantics should be honored for this request. The *override referrer source* must be null.

Parse *manifest* according to the [rules for parsing manifests](#)<sup>p813</sup>, obtaining a list of [explicit entries](#)<sup>p809</sup>, [fallback entries](#)<sup>p809</sup> and the [fallback namespaces](#)<sup>p809</sup> that map to them, entries for the [online whitelist](#)<sup>p809</sup>, and values for the [online whitelist wildcard flag](#)<sup>p809</sup> and the [cache mode flag](#)<sup>p809</sup>.

**Note** *The MIME type*<sup>p42</sup> of the resource is ignored — it is assumed to be [text/cache-manifest](#)<sup>p1120</sup>. In the future, if new manifest formats are supported, the different types will probably be distinguished on the basis of the file signatures (for the current format, that is the "CACHE MANIFEST" string at the top of the file).

5. If *fetching the manifest* fails due to a 404 or 410 response [or equivalent](#)<sup>p83</sup>, then run these substeps:
  1. Mark *cache group* as [obsolete](#)<sup>p810</sup>. This *cache group* no longer exists for any purpose other than the processing of [Document](#)<sup>p102</sup> objects already associated with an [application cache](#)<sup>p809</sup> in the *cache group*.
  2. Let *task list* be an empty list of [tasks](#)<sup>p834</sup>.
  3. For each [cache host](#)<sup>p810</sup> associated with an [application cache](#)<sup>p809</sup> in *cache group*, create a [task](#)<sup>p834</sup> to [fire a simple event](#)<sup>p846</sup> named [obsolete](#)<sup>p808</sup> that is cancelable at the [ApplicationCache](#)<sup>p824</sup> singleton of the [cache host](#)<sup>p810</sup>, and append it to *task list*. The default action of these events must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that the application is no longer available for offline use.
  4. For each entry in *cache group*'s [list of pending master entries](#)<sup>p810</sup>, create a [task](#)<sup>p834</sup> to [fire a simple event](#)<sup>p846</sup> that is cancelable named [error](#)<sup>p809</sup> (not [obsolete](#)<sup>p808</sup>!) at the [ApplicationCache](#)<sup>p824</sup> singleton of the [Document](#)<sup>p102</sup> for this entry, if there still is one, and append it to *task list*. The default action of this event must be, if the user agent [shows caching progress](#)<sup>p816</sup>,

the display of some sort of user interface indicating to the user that the user agent failed to save the application for offline use.

5. If *cache group* has an [application cache](#)<sup>p809</sup> whose [completeness flag](#)<sup>p809</sup> is *incomplete*, then discard that [application cache](#)<sup>p809</sup>.
6. If appropriate, remove any user interface indicating that an update for this cache is in progress.
7. Let the [status](#)<sup>p810</sup> of *cache group* be *idle*.
8. For each [task](#)<sup>p834</sup> in *task list*, [queue that task as a post-load task](#)<sup>p822</sup>.
9. Abort the [application cache download process](#)<sup>p816</sup>.
6. Otherwise, if *fetching the manifest* fails in some other way (e.g. the server returns another 4xx or 5xx response [or equivalent](#)<sup>p83</sup>, or there is a DNS error, or the connection times out, or the user cancels the download, or the parser for manifests fails when checking the magic signature), or if the server returned a redirect, then run the [cache failure steps](#)<sup>p821</sup>. [[HTTP](#)<sup>p1150</sup>]
7. If this is an [upgrade attempt](#)<sup>p817</sup> and the newly downloaded *manifest* is byte-for-byte identical to the manifest found in the [newest](#)<sup>p810</sup> [application cache](#)<sup>p809</sup> in *cache group*, or the server reported it as "304 Not Modified" [or equivalent](#)<sup>p83</sup>, then run these substeps:
  1. Let *cache* be the [newest](#)<sup>p810</sup> [application cache](#)<sup>p809</sup> in *cache group*.
  2. Let *task list* be an empty list of [tasks](#)<sup>p834</sup>.
  3. For each entry in *cache group*'s [list of pending master entries](#)<sup>p810</sup>, wait for the resource for this entry to have either completely downloaded or failed.

If the download failed (e.g. the server returns a 4xx or 5xx response [or equivalent](#)<sup>p83</sup>, or there is a DNS error, the connection times out, or the user cancels the download), or if the resource is labeled with the "no-store" cache directive, then create a [task](#)<sup>p834</sup> to [fire a simple event](#)<sup>p846</sup> that is cancelable named [error](#)<sup>p809</sup> at the [ApplicationCache](#)<sup>p824</sup> singleton of the [Document](#)<sup>p102</sup> for this entry, if there still is one, and append it to *task list*. The default action of this event must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that the user agent failed to save the application for offline use.

Otherwise, associate the [Document](#)<sup>p102</sup> for this entry with *cache*; store the resource for this entry in *cache*, if it isn't already there, and categorise its entry as a [master entry](#)<sup>p809</sup>. If applying the [URL parser](#)<sup>p48</sup> algorithm to the resource's [URL](#)<sup>p48</sup> results in a [parsed URL](#)<sup>p48</sup> that has a non-null [fragment](#)<sup>p48</sup> component, the [URL](#)<sup>p48</sup> used for the entry in *cache* must instead be the [absolute URL](#)<sup>p48</sup> obtained from applying the [URL serialiser](#)<sup>p48</sup> algorithm to the [parsed URL](#)<sup>p48</sup> with the [exclude fragment flag](#) set (application caches never include fragment identifiers).
  4. For each [cache host](#)<sup>p810</sup> associated with an [application cache](#)<sup>p809</sup> in *cache group*, create a [task](#)<sup>p834</sup> to [fire a simple event](#)<sup>p846</sup> that is cancelable named [noupdate](#)<sup>p808</sup> at the [ApplicationCache](#)<sup>p824</sup> singleton of the [cache host](#)<sup>p810</sup>, and append it to *task list*. The default action of these events must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that the application is up to date.
  5. Empty *cache group*'s [list of pending master entries](#)<sup>p810</sup>.
  6. If appropriate, remove any user interface indicating that an update for this cache is in progress.
  7. Let the [status](#)<sup>p810</sup> of *cache group* be *idle*.
  8. For each [task](#)<sup>p834</sup> in *task list*, [queue that task as a post-load task](#)<sup>p822</sup>.
  9. Abort the [application cache download process](#)<sup>p816</sup>.
8. Let *new cache* be a newly created [application cache](#)<sup>p809</sup> in *cache group*. Set its [completeness flag](#)<sup>p809</sup> to *incomplete*.
9. For each entry in *cache group*'s [list of pending master entries](#)<sup>p810</sup>, associate the [Document](#)<sup>p102</sup> for this entry with *new cache*.
10. Set the [status](#)<sup>p810</sup> of *cache group* to *downloading*.
11. For each [cache host](#)<sup>p810</sup> associated with an [application cache](#)<sup>p809</sup> in *cache group*, [queue a post-load task](#)<sup>p822</sup> to [fire a simple event](#)<sup>p846</sup> that is cancelable named [downloading](#)<sup>p808</sup> at the [ApplicationCache](#)<sup>p824</sup> singleton of the [cache host](#)<sup>p810</sup>. The default action of these events must be, if the user agent [shows caching progress](#)<sup>p816</sup>, the display of some sort of user interface indicating to the user that a new version is being downloaded.

12. Let *file list* be an empty list of URLs with flags.
13. Add all the URLs in the list of [explicit entries](#) obtained by parsing *manifest* to *file list*, each flagged with "explicit entry".
14. Add all the URLs in the list of [fallback entries](#) obtained by parsing *manifest* to *file list*, each flagged with "fallback entry".
15. If this is an [upgrade attempt](#), then add all the URLs of [master entries](#) in the [newest application cache](#) in *cache group* whose [completeness flag](#) is *complete* to *file list*, each flagged with "master entry".
16. If any URL is in *file list* more than once, then merge the entries into one entry for that URL, that entry having all the flags that the original entries had.
17. For each URL in *file list*, run the following steps. These steps may be run in parallel for two or more of the URLs at a time. If, while running these steps, the [ApplicationCache](#) object's [abort\(\)](#) method [sends a signal](#) to this instance of the [application cache download process](#) algorithm, then run the [cache failure steps](#) instead.
  1. If the resource URL being processed was flagged as neither an "explicit entry" nor a "fallback entry", then the user agent may skip this URL.

**Note** *This is intended to allow user agents to expire resources not listed in the manifest from the cache. Generally, implementors are urged to use an approach that expires lesser-used resources first.*

2. For each [cache host](#) associated with an [application cache](#) in *cache group*, [queue a progress post-load task](#) to [fire](#) a [trusted](#) event with the name [progress](#), which does not bubble, which is cancelable, and which uses the [ProgressEvent](#) interface, at the [ApplicationCache](#) singleton of the [cache host](#). The [lengthComputable](#) attribute must be set to true, the [total](#) attribute must be set to the number of files in *file list*, and the [loaded](#) attribute must be set to the number of files in *file list* that have been either downloaded or skipped so far. The default action of these events must be, if the user agent [shows caching progress](#), the display of some sort of user interface indicating to the user that a file is being downloaded in preparation for updating the application. [\[XHR\]](#)
3. [Fetch](#) the resource, from the [origin](#) of the [URL](#) *manifest URL*, with the [blocking flag](#) set and the [manual redirect flag](#) set. If this is an [upgrade attempt](#), then use the [newest application cache](#) in *cache group* as an HTTP cache, and honor HTTP caching semantics (such as expiration, ETags, and so forth) with respect to that cache. User agents may also have other caches in place that are also honored. The [override referrer source](#) must be null.

**Note** *If the resource in question is already being downloaded for other reasons then the existing download process can sometimes be used for the purposes of this step, as defined by the [fetching](#) algorithm.*

**Example** An example of a resource that might already be being downloaded is a large image on a Web page that is being seen for the first time. The image would get downloaded to satisfy the [img](#) element on the page, as well as being listed in the cache manifest. According to the rules for [fetching](#) that image only need be downloaded once, and it can be used both for the cache and for the rendered Web page.

4. If the previous step fails (e.g. the server returns a 4xx or 5xx response [or equivalent](#), or there is a DNS error, or the connection times out, or the user cancels the download), or if the server returned a redirect, or if the resource is labeled with the "no-store" cache directive, then run the first appropriate step from the following list: [\[HTTP\]](#)

↪ **If the URL being processed was flagged as an "explicit entry" or a "fallback entry"**

If these steps are being run in parallel for any other URLs in *file list*, then abort these steps for those other URLs. Run the [cache failure steps](#).

**Note** *Redirects are fatal because they are either indicative of a network problem (e.g. a captive portal); or would allow resources to be added to the cache under URLs that differ from any URL that the networking model will allow access to, leaving orphan entries; or would allow resources to be stored under URLs different than their true URLs. All of these situations are bad.*

↪ **If the error was a 404 or 410 HTTP response [or equivalent](#)**

↪ **If the resource was labeled with the "no-store" cache directive**

Skip this resource. It is dropped from the cache.

↪ **Otherwise**

Copy the resource and its metadata from the [newest application cache](#) in *cache group* whose [completeness flag](#) is *complete*, and act as if that was the fetched resource, ignoring the resource obtained from the network.

User agents may warn the user of these errors as an aid to development.

**Note** *These rules make errors for resources listed in the manifest fatal, while making it possible for other resources to be removed from caches when they are removed from the server, without errors, and making non-manifest resources survive server-side errors.*

**Note** *Except for the "no-store" directive, HTTP caching rules that would cause a file to be expired or otherwise not cached are ignored for the purposes of the application cache download process<sup>p816</sup>.*

5. Otherwise, the fetching succeeded. Store the resource in the new cache.

If the user agent is not able to store the resource (e.g. because of quota restrictions), the user agent may prompt the user or try to resolve the problem in some other manner (e.g. automatically pruning content in other caches). If the problem cannot be resolved, the user agent must run the [cache failure steps<sup>p821</sup>](#).

6. If the URL being processed was flagged as an "explicit entry" in file list, then categorise the entry as an [explicit entry<sup>p809</sup>](#).
  7. If the URL being processed was flagged as a "fallback entry" in file list, then categorise the entry as a [fallback entry<sup>p809</sup>](#).
  8. If the URL being processed was flagged as an "master entry" in file list, then categorise the entry as a [master entry<sup>p809</sup>](#).
  9. As an optimization, if the resource is an HTML or XML file whose root element is an [html<sup>p137</sup>](#) element with a [manifest<sup>p137</sup>](#) attribute whose value doesn't match the manifest URL of the application cache being processed, then the user agent should mark the entry as being [foreign<sup>p809</sup>](#).
18. For each [cache host<sup>p810</sup>](#) associated with an [application cache<sup>p809</sup>](#) in cache group, queue a progress post-load task<sup>p822</sup> to fire<sup>p43</sup> a trusted<sup>p43</sup> event with the name [progress<sup>p808</sup>](#), which does not bubble, which is cancelable, and which uses the [ProgressEvent<sup>p52</sup>](#) interface, at the [ApplicationCache<sup>p824</sup>](#) singleton of the [cache host<sup>p810</sup>](#). The [lengthComputable<sup>p53</sup>](#) attribute must be set to true, the [total<sup>p53</sup>](#) and the [loaded<sup>p53</sup>](#) attributes must be set to the number of files in file list. The default action of these events must be, if the user agent shows caching progress<sup>p816</sup>, the display of some sort of user interface indicating to the user that all the files have been downloaded. [\[XHR\]<sup>p1154</sup>](#)
  19. Store the list of [fallback namespaces<sup>p809</sup>](#), and the URLs of the [fallback entries<sup>p809</sup>](#) that they map to, in new cache.
  20. Store the URLs that form the new [online whitelist<sup>p809</sup>](#) in new cache.
  21. Store the value of the new [online whitelist wildcard flag<sup>p809</sup>](#) in new cache.
  22. Store the value of the new [cache mode flag<sup>p809</sup>](#) in new cache.
  23. For each entry in cache group's [list of pending master entries<sup>p810</sup>](#), wait for the resource for this entry to have either completely downloaded or failed.

If the download failed (e.g. the server returns a 4xx or 5xx response [or equivalent<sup>p83</sup>](#), or there is a DNS error, the connection times out, or the user cancels the download), or if the resource is labeled with the "no-store" cache directive, then run these substeps:

1. Unassociate the [Document<sup>p102</sup>](#) for this entry from new cache.
2. Queue a post-load task<sup>p822</sup> to fire a simple event<sup>p846</sup> that is cancelable named [error<sup>p809</sup>](#) at the [ApplicationCache<sup>p824</sup>](#) singleton of the [Document<sup>p102</sup>](#) for this entry, if there still is one. The default action of this event must be, if the user agent shows caching progress<sup>p816</sup>, the display of some sort of user interface indicating to the user that the user agent failed to save the application for offline use.
3. If this is a [cache attempt<sup>p817</sup>](#) and this entry is the last entry in cache group's [list of pending master entries<sup>p810</sup>](#), then run these further substeps:
  1. Discard cache group and its only [application cache<sup>p809</sup>](#), new cache.
  2. If appropriate, remove any user interface indicating that an update for this cache is in progress.
  3. Abort the [application cache download process<sup>p816</sup>](#).
4. Otherwise, remove this entry from cache group's [list of pending master entries<sup>p810</sup>](#).

Otherwise, store the resource for this entry in new cache, if it isn't already there, and categorise its entry as a [master entry<sup>p809</sup>](#).

24. [Fetch<sup>p84</sup>](#) the resource from *manifest URL* again, with the *blocking flag* set, and let *second manifest* be that resource. HTTP caching semantics should again be honored for this request. The *override referrer source* must be null.
- Note** Since caching can be honored, authors are encouraged to avoid setting the cache headers on the manifest in such a way that the user agent would simply not contact the network for this second request; otherwise, the user agent would not notice if the cache had changed during the cache update process.
25. If the previous step failed for any reason, or if the fetching attempt involved a redirect, or if *second manifest* and *manifest* are not byte-for-byte identical, then schedule a rerun of the entire algorithm with the same parameters after a short delay, and run the [cache failure steps<sup>p821</sup>](#).
26. Otherwise, store *manifest* in *new cache*, if it's not there already, and categorise its entry as [the manifest<sup>p809</sup>](#).
27. Set the [completeness flag<sup>p809</sup>](#) of *new cache* to *complete*.
28. Let *task list* be an empty list of [tasks<sup>p834</sup>](#).
29. If this is a [cache attempt<sup>p817</sup>](#), then for each [cache host<sup>p810</sup>](#) associated with an [application cache<sup>p809</sup>](#) in *cache group*, create a [task<sup>p834</sup>](#) to [fire a simple event<sup>p846</sup>](#) that is cancelable named [cached<sup>p808</sup>](#) at the [ApplicationCache<sup>p824</sup>](#) singleton of the [cache host<sup>p810</sup>](#), and append it to *task list*. The default action of these events must be, if the user agent [shows caching progress<sup>p816</sup>](#), the display of some sort of user interface indicating to the user that the application has been cached and that they can now use it offline.
- Otherwise, it is an [upgrade attempt<sup>p817</sup>](#). For each [cache host<sup>p810</sup>](#) associated with an [application cache<sup>p809</sup>](#) in *cache group*, create a [task<sup>p834</sup>](#) to [fire a simple event<sup>p846</sup>](#) that is cancelable named [updateready<sup>p808</sup>](#) at the [ApplicationCache<sup>p824</sup>](#) singleton of the [cache host<sup>p810</sup>](#), and append it to *task list*. The default action of these events must be, if the user agent [shows caching progress<sup>p816</sup>](#), the display of some sort of user interface indicating to the user that a new version is available and that they can activate it by reloading the page.
30. If appropriate, remove any user interface indicating that an update for this cache is in progress.
31. Set the [update status<sup>p810</sup>](#) of *cache group* to *idle*.
32. For each [task<sup>p834</sup>](#) in *task list*, [queue that task as a post-load task<sup>p822</sup>](#).
- The **cache failure steps** are as follows:
1. Let *task list* be an empty list of [tasks<sup>p834</sup>](#).
  2. For each entry in *cache group*'s [list of pending master entries<sup>p810</sup>](#), run the following further substeps. These steps may be run in parallel for two or more entries at a time.
    1. Wait for the resource for this entry to have either completely downloaded or failed.
    2. Unassociate the [Document<sup>p102</sup>](#) for this entry from its [application cache<sup>p809</sup>](#), if it has one.
    3. Create a [task<sup>p834</sup>](#) to [fire a simple event<sup>p846</sup>](#) that is cancelable named [error<sup>p809</sup>](#) at the [ApplicationCache<sup>p824</sup>](#) singleton of the [Document<sup>p102</sup>](#) for this entry, if there still is one, and append it to *task list*. The default action of these events must be, if the user agent [shows caching progress<sup>p816</sup>](#), the display of some sort of user interface indicating to the user that the user agent failed to save the application for offline use.
  3. For each [cache host<sup>p810</sup>](#) still associated with an [application cache<sup>p809</sup>](#) in *cache group*, create a [task<sup>p834</sup>](#) to [fire a simple event<sup>p846</sup>](#) that is cancelable named [error<sup>p809</sup>](#) at the [ApplicationCache<sup>p824</sup>](#) singleton of the [cache host<sup>p810</sup>](#), and append it to *task list*. The default action of these events must be, if the user agent [shows caching progress<sup>p816</sup>](#), the display of some sort of user interface indicating to the user that the user agent failed to save the application for offline use.
  4. Empty *cache group*'s [list of pending master entries<sup>p810</sup>](#).
  5. If *cache group* has an [application cache<sup>p809</sup>](#) whose [completeness flag<sup>p809</sup>](#) is *incomplete*, then discard that [application cache<sup>p809</sup>](#).
  6. If appropriate, remove any user interface indicating that an update for this cache is in progress.
  7. Let the [status<sup>p810</sup>](#) of *cache group* be *idle*.
  8. If this was a [cache attempt<sup>p817</sup>](#), discard *cache group* altogether.
  9. For each [task<sup>p834</sup>](#) in *task list*, [queue that task as a post-load task<sup>p822</sup>](#).
  10. Abort the [application cache download process<sup>p816</sup>](#).

Attempts to [fetch<sup>p84</sup>](#) resources as part of the [application cache download process<sup>p816</sup>](#) may be done with cache-defeating semantics, to avoid problems with stale or inconsistent intermediary caches.

User agents may invoke the [application cache download process<sup>p816</sup>](#), in the background, for any [application cache group<sup>p809</sup>](#), at any time (with no [cache host<sup>p810</sup>](#)). This allows user agents to keep caches primed and to update caches even before the user visits a site.

Each [Document<sup>p102</sup>](#) has a list of **pending application cache download process tasks** that is used to delay events fired by the algorithm above until the document's [load<sup>b1144</sup>](#) event has fired. When the [Document<sup>p102</sup>](#) is created, the list must be empty.

When the steps above say to **queue a post-load task** *task*, where *task* is a [task<sup>p834</sup>](#) that dispatches an event on a target [ApplicationCache<sup>p824</sup>](#) object *target*, the user agent must run the appropriate steps from the following list:

If *target*'s [node document](#) is ready for post-load tasks<sup>p1033</sup>

Queue<sup>p835</sup> the task *task*.

Otherwise

Add *task* to *target*'s [node document](#)'s list of **pending application cache download process tasks**<sup>p822</sup>.

When the steps above say to **queue a progress post-load task** *task*, where *task* is a [task<sup>p834</sup>](#) that dispatches an event on a target [ApplicationCache<sup>p824</sup>](#) object *target*, the user agent must run the following steps:

1. If there is a *task* in *target*'s [node document](#)'s list of **pending application cache download process tasks**<sup>p822</sup> that is labeled as a **progress task**, then remove that task from the list.
2. Label *task* as a **progress task**.
3. [Queue a post-load task<sup>p822</sup>](#) *task*.

The [task source<sup>p835</sup>](#) for these [tasks<sup>p834</sup>](#) is the [networking task source<sup>p839</sup>](#).

## 7.7.5 The application cache selection algorithm

When the **application cache selection algorithm** algorithm is invoked with a [Document<sup>p102</sup>](#) *document* and optionally a manifest [URL<sup>p48</sup>](#) *manifest URL*, the user agent must run the first applicable set of steps from the following list:

↪ If there is a **manifest URL**, and *document* was loaded from an [application cache<sup>p809</sup>](#), and the URL of the [manifest<sup>p809</sup>](#) of that cache's [application cache group<sup>p809</sup>](#) is not the same as **manifest URL**

Mark the entry for the resource from which *document* was taken in the [application cache<sup>p809</sup>](#) from which it was loaded as [foreign<sup>p809</sup>](#).

Restart the current navigation from the top of the [navigation algorithm<sup>p791</sup>](#), undoing any changes that were made as part of the initial load (changes can be avoided by ensuring that the step to [update the session history with the new page<sup>p796</sup>](#) is only ever completed *after* this [application cache selection algorithm<sup>p822</sup>](#) is run, though this is not required).

**Note** *The navigation will not result in the same resource being loaded, because "foreign" entries are never picked during navigation.*

User agents may notify the user of the inconsistency between the cache manifest and the document's own metadata, to aid in application development.

↪ If *document* was loaded from an [application cache<sup>p809</sup>](#), and that [application cache<sup>p809</sup>](#) still exists (it is not now [obsolete<sup>p810</sup>](#))

Associate *document* with the [application cache<sup>p809</sup>](#) from which it was loaded. Invoke, in the background, the [application cache download process<sup>p816</sup>](#) for that [application cache<sup>p809</sup>](#)'s [application cache group<sup>p809</sup>](#), with *document* as the [cache host<sup>p810</sup>](#).

↪ If *document* was loaded using HTTP GET [or equivalent<sup>p83</sup>](#), and, there is a **manifest URL**, and **manifest URL** has the [same origin<sup>p778</sup>](#) as *document*

Invoke, in the background, the [application cache download process<sup>p816</sup>](#) for **manifest URL**, with *document* as the [cache host<sup>p810</sup>](#) and with the resource from which *document* was parsed as the [master<sup>p809</sup>](#) resource.

If there are [relevant application caches](#)<sup>p810</sup> that are identified by a URL with the [same origin](#)<sup>p778</sup> as the URL of *document*, and that have this URL as one of their entries, excluding entries marked as [foreign](#)<sup>p809</sup>, then the user agent should use the [most appropriate application cache](#)<sup>p810</sup> of those that match as an HTTP cache for any subresource loads. User agents may also have other caches in place that are also honored.

↪ **Otherwise**

The [Document](#)<sup>p102</sup> is not associated with any [application cache](#)<sup>p809</sup>.

If there was a *manifest URL*, the user agent may report to the user that it was ignored, to aid in application development.

## 7.7.6 Changes to the networking model

When a [cache host](#)<sup>p810</sup> is associated with an [application cache](#)<sup>p809</sup> whose [completeness flag](#)<sup>p809</sup> is *complete*, any and all loads for resources related to that [cache host](#)<sup>p810</sup> other than those for [child browsing contexts](#)<sup>p763</sup> must go through the following steps instead of immediately invoking the mechanisms appropriate to that resource's scheme:

1. If the resource is not to be fetched using the HTTP GET mechanism [or equivalent](#)<sup>p83</sup>, or if applying the [URL parser](#)<sup>p48</sup> algorithm to both its [URL](#)<sup>p48</sup> and the [application cache](#)<sup>p809</sup>'s [manifest](#)<sup>p809</sup>'s URL results in two [parsed URLs](#)<sup>p48</sup> with different [scheme](#)<sup>p48</sup> components, then [fetch](#)<sup>p84</sup> the resource normally and abort these steps.
2. If the resource's URL is [a master entry](#)<sup>p809</sup>, [the manifest](#)<sup>p809</sup>, [an explicit entry](#)<sup>p809</sup>, or [a fallback entry](#)<sup>p809</sup> in the [application cache](#)<sup>p809</sup>, then get the resource from the cache (instead of fetching it), and abort these steps.
3. If there is an entry in the [application cache](#)<sup>p809</sup>'s [online whitelist](#)<sup>p809</sup> that has the [same origin](#)<sup>p778</sup> as the resource's URL and that is a [prefix match](#)<sup>p58</sup> for the resource's URL, then [fetch](#)<sup>p84</sup> the resource normally and abort these steps.
4. If the resource's URL has the [same origin](#)<sup>p778</sup> as the manifest's URL, and there is a [fallback namespace](#)<sup>p809</sup> *f* in the [application cache](#)<sup>p809</sup> that is a [prefix match](#)<sup>p58</sup> for the resource's URL, then:  
[Fetch](#)<sup>p84</sup> the resource normally. If this results in a redirect to a resource with another [origin](#)<sup>p776</sup> (indicative of a captive portal), or a 4xx or 5xx status code [or equivalent](#)<sup>p83</sup>, or if there were network errors (but not if the user canceled the download), then instead get, from the cache, the resource of the [fallback entry](#)<sup>p809</sup> corresponding to the [fallback namespace](#)<sup>p809</sup> *f*. Abort these steps.
5. If the [application cache](#)<sup>p809</sup>'s [online whitelist wildcard flag](#)<sup>p809</sup> is *open*, then [fetch](#)<sup>p84</sup> the resource normally and abort these steps.
6. Fail the resource load as if there had been a generic network error.

**Note** *The above algorithm ensures that so long as the [online whitelist wildcard flag](#)<sup>p809</sup> is blocking, resources that are not present in the [manifest](#)<sup>p809</sup> will always fail to load (at least, after the [application cache](#)<sup>p809</sup> has been primed the first time), making the testing of offline applications simpler.*

## 7.7.7 Expiring application caches

As a general rule, user agents should not expire application caches, except on request from the user, or after having been left unused for an extended period of time.

Application caches and cookies have similar implications with respect to privacy (e.g. if the site can identify the user when providing the cache, it can store data in the cache that can be used for cookie resurrection). Implementors are therefore encouraged to expose application caches in a manner related to HTTP cookies, allowing caches to be expunged together with cookies and other origin-specific data.

**Example** For example, a user agent could have a "delete site-specific data" feature that clears all cookies, application caches, local storage, databases, etc, from an origin all at once.

## 7.7.8 Disk space

User agents should consider applying constraints on disk usage of [application caches<sup>p809</sup>](#), and care should be taken to ensure that the restrictions cannot be easily worked around using subdomains.

User agents should allow users to see how much space each domain is using, and may offer the user the ability to delete specific [application caches<sup>p809</sup>](#).

For predictability, quotas should be based on the uncompressed size of data stored.

**Note** *How quotas are presented to the user is not defined by this specification. User agents are encouraged to provide features such as allowing a user to indicate that certain sites are trusted to use more than the default quota, e.g. by presenting a non-modal user interface while a cache is being updated, or by having an explicit whitelist in the user agent's configuration interface.*

## 7.7.9 Security concerns with offline applications caches

*This section is non-normative.*

The main risk introduced by offline application caches is that an injection attack can be elevated into persistent site-wide page replacement. This attack involves using an injection vulnerability to upload two files to the victim site. The first file is an application cache manifest consisting of just a fallback entry pointing to the second file, which is an HTML page whose manifest is declared as that first file. Once the user has been directed to that second file, all subsequent accesses to any file covered by the given fallback namespace while either the user or the site is offline will instead show that second file. Targetted denial-of-service attacks or cookie bombing attacks (where the client is made to send so many cookies that the server refuses to process the request) can be used to ensure that the site appears offline.

To mitigate this, manifests can only specify fallbacks that are in the same path as the manifest itself. This means that a content injection upload vulnerability in a particular directory on a server can only be escalated to a take-over of that directory and its subdirectories. If there is no way to inject a file into the root directory, the entire site cannot be taken over.

If a site has been attacked in this way, simply removing the offending manifest might eventually clear the problem, since the next time the manifest is updated, a 404 error will be seen, and the user agent will clear the cache. "Eventually" is the key word here, however; while the attack on the user or server is ongoing, such that connections from an affected user to the affected site are blocked, the user agent will simply assume that the user is offline and will continue to use the hostile manifest. Unfortunately, if a cookie bombing attack has also been used, merely removing the manifest is insufficient; in addition, the server has to be configured to return a 404 or 410 response instead of the 413 "Request Entity Too Large" response.

TLS does not inherently protect a site from this attack, since the attack relies on content being served from the server itself. Not using application caches also does not prevent this attack, since the attack relies on an attacker-provided manifest.

## 7.7.10 Application cache API

**IDL**

```
[Exposed=(Window,SharedWorker)]
interface ApplicationCache : EventTarget {

 // update_status
 const unsigned short UNCACHED = 0;
 const unsigned short IDLE = 1;
 const unsigned short CHECKING = 2;
 const unsigned short DOWNLOADING = 3;
 const unsigned short UPDATEREADY = 4;
 const unsigned short OBSOLETE = 5;
 readonly attribute unsigned short status;

 // updates
 void update();
 void abort();
 void swapCache();
}
```

```

// events
attribute EventHandler onchecking;
attribute EventHandler onerror;
attribute EventHandler onnoupdate;
attribute EventHandler ondownloading;
attribute EventHandler onprogress;
attribute EventHandler onupdateready;
attribute EventHandler oncached;
attribute EventHandler onobsolete;
};

```

### Note

**cache = window.applicationCache<sup>p825</sup>**

(In a window.) Returns the [ApplicationCache<sup>p824</sup>](#) object that applies to the [active document<sup>p762</sup>](#) of that [Window<sup>p768</sup>](#).

**cache = self.applicationCache<sup>p825</sup>**

(In a shared worker.) Returns the [ApplicationCache<sup>p824</sup>](#) object that applies to the current shared worker.

**cache.status<sup>p825</sup>**

Returns the current status of the application cache, as given by the constants defined below.

**cache.update<sup>p826</sup>()**

Invokes the [application cache download process<sup>p816</sup>](#).

Throws an [InvalidStateError<sup>p50</sup>](#) exception if there is no application cache to update.

Calling this method is not usually necessary, as user agents will generally take care of updating [application caches<sup>p809</sup>](#) automatically.

The method can be useful in situations such as long-lived applications. For example, a Web mail application might stay open in a browser tab for weeks at a time. Such an application could want to test for updates each day.

**cache.abort<sup>p826</sup>()**

Cancels the [application cache download process<sup>p816</sup>](#).

This method is intended to be used by Web application showing their own caching progress UI, in case the user wants to stop the update (e.g. because bandwidth is limited).

**cache.swapCache<sup>p826</sup>()**

Switches to the most recent application cache, if there is a newer one. If there isn't, throws an [InvalidStateError<sup>p50</sup>](#) exception.

This does not cause previously-loaded resources to be reloaded; for example, images do not suddenly get reloaded and style sheets and scripts do not get reparsed or reevaluated. The only change is that subsequent requests for cached resources will obtain the newer copies.

The [updateReady<sup>p808</sup>](#) event will fire before this method can be called. Once it fires, the Web application can, at its leisure, call this method to switch the underlying cache to the one with the more recent updates. To make proper use of this, applications have to be able to bring the new features into play; for example, reloading scripts to enable new features.

An easier alternative to [swapCache\(\)<sup>p826</sup>](#) is just to reload the entire page at a time suitable for the user, using [location.reload\(\)<sup>p789</sup>](#).

There is a one-to-one mapping from [cache hosts<sup>p810</sup>](#) to [ApplicationCache<sup>p824</sup>](#) objects. The [applicationCache](#) attribute on [Window<sup>p768</sup>](#) objects must return the [ApplicationCache<sup>p824</sup>](#) object associated with the [Window<sup>p768</sup>](#) object's [active document<sup>p762</sup>](#). The [applicationCache](#) attribute on [SharedWorkerGlobalScope<sup>p924</sup>](#) objects must return the [ApplicationCache<sup>p824</sup>](#) object associated with the worker.

**Note** A [Window<sup>p768</sup>](#) or [SharedWorkerGlobalScope<sup>p924</sup>](#) object has an associated [ApplicationCache<sup>p824</sup>](#) object even if that [cache host<sup>p810</sup>](#) has no actual [application cache<sup>p809</sup>](#).

The [status](#) attribute, on getting, must return the current state of the [application cache<sup>p809</sup>](#) that the [ApplicationCache<sup>p824</sup>](#) object's [cache host<sup>p810</sup>](#) is associated with, if any. This must be the appropriate value from the following list:

#### **UNCACHED** (numeric value 0)

The [ApplicationCache](#) object's [cache host](#) is not associated with an [application cache](#) at this time.

#### **IDLE** (numeric value 1)

The [ApplicationCache](#) object's [cache host](#) is associated with an [application cache](#) whose [application cache group](#)'s [update status](#) is *idle*, and that [application cache](#) is the [newest](#) cache in its [application cache group](#), and the [application cache group](#) is not marked as [obsolete](#).

#### **CHECKING** (numeric value 2)

The [ApplicationCache](#) object's [cache host](#) is associated with an [application cache](#) whose [application cache group](#)'s [update status](#) is *checking*.

#### **DOWNLOADING** (numeric value 3)

The [ApplicationCache](#) object's [cache host](#) is associated with an [application cache](#) whose [application cache group](#)'s [update status](#) is *downloading*.

#### **UPDATEREADY** (numeric value 4)

The [ApplicationCache](#) object's [cache host](#) is associated with an [application cache](#) whose [application cache group](#)'s [update status](#) is *idle*, and whose [application cache group](#) is not marked as [obsolete](#), but that [application cache](#) is *not* the [newest](#) cache in its group.

#### **OBsolete** (numeric value 5)

The [ApplicationCache](#) object's [cache host](#) is associated with an [application cache](#) whose [application cache group](#) is marked as [obsolete](#).

If the [update\(\)](#) method is invoked, the user agent must invoke the [application cache download process](#), in the background, for the [application cache group](#) of the [application cache](#) with which the [ApplicationCache](#) object's [cache host](#) is associated, but without giving that [cache host](#) to the algorithm. If there is no such [application cache](#), or if its [application cache group](#) is marked as [obsolete](#), then the method must throw an [InvalidStateError](#) exception instead.

If the [abort\(\)](#) method is invoked, the user agent must send a signal to the current [application cache download process](#) for the [application cache group](#) of the [application cache](#) with which the [ApplicationCache](#) object's [cache host](#) is associated, if any. If there is no such [application cache](#), or it does not have a current [application cache download process](#), then do nothing.

If the [swapCache\(\)](#) method is invoked, the user agent must run the following steps:

1. Check that [ApplicationCache](#) object's [cache host](#) is associated with an [application cache](#). If it is not, then throw an [InvalidStateError](#) exception and abort these steps.
2. Let *cache* be the [application cache](#) with which the [ApplicationCache](#) object's [cache host](#) is associated. (By definition, this is the same as the one that was found in the previous step.)
3. If *cache*'s [application cache group](#) is marked as [obsolete](#), then unassociate the [ApplicationCache](#) object's [cache host](#) from *cache* and abort these steps. (Resources will now load from the network instead of the cache.)
4. Check that there is an application cache in the same [application cache group](#) as *cache* whose [completeness flag](#) is *complete* and that is [newer](#) than *cache*. If there is not, then throw an [InvalidStateError](#) exception and abort these steps.
5. Let *new cache* be the [newest](#) [application cache](#) in the same [application cache group](#) as *cache* whose [completeness flag](#) is *complete*.
6. Unassociate the [ApplicationCache](#) object's [cache host](#) from *cache* and instead associate it with *new cache*.

The following are the [event handlers](#) (and their corresponding [event handler event types](#)) that must be supported, as [event handler IDL attributes](#), by all objects implementing the [ApplicationCache](#) interface:

<a href="#">Event handler</a>	<a href="#">Event handler event type</a>
<a href="#">onchecking</a>	<a href="#">checking</a>
<a href="#">onerror</a>	<a href="#">error</a>
<a href="#">onoupdate</a>	<a href="#">noupdate</a>

Event handler <sup>p839</sup>	Event handler event type <sup>p839</sup>
ondownloading	downloading <sup>p808</sup>
onprogress	progress <sup>p808</sup>
onupdateready	updateready <sup>p808</sup>
oncached	cached <sup>p808</sup>
onobsolete	obsolete <sup>p808</sup>

## 7.7.11 Browser state

### IDL

```
[NoInterfaceObject, Exposed=(Window,Worker)]
interface NavigatorOnLine {
 readonly attribute boolean onLine;
};
```

### Note

`window.navigatorp858.onLinep827`

Returns false if the user agent is definitely offline (disconnected from the network). Returns true if the user agent might be online.

The events `onlinep1144` and `offlinep1144` are fired when the value of this attribute changes.

Support:	
Chrome	14+
IE	9+
Chrome for Android	40+
Firefox (limited)	4+
iOS Safari	4.2-4.3+
Android Browser	2.3+
UC Browser for Android (limited)	9.9+
Opera Mini	None
Safari	5+
Opera	15+
IE Mobile	10+
Firefox for Android	33+

Source: [caniuse.com](http://caniuse.com)

The `navigator.onLine` attribute must return false if the user agent will not contact the network when the user follows links or when a script requests a remote page (or knows that such an attempt would fail), and must return true otherwise.

When the value that would be returned by the `navigator.onLinep827` attribute of a `Windowp768` or `WorkerGlobalScopep923` changes from true to false, the user agent must `queue a taskp835` to `fire a simple eventp846` named `offlinep1144` at the `Windowp768` or `WorkerGlobalScopep923` object.

On the other hand, when the value that would be returned by the `navigator.onLinep827` attribute of a `Windowp768` or `WorkerGlobalScopep923` changes from false to true, the user agent must `queue a taskp835` to `fire a simple eventp846` named `onlinep1144` at the `Windowp768` or `WorkerGlobalScopep923` object.

The `task sourcep835` for these `tasksp834` is the `networking task sourcep839`.

**Note** This attribute is inherently unreliable. A computer can be connected to a network without having Internet access.

### Example

In this example, an indicator is updated as the browser goes online and offline.

```
<!DOCTYPE HTML>
<html>
<head>
<title>Online status</title>
<script>
 function updateIndicator() {
 document.getElementById('indicator').textContent = navigator.onLine ? 'online' : 'offline';
 }
</script>
</head>
<body onload="updateIndicator()" ononline="updateIndicator()" onoffline="updateIndicator()">
<p>The network is: (state unknown)
</body>
</html>
```

## 8 Web application APIs

Spec bugs: 27212

### 8.1 Scripting

#### 8.1.1 Introduction

Various mechanisms can cause author-provided executable code to run in the context of a document. These mechanisms include, but are probably not limited to:

- Processing of [script<sup>p591</sup>](#) elements.
- Navigating to [javascript: URLs<sup>p792</sup>](#).
- Event handlers, whether registered through the DOM using `addEventListener()`, by explicit [event handler content attributes<sup>p839</sup>](#), by [event handler IDL attributes<sup>p839</sup>](#), or otherwise.
- Processing of technologies like SVG that have their own scripting features.

#### 8.1.2 Enabling and disabling scripting

Scripting is enabled in a [browsing context<sup>p762</sup>](#) when all of the following conditions are true:

- The user agent supports scripting.
- The user has not disabled scripting for this [browsing context<sup>p762</sup>](#) at this time. (User agents may provide users with the option to disable scripting globally, or in a finer-grained manner, e.g. on a per-origin basis.)
- The [browsing context<sup>p762</sup>](#)'s [active document<sup>p762</sup>](#)'s [active sandboxing flag set<sup>p782</sup>](#) does not have its [sandboxed scripts browsing context flag<sup>p780</sup>](#) set.

Scripting is disabled in a [browsing context<sup>p762</sup>](#) when any of the above conditions are false (i.e. when scripting is not [enabled<sup>p828</sup>](#)).

Scripting is enabled for a *node* if the [Document<sup>p102</sup>](#) object of the node (the node itself, if it is itself a [Document<sup>p102</sup>](#) object) has an associated [browsing context<sup>p762</sup>](#), and [scripting is enabled<sup>p828</sup>](#) in that [browsing context<sup>p762</sup>](#).

Scripting is disabled for a node if there is no such [browsing context<sup>p762</sup>](#), or if [scripting is disabled<sup>p828</sup>](#) in that [browsing context<sup>p762</sup>](#).

#### 8.1.3 Processing model

##### 8.1.3.1 Definitions

This specification describes three kinds of [JavaScript global environments<sup>p50</sup>](#): the **document environment**, the **dedicated worker environment**, and the **shared worker environment**. The [dedicated worker environment<sup>p828</sup>](#) and the [shared worker environment<sup>p828</sup>](#) are both types of **worker environments**.

Except where otherwise specified, a [JavaScript global environment<sup>p50</sup>](#) is a [document environment<sup>p828</sup>](#).

A **script** has:

##### A **code entry-point**

A code entry-point represents a block of executable code that the script exposes to other scripts and to the user agent. Typically, the code corresponding to the code entry-point is executed immediately after the script is parsed, but for event handlers, it is called each time the handler is invoked.

**Example** In JavaScript `script`<sup>p591</sup> blocks, this corresponds to the execution context of the global code.

### Optionally, a *muted errors* flag

A flag which, if set, means that error information will not be provided for errors in this script (used to mute errors for cross-origin scripts, since that can leak private information).

### A *settings object*

An [environment settings object](#)<sup>p829</sup>, various settings that are shared with other scripts in the same context.

Spec bugs: [27190](#)

An **environment settings object** specifies algorithms for obtaining the following:

### A *script execution environment* for each language supported by the user agent

The characteristics of the script execution environment depend on the language, and are not defined by this specification.

**Example** In JavaScript, the script execution environment consists of the interpreter, the stack of *execution contexts*, the *global code* and *function code* and the [Function](#)<sup>p49</sup> objects resulting, and so forth.

### A *global object*

An object that provides the APIs that can be called by the code in scripts that use this [settings object](#)<sup>p829</sup>.

**Note** This is typically a [Window](#)<sup>p768</sup> object or a [WorkerGlobalScope](#)<sup>p923</sup> object. When a [global object](#)<sup>p829</sup> is an empty object, it can't do anything that interacts with the environment.

If the [global object](#)<sup>p829</sup> is a [Window](#)<sup>p768</sup> object, then, in JavaScript, the `ThisBinding` of the global execution context for this script must be the [Window](#)<sup>p768</sup> object's [WindowProxy](#)<sup>p775</sup> object, rather than the global object. [ECMA262]<sup>p1150</sup>

**Note** This is a [willful violation](#)<sup>p26</sup> of the JavaScript specification current at the time of writing (ECMAScript edition 5, as defined in section 10.4.1.1 Initial Global Execution Context, step 3). The JavaScript specification requires that the `this` keyword in the global scope return the global object, but this is not compatible with the security design prevalent in implementations as specified herein. [ECMA262]<sup>p1150</sup>

### A *responsible browsing context*

A [browsing context](#)<sup>p762</sup> that is assigned responsibility for actions taken by the scripts that use this [environment settings object](#)<sup>p829</sup>.

**Example** When a script creates and [navigates](#)<sup>p791</sup> a new [top-level browsing context](#)<sup>p763</sup>, the [opener](#)<sup>p764</sup> attribute of the new [browsing context](#)<sup>p762</sup>'s [Window](#)<sup>p768</sup> object will be set to the [responsible browsing context](#)<sup>p829</sup>'s [WindowProxy](#)<sup>p775</sup> object.

### A *responsible event loop*

An [event loop](#)<sup>p834</sup> that is used when it would not be immediately clear what event loop to use.

### A *responsible document*

A [Document](#)<sup>p102</sup> that is assigned responsibility for actions taken by the scripts that use this [environment settings object](#)<sup>p829</sup>.

**Example** For example, the [address](#) of the [responsible document](#)<sup>p829</sup> is used to set the [address](#) of the [Document](#)<sup>p102</sup> after it has been reset using `document.open()`<sup>p848</sup>.

If the [responsible event loop](#)<sup>p829</sup> is not a [browsing context](#)<sup>p762</sup> [event loop](#)<sup>p834</sup>, then the [environment settings object](#)<sup>p829</sup> has no [responsible document](#)<sup>p829</sup>.

### A *referrer source*

Either a [Document](#)<sup>p102</sup> (specifically, the [responsible document](#)<sup>p829</sup>), or a [URL](#)<sup>p48</sup>, which is used by some APIs to determine what value to use for the [Referer](#)<sup>p49</sup> (sic) header in calls to the [fetching](#)<sup>p84</sup> algorithm.

### An *API URL character encoding*

A character encoding used to encode URLs by APIs called by scripts that use this [environment settings object](#)<sup>p829</sup>.

### An *API base URL*

An [absolute URL](#)<sup>p48</sup> used by APIs called by scripts that use this [environment settings object](#)<sup>p829</sup> to resolve [relative URLs](#)<sup>p48</sup>.

## An [origin](#)<sup>p776</sup> and an [effective script origin](#)<sup>p776</sup>

An instrument used in security checks.

The **relevant settings object for a global object**  $o$  is the [environment settings object](#)<sup>p829</sup> whose [global object](#)<sup>p829</sup> is  $o$ . (There is always a 1:1 mapping of global objects to environment settings objects.)

The **relevant settings object for a script**  $s$  is the [settings object](#)<sup>p829</sup> of  $s$ .

### 8.1.3.2 Script settings for browsing contexts

Whenever a new [Window](#)<sup>p768</sup> object is created, it must also create an [environment settings object](#)<sup>p829</sup> whose algorithms are defined as follows:

#### The [script execution environments](#)<sup>p829</sup>

When the [environment settings object](#)<sup>p829</sup> is created, for each language supported by the user agent, create an appropriate execution environment as defined by the relevant specification.

When a [script execution environment](#)<sup>p829</sup> is needed, return the appropriate one from those created when the [environment settings object](#)<sup>p829</sup> was created.

#### The [global object](#)<sup>p829</sup>

Return the [Window](#)<sup>p768</sup> object itself.

#### The [responsible browsing context](#)<sup>p829</sup>

Return the [browsing context](#)<sup>p762</sup> with which the [Window](#)<sup>p768</sup> object is associated.

#### The [responsible event loop](#)<sup>p829</sup>

Return the [event loop](#)<sup>p834</sup> that is associated with the [unit of related similar-origin browsing contexts](#)<sup>p765</sup> to which the [Window](#)<sup>p768</sup> object's [browsing context](#)<sup>p762</sup> belongs.

#### The [responsible document](#)<sup>p829</sup>

Return the [Document](#)<sup>p102</sup> with which the [Window](#)<sup>p768</sup> is currently associated.

#### The [referrer source](#)<sup>p829</sup>

Return the [Document](#)<sup>p102</sup> with which the [Window](#)<sup>p768</sup> is currently associated.

#### The [API URL character encoding](#)<sup>p829</sup>

Return the current [character encoding](#)<sup>p51</sup> of the [Document](#)<sup>p102</sup> with which the [Window](#)<sup>p768</sup> is currently associated.

#### The [API base URL](#)<sup>p829</sup>

Return the current [base URL](#)<sup>p82</sup> of the [Document](#)<sup>p102</sup> with which the [Window](#)<sup>p768</sup> is currently associated.

#### The [origin](#)<sup>p776</sup>

Return the [origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup> with which the [Window](#)<sup>p768</sup> is currently associated.

#### The [effective script origin](#)<sup>p776</sup>

Return the [effective script origin](#)<sup>p776</sup> of the [Document](#)<sup>p102</sup> with which the [Window](#)<sup>p768</sup> is currently associated.

### 8.1.3.3 Calling scripts

Each [unit of related similar-origin browsing contexts](#)<sup>p765</sup> has a **stack of script settings objects**, which must be initially empty. When a new [environment settings object](#)<sup>p829</sup> is *pushed* onto this stack, the specified [environment settings object](#)<sup>p829</sup> is to be added to the stack; when the [environment settings object](#)<sup>p829</sup> on this stack that was most recently pushed onto it is to be *popped* from the stack, it must be removed. Entries on this stack can be labeled as **candidate entry settings objects**.

When a user agent is to **jump to a code entry-point** for a [script](#)<sup>p828</sup>  $s$ , the user agent must run the following steps:

1. Let `context` be the [settings object](#)<sup>p829</sup> of `s`.
2. [Prepare to run a callback](#)<sup>p831</sup> with `context` as the [environment settings object](#)<sup>p829</sup>. If this returns "do not run" then abort these steps.
3. Make the appropriate [script execution environment](#)<sup>p829</sup> specified by `context` execute the `s`'s [code entry-point](#)<sup>p828</sup>.
4. [Clean up after running a callback](#)<sup>p831</sup>.

The steps to **prepare to run a callback** with an [environment settings object](#)<sup>p829</sup> `o` are as follows. They return either "run" or "do not run".

1. If the [global object](#)<sup>p829</sup> specified by `o` is a [Window](#)<sup>p768</sup> object whose [Document](#)<sup>p102</sup> object is not [fully active](#)<sup>p763</sup>, then return "do not run" and abort these steps.
2. If [scripting is disabled](#)<sup>p828</sup> for the [responsible browsing context](#)<sup>p829</sup> specified by `o`, then return "do not run" and abort these steps.
3. Push `o` onto the [stack of script settings objects](#)<sup>p830</sup>, and label it as a [candidate entry settings object](#)<sup>p830</sup>.
4. Return "run".

The steps to **clean up after running a callback** are as follows:

1. Pop the current [incumbent settings object](#)<sup>p831</sup> from the [stack of script settings objects](#)<sup>p830</sup>.
2. If the [stack of script settings objects](#)<sup>p830</sup> is now empty, [run the global script clean-up jobs](#)<sup>p832</sup>. (These cannot run scripts.)
3. If the [stack of script settings objects](#)<sup>p830</sup> is now empty, [perform a microtask checkpoint](#)<sup>p837</sup>. (If this runs scripts, these algorithms will be invoked reentrantly.)

**Note** *These algorithms are not invoked by one script directly calling another, but they can be invoked reentrantly in an indirect manner, e.g. if a script dispatches an event which has event listeners registered.*

When a JavaScript `SourceElements` production is to be evaluated, the [settings object](#)<sup>p829</sup> of the [script](#)<sup>p828</sup> corresponding to that `SourceElements` must be pushed onto the [stack of script settings objects](#)<sup>p830</sup> before the evaluation begins, and popped when the evaluation ends (regardless of whether it's an abrupt completion or not).

The **entry settings object** is the most-recently added [environment settings object](#)<sup>p829</sup> in the [stack of script settings objects](#)<sup>p830</sup> that is labeled as a [candidate entry settings object](#)<sup>p830</sup>. If the stack is empty, or has no entries labeled as such, then there is no [entry settings object](#)<sup>p831</sup>. It is used to obtain, amongst other things, the [API base URL](#)<sup>p829</sup> to [resolve](#)<sup>p82</sup> relative [URLs](#)<sup>p48</sup> used in scripts running in that [unit of related similar-origin browsing contexts](#)<sup>p765</sup>.

The **incumbent settings object** is the [environment settings object](#)<sup>p829</sup> in the [stack of script settings objects](#)<sup>p830</sup> that was most-recently added (i.e. the last one on the stack). If the stack is empty, then there is no [incumbent settings object](#)<sup>p831</sup>. It is used in some security checks.

**Note** *The Web IDL specification also uses these algorithms. [WEBIDL]<sup>p1154</sup>*

### Example

Consider the following two pages, with the first being loaded in a browser window and the second being loaded in the [iframe](#)<sup>p299</sup> of the first:

```
<!-- a/a.html -->
<!DOCTYPE HTML>
<title>Outer page</title>
<iframe src=".../b/b.html"></iframe>
<input type=button onclick="frames[0].hello()" value="Hello">

<!-- b/b.html -->
<!DOCTYPE HTML>
<title>Inner page</title>
<script>
 function hello() {
 location.assign('c.html');
 }
</script>
```

When the button is pressed in the inner frame, the outer page runs script in the inner page. While the `hello()` function is running, the [entry settings object](#)<sup>p831</sup> is that of the outer file (`a/a.html`), and the [incumbent settings object](#)<sup>p831</sup> is that of the inner file (`b/b.html`). The `assign()`<sup>p788</sup> method uses the [entry settings object](#)<sup>p831</sup> to resolve the URL, so we end up loading `a/c.html`, but it uses the [incumbent settings object](#)<sup>p831</sup> to establish the [source browsing context](#)<sup>p791</sup>, from which the referrer is established, so the [Referer](#)<sup>p49</sup> header sent with the request for `a/c.html` specifies the inner file's URL (the one ending with `b/b.html`).

Each [unit of related similar-origin browsing contexts](#)<sup>p765</sup> has a **global script clean-up jobs list**, which must initially be empty. A global script clean-up job cannot run scripts, and cannot be sensitive to the order in which other clean-up jobs are executed. The File API uses this to release [blob:](#) URLs. [\[FILEAPI\]](#)<sup>p1150</sup>

When the user agent is to **run the global script clean-up jobs**, the user agent must perform each of the jobs in the [global script clean-up jobs list](#)<sup>p832</sup> and then empty the list.

#### 8.1.3.4 Creating scripts

When the specification says that a [script](#)<sup>p828</sup> is to be **created**, given some script source, a script source URL, its scripting language, an [environment settings object](#)<sup>p829</sup>, and optionally a *muted errors* flag, the user agent must run the following steps:

1. Let `script` be a new [script](#)<sup>p828</sup> that this algorithm will subsequently initialise.
2. If [scripting is disabled](#)<sup>p828</sup> for [browsing context](#)<sup>p762</sup> passed to this algorithm, then abort these steps, as if the script source described a program that did nothing but return void.
3. Obtain the appropriate [script execution environment](#)<sup>p829</sup> for the given scripting language from the [environment settings object](#)<sup>p829</sup> provided.
4. Parse/compile/initialise the source of the script using the [script execution environment](#)<sup>p829</sup>, as appropriate for the scripting language, and thus obtain `script`'s [code entry-point](#)<sup>p828</sup>.
5. Let `script`'s [settings object](#)<sup>p829</sup> be the [environment settings object](#)<sup>p829</sup> provided.
6. If the *muted errors* flag was set, then set `script`'s [muted errors](#)<sup>p829</sup> flag.
7. If all the steps above succeeded (in particular, if the script was compiled successfully), [Jump](#)<sup>p830</sup> to `script`'s [code entry-point](#)<sup>p828</sup>.

Otherwise, [report the error](#)<sup>p833</sup> for `script`, with the problematic position (line number and column number), using the [global object](#)<sup>p829</sup> specified by the [environment settings object](#)<sup>p829</sup> as the target. If the error is still [not handled](#)<sup>p833</sup> after this, then the error may be reported to the user.

#### 8.1.3.5 Killing scripts

User agents may impose resource limitations on scripts, for example CPU quotas, memory limits, total execution time limits, or bandwidth limitations. When a script exceeds a limit, the user agent may either throw a [QuotaExceededError](#)<sup>p50</sup> exception, abort the script without an exception, prompt the user, or throttle script execution.

##### Example

For example, the following script never terminates. A user agent could, after waiting for a few seconds, prompt the user to either terminate the script or let it continue.

```
<script>
 while (true) { /* loop */ }
</script>
```

User agents are encouraged to allow users to disable scripting whenever the user is prompted either by a script (e.g. using the `window.alert()`<sup>p855</sup> API) or because of a script's actions (e.g. because it has exceeded a time limit).

If scripting is disabled while a script is executing, the script should be terminated immediately.

User agents may allow users to specifically disable scripts just for the purposes of closing a [browsing context](#)<sup>p762</sup>.

**Example** For example, the prompt mentioned in the example above could also offer the user with a mechanism to just close the page entirely, without running any [unload](#)<sup>p1145</sup> event handlers.

Spec bugs: [27459](#), [27460](#)

### 8.1.3.6 Runtime script errors

When the user agent is required to **report an error** for a particular [script](#)<sup>p828</sup> *script* with a particular position *line:col*, using a particular *target target* it must run these steps, after which the error is either **handled** or **not handled**:

p30

1. If *target* is [in error reporting mode](#)<sup>p833</sup>, then abort these steps; the error is [not handled](#)<sup>p833</sup>.
2. Let *target* be [in error reporting mode](#).
3. Let *message* be a user-agent-defined string describing the error in a helpful manner.
4. Let *error object* be the object that represents the error: in the case of an uncaught exception, that would be the object that was thrown; in the case of a JavaScript error that would be an [Error](#)<sup>p49</sup> object. If there is no corresponding object, then the null value must be used instead.
5. Let *location* be an [absolute URL](#)<sup>p48</sup> that corresponds to the resource from which *script* was obtained.

**Note** The resource containing the script will typically be the file from which the [Document](#)<sup>p102</sup> was parsed, e.g. for inline [script](#)<sup>p591</sup> elements or [event handler content attributes](#)<sup>p839</sup>; or the JavaScript file that the script was in, for external scripts. Even for dynamically-generated scripts, user agents are strongly encouraged to attempt to keep track of the original source of a script. For example, if an external script uses the [document.write\(\)](#)<sup>p851</sup> API to insert an inline [script](#)<sup>p591</sup> element during parsing, the URL of the resource containing the script would ideally be reported as being the external script, and the line number might ideally be reported as the line with the [document.write\(\)](#)<sup>p851</sup> call or where the string passed to that call was first constructed. Naturally, implementing this can be somewhat non-trivial.

**Note** User agents are similarly encouraged to keep careful track of the original line numbers, even in the face of [document.write\(\)](#)<sup>p851</sup> calls mutating the document as it is parsed, or [event handler content attributes](#)<sup>p839</sup> spanning multiple lines.

6. If *script* has [muted errors](#)<sup>p829</sup>, then set *message* to "Script error.", set *location* to the empty string, set *line* and *col* to 0, and set *error object* to null.
7. Let *event* be a new [trusted](#)<sup>p43</sup> [ErrorEvent](#)<sup>p834</sup> object that does not bubble but is cancelable, and which has the event name [error](#)<sup>p1144</sup>.
8. Initialise *event's* [message](#)<sup>p834</sup> attribute to *message*.
9. Initialise *event's* [filename](#)<sup>p834</sup> attribute to *location*.
10. Initialise *event's* [lineno](#)<sup>p834</sup> attribute to *line*.
11. Initialise *event's* [colno](#)<sup>p834</sup> attribute to *col*.
12. Initialise *event's* [error](#)<sup>p834</sup> attribute to *error object*.
13. [Dispatch](#)<sup>p43</sup> *event* at *target*.
14. Let *target* no longer be [in error reporting mode](#)<sup>p833</sup>.
15. If *event* was canceled, then the error is [handled](#)<sup>p833</sup>. Otherwise, the error is [not handled](#)<sup>p833</sup>.

#### 8.1.3.6.1 Runtime script errors in documents

When the user agent is to **report an exception** *E*, the user agent must [report the error](#)<sup>p833</sup> for the relevant [script](#)<sup>p828</sup>, with the problematic position (line number and column number) in the resource containing the script, using the [global object](#)<sup>p829</sup> specified by the script's [settings object](#)<sup>p829</sup> as the target. If the error is still [not handled](#)<sup>p833</sup> after this, then the error may be reported to the user.

When an exception is thrown during the execution of one of the scripts associated with a [Document](#)<sup>p102</sup>, and the exception is not caught, the user agent must [report the exception](#)<sup>p833</sup>.

## IDL

```
[Constructor(DOMString type, optional ErrorEventInit eventInitDict), Exposed=(Window,Worker)]
interface ErrorEvent : Event {
 readonly attribute DOMString message;
 readonly attribute DOMString filename;
 readonly attribute unsigned long lineno;
 readonly attribute unsigned long colno;
 readonly attribute any error;
};

dictionary ErrorEventInit : EventInit {
 DOMString message;
 DOMString filename;
 unsigned long lineno;
 unsigned long colno;
 any error;
};
```

The [message](#) attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to the empty string. It represents the error message.

The [filename](#) attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to the empty string. It represents the [absolute URL](#)<sup>p48</sup> of the script in which the error originally occurred.

The [lineno](#) attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to zero. It represents the line number where the error occurred in the script.

The [colno](#) attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to zero. It represents the column number where the error occurred in the script.

The [error](#) attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. Where appropriate, it is set to the object representing the error (e.g. the exception object in the case of an uncaught DOM exception).

## 8.1.4 Event loops

### 8.1.4.1 Definitions

To coordinate events, user interaction, scripts, rendering, networking, and so forth, user agents must use **event loops** as described in this section. There are two kinds of event loops: those for [browsing contexts](#)<sup>p762</sup>, and those for [workers](#)<sup>p911</sup>.

There must be at least one [browsing context](#)<sup>p762</sup> [event loop](#)<sup>p834</sup> per user agent, and at most one per [unit of related similar-origin browsing contexts](#)<sup>p765</sup>.

**Note** When there is more than one [event loop](#)<sup>p834</sup> for a [unit of related browsing contexts](#)<sup>p765</sup>, complications arise when a [browsing context](#)<sup>p762</sup> in that group is navigated<sup>p791</sup> such that it switches from one [unit of related similar-origin browsing contexts](#)<sup>p765</sup> to another. This specification does not currently describe how to handle these complications.

A [browsing context](#)<sup>p762</sup> [event loop](#)<sup>p834</sup> always has at least one [browsing context](#)<sup>p762</sup>. If such an [event loop](#)<sup>p834</sup>'s [browsing contexts](#)<sup>p762</sup> all go away, then the [event loop](#)<sup>p834</sup> goes away as well. A [browsing context](#)<sup>p762</sup> always has an [event loop](#)<sup>p834</sup> coordinating its activities.

[Worker event loops](#)<sup>p925</sup> are simpler: each worker has one [event loop](#)<sup>p834</sup>, and the [worker processing model](#)<sup>p926</sup> manages the [event loop](#)<sup>p834</sup>'s lifetime.

An [event loop](#)<sup>p834</sup> has one or more **task queues**. A [task queue](#)<sup>p834</sup> is an ordered list of **tasks**, which are algorithms that are responsible for such work as:

#### Events

Dispatching an [Event](#)<sup>p51</sup> object at a particular [EventTarget](#)<sup>p51</sup> object is often done by a dedicated task.

**Note** Not all events are dispatched using the [task queue<sup>p834</sup>](#), many are dispatched during other tasks.

## Parsing

The [HTML parser<sup>p952</sup>](#) tokenizing one or more bytes, and then processing any resulting tokens, is typically a task.

## Callbacks

Calling a callback is often done by a dedicated task.

## Using a resource

When an algorithm [fetches<sup>p84</sup>](#) a resource, if the fetching occurs in a non-blocking fashion then the processing of the resource once some or all of the resource is available is performed by a task.

## Reacting to DOM manipulation

Some elements have tasks that trigger in response to DOM manipulation, e.g. when that element is [inserted into the document<sup>p42</sup>](#).

Each [task<sup>p834</sup>](#) in a [browsing context<sup>p762</sup> event loop<sup>p834</sup>](#) is associated with a [Document<sup>p102</sup>](#); if the task was queued in the context of an element, then it is the element's [node document](#); if the task was queued in the context of a [browsing context<sup>p762</sup>](#), then it is the [browsing context<sup>p762</sup>'s active document<sup>p762</sup>](#) at the time the task was queued; if the task was queued by or for a [script<sup>p828</sup>](#) then the document is the [responsible document<sup>p829</sup>](#) specified by the script's [settings object<sup>p829</sup>](#).

A [task<sup>p834</sup>](#) is intended for a specific [event loop<sup>p834</sup>](#): the [event loop<sup>p834</sup>](#) that is handling [tasks<sup>p834</sup>](#) for the [task<sup>p834</sup>](#)'s associated [Document<sup>p102</sup>](#) or [worker<sup>p911</sup>](#).

When a user agent is to **queue a task**, it must add the given task to one of the [task queues<sup>p834</sup>](#) of the relevant [event loop<sup>p834</sup>](#).

Each [task<sup>p834</sup>](#) is defined as coming from a specific **task source**. All the tasks from one particular [task source<sup>p835</sup>](#) and destined to a particular [event loop<sup>p834</sup>](#) (e.g. the callbacks generated by timers of a [Document<sup>p102</sup>](#), the events fired for mouse movements over that [Document<sup>p102</sup>](#), the tasks queued for the parser of that [Document<sup>p102</sup>](#)) must always be added to the same [task queue<sup>p834</sup>](#), but [tasks<sup>p834</sup>](#) from different [task sources<sup>p835</sup>](#) may be placed in different [task queues<sup>p834</sup>](#).

**Example** For example, a user agent could have one [task queue<sup>p834</sup>](#) for mouse and key events (the [user interaction task source<sup>p838</sup>](#)), and another for everything else. The user agent could then give keyboard and mouse events preference over other tasks three quarters of the time, keeping the interface responsive but not starving other task queues, and never processing events from any one [task source<sup>p835</sup>](#) out of order.

Each [event loop<sup>p834</sup>](#) has a **currently running task**. Initially, this is null. It is used to handle reentrancy. Each [event loop<sup>p834</sup>](#) also has a **performing a microtask checkpoint** flag, which must initially be false. It is used to prevent reentrant invocation of the [perform a microtask checkpoint<sup>p837</sup>](#) algorithm.

A user agent may have one **storage mutex**. This mutex is used to control access to shared state like cookies. At any one point, the [storage mutex<sup>p835</sup>](#) is either free, or owned by a particular [event loop<sup>p834</sup>](#) or instance of the [fetching<sup>p84</sup>](#) algorithm.

If a user agent does not implement a [storage mutex<sup>p835</sup>](#), it is exempt from implementing the requirements that require it to acquire or release it.

**Note** User agent implementors have to make a choice between two evils. On the one hand, not implementing the storage mutex means that there is a risk of data corruption: a site could, for instance, try to read a cookie, increment its value, then write it back out, using the new value of the cookie as a unique identifier for the session; if the site does this twice in two different browser windows at the same time, it might end up using the same "unique" identifier for both sessions, with potentially disastrous effects. On the other hand, implementing the storage mutex has potentially serious performance implications: whenever a site uses Web Storage or cookies, all other sites that try to use Web Storage or cookies are blocked until the first site finishes.

**⚠ Warning!** So far, all browsers faced with this decision have opted to not implement the [storage mutex<sup>p835</sup>](#).

Whenever a [script<sup>p828</sup>](#) calls into a [plugin<sup>p43</sup>](#), and whenever a [plugin<sup>p43</sup>](#) calls into a [script<sup>p828</sup>](#), the user agent must release the [storage mutex<sup>p835</sup>](#).

### 8.1.4.2 Processing model

An [event loop<sup>p834</sup>](#) must continually run through the following steps for as long as it exists:

- Select the oldest [task](#)<sup>p834</sup> on one of the [event loop](#)<sup>p834</sup>'s [task queues](#)<sup>p834</sup>, if any, ignoring, in the case of a [browsing context](#)<sup>p762</sup> [event loop](#)<sup>p834</sup>, tasks whose associated [Document](#)<sup>p102</sup>s are not [fully active](#)<sup>p763</sup>. The user agent may pick any [task queue](#)<sup>p834</sup>. If there is no task to select, then jump to the *microtasks* step below.
- Set the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup> to the [task](#)<sup>p834</sup> selected in the previous step.
- Run*: Run the selected [task](#)<sup>p834</sup>.
- Set the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup> back to null.
- If the [storage mutex](#)<sup>p835</sup> is now owned by the [event loop](#)<sup>p834</sup>, release it so that it is once again free.
- Remove the task that was run in the *run* step above from its [task queue](#)<sup>p834</sup>.
- Microtasks*: [Perform a microtask checkpoint](#)<sup>p837</sup>.
- Update the rendering*: If this [event loop](#)<sup>p834</sup> is a [browsing context](#)<sup>p762</sup> [event loop](#)<sup>p834</sup> (as opposed to a [worker](#)<sup>p911</sup> [event loop](#)<sup>p834</sup>), then run the following substeps.
  - Let [now](#) be the value that would be returned by the [Performance](#)<sup>p52</sup> object's [now\(\)](#)<sup>p52</sup> method. [\[HRT\]](#)<sup>p1150</sup>
  - Let [docs](#) be the list of [Document](#)<sup>p102</sup> objects associated with the [event loop](#)<sup>p834</sup> in question, sorted arbitrarily except that the following conditions must be met:
    - Any [Document](#)<sup>p102</sup> [B](#) that is nested through a [Document](#)<sup>p102</sup> [A](#) must be listed after [A](#) in the list.
    - If there are two documents [A](#) and [B](#) whose [browsing contexts](#)<sup>p762</sup> are both [nested browsing contexts](#)<sup>p763</sup> and their [browsing context containers](#)<sup>p763</sup> are both elements in the same [Document](#)<sup>p102</sup> [C](#), then the order of [A](#) and [B](#) in the list must match the relative [tree order](#)<sup>p42</sup> of their respective [browsing context containers](#)<sup>p763</sup> in [C](#).

In the steps below that iterate over [docs](#), each [Document](#)<sup>p102</sup> must be processed in the order it is found in the list.

  - If there is a [top-level browsing context](#)<sup>p763</sup> [B](#) that the user agent believes would not benefit from having its rendering updated at this time, then remove from [docs](#) all [Document](#)<sup>p102</sup> objects whose [browsing context](#)<sup>p762</sup>'s [top-level browsing context](#)<sup>p763</sup> is [B](#).

**Note** Whether a [top-level browsing context](#)<sup>p763</sup> would benefit from having its rendering updated depends on various factors, such as the update frequency. For example, if the browser is attempting to achieve a 60 Hz refresh rate, then these steps are only necessary every 60th of a second (about 16.7ms). If the browser finds that a [top-level browsing context](#)<sup>p763</sup> is not able to sustain this rate, it might drop to a more sustainable 30Hz for that set of [Document](#)<sup>p102</sup>s, rather than occasionally dropping frames. (This specification does not mandate any particular model for when to update the rendering.) Similarly, if a [top-level browsing context](#)<sup>p763</sup> is in the background, the user agent might decide to drop that page to a much slower 4Hz, or even less.

  - For each [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> in [docs](#), [run the resize steps](#) for that [Document](#)<sup>p102</sup>, passing in [now](#) as the timestamp. [\[CSSOMVIEW\]](#)<sup>p1149</sup> Spec bugs: [27483](#)
  - For each [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> in [docs](#), [run the scroll steps](#) for that [Document](#)<sup>p102</sup>, passing in [now](#) as the timestamp. [\[CSSOMVIEW\]](#)<sup>p1149</sup>
  - For each [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> in [docs](#), [evaluate media queries and report changes](#) for that [Document](#)<sup>p102</sup>, passing in [now](#) as the timestamp. [\[CSSOMVIEW\]](#)<sup>p1149</sup>
  - For each [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> in [docs](#), [run CSS animations and send events](#) for that [Document](#)<sup>p102</sup>, passing in [now](#) as the timestamp. [\[CSSANIMATIONS\]](#)<sup>p1149</sup>
  - For each [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> in [docs](#), [run the fullscreen rendering steps](#) for that [Document](#)<sup>p102</sup>, passing in [now](#) as the timestamp. [\[FULLSCREEN\]](#)<sup>p1150</sup> Spec bugs: [28001](#)
  - For each [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> in [docs](#), [run the animation frame callbacks](#)<sup>p879</sup> for that [Document](#)<sup>p102</sup>, passing in [now](#) as the timestamp.
  - For each [fully active](#)<sup>p763</sup> [Document](#)<sup>p102</sup> in [docs](#), update the rendering or user interface of that [Document](#)<sup>p102</sup> and its [browsing context](#)<sup>p762</sup> to reflect the current state.

9. If this is a [worker](#)<sup>p911</sup> [event loop](#)<sup>p834</sup> (i.e. one running for a [WorkerGlobalScope](#)<sup>p923</sup>), but there are no [tasks](#)<sup>p834</sup> in the [event loop](#)<sup>p834</sup>'s [task queues](#)<sup>p834</sup> and the [WorkerGlobalScope](#)<sup>p923</sup> object's [closing](#)<sup>p925</sup> flag is true, then destroy the [event loop](#)<sup>p834</sup>, aborting these steps, resuming the [run a worker](#)<sup>p926</sup> steps described in the Web Workers section below.
10. Return to the [first step](#)<sup>p836</sup> of the [event loop](#)<sup>p834</sup>.

Each [event loop](#)<sup>p834</sup> has a **microtask queue**. A **microtask** is a [task](#)<sup>p834</sup> that is originally to be queued on the [microtask queue](#)<sup>p837</sup> rather than a [task queue](#)<sup>p834</sup>. There are two kinds of [microtasks](#)<sup>p837</sup>: **solitary callback microtasks**, and **compound microtasks**.

**Note** *This specification only has [solitary callback microtasks](#)<sup>p837</sup>. Specifications that use [compound microtasks](#)<sup>p837</sup> have to take extra care to [wrap callbacks](#)<sup>p837</sup> to handle [spinning the event loop](#)<sup>p838</sup>.*

When an algorithm requires a [microtask](#)<sup>p837</sup> to be **queued**, it must be appended to the relevant [event loop](#)<sup>p834</sup>'s [microtask queue](#)<sup>p837</sup>; the [task source](#)<sup>p835</sup> of such a [microtask](#)<sup>p837</sup> is the **microtask task source**.

**Note** *It is possible for a [microtask](#)<sup>p837</sup> to be moved to a regular [task queue](#)<sup>p834</sup>, if, during its initial execution, it [spins the event loop](#)<sup>p838</sup>. In that case, the [microtask task source](#)<sup>p837</sup> is the [task source](#)<sup>p835</sup> used. Normally, the [task source](#)<sup>p835</sup> of a [microtask](#)<sup>p837</sup> is irrelevant.*

When a user agent is to **perform a microtask checkpoint**, if the [performing a microtask checkpoint](#)<sup>p835</sup> flag is false, then the user agent must run the following steps:

1. Let the [performing a microtask checkpoint](#)<sup>p835</sup> flag be true.
2. **Microtask queue handling:** If the [event loop](#)<sup>p834</sup>'s [microtask queue](#)<sup>p837</sup> is empty, jump to the **done** step below.
3. Select the oldest [microtask](#)<sup>p837</sup> on the [event loop](#)<sup>p834</sup>'s [microtask queue](#)<sup>p837</sup>.
4. Set the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup> to the [task](#)<sup>p834</sup> selected in the previous step.
5. **Run:** Run the selected [task](#)<sup>p834</sup>.
 

**Note** *This might involve invoking scripted callbacks, which eventually calls the [clean up after running a callback](#)<sup>p831</sup> steps, which call this [perform a microtask checkpoint](#)<sup>p837</sup> algorithm again, which is why we use the [performing a microtask checkpoint](#)<sup>p835</sup> flag to avoid reentrancy.*
6. Set the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup> back to null.
7. If the [storage mutex](#)<sup>p835</sup> is now owned by the [event loop](#)<sup>p834</sup>, release it so that it is once again free.
8. Remove the [microtask](#)<sup>p837</sup> run in the step above from the [microtask queue](#)<sup>p837</sup>, and return to the **microtask queue handling** step.
9. **Done:** Let the [performing a microtask checkpoint](#)<sup>p835</sup> flag be false.

If, while a [compound microtask](#)<sup>p837</sup> is running, the user agent is required to **execute a compound microtask subtask** to run a series of steps, the user agent must run the following steps:

1. Let **parent** be the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup> (the currently running [compound microtask](#)<sup>p837</sup>).
2. Let **subtask** be a new [task](#)<sup>p834</sup> that consists of running the given series of steps. The [task source](#)<sup>p835</sup> of such a [microtask](#)<sup>p837</sup> is the [microtask task source](#)<sup>p837</sup>. This is a **compound microtask subtask**.
3. Set the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup> to **subtask**.
4. Run **subtask**.
5. Set the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup> back to **parent**.

When an algorithm running [in parallel](#)<sup>p41</sup> is to **await a stable state**, the user agent must [queue a microtask](#)<sup>p837</sup> that runs the following steps, and must then stop executing (execution of the algorithm resumes when the microtask is run, as described in the following steps):

1. Run the algorithm's **synchronous section**.
2. Resumes execution of the algorithm [in parallel](#)<sup>p41</sup>, if appropriate, as described in the algorithm's steps.

Note Steps in [synchronous sections](#)<sup>p837</sup> are marked with .

When an algorithm says to **spin the event loop** until a condition *goal* is met, the user agent must run the following steps:

1. Let *task* be the [event loop](#)<sup>p834</sup>'s [currently running task](#)<sup>p835</sup>.

**Note** This might be a [microtask](#)<sup>p837</sup>, in which case it is a [solitary callback microtask](#)<sup>p837</sup>. It could also be a [compound microtask subtask](#)<sup>p837</sup>, or a regular [task](#)<sup>p834</sup> that is not a [microtask](#)<sup>p837</sup>. It will not be a [compound microtask](#)<sup>p837</sup>.

2. Let *task source* be *task*'s [task source](#)<sup>p835</sup>.
3. Let *old stack of script settings objects* be a copy of the [stack of script settings objects](#)<sup>p830</sup>.
4. Empty the [stack of script settings objects](#)<sup>p830</sup>.
5. [Run the global script clean-up jobs](#)<sup>p832</sup>.
6. [Perform a microtask checkpoint](#)<sup>p837</sup>.
7. Stop *task*, allowing whatever algorithm that invoked it to resume, but continue these steps [in parallel](#)<sup>p41</sup>.

**Note** This causes one of the following algorithms to continue: the [event loop](#)<sup>p834</sup>'s main set of steps, the [perform a microtask checkpoint](#)<sup>p837</sup> algorithm, or the [execute a compound microtask subtask](#)<sup>p837</sup> algorithm to continue.

8. Wait until the condition *goal* is met.
9. [Queue a task](#)<sup>p835</sup> to continue running these steps, using the [task source](#)<sup>p835</sup> *task source*. Wait until this new task runs before continuing these steps.
10. Replace the [stack of script settings objects](#)<sup>p830</sup> with the *old stack of script settings objects*.
11. Return to the caller.

Some of the algorithms in this specification, for historical reasons, require the user agent to **pause** while running a [task](#)<sup>p834</sup> until a condition *goal* is met. This means running the following steps:

1. If necessary, update the rendering or user interface of any [Document](#)<sup>p102</sup> or [browsing context](#)<sup>p762</sup> to reflect the current state.
2. Wait until the condition *goal* is met. While a user agent has a paused [task](#)<sup>p834</sup>, the corresponding [event loop](#)<sup>p834</sup> must not run further [tasks](#)<sup>p834</sup>, and any script in the currently running [task](#)<sup>p834</sup> must block. User agents should remain responsive to user input while paused, however, albeit in a reduced capacity since the [event loop](#)<sup>p834</sup> will not be doing anything.

When a user agent is to **obtain the storage mutex** as part of running a [task](#)<sup>p834</sup>, it must run through the following steps:

1. If the [storage mutex](#)<sup>p835</sup> is already owned by this [task](#)<sup>p834</sup>'s [event loop](#)<sup>p834</sup>, then abort these steps.
2. Otherwise, [pause](#)<sup>p838</sup> until the [storage mutex](#)<sup>p835</sup> can be taken by the [event loop](#)<sup>p834</sup>.
3. Take ownership of the [storage mutex](#)<sup>p835</sup>.

#### 8.1.4.3 Generic task sources

The following [task sources](#)<sup>p835</sup> are used by a number of mostly unrelated features in this and other specifications.

##### The **DOM manipulation task source**

This [task source](#)<sup>p835</sup> is used for features that react to DOM manipulations, such as things that happen in a non-blocking fashion when an element is [inserted into the document](#)<sup>p42</sup>.

##### The **user interaction task source**

This [task source](#)<sup>p835</sup> is used for features that react to user interaction, for example keyboard or mouse input.

Events sent in response to user input (e.g. `click`<sup>p52</sup> events) must be fired using `tasks`<sup>p834</sup> queued<sup>p835</sup> with the [user interaction task source](#)<sup>p838</sup>. [\[DOMEVENTS\]](#)<sup>p1149</sup>

### The **networking task source**

This [task source](#)<sup>p835</sup> is used for features that trigger in response to network activity.

### The **history traversal task source**

This [task source](#)<sup>p835</sup> is used to queue calls to `history.back()`<sup>p784</sup> and similar APIs.

## 8.1.5 Events

### 8.1.5.1 Event handlers

Spec bugs: [27274](#)

Many objects can have **event handlers** specified. These act as non-capture event listeners for the object on which they are specified. [\[DOM\]](#)<sup>p1149</sup>

An [event handler](#)<sup>p839</sup> has a name, which always starts with "on" and is followed by the name of the event for which it is intended.

An [event handler](#)<sup>p839</sup> can either have the value null, or be set to a callback object, or be set to an [internal raw uncompiled handler](#)<sup>p841</sup>. The [EventHandler](#)<sup>p841</sup> callback function type describes how this is exposed to scripts. Initially, event handlers must be set to null.

Event handlers are exposed in one of two ways.

The first way, common to all event handlers, is as an [event handler IDL attribute](#)<sup>p839</sup>.

The second way is as an [event handler content attribute](#)<sup>p839</sup>. Event handlers on [HTML elements](#)<sup>p42</sup> and some of the event handlers on [Window](#)<sup>p768</sup> objects are exposed in this way.

An **event handler IDL attribute** is an IDL attribute for a specific [event handler](#)<sup>p839</sup>. The name of the IDL attribute is the same as the name of the [event handler](#)<sup>p839</sup>.

[Event handler IDL attributes](#)<sup>p839</sup>, on setting, must set the corresponding [event handler](#)<sup>p839</sup> to their new value, and on getting, must return the result of [getting the current value of the event handler](#)<sup>p841</sup> in question (this can throw an exception, in which case the getting propagates it to the caller, it does not catch it).

If an [event handler IDL attribute](#)<sup>p839</sup> exposes an [event handler](#)<sup>p839</sup> of an object that doesn't exist, it must always return null on getting and must do nothing on setting.

**Note** This can happen in particular for [event handler IDL attribute](#)<sup>p839</sup> on [body](#)<sup>p157</sup> elements that do not have corresponding [Window](#)<sup>p768</sup> objects.

**Note** Certain event handler IDL attributes have additional requirements, in particular the [onmessage](#)<sup>p907</sup> attribute of [MessagePort](#)<sup>p904</sup> objects.

An **event handler content attribute** is a content attribute for a specific [event handler](#)<sup>p839</sup>. The name of the content attribute is the same as the name of the [event handler](#)<sup>p839</sup>.

[Event handler content attributes](#)<sup>p839</sup>, when specified, must contain valid JavaScript code which, when parsed, would match the [FunctionBody](#) production after automatic semicolon insertion. [\[ECMA262\]](#)<sup>p1150</sup>

When an [event handler content attribute](#)<sup>p839</sup> is set, the user agent must set the corresponding [event handler](#)<sup>p839</sup> to an [internal raw uncompiled handler](#)<sup>p841</sup> consisting of the attribute's new value and the script location where the attribute was set to this value

When an event handler content attribute is removed, the user agent must set the corresponding [event handler](#)<sup>p839</sup> to null.

When an [event handler](#)<sup>p839</sup> *H* of an element or object *T* implementing the [EventTarget](#)<sup>p51</sup> interface is first set to a non-null value, the user agent must append an [event listener](#)<sup>p51</sup> to the list of [event listeners](#)<sup>p51</sup> associated with *T* with type set to the **event handler event type** corresponding to *H*, capture set to false, and listener set to [the event handler processing algorithm](#)<sup>p840</sup> defined below. [\[DOM\]](#)<sup>p1149</sup>

- Note** *The listener is emphatically not the [event handler](#) itself. Every event handler ends up registering the same listener, the algorithm defined below, which takes care of invoking the right callback, and processing the callback's return value.*
- Note** *This only happens the first time the [event handler](#)'s value is set. Since listeners are called in the order they were registered, the order of event listeners for a particular event type will always be first the event listeners registered with [addEventListener\(\)](#) before the first time the [event handler](#) was set to a non-null value, then the callback to which it is currently set, if any, and finally the event listeners registered with [addEventListener\(\)](#) after the first time the [event handler](#) was set to a non-null value.*

### Example

This example demonstrates the order in which event listeners are invoked. If the button in this example is clicked by the user, the page will show four alerts, with the text "ONE", "TWO", "THREE", and "FOUR" respectively.

```
<button id="test">Start Demo</button>
<script>
 var button = document.getElementById('test');
 button.addEventListener('click', function () { alert('ONE') }, false);
 button.setAttribute('onclick', "alert('NOT CALLED')"); // event handler listener is registered here
 button.addEventListener('click', function () { alert('THREE') }, false);
 button.onclick = function () { alert('TWO'); };
 button.addEventListener('click', function () { alert('FOUR') }, false);
</script>
```

- Note** *The interfaces implemented by the event object do not influence whether an [event handler](#) is triggered or not.*

The event handler processing algorithm for an [event handler](#)  $H$  and an [Event](#) object  $E$  is as follows:

1. Let  $callback$  be the result of [getting the current value of the event handler](#)  $H$ .
2. If  $callback$  is null, then abort these steps.
3. Process the [Event](#) object  $E$  as follows:
  - ↪ If  $E$  is an [ErrorEvent](#) object and the [event handler IDL attribute](#)'s type is [OnErrorEventHandler](#)
[Invoke](#) with five arguments, the first one having the value of  $E$ 's [message](#) attribute, the second having the value of  $E$ 's [filename](#) attribute, the third having the value of  $E$ 's [lineno](#) attribute, the fourth having the value of  $E$ 's [colno](#) attribute, the fifth having the value of  $E$ 's [error](#) attribute, and with the [callback this value](#) set to  $E$ 's [currentTarget](#). Let  $return value$  be the callback's return value. [\[WEBIDL\]](#)
  - ↪ Otherwise
 [Invoke](#) with one argument, the value of which is the [Event](#) object  $E$ , with the [callback this value](#) set to  $E$ 's [currentTarget](#). Let  $return value$  be the callback's return value. [\[WEBIDL\]](#)

In this step, **invoke** means to [invoke the Web IDL callback function](#).

If an exception gets thrown by the callback, end these steps and allow the exception to propagate. (It will propagate to the [DOM event dispatch logic](#), which will then [report the exception](#).)

4. Process  $return value$  as follows:
  - ↪ If the event type is [mouseover](#)
  - ↪ If the event type is [error](#) and  $E$  is an [ErrorEvent](#) object

If  $return value$  is a Web IDL boolean true value, then cancel the event.

- ↪ If the event type is [beforeunload](#)

**Note** *The [event handler IDL attribute](#)'s type is [OnBeforeUnloadEventHandler](#), and the return value will therefore have been coerced into either the value null or a DOMString.*

If the  $return value$  is null, then cancel the event.

Otherwise, If the [Event](#) object  $E$  is a [BeforeUnloadEvent](#) object, and the [Event](#) object  $E$ 's [returnValue](#) attribute's value is the empty string, then set the [returnValue](#) attribute's value to  $return value$ .

↪ **Otherwise**

If *return value* is a Web IDL boolean false value, then cancel the event.

The [Event Handler<sup>p841</sup>](#) callback function type represents a callback used for event handlers. It is represented in Web IDL as follows:

IDL

```
[TreatNonObjectAsNull]
callback EventHandlerNonNull = any (Event event);
typedef EventHandlerNonNull? EventHandler;
```

**Note** In JavaScript, any [Function<sup>p49</sup>](#) object implements this interface.

**Example**

For example, the following document fragment:

```
<body onload="alert(this)" onclick="alert(this)">
```

...leads to an alert saying "[object Window]" when the document is loaded, and an alert saying "[object HTMLBodyElement]" whenever the user clicks something in the page.

**Note** The return value of the function affects whether the event is canceled or not: as described above, if the return value is false, the event is canceled (except for [mouseover<sup>p52</sup>](#) events, where the return value has to be true to cancel the event). With [beforeunload<sup>p144</sup>](#) events, the value is instead used to determine the message to show the user.

For historical reasons, the [onerror<sup>p844</sup>](#) handler has different arguments:

IDL

```
[TreatNonObjectAsNull]
callback OnErrorHandlerNonNull = any ((Event or DOMString) event, optional DOMString source,
optional unsigned long lineno, optional unsigned long column, optional any error);
typedef OnErrorHandlerNonNull? OnErrorHandler;
```

Similarly, the [onbeforeunload<sup>p844</sup>](#) handler has a different return value:

IDL

```
[TreatNonObjectAsNull]
callback OnBeforeUnloadEventHandlerNonNull = DOMString? (Event event);
typedef OnBeforeUnloadEventHandlerNonNull? OnBeforeUnloadEventHandler;
```

An **internal raw uncompiled handler** is a tuple with the following information:

- An uncompiled script body
- A location where the script body originated, in case an error needs to be reported

When the user agent is to **get the current value of the event handler H**, it must run these steps:

1. If *H*'s value is an [internal raw uncompiled handler<sup>p841</sup>](#), run these substeps:
  1. If *H* is an element's [event handler<sup>p839</sup>](#), then let *element* be the element, and *document* be the element's [node document](#). Otherwise, *H* is a [Window<sup>p768</sup>](#) object's [event handler<sup>p839</sup>](#). Let *element* be null, and let *document* be the [Document<sup>p102</sup>](#) most recently associated with that [Window<sup>p768</sup>](#) object.
  2. If *document* is not in a [browsing context<sup>p762</sup>](#), or if [scripting is enabled<sup>p828</sup>](#) for *document*'s [browsing context<sup>p762</sup>](#), then return null and abort the algorithm for [getting the current value of the event handler<sup>p841</sup>](#).
  3. Let *body* be the uncompiled script body in the [internal raw uncompiled handler<sup>p841</sup>](#).
  4. Let *location* be the location where the script body originated, as given by the [internal raw uncompiled handler<sup>p841</sup>](#).
  5. If *element* is not null and *element* has a [form owner<sup>p527</sup>](#), let *form owner* be that [form owner<sup>p527</sup>](#). Otherwise, let *form owner* be null.

6. Let *script settings* be the [environment settings object](#)<sup>b829</sup> created for the [Window](#)<sup>p768</sup> object with which *document* is currently associated.
7. Obtain the [script execution environment](#)<sup>p829</sup> for JavaScript from *script settings*.
8. If *body* is not parseable as *FunctionBody* or if parsing detects an *early error*, then follow these substeps:
  1. Set *H*'s value to null.
  2. [Report the error](#)<sup>b833</sup> for the appropriate [script](#)<sup>p828</sup> and with the appropriate position (line number and column number) given by *location*, using the [global object](#)<sup>p829</sup> specified by *script settings* as the target. If the error is still [not handled](#)<sup>b833</sup> after this, then the error may be reported to the user.
  3. Jump to the step labeled *end* below.

**Note** *FunctionBody* is defined in ECMAScript edition 5 section 13 Function Definition. Early error is defined in ECMAScript edition 5 section 16 Errors. [\[ECMA262\]<sup>p1150</sup>](#)

9. If *body* begins with a Directive Prologue that contains a Use Strict Directive then let *strict* be true, otherwise let *strict* be false.
- Note** The terms "Directive Prologue" and "Use Strict Directive" are defined in ECMAScript edition 5 section 14.1 Directive Prologues and the Use Strict Directive. [\[ECMA262\]<sup>p1150</sup>](#)
10. Using the [script execution environment](#)<sup>p829</sup> obtained above, create a function object (as defined in ECMAScript edition 5 section 13.2 Creating Function Objects), with:

#### Parameter list *FormalParameterList*

↪ If *H* is an [onerror](#)<sup>b844</sup> [event handler](#)<sup>p839</sup> of a [Window](#)<sup>p768</sup> object

Let the function have five arguments, named *event*, *source*, *lineno*, *colno*, and *error*.

↪ Otherwise

Let the function have a single argument called *event*.

#### Function body *FunctionBody*

The result of parsing *body* above.

#### Lexical Environment Scope

1. If *H* is an element's [event handler](#)<sup>p839</sup>, then let *Scope* be the result of *NewObjectEnvironment*(*document*, the *global environment*).
- Otherwise, *H* is a [Window](#)<sup>p768</sup> object's [event handler](#)<sup>p839</sup>: let *Scope* be the *global environment*.
2. If *form owner* is not null, let *Scope* be the result of *NewObjectEnvironment*(*form owner*, *Scope*).
3. If *element* is not null, let *Scope* be the result of *NewObjectEnvironment*(*element*, *Scope*).

**Note** *NewObjectEnvironment()* is defined in ECMAScript edition 5 section 10.2.2.3 *NewObjectEnvironment* (*O*, *E*). [\[ECMA262\]<sup>p1150</sup>](#)

#### Boolean flag *Strict*

The value of *strict*.

Let *function* be this new function.

11. Let *script* be a new [script](#)<sup>p828</sup>.
  12. Let *script*'s [code entry-point](#)<sup>p828</sup> be *function*.
  13. Let *script*'s [settings object](#)<sup>b829</sup> be *script settings*.
  14. Set *H* to *function*.
2. *End*: Return *H*'s value.

The following are the [event handlers](#)<sup>p839</sup> (and their corresponding [event handler event types](#)<sup>p839</sup>) that must be supported by all [HTML elements](#)<sup>p42</sup>, as both [event handler content attributes](#)<sup>p839</sup> and [event handler IDL attributes](#)<sup>p839</sup>; and that must be supported by all [Document](#)<sup>p102</sup> and [Window](#)<sup>p768</sup> objects, as [event handler IDL attributes](#)<sup>p839</sup>:

### 8.1.5.3 Event firing

Certain operations and methods are defined as firing events on elements. For example, the `click()` method on the `HTMLElement` interface is defined as firing a `click` event on the element. [\[DOMEVENTS\]](#)

**Firing a simple event named e** means that a `trusted` event with the name `e`, which does not bubble (except where otherwise stated) and is not cancelable (except where otherwise stated), and which uses the `Event` interface, must be created and `dispatched` at the given target.

**Firing a synthetic mouse event named e** means that an event with the name `e`, which is `trusted` (except where otherwise stated), does not bubble (except where otherwise stated), is not cancelable (except where otherwise stated), and which uses the `MouseEvent` interface, must be created and dispatched at the given target. The event object must have its `screenX`, `screenY`, `clientX`, `clientY`, and `button` attributes initialised to 0, its `ctrlKey`, `shiftKey`, `altKey`, and `metaKey` attributes initialised according to the current state of the key input device, if any (false for any keys that are not available), its `detail` attribute initialised to 1, its `relatedTarget` attribute initialised to null (except where otherwise stated), and its `view` attribute initialised to the `Window` object of the `Document` object of the given target node, if any, or else null. The `getModifierState()` method on the object must return values appropriately describing the state of the key input device at the time the event is created.

**Firing a click event** means `firing a synthetic mouse event named click`, which bubbles and is cancelable.

The default action of these events is to do nothing except where otherwise stated.

### 8.1.5.4 Events and the `Window` object

When an event is dispatched at a DOM node in a `Document` in a `browsing context`, if the event is not a `load` event, the user agent must act as if, for the purposes of `event dispatching`, the `Window` object is the parent of the `Document` object. [\[DOM\]](#)

## 8.2 Base64 utility methods

The [atob\(\)](#)<sup>p847</sup> and [btoa\(\)](#)<sup>p847</sup> methods allow authors to transform content to and from the base64 encoding.

### IDL

```
[NoInterfaceObject, Exposed=(Window,Worker)]
interface WindowBase64 {
 DOMString btoa(DOMString btoa);
 DOMString atob(DOMString atob);
};
Window implements WindowBase64;
```

Support:	
	Chrome 4+
	IE 10+
	Chrome for Android 40+
	Firefox 2+
	iOS Safari 3.2+
	Android Browser 2.1+
	UC Browser for Android 9.9+
	Opera Mini 5.0-8.0+
	Safari 3.1+
	Opera 10.6+
	IE Mobile 10+
	Firefox for Android 33+

Source: [caniuse.com](#)

### Note

`result = window.btoap847( data )`

Takes the input data, in the form of a Unicode string containing only characters in the range U+0000 to U+00FF, each representing a binary byte with values 0x00 to 0xFF respectively, and converts it to its base64 representation, which it returns.

Throws an [InvalidCharacterError](#)<sup>p50</sup> exception if the input string contains any out-of-range characters.

`result = window.atobp847( data )`

Takes the input data, in the form of a Unicode string containing base64-encoded binary data, decodes it, and returns a string consisting of characters in the range U+0000 to U+00FF, each representing a binary byte with values 0x00 to 0xFF respectively, corresponding to that binary data.

Throws an [InvalidCharacterError](#)<sup>p50</sup> exception if the input string is not valid base64 data.

### Note

The [WindowBase64](#)<sup>p847</sup> interface adds to the [Window](#)<sup>p768</sup> interface and the [WorkerGlobalScope](#)<sup>p923</sup> interface (part of Web workers).

The [btoa\(\)](#) method must throw an [InvalidCharacterError](#)<sup>p50</sup> exception if the method's first argument contains any character whose code point is greater than U+00FF. Otherwise, the user agent must convert that argument to a sequence of octets whose *n*th octet is the eight-bit representation of the code point of the *n*th character of the argument, and then must apply the base64 algorithm to that sequence of octets, and return the result. [\[RFC4648\]](#)<sup>p153</sup>

The [atob\(\)](#) method must run the following steps to parse the string passed in the method's first argument:

1. Let *input* be the string being parsed.
2. Let *position* be a pointer into *input*, initially pointing at the start of the string.
3. Remove all [space characters](#)<sup>p58</sup> from *input*.
4. If the length of *input* divides by 4 leaving no remainder, then: if *input* ends with one or two U+003D EQUALS SIGN (=) characters, remove them from *input*.
5. If the length of *input* divides by 4 leaving a remainder of 1, throw an [InvalidCharacterError](#)<sup>p50</sup> exception and abort these steps.
6. If *input* contains a character that is not in the following list of characters and character ranges, throw an [InvalidCharacterError](#)<sup>p50</sup> exception and abort these steps:
  - U+002B PLUS SIGN (+)
  - U+002F SOLIDUS (/)
  - [Alphanumeric ASCII characters](#)<sup>p59</sup>
7. Let *output* be a string, initially empty.
8. Let *buffer* be a buffer that can have bits appended to it, initially empty.
9. While *position* does not point past the end of *input*, run these substeps:
  1. Find the character pointed to by *position* in the first column of the following table. Let *n* be the number given in the second cell of the same row.

A: 0	F: 5	K: 10	P: 15	U: 20	Z: 25	e: 30	j: 35	o: 40	t: 45	y: 50	3: 55	8: 60

D: 3	I: 8	N: 13	S: 18	X: 23	c: 28	h: 33	m: 38	r: 43	w: 48	1: 53	6: 58	11: 63
E: 4	J: 9	O: 14	T: 19	Y: 24	d: 29	i: 34	n: 39	s: 44	x: 49	2: 54	7: 59	

2. Append to *buffer* the six bits corresponding to *number*, most significant bit first.
  3. If *buffer* has accumulated 24 bits, interpret them as three 8-bit big-endian numbers. Append the three characters with code points equal to those numbers to *output*, in the same order, and then empty *buffer*.
  4. Advance *position* by one character.
10. If *buffer* is not empty, it contains either 12 or 18 bits. If it contains 12 bits, discard the last four and interpret the remaining eight as an 8-bit big-endian number. If it contains 18 bits, discard the last two and interpret the remaining 16 as two 8-bit big-endian numbers. Append the one or two characters with code points equal to those one or two numbers to *output*, in the same order.
- Note** *The discarded bits mean that, for instance, `atob("YQ")` and `atob("YR")` both return "a".*
11. Return *output*.

## 8.3 Dynamic markup insertion

**Note** APIs for dynamically inserting markup into the document interact with the parser, and thus their behaviour varies depending on whether they are used with [HTML documents](#)<sup>p51</sup> (and the [HTML parser](#)<sup>p952</sup>) or XHTML in [XML documents](#)<sup>p51</sup> (and the [XML parser](#)<sup>p1054</sup>).

### 8.3.1 Opening the input stream

The `open()` method comes in several variants with different numbers of arguments.

Spec bugs: [27419](#)

**Note**

**`document = document . openp848( [ type [, replace ] ] )`**

Causes the [Document](#)<sup>p102</sup> to be replaced in-place, as if it was a new [Document](#)<sup>p102</sup> object, but reusing the previous object, which is then returned.

If the *type* argument is omitted or has the value "[text/html](#)<sup>p1116</sup>", then the resulting [Document](#)<sup>p102</sup> has an HTML parser associated with it, which can be given data to parse using [document.write\(\)](#)<sup>p851</sup>. Otherwise, all content passed to [document.write\(\)](#)<sup>p851</sup> will be parsed as plain text.

If the *replace* argument is present and has the value "replace", the existing entries in the session history for the [Document](#)<sup>p102</sup> object are removed.

The method has no effect if the [Document](#)<sup>p102</sup> is still being parsed.

Throws an [InvalidStateError](#)<sup>p50</sup> exception if the [Document](#)<sup>p102</sup> is an [XML document](#)<sup>p51</sup>.

**`window = document . openp848( url, name, features [, replace ] )`**

Works like the [window.open\(\)](#)<sup>p771</sup> method.

[Document](#)<sup>p102</sup> objects have an **ignore-opens-during-unload counter**, which is used to prevent scripts from invoking the [document.open\(\)](#)<sup>p848</sup> method (directly or indirectly) while the document is [being unloaded](#)<sup>p805</sup>. Initially, the counter must be set to zero.

When called with two arguments (or fewer), the [document.open\(\)](#)<sup>p848</sup> method must act as follows:

1. If the [Document](#)<sup>p102</sup> object is not flagged as an [HTML document](#)<sup>p51</sup>, throw an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
2. If the [Document](#)<sup>p102</sup> object is not an [active document](#)<sup>p762</sup>, then abort these steps.
3. Let *type* be the value of the first argument.

- If the second argument is an [ASCII case-insensitive](#)<sup>p58</sup> match for the value "replace", then let *replace* be true.

Otherwise, if the [browsing context](#)<sup>p762</sup>'s [session history](#)<sup>p782</sup> contains only one [Document](#)<sup>p102</sup>, and that was the [about:blank](#)<sup>p84</sup> [Document](#)<sup>p102</sup> created when the [browsing context](#)<sup>p762</sup> was [created](#)<sup>p762</sup>, and that [Document](#)<sup>p102</sup> has never had the [unload a document](#)<sup>p805</sup> algorithm invoked on it (e.g. by a previous call to [document.open\(\)](#)<sup>p848</sup>), then let *replace* be true.

Otherwise, let *replace* be false.

- If the [Document](#)<sup>p102</sup> has an [active parser](#)<sup>p105</sup> whose [script nesting level](#)<sup>p954</sup> is greater than zero, then the method does nothing. Abort these steps and return the [Document](#)<sup>p102</sup> object on which the method was invoked.

**Note** This basically causes [document.open\(\)](#)<sup>p848</sup> to be ignored when it's called in an inline script found during parsing, while still letting it have an effect when called from a non-parser task such as a timer callback or event handler.

- Similarly, if the [Document](#)<sup>p102</sup>'s [ignore-opens-during-unload counter](#)<sup>p848</sup> is greater than zero, then the method does nothing. Abort these steps and return the [Document](#)<sup>p102</sup> object on which the method was invoked.

**Note** This basically causes [document.open\(\)](#)<sup>p848</sup> to be ignored when it's called from a [beforeunload](#)<sup>p1144</sup> [pagehide](#)<sup>p1144</sup>, or [unload](#)<sup>p1145</sup> event handler while the [Document](#)<sup>p102</sup> is being unloaded.

- Release the [storage mutex](#)<sup>p835</sup>.
- Set the [Document](#)<sup>p102</sup>'s [salvageable](#)<sup>p804</sup> state to false.
- Prompt to unload<sup>p804</sup> the [Document](#)<sup>p102</sup> object. If the user refused to allow the document to be unloaded<sup>p804</sup>, then abort these steps and return the [Document](#)<sup>p102</sup> object on which the method was invoked.
- Unload<sup>p805</sup> the [Document](#)<sup>p102</sup> object, with the *recycle* parameter set to true.
- Abort<sup>p806</sup> the [Document](#)<sup>p102</sup>.
- Unregister all event listeners registered on the [Document](#)<sup>p102</sup> node and its descendants.
- Remove any [tasks](#)<sup>p834</sup> associated with the [Document](#)<sup>p102</sup> in any [task source](#)<sup>p835</sup>.
- Remove all child nodes of the document, without firing any mutation events.
- Replace the [Document](#)<sup>p102</sup>'s singleton objects with new instances of those objects. (This includes in particular the [Window](#)<sup>p768</sup>, [Location](#)<sup>p788</sup>, [History](#)<sup>p783</sup>, [ApplicationCache](#)<sup>p824</sup>, and [Navigator](#)<sup>p858</sup>, objects, the various [BarProp](#)<sup>p774</sup> objects, the two [Storage](#)<sup>p935</sup> objects, the various [HTMLCollection](#)<sup>p51</sup> objects, and objects defined by other specifications, like [Selection](#)<sup>p52</sup>. It also includes all the Web IDL prototypes in the JavaScript binding, including the [Document](#)<sup>p102</sup> object's prototype.)

**Note** The new [Window](#)<sup>p768</sup> object has a new [environment settings object](#)<sup>p829</sup>.

- Change the [document's character encoding](#)<sup>p51</sup> to UTF-8.
- If the [Document](#)<sup>p102</sup> is ready for post-load tasks<sup>p1033</sup>, then set the [Document](#)<sup>p102</sup> object's [reload override flag](#)<sup>p102</sup> and set the [Document](#)<sup>p102</sup>'s [reload override buffer](#)<sup>p102</sup> to the empty string.
- Set the [Document](#)<sup>p102</sup>'s [salvageable](#)<sup>p804</sup> state back to true.
- Change the [document's address](#) to the [address](#) of the [responsible document](#)<sup>p829</sup> specified by the [entry settings object](#)<sup>p831</sup>.
- If the [Document](#)<sup>p102</sup>'s [iframe load in progress](#)<sup>p302</sup> flag is set, set the [Document](#)<sup>p102</sup>'s [mute iframe load](#)<sup>p302</sup> flag.
- Create a new [HTML parser](#)<sup>p952</sup> and associate it with the document. This is a **script-created parser** (meaning that it can be closed by the [document.open\(\)](#)<sup>p848</sup> and [document.close\(\)](#)<sup>p850</sup> methods, and that the tokenizer will wait for an explicit call to [document.close\(\)](#)<sup>p850</sup> before emitting an end-of-file token). The encoding [confidence](#)<sup>p955</sup> is *irrelevant*.
- Set the [current document readiness](#)<sup>p105</sup> of the document to "loading".
- If *type* is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "replace", then, for historical reasons, set it to the string "text/html".

Otherwise:

If the *type* string contains a U+003B SEMICOLON character (;), remove the first such character and all characters from it up to the end of the string.

[Strip leading and trailing whitespace<sup>p59</sup>](#) from type.

24. If type is not now an [ASCII case-insensitive<sup>p58</sup>](#) match for the string "[text/html<sup>p1116</sup>](#)", then act as if the tokenizer had emitted a start tag token with the tag name "pre" followed by a single U+000A LINE FEED (LF) character, then switch the [HTML parser<sup>p952</sup>](#)'s tokenizer to the [PLAINTEXT state<sup>p968</sup>](#).
  25. Remove all the entries in the [browsing context<sup>p762</sup>](#)'s [session history<sup>p782</sup>](#) after the [current entry<sup>p783</sup>](#). If the [current entry<sup>p783</sup>](#) is the last entry in the session history, then no entries are removed.
- Note** *This doesn't necessarily have to affect<sup>p790</sup> the user agent's user interface.*
26. Remove any [tasks<sup>p834</sup>](#) queued by the [history traversal task source<sup>p839</sup>](#) that are associated with any [Document<sup>p102</sup>](#) objects in the [top-level browsing context<sup>p763</sup>](#)'s [document family<sup>p763</sup>](#).
  27. Remove any earlier entries that share the same [Document<sup>p102</sup>](#).
  28. If replace is false, then add a new entry, just before the last entry, and associate with the new entry the text that was parsed by the previous parser associated with the [Document<sup>p102</sup>](#) object, as well as the state of the document at the start of these steps. This allows the user to step backwards in the session history to see the page before it was blown away by the [document.open\(\)<sup>p848</sup>](#) call. This new entry does not have a [Document<sup>p102</sup>](#) object, so a new one will be created if the session history is traversed to that entry.
  29. Finally, set the [insertion point<sup>p961</sup>](#) to point at just before the end of the [input stream<sup>p960</sup>](#) (which at this point will be empty).
  30. Return the [Document<sup>p102</sup>](#) on which the method was invoked.

**Note** *The [document.open\(\)<sup>p848</sup>](#) method does not affect whether a [Document<sup>p102</sup>](#) is ready for post-load tasks<sup>p1033</sup> or completely loaded<sup>p1033</sup>.*

When called with four arguments, the [open\(\)<sup>p848</sup>](#) method on the [Document<sup>p102</sup>](#) object must call the [open\(\)<sup>p771</sup>](#) method on the [Window<sup>p768</sup>](#) object of the [Document<sup>p102</sup>](#) object, with the same arguments as the original call to the [open\(\)<sup>p848</sup>](#) method, and return whatever that method returned. If the [Document<sup>p102</sup>](#) object has no [Window<sup>p768</sup>](#) object, then the method must throw an [InvalidAccessError<sup>p50</sup>](#) exception.

### 8.3.2 Closing the input stream

**Note**

[document.close<sup>p850</sup>\(\)](#)

Closes the input stream that was opened by the [document.open\(\)<sup>p848</sup>](#) method.

Throws an [InvalidStateError<sup>p50</sup>](#) exception if the [Document<sup>p102</sup>](#) is an [XML document<sup>p51</sup>](#).

The [close\(\)](#) method must run the following steps:

1. If the [Document<sup>p102</sup>](#) object is not flagged as an [HTML document<sup>p51</sup>](#), throw an [InvalidStateError<sup>p50</sup>](#) exception and abort these steps.
2. If there is no [script-created parser<sup>p849</sup>](#) associated with the document, then abort these steps.
3. Insert an [explicit "EOF" character<sup>p961</sup>](#) at the end of the parser's [input stream<sup>p960</sup>](#).
4. If there is a [pending parsing-blocking script<sup>p596</sup>](#), then abort these steps.
5. Run the tokenizer, processing resulting tokens as they are emitted, and stopping when the tokenizer reaches the [explicit "EOF" character<sup>p961</sup>](#) or [spins the event loop<sup>p838</sup>](#).

### 8.3.3 [document.write\(\)<sup>p851</sup>](#)

**Note**

`document.writep851(text...)`

In general, adds the given string(s) to the `Documentp102`'s input stream.

**⚠ Warning!** *This method has very idiosyncratic behaviour. In some cases, this method can affect the state of the `HTML parserp952` while the parser is running, resulting in a DOM that does not correspond to the source of the document (e.g. if the string written is the string "<plaintext>" or "<!--"). In other cases, the call can clear the current page first, as if `document.open()p848` had been called. In yet more cases, the method is simply ignored, or throws an exception. To make matters worse, the exact behaviour of this method can in some cases be dependent on network latency, which can lead to failures that are very hard to debug. For all these reasons, use of this method is strongly discouraged.*

This method throws an `InvalidStateErrorp50` exception when invoked on `XML documentsp51`.

`Documentp102` objects have an **ignore-destructive-writes counter**, which is used in conjunction with the processing of `scriptp591` elements to prevent external scripts from being able to use `document.write()p851` to blow away the document by implicitly calling `document.open()p848`. Initially, the counter must be set to zero.

The `document.write(...)` method must act as follows:

1. If the method was invoked on an `XML documentp51`, throw an `InvalidStateErrorp50` exception and abort these steps.
2. If the `Documentp102` object is not an `active documentp762`, then abort these steps.
3. If the `insertion pointp961` is undefined and either the `Documentp102`'s `ignore-opens-during-unload counterp848` is greater than zero or the `Documentp102`'s `ignore-destructive-writes counterp851` is greater than zero, abort these steps.
4. If the `insertion pointp961` is undefined, call the `open()p848` method on the `documentp102` object (with no arguments). If the user [refused to allow the document to be unloaded<sup>p804</sup>](#), then abort these steps. Otherwise, the `insertion pointp961` will point at just before the end of the (empty) `input streamp960`.
5. Insert the string consisting of the concatenation of all the arguments to the method into the `input streamp960` just before the `insertion pointp961`.
6. If the `Documentp102` object's `reload override flagp102` is set, then append the string consisting of the concatenation of all the arguments to the method to the `Documentp102`'s `reload override bufferp102`.
7. If there is no `pending parsing-blocking scriptp596`, have the `HTML parserp952` process the characters that were inserted, one at a time, processing resulting tokens as they are emitted, and stopping when the tokenizer reaches the insertion point or when the processing of the tokenizer is aborted by the tree construction stage (this can happen if a `scriptp591` end tag token is emitted by the tokenizer).
8. Finally, return from the method.

**Note** *If the `document.write()p851` method was called from script executing inline (i.e. executing because the parser parsed a set of `scriptp591` tags), then this is a [reentrant invocation of the parser<sup>p954</sup>](#).*

### 8.3.4 `document.writelnp851`

**Note**

`document.writelnp851(text...)`

Adds the given string(s) to the `Documentp102`'s input stream, followed by a newline character. If necessary, calls the `open()p848` method implicitly first.

This method throws an `InvalidStateErrorp50` exception when invoked on `XML documentsp51`.

The `document.writeln(...)` method, when invoked, must act as if the `document.write()p851` method had been invoked with the same argument(s), plus an extra argument consisting of a string containing a single line feed character (U+000A).

## 8.4 Timers

The `setTimeout()`<sup>852</sup> and `setInterval()`<sup>852</sup> methods allow authors to schedule timer-based callbacks.

IDL

```
[NoInterfaceObject, Exposed=(Window,Worker)]
interface WindowTimers {
 long setTimeout(Function handler, optional long timeout = 0, any... arguments);
 long setTimeout(DOMString handler, optional long timeout = 0, any... arguments);
 void clearTimeout(optional long handle = 0);
 long setInterval(Function handler, optional long timeout = 0, any... arguments);
 long setInterval(DOMString handler, optional long timeout = 0, any... arguments);
 void clearInterval(optional long handle = 0);
};

Window implements WindowTimers;
```

Note

`handle = window.setTimeout852( handler [, timeout [, arguments... ] ] )`

Schedules a timeout to run `handler` after `timeout` milliseconds. Any `arguments` are passed straight through to the `handler`.

`handle = window.setTimeout852( code [, timeout ] )`

Schedules a timeout to compile and run `code` after `timeout` milliseconds.

`window.clearTimeout852( handle )`

Cancels the timeout set with `setTimeout()`<sup>852</sup> identified by `handle`.

`handle = window.setInterval852( handler [, timeout [, arguments... ] ] )`

Schedules a timeout to run `handler` every `timeout` milliseconds. Any `arguments` are passed straight through to the `handler`.

`handle = window.setInterval852( code [, timeout ] )`

Schedules a timeout to compile and run `code` every `timeout` milliseconds.

`window.clearInterval852( handle )`

Cancels the timeout set with `setInterval()`<sup>852</sup> identified by `handle`.

Note Timers can be nested; after five such nested timers, however, the interval is forced to be at least four milliseconds.

Note This API does not guarantee that timers will run exactly on schedule. Delays due to CPU load, other tasks, etc, are to be expected.

Note The `WindowTimers`<sup>852</sup> interface adds to the `Window`<sup>8768</sup> interface and the `WorkerGlobalScope`<sup>923</sup> interface (part of Web workers).

Each object that implements the `WindowTimers`<sup>852</sup> interface has a **list of active timers**. Each entry in this lists is identified by a number, which must be unique within the list for the lifetime of the object that implements the `WindowTimers`<sup>852</sup> interface.

The `setTimeout()` method must return the value returned by the `timer initialisation steps`<sup>853</sup>, passing them the method's arguments, the object on which the method for which the algorithm is running is implemented (a `Window`<sup>8768</sup> or `WorkerGlobalScope`<sup>923</sup> object) as the `method context`, and the `repeat` flag set to false.

The `setInterval()` method must return the value returned by the `timer initialisation steps`<sup>853</sup>, passing them the method's arguments, the object on which the method for which the algorithm is running is implemented (a `Window`<sup>8768</sup> or `WorkerGlobalScope`<sup>923</sup> object) as the `method context`, and the `repeat` flag set to true.

The `clearTimeout()` and `clearInterval()` methods must clear the entry identified as `handle` from the `list of active timers`<sup>852</sup> of the `WindowTimers`<sup>852</sup> object on which the method was invoked, if any, where `handle` is the argument passed to the method. (If `handle` does not identify an entry in the `list of active timers`<sup>852</sup> of the `WindowTimers`<sup>852</sup> object on which the method was invoked, the method does nothing.)

The **timer initialisation steps**, which are invoked with some method arguments, a *method context*, a *repeat* flag which can be true or false, and optionally (and only if the *repeat* flag is true) a *previous handle*, are as follows:

1. Let *method context proxy* be *method context* if that is a [WorkerGlobalScope<sup>p923</sup>](#) object, or else the [WindowProxy<sup>p775</sup>](#) that corresponds to *method context*.
2. If *previous handle* was provided, let *handle* be *previous handle*; otherwise, let *handle* be a user-agent-defined integer that is greater than zero that will identify the timeout to be set by this call in the [list of active timers<sup>p852</sup>](#).
3. If *previous handle* was not provided, add an entry to the [list of active timers<sup>p852</sup>](#) for *handle*.
4. Let *task* be a [task<sup>p834</sup>](#) that runs the following substeps:
  1. If the entry for *handle* in the [list of active timers<sup>p852</sup>](#) has been cleared, then abort this [task<sup>p834</sup>](#)'s substeps.
  2. Run the appropriate set of steps from the following list:
    - ↪ If the first method argument is a [Function<sup>p49</sup>](#)  
Invoke the [Function<sup>p49</sup>](#). Use the third and subsequent method arguments (if any) as the arguments for invoking the [Function<sup>p49</sup>](#). Use *method context proxy* as the *thisArg* for invoking the [Function<sup>p49</sup>](#). [\[ECMA262\]<sup>p1150</sup>](#)
    - ↪ Otherwise
      - 1. Let *script source* be the first method argument.
      - 2. Let *script language* be JavaScript.
      - 3. Let *settings object* be *method context*'s [environment settings object<sup>p829</sup>](#).
      - 4. [Create a script<sup>p832</sup>](#) using *script source* as the script source, the [URL<sup>p48</sup>](#) where *script source* can be found, *scripting language* as the scripting language, and *settings object* as the [environment settings object<sup>p829</sup>](#).
  3. If the *repeat* flag is true, then call [timer initialisation steps<sup>p853</sup>](#) again, passing them the same method arguments, the same *method context*, with the *repeat* flag still set to true, and with the *previous handle* set to *handle*.
  5. Let *timeout* be the second method argument.
  6. If the currently running [task<sup>p834</sup>](#) is a task that was created by this algorithm, then let *nesting level* be the [task<sup>p834</sup>](#)'s [timer nesting level<sup>p853</sup>](#). Otherwise, let *nesting level* be zero.
  7. If *nesting level* is greater than 5, and *timeout* is less than 4, then increase *timeout* to 4.
  8. Increment *nesting level* by one.
  9. Let *task*'s [timer nesting level](#) be *nesting level*.
  10. Return *handle*, and then continue running this algorithm [in parallel<sup>p41</sup>](#).
  11. If *method context* is a [Window<sup>p768</sup>](#) object, wait until the [Document<sup>p102</sup>](#) associated with *method context* has been [fully active<sup>p763</sup>](#) for a further *timeout* milliseconds (not necessarily consecutively).  
Otherwise, *method context* is a [WorkerGlobalScope<sup>p923</sup>](#) object; wait until *timeout* milliseconds have passed with the worker not suspended (not necessarily consecutively).
  12. Wait until any invocations of this algorithm that had the same *method context*, that started before this one, and whose *timeout* is equal to or less than this one's, have completed.

**Note** Argument conversion as defined by Web IDL (for example, invoking `toString()` methods on objects passed as the first argument) happens in the algorithms defined in Web IDL, before this algorithm is invoked.

#### Example

So for example, the following rather silly code will result in the log containing "ONE TWO":

```
var log = '';
function logger(s) { log += s + ' ';
```

```

 setTimeout({ toString: function () {
 setTimeout("logger('ONE')", 100);
 return "logger('TWO')";
 } }, 100);

```

13. Optionally, wait a further user-agent defined length of time.

**Note** *This is intended to allow user agents to pad timeouts as needed to optimise the power usage of the device. For example, some processors have a low-power mode where the granularity of timers is reduced; on such platforms, user agents can slow timers down to fit this schedule instead of requiring the processor to use the more accurate mode with its associated higher power usage.*

14. Queue<sup>p835</sup> the task<sup>p834</sup> task.

**Note** *Once the task has been processed, if the repeat flag is false, it is safe to remove the entry for handle from the list of active timers<sup>p852</sup> (there is no way for the entry's existence to be detected past this point, so it does not technically matter one way or the other).*

The task source<sup>p835</sup> for these tasks<sup>p834</sup> is the timer task source.

#### Example

To run tasks of several milliseconds back to back without any delay, while still yielding back to the browser to avoid starving the user interface (and to avoid the browser killing the script for hogging the CPU), simply queue the next timer before performing work:

```

function doExpensiveWork() {
 var done = false;
 // ...
 // this part of the function takes up to five milliseconds
 // set done to true if we're done
 // ...
 return done;
}

function rescheduleWork() {
 var handle = setTimeout(rescheduleWork, 0); // preschedule next iteration
 if (doExpensiveWork())
 clearTimeout(handle); // clear the timeout if we don't need it
}

function scheduleWork() {
 setTimeout(rescheduleWork, 0);
}

scheduleWork(); // queues a task to do lots of work

```

## 8.5 User prompts

### 8.5.1 Simple dialogs

#### Note

`window.alertp855(message)`

Displays a modal alert with the given message, and waits for the user to dismiss it.

A call to the `navigator.yieldForStorageUpdates()p868` method is implied when this method is invoked.

`result = window.confirmp855(message)`

Displays a modal OK/Cancel prompt with the given message, waits for the user to dismiss it, and returns true if the user clicks OK and false if the user clicks Cancel.

A call to the `navigator.yieldForStorageUpdates()`<sup>p868</sup> method is implied when this method is invoked.

`result = window.prompt(message [, default])`

Displays a modal text field prompt with the given message, waits for the user to dismiss it, and returns the value that the user entered. If the user cancels the prompt, then returns null instead. If the second argument is present, then the given value is used as a default.

A call to the `navigator.yieldForStorageUpdates()`<sup>p868</sup> method is implied when this method is invoked.

**Note** Logic that depends on `tasks`<sup>p834</sup> or `microtasks`<sup>p837</sup>, such as `media elements`<sup>p326</sup> loading their `media data`<sup>p328</sup>, are stalled when these methods are invoked.

The `alert(message)` method, when invoked, must run the following steps:

1. If the `event loop`<sup>p834</sup>'s `termination nesting level`<sup>b804</sup> is non-zero, optionally abort these steps.
2. Release the `storage mutex`<sup>p835</sup>.
3. Optionally, abort these steps. (For example, the user agent might give the user the option to ignore all alerts, and would thus abort at this step whenever the method was invoked.)
4. If the method was invoked with no arguments, then let `message` be the empty string; otherwise, let `message` be the method's first argument.
5. Show the given `message` to the user.
6. Optionally, `pause`<sup>p838</sup> while waiting for the user to acknowledge the message.

The `confirm(message)` method, when invoked, must run the following steps:

1. If the `event loop`<sup>p834</sup>'s `termination nesting level`<sup>b804</sup> is non-zero, optionally abort these steps, returning false.
2. Release the `storage mutex`<sup>p835</sup>.
3. Optionally, return false and abort these steps. (For example, the user agent might give the user the option to ignore all prompts, and would thus abort at this step whenever the method was invoked.)
4. Show the given `message` to the user, and ask the user to respond with a positive or negative response.
5. `Pause`<sup>p838</sup> until the user responds either positively or negatively.
6. If the user responded positively, return true; otherwise, the user responded negatively: return false.

The `prompt(message, default)` method, when invoked, must run the following steps:

1. If the `event loop`<sup>p834</sup>'s `termination nesting level`<sup>b804</sup> is non-zero, optionally abort these steps, returning null.
2. Release the `storage mutex`<sup>p835</sup>.
3. Optionally, return null and abort these steps. (For example, the user agent might give the user the option to ignore all prompts, and would thus abort at this step whenever the method was invoked.)
4. Show the given `message` to the user, and ask the user to either respond with a string value or abort. The response must be defaulted to the value given by `default`.
5. `Pause`<sup>p838</sup> while waiting for the user's response.
6. If the user aborts, then return null; otherwise, return the string that the user responded with.

## 8.5.2 Printing

**Note**

## `window.print()`

Prompts the user to print the page.

A call to the `navigator.yieldForStorageUpdates()` method is implied when this method is invoked.

When the `print()` method is invoked, if the `Document` is `ready for post-load tasks`, then the user agent must run the `printing steps` in parallel. Otherwise, the user agent must only set the `print when loaded` flag on the `Document`.

User agents should also run the `printing steps` whenever the user asks for the opportunity to `obtain a physical form` (e.g. printed copy), or the representation of a physical form (e.g. PDF copy), of a document.

The `printing steps` are as follows:

Spec bugs: 27864

1. The user agent may display a message to the user or abort these steps (or both).

**Example** For instance, a kiosk browser could silently ignore any invocations of the `print()` method.

**Example** For instance, a browser on a mobile device could detect that there are no printers in the vicinity and display a message saying so before continuing to offer a "save to PDF" option.

2. The user agent must fire a simple event named `beforeprint` at the `Window` object of the `Document` that is being printed, as well as any `nested browsing contexts` in it.

**Example** The `beforeprint` event can be used to annotate the printed copy, for instance adding the time at which the document was printed.

3. The user agent must release the `storage mutex`.

4. The user agent should offer the user the opportunity to `obtain a physical form` (or the representation of a physical form) of the document. The user agent may wait for the user to either accept or decline before returning; if so, the user agent must `pause` while the method is waiting. Even if the user agent doesn't wait at this point, the user agent must use the state of the relevant documents as they are at this point in the algorithm if and when it eventually creates the alternate form.

5. The user agent must fire a simple event named `afterprint` at the `Window` object of the `Document` that is being printed, as well as any `nested browsing contexts` in it.

**Example** The `afterprint` event can be used to revert annotations added in the earlier event, as well as showing post-printing UI. For instance, if a page is walking the user through the steps of applying for a home loan, the script could automatically advance to the next step after having printed a form or other.

### 8.5.3 Dialogs implemented using separate documents with `showModalDialog()`

Spec bugs: 18154

This feature is in the process of being removed from the Web platform. (This is a long process that takes many years.) Using the `showModalDialog()` API at this time is highly discouraged.

The `showModalDialog(url, argument)` method, when invoked, must cause the user agent to run the following steps:

1. Resolve `url` relative to the API base URL specified by the `entry settings object`.

If this fails, then throw a `SyntaxError` exception and abort these steps.

2. If the `event loop`'s `termination nesting level` is non-zero, optionally abort these steps, returning the empty string.

3. Release the `storage mutex`.

4. If the user agent is configured such that this invocation of `showModalDialog()` is somehow disabled, then return the empty string and abort these steps.

**Note** User agents are expected to disable this method in certain cases to avoid user annoyance (e.g. as part of their popup blocker feature). For instance, a user agent could require that a site be white-listed before enabling this method, or the user agent could be configured to only allow one modal dialog at a time.

5. If the [active sandboxing flag set](#)<sup>p782</sup> of the [active document](#)<sup>p762</sup> of the [responsible browsing context](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup> has its [sandboxed auxiliary navigation browsing context flag](#)<sup>p780</sup> set, then return the empty string and abort these steps.
6. Let *incumbent origin* be the [effective script origin](#)<sup>p776</sup> specified by the [incumbent settings object](#)<sup>p831</sup> at the time the [showModalDialog\(\)](#)<sup>p856</sup> method was called.
7. Let *the list of background browsing contexts* be a list of all the browsing contexts that:
  - are part of the same [unit of related browsing contexts](#)<sup>p765</sup> as the browsing context of the [Window](#)<sup>p768</sup> object on which the [showModalDialog\(\)](#)<sup>p856</sup> method was called, and that
  - have an [active document](#)<sup>p762</sup> whose [origin](#)<sup>p776</sup> is the [same](#)<sup>p778</sup> as *incumbent origin*,...as well as any browsing contexts that are nested inside any of the browsing contexts matching those conditions.
8. Disable the user interface for all the browsing contexts in *the list of background browsing contexts*. This should prevent the user from navigating those browsing contexts, causing events to be sent to those browsing context, or editing any content in those browsing contexts. However, it does not prevent those browsing contexts from receiving events from sources other than the user, from running scripts, from running animations, and so forth.
9. [Create](#)<sup>p762</sup> a new [auxiliary browsing context](#)<sup>p764</sup>, with the [opener browsing context](#)<sup>p764</sup> being the browsing context of the [Window](#)<sup>p768</sup> object on which the [showModalDialog\(\)](#)<sup>p856</sup> method was called. The new auxiliary browsing context has no name.

**Note** This [browsing context](#)<sup>p762</sup>'s [Document](#)<sup>p102</sup>'s [Window](#)<sup>p768</sup> objects all implement the [WindowModal](#)<sup>p858</sup> interface.
10. Set all the flags in the new browsing context's [popup sandboxing flag set](#)<sup>p781</sup> that are set in the [active sandboxing flag set](#)<sup>p782</sup> of the [active document](#)<sup>p762</sup> of the [responsible browsing context](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup>. The [responsible browsing context](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup> must be set as the new browsing context's [one permitted sandboxed navigator](#)<sup>p780</sup>.
11. Let the [dialog arguments](#)<sup>p858</sup> of the new browsing context be set to the value of *argument*, or the [undefined](#) value if the argument was omitted.
12. Let the [dialog arguments' origin](#)<sup>p858</sup> be *incumbent origin*.
13. Let the [return value](#)<sup>p858</sup> of the new browsing context be the [undefined](#) value.
14. Let the [return value origin](#)<sup>p858</sup> be *incumbent origin*.
15. [Navigate](#)<sup>p791</sup> the new [browsing context](#)<sup>p762</sup> to the [absolute URL](#)<sup>p48</sup> that resulted from [resolving](#)<sup>p82</sup> *url* earlier, with [replacement enabled](#)<sup>p802</sup>, and with the [responsible browsing context](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup> as the [source browsing context](#)<sup>p791</sup>.
16. [Spin the event loop](#)<sup>p838</sup> until the new [browsing context](#)<sup>p762</sup> is [closed](#)<sup>p774</sup>. The user agent must allow the user to indicate that the [browsing context](#)<sup>p762</sup> is to be closed.
17. Reenable the user interface for all the browsing contexts in *the list of background browsing contexts*.
18. If the [auxiliary browsing context](#)<sup>p764</sup>'s [return value origin](#)<sup>p858</sup> at the time the browsing context was [closed](#)<sup>p774</sup> was the [same](#)<sup>p778</sup> as *incumbent origin*, then let *return value* be the [auxiliary browsing context](#)<sup>p764</sup>'s [return value](#)<sup>p858</sup> as it stood when the browsing context was [closed](#)<sup>p774</sup>.

Otherwise, let *return value* be undefined.

19. Return *return value*.

The [Window](#)<sup>p768</sup> objects of [Document](#)<sup>p102</sup>'s hosted by [browsing contexts](#)<sup>p762</sup> created by the above algorithm must also implement the [WindowModal](#)<sup>p858</sup> interface.

**Note** When this happens, the members of the [WindowModal](#)<sup>p858</sup> interface, in JavaScript environments, appear to actually be part of the [Window](#)<sup>p768</sup> interface (e.g. they are on the same prototype chain as the [window.alert\(\)](#)<sup>p855</sup> method).

IDL

```
[NoInterfaceObject]
interface WindowModal {
 readonly attribute any dialogArguments;
 attribute any returnValue;
};
```

Note

**window.dialogArguments<sup>p858</sup>**Returns the **argument** argument that was passed to the showModalDialog()<sup>p856</sup> method.**window.returnValue<sup>p858</sup> [= value]**

Returns the current return value for the window.

Can be set, to change the value that will be returned by the showModalDialog()<sup>p856</sup> method.

Such browsing contexts have associated **dialog arguments**, which are stored along with the **dialog arguments' origin**. These values are set by the showModalDialog()<sup>p856</sup> method in the algorithm above, when the browsing context is created, based on the arguments provided to the method.

The **dialogArguments** IDL attribute, on getting, must check whether its browsing context's active document<sup>p762</sup>'s effective script origin<sup>p776</sup> is the same<sup>p778</sup> as the dialog arguments' origin<sup>p858</sup>. If it is, then the browsing context's **dialog arguments**<sup>p858</sup> must be returned unchanged. Otherwise, the IDL attribute must return undefined.

These browsing contexts also have an associated **return value** and **return value origin**. As with the previous two values, these values are set by the showModalDialog()<sup>p856</sup> method in the algorithm above, when the browsing context is created.

The **returnValue** IDL attribute, on getting, must check whether its browsing context's active document<sup>p762</sup>'s effective script origin<sup>p776</sup> is the same<sup>p778</sup> as the current return value origin<sup>p858</sup>. If it is, then the browsing context's return value<sup>p858</sup> must be returned unchanged. Otherwise, the IDL attribute must return undefined. On setting, the attribute must set the return value<sup>p858</sup> to the given new value, and the return value origin<sup>p858</sup> to the browsing context's active document<sup>p762</sup>'s effective script origin<sup>p776</sup>.

Note *The window.close()<sup>p772</sup> method can be used to close the browsing context.*

## 8.6 System state and capabilities

### 8.6.1 The **Navigator**<sup>p858</sup> object

Spec bugs: 27820

The **navigator** attribute of the **Window**<sup>p768</sup> interface must return an instance of the **Navigator**<sup>p858</sup> interface, which represents the identity and state of the user agent (the client), and allows Web pages to register themselves as potential protocol and content handlers:

```
interface Navigator {
 // objects implementing this interface also implement the interfaces given below
};

Navigator implements NavigatorID;
Navigator implements NavigatorLanguage;
Navigator implements NavigatorOnLine;
Navigator implements NavigatorContentUtils;
Navigator implements NavigatorStorageUtils;
Navigator implements NavigatorPlugins;
```

These interfaces are defined separately so that other specifications can re-use parts of the **Navigator**<sup>p858</sup> interface.

## IDL

```
[NoInterfaceObject, Exposed=(Window,Worker)]
interface NavigatorID {
 readonly attribute DOMString appCodeName; // constant "Mozilla"
 readonly attribute DOMString appName;
 readonly attribute DOMString appVersion;
 readonly attribute DOMString platform;
 readonly attribute DOMString product; // constant "Gecko"
 boolean taintEnabled(); // constant false
 readonly attribute DOMString userAgent;
 readonly attribute DOMString vendorSub;
};
```

In certain cases, despite the best efforts of the entire industry, Web browsers have bugs and limitations that Web authors are forced to work around.

This section defines a collection of attributes that can be used to determine, from script, the kind of user agent in use, in order to work around these issues.

Client detection should always be limited to detecting known current versions; future versions and unknown versions should always be assumed to be fully compliant.

## Note

`window.navigatorp858.appCodeNamep859`

Returns the string "Mozilla".

`window.navigatorp858.appNamep859`

Returns the name of the browser.

`window.navigatorp858.appVersionp859`

Returns the version of the browser.

`window.navigatorp858.platformp859`

Returns the name of the platform.

`window.navigatorp858.productp860`

Returns the string "Gecko".

`window.navigatorp858.taintEnabledp860()`

Returns false.

`window.navigatorp858.userAgentp860`

Returns the complete User-Agent header.

**appCodeName**

Must return the string "Mozilla".

**appName**

Must return either the string "Netscape" or the full name of the browser, e.g. "Mellblom Browsernator".

**appVersion**

Must return either the string "4.0" or a string representing the version of the browser in detail, e.g. "1.0 (VMS; en-US) Mellblomenator/9000".

**platform**

Must return either the empty string or a string representing the platform on which the browser is executing, e.g. "MacIntel", "Win32", "FreeBSD i386", "WebTV OS".

### **product**

Must return the string "Gecko".

### **taintEnabled()**

Must return false.

### **userAgent**

Must return the string used for the value of the "User-Agent" header in HTTP requests, or the empty string if no such header is ever sent.

### **vendorSub**

Must return the empty string.

**Any information in this API that varies from user to user can be used to profile the user. In fact, if enough such information is available, a user can actually be uniquely identified. For this reason, user agent implementors are strongly urged to include as little information in this API as possible.**

p30

### **8.6.1.2 Language preferences**

**IDL**

```
[NoInterfaceObject, Exposed=(Window,Worker)]
interface NavigatorLanguage {
 readonly attribute DOMString? language;
 readonly attribute DOMString[] languages;
};
```

#### **Note**

`window.navigatorp858.languagep860`

Returns a language tag representing the user's preferred language.

`window.navigatorp858.languagesp860`

Returns an array of language tags representing the user's preferred languages, with the most preferred language first.

The most preferred language is the one returned by `navigator.languagep860`.

**Note** A `languagechangep1144` event is fired at the `Windowp768` or `WorkerGlobalScopep923` object when the user agent's understanding of what the user's preferred languages are changes.

#### **language**

Must return a valid BCP 47 language tag representing either `a plausible languagep860` or the user's most preferred language. [\[BCP47\]<sup>p1148</sup>](#)

#### **languages**

Must return a `read onlyp49` array of valid BCP 47 language tags representing either one or more `plausible languagesp860`, or the user's preferred languages, ordered by preference with the most preferred language first. The same object must be returned until the user agent needs to return different values, or values in a different order. [\[BCP47\]<sup>p1148</sup>](#)

Whenever the user agent needs to make the `navigator.languagesp860` attribute of a `Windowp768` or `WorkerGlobalScopep923` object return a new set of language tags, the user agent must `queue a taskp835` to fire a simple event<sup>p846</sup> named `languagechangep1144` at the `Windowp768` or `WorkerGlobalScopep923` object and wait until that task begins to be executed before actually returning a new value.

The `task sourcep835` for this `taskp834` is the `DOM manipulation task sourcep838`.

To determine a **plausible language**, the user agent should bear in mind the following:

- Any information in this API that varies from user to user can be used to profile or identify the user.
- If the user is not using a service that obfuscates the user's point of origin (e.g. the Tor anonymity network), then the value that is likely to distinguish the user from other users with similar origins (e.g. from the same IP address block) is the language used by the majority of such users. [\[TOR\]<sup>p1153</sup>](#)

p30

- If the user is using an anonymizing service, then the value "`en-US`" is suggested; if all users of the service use that same value, that reduces the possibility of distinguishing the users from each other.

To avoid introducing any more fingerprinting vectors, user agents should use the same list for the APIs defined in this function as for the HTTP `Accept-Language`<sup>p49</sup> header.

Spec bugs: 13883

### 8.6.1.3 Custom scheme and content handlers: the `registerProtocolHandler()`<sup>p861</sup> and `registerContentHandler()`<sup>p861</sup> methods

IDL

```
[NoInterfaceObject]
interface NavigatorContentUtils {
 // content handler registration
 void registerProtocolHandler(DOMString scheme, DOMString url, DOMString title);
 void registerContentHandler(DOMString mimeType, DOMString url, DOMString title);
 DOMString isProtocolHandlerRegistered(DOMString scheme, DOMString url);
 DOMString isContentHandlerRegistered(DOMString mimeType, DOMString url);
 void unregisterProtocolHandler(DOMString scheme, DOMString url);
 void unregisterContentHandler(DOMString mimeType, DOMString url);
};
```

Spec bugs: 13883

The `registerProtocolHandler()` method allows Web sites to register themselves as possible handlers for particular schemes. For example, an online telephone messaging service could register itself as a handler of the `sms:` scheme, so that if the user clicks on such a link, he is given the opportunity to use that Web site. Analogously, the `registerContentHandler()` method allows Web sites to register themselves as possible handlers for content in a particular [MIME type](#)<sup>p42</sup>. For example, the same online telephone messaging service could register itself as a handler for `text/vcard`<sup>p1147</sup> files, so that if the user has no native application capable of handling vCards, his Web browser can instead suggest he use that site to view contact information stored on vCards that he opens. [SMS]<sup>p1153</sup> [RFC6350]<sup>p1153</sup>

Spec bugs: 26876

Note

`window.navigator`<sup>p858</sup>.`registerProtocolHandler`<sup>p861</sup>(`scheme, url, title`)  
`window.navigator`<sup>p858</sup>.`registerContentHandler`<sup>p861</sup>(`mimeType, url, title`)

Registers a handler for the given scheme or content type, at the given URL, with the given title.

The string "%s" in the URL is used as a placeholder for where to put the URL of the content to be handled.

Throws a `SecurityError`<sup>p50</sup> exception if the user agent blocks the registration (this might happen if trying to register as a handler for "http", for instance).

Throws a `SyntaxError`<sup>p50</sup> exception if the "%s" string is missing in the URL.

User agents may, within the constraints described in this section, do whatever they like when the methods are called. A UA could, for instance, prompt the user and offer the user the opportunity to add the site to a shortlist of handlers, or make the handlers his default, or cancel the request. UAs could provide such a UI through modal UI or through a non-modal transient notification interface. UAs could also simply silently collect the information, providing it only when relevant to the user.

User agents should keep track of which sites have registered handlers (even if the user has declined such registrations) so that the user is not repeatedly prompted with the same request.

The arguments to the methods have the following meanings and corresponding implementation requirements. The requirements that involve throwing exceptions must be processed in the order given below, stopping at the first exception thrown. (So the exceptions for the first argument take precedence over the exceptions for the second argument.)

#### `scheme` (`registerProtocolHandler()`<sup>p861</sup> only)

A scheme, such as "mailto" or "web+auth". The scheme must be compared in an [ASCII case-insensitive](#)<sup>p58</sup> manner by user agents for the purposes of comparing with the scheme part of URLs that they consider against the list of registered handlers.

The `scheme` value, if it contains a colon (as in "mailto:"), will never match anything, since schemes don't contain colons.

If the `registerProtocolHandler()`<sup>p861</sup> method is invoked with a scheme that is neither a [whitelisted scheme](#)<sup>p862</sup> nor a scheme whose value starts with the substring "web+" and otherwise contains only [lowercase ASCII letters](#)<sup>p58</sup>, and whose length is at least five characters (including the "web+" prefix), the user agent must throw a [SecurityError](#)<sup>p50</sup> exception.

The following schemes are the **whitelisted schemes**:

- bitcoin
- geo
- im
- irc
- ircs
- magnet
- mailto
- mms
- news
- nntp
- openpgp4fpr
- sip
- sms
- smsto
- ssh
- tel
- urn
- webcal
- wtai
- xmpp

**Note** This list can be changed. If there are schemes that should be added, please send feedback.

**Note** This list excludes any schemes that could reasonably be expected to be supported inline, e.g. in an [iframe](#)<sup>p299</sup>, such as `http` or (more theoretically) `gopher`. If those were supported, they could potentially be used in man-in-the-middle attacks, by replacing pages that have frames with such content with content under the control of the protocol handler. If the user agent has native support for the schemes, this could further be used for cookie-theft attacks.

#### `mimeType (registerContentHandler()p861 only)`

A [MIME type](#)<sup>p42</sup>, such as `model/vnd.flatland.3dml` or `application/vnd.google-earth.kml+xml`. The [MIME type](#)<sup>p42</sup> must be compared in an [ASCII case-insensitive](#)<sup>p58</sup> manner by user agents for the purposes of comparing with MIME types of documents that they consider against the list of registered handlers.

User agents must compare the given values only to the MIME type/subtype parts of content types, not to the complete type including parameters. Thus, if `mimeType` values passed to this method include characters such as commas or whitespace, or include MIME parameters, then the handler being registered will never be used.

**Note** The type is compared to the [MIME type](#)<sup>p42</sup> used by the user agent after the sniffing algorithms have been applied.

If the `registerContentHandler()`<sup>p861</sup> method is invoked with a [MIME type](#)<sup>p42</sup> that is in the [type blacklist](#)<sup>p862</sup> or that the user agent has deemed a privileged type, the user agent must throw a [SecurityError](#)<sup>p50</sup> exception.

The following [MIME types](#)<sup>p42</sup> are in the [type blacklist](#):

- [application/x-www-form-urlencoded](#)<sup>p1119</sup>
- [application/xhtml+xml](#)<sup>p1118</sup>
- [application/xml](#)<sup>p1145</sup>
- [image/gif](#)<sup>p1145</sup>
- [image/jpeg](#)<sup>p1146</sup>
- [image/png](#)<sup>p1146</sup>
- [image/svg+xml](#)<sup>p1146</sup>
- [multipart/x-mixed-replace](#)<sup>p1117</sup>
- [text/cache-manifest](#)<sup>p1120</sup>
- [text/css](#)<sup>p1146</sup>
- [text/html](#)<sup>p1116</sup>
- [text/ping](#)<sup>p1121</sup>
- [text/plain](#)
- [text/xml](#)<sup>p1147</sup>
- All types that the user agent supports displaying natively in a [browsing context](#)<sup>p762</sup> during [navigation](#)<sup>b791</sup>, except for [application/rss+xml](#)<sup>p1145</sup> and [application/atom+xml](#)<sup>p1145</sup>

**Note** This list can be changed. If there are MIME types that should be added, please send feedback.

## *url*

A string used to build the [URL<sup>p48</sup>](#) of the page that will handle the requests.

User agents must throw a [SyntaxError<sup>p50</sup>](#) exception if the *url* argument passed to one of these methods does not contain the exact literal string "%s".

User agents must throw a [SyntaxError<sup>p50</sup>](#) exception if [resolving<sup>p82</sup>](#) the *url* argument relative to the [API base URL<sup>p829</sup>](#) specified by the [entry settings object<sup>p831</sup>](#) is not successful.

**Note** *The resulting [absolute URL<sup>p48</sup>](#) would by definition not be a [valid URL<sup>p81</sup>](#) as it would include the string "%s" which is not a valid component in a URL.*

User agents must throw a [SecurityError<sup>p50</sup>](#) exception if the resulting [absolute URL<sup>p48</sup>](#) has an [origin<sup>p776</sup>](#) that differs from the [origin<sup>p776</sup>](#) specified by the [entry settings object<sup>p831</sup>](#).

**Note** *This is forcibly the case if the %s placeholder is in the scheme, host, or port parts of the URL.*

The resulting [absolute URL<sup>p48</sup>](#) is the **proto-URL**. It identifies the handler for the purposes of the methods described below.

When the user agent uses this handler, it must replace the first occurrence of the exact literal string "%s" in the *url* argument with an escaped version of the [absolute URL<sup>p48</sup>](#) of the content in question (as defined below), then [resolve<sup>p82</sup>](#) the resulting URL, relative to the [API base URL<sup>p829</sup>](#) specified by the [entry settings object<sup>p831</sup>](#) at the time the [registerContentHandler\(\)<sup>p861</sup>](#) or [registerProtocolHandler\(\)<sup>p861</sup>](#) methods were invoked, and then [navigate<sup>p791</sup>](#) an appropriate [browsing context<sup>p762</sup>](#) to the resulting URL using the GET method (or [equivalent<sup>p83</sup>](#) for non-HTTP URLs).

To get the escaped version of the [absolute URL<sup>p48</sup>](#) of the content in question, the user agent must replace every character in that [absolute URL<sup>p48</sup>](#) that is not a character in the URL [default encode set<sup>p48</sup>](#) with the result of [UTF-8 percent encoding<sup>p48</sup>](#) that character.

**Example** If the user had visited a site at `http://example.com/` that made the following call:

```
navigator.registerContentHandler('application/x-soup', 'soup?url=%s', 'SoupWeb™')
```

...and then, much later, while visiting `http://www.example.net/`, clicked on a link such as:

```
Download our Chicken Kiwi soup!
```

...then, assuming this `chickenkiwi.soup` file was served with the [MIME type<sup>p42</sup>](#) `application/x-soup`, the UA might navigate to the following URL:

```
http://example.com/soup?url=http://www.example.net/chickenk%C3%AFwi.soup
```

This site could then fetch the `chickenkiwi.soup` file and do whatever it is that it does with soup (synthesise it and ship it to the user, or whatever).

## *title*

A descriptive title of the handler, which the UA might use to remind the user what the site in question is.

This section does not define how the pages registered by these methods are used, beyond the requirements on how to process the *url* value (see above). To some extent, the [processing model for navigating across documents<sup>p791</sup>](#) defines some cases where these methods are relevant, but in general UAs may use this information wherever they would otherwise consider handing content to native plugins or helper applications.

UAs must not use registered content handlers to handle content that was returned as part of a non-GET transaction (or rather, as part of any non-idempotent transaction), as the remote site would not be able to fetch the same data.

In addition to the registration methods, there are also methods for determining if particular handlers have been registered, and for unregistering handlers.

**Note**

```
state = window.navigatorp858.isProtocolHandlerRegisteredp864(scheme, url)
state = window.navigatorp858.isContentHandlerRegisteredp864(mimeType, url)
```

Returns one of the following strings describing the state of the handler given by the arguments:

**new**

Indicates that no attempt has been made to register the given handler (or that the handler has been unregistered). It would be appropriate to promote the availability of the handler or to just automatically register the handler.

**registered**

Indicates that the given handler has been registered or that the site is blocked from registering the handler. Trying to register the handler again would have no effect.

**declined**

Indicates that the given handler has been offered but was rejected. Trying to register the handler again may prompt the user again.

```
window.navigatorp858.unregisterProtocolHandlerp865(scheme, url)
```

```
window.navigatorp858.unregisterContentHandlerp865(mimeType, url)
```

Unregisters the handler given by the arguments.

The **isProtocolHandlerRegistered()** method must return the [handler state string<sup>p864</sup>](#) that most closely describes the current state of the handler described by the two arguments to the method, where the first argument gives the scheme and the second gives the string used to build the [URL<sup>p48</sup>](#) of the page that will handle the requests.

The first argument must be compared to the schemes for which custom protocol handlers are registered in an [ASCII case-insensitive<sup>p58</sup>](#) manner to find the relevant handlers.

The second argument must be preprocessed as described below, and if that is successful, must then be matched against the [proto-URLs<sup>p863</sup>](#) of the relevant handlers to find the described handler.

The **isContentHandlerRegistered()** method must return the [handler state string<sup>p864</sup>](#) that most closely describes the current state of the handler described by the two arguments to the method, where the first argument gives the [MIME type<sup>p42</sup>](#) and the second gives the string used to build the [URL<sup>p48</sup>](#) of the page that will handle the requests.

The first argument must be compared to the [MIME types<sup>p42</sup>](#) for which custom content handlers are registered in an [ASCII case-insensitive<sup>p58</sup>](#) manner to find the relevant handlers.

The second argument must be preprocessed as described below, and if that is successful, must then be matched against the [proto-URLs<sup>p863</sup>](#) of the relevant handlers to find the described handler.

The **handler state strings** are the following strings. Each string describes several situations, as given by the following list.

**new**

The described handler has never been registered for the given scheme or type.

The described handler was once registered for the given scheme or type, but the site has since unregistered it. If the handler were to be reregistered, the user would be notified accordingly.

The described handler was once registered for the given scheme or type, but the site has since unregistered it, but the user has indicated that the site is to be blocked from registering the type again, so the user agent would ignore further registration attempts.

**registered**

An attempt was made to register the described handler for the given scheme or type, but the user has not yet been notified, and the user agent would ignore further registration attempts. (Maybe the user agent batches registration requests to display them when the user requests to be notified about them, and the user has not yet requested that the user agent notify it of the previous registration attempt.)

The described handler is registered for the given scheme or type (maybe, or maybe not, as the default handler).

The described handler is permanently blocked from being (re)registered. (Maybe the user marked the registration attempt as spam, or blocked the site for other reasons.)

## declined

An attempt was made to register the described handler for the given scheme or type, but the user has not yet been notified; however, the user might be notified if another registration attempt were to be made. (Maybe the last registration attempt was made while the page was in the background and the user closed the page without looking at it, and the user agent requires confirmation for this registration attempt.) An attempt was made to register the described handler for the given scheme or type, but the user has not yet responded.

An attempt was made to register the described handler for the given scheme or type, but the user declined the offer. The user has not indicated that the handler is to be permanently blocked, however, so another attempt to register the described handler might result in the user being prompted again.

The described handler was once registered for the given scheme or type, but the user has since removed it. The user has not indicated that the handler is to be permanently blocked, however, so another attempt to register the described handler might result in the user being prompted again.

The `unregisterProtocolHandler()` method must unregister the handler described by the two arguments to the method, where the first argument gives the scheme and the second gives the string used to build the [URL<sup>p48</sup>](#) of the page that will handle the requests.

The first argument must be compared to the schemes for which custom protocol handlers are registered in an [ASCII case-insensitive<sup>p58</sup>](#) manner to find the relevant handlers.

The second argument must be preprocessed as described below, and if that is successful, must then be matched against the [proto-URLs<sup>p863</sup>](#) of the relevant handlers to find the described handler.

The `unregisterContentHandler()` method must unregister the handler described by the two arguments to the method, where the first argument gives the [MIME type<sup>p42</sup>](#) and the second gives the string used to build the [URL<sup>p48</sup>](#) of the page that will handle the requests.

The first argument must be compared to the [MIME types<sup>p42</sup>](#) for which custom content handlers are registered in an [ASCII case-insensitive<sup>p58</sup>](#) manner to find the relevant handlers.

The second argument must be preprocessed as described below, and if that is successful, must then be matched against the [proto-URLs<sup>p863</sup>](#) of the relevant handlers to find the described handler.

The second argument of the four methods described above must be preprocessed as follows:

1. If the string does not contain the substring "%s", abort these steps. There's no matching handler.
2. [Resolve<sup>p82</sup>](#) the string relative to the [API base URL<sup>p829</sup>](#) specified by the [entry settings object<sup>p831</sup>](#).
3. If this fails, then throw a [SyntaxError<sup>p50</sup>](#) exception, aborting the method.
4. If the resulting [absolute URL<sup>p48</sup>](#)'s [origin<sup>p776</sup>](#) is not the [same origin<sup>p778</sup>](#) as the [origin<sup>p776</sup>](#) specified by the [entry settings object<sup>p831</sup>](#), throw a [SecurityError<sup>p50</sup>](#) exception, aborting the method.
5. Return the resulting [absolute URL<sup>p48</sup>](#) as the result of preprocessing the argument.

### 8.6.1.3.1 Security and privacy

These mechanisms can introduce a number of concerns, in particular privacy concerns.

**Hijacking all Web usage.** User agents should not allow schemes that are key to its normal operation, such as `http` or `https`, to be rerouted through third-party sites. This would allow a user's activities to be trivially tracked, and would allow user information, even in secure connections, to be collected.

**Hijacking defaults.** User agents are strongly urged to not automatically change any defaults, as this could lead the user to send data to remote hosts that the user is not expecting. New handlers registering themselves should never automatically cause those sites to be used.

**Registration spamming.** User agents should consider the possibility that a site will attempt to register a large number of handlers, possibly from multiple domains (e.g. by redirecting through a series of pages each on a different domain, and each registering a handler for [video/mpeg<sup>p147</sup>](#) —

analogous practices abusing other Web browser features have been used by pornography Web sites for many years). User agents should gracefully handle such hostile attempts, protecting the user.

**Misleading titles.** User agents should not rely wholly on the *title* argument to the methods when presenting the registered handlers to the user, since sites could easily lie. For example, a site `hostile.example.net` could claim that it was registering the "Cuddly Bear Happy Content Handler". User agents should therefore use the handler's domain in any UI along with any title.

**Hostile handler metadata.** User agents should protect against typical attacks against strings embedded in their interface, for example ensuring that markup or escape characters in such strings are not executed, that null bytes are properly handled, that over-long strings do not cause crashes or buffer overruns, and so forth.

**Leaking Intranet URLs.** The mechanism described in this section can result in secret Intranet URLs being leaked, in the following manner:

1. The user registers a third-party content handler as the default handler for a content type.
2. The user then browses his corporate Intranet site and accesses a document that uses that content type.
3. The user agent contacts the third party and hands the third party the URL to the Intranet content.

No actual confidential file data is leaked in this manner, but the URLs themselves could contain confidential information. For example, the URL could be `http://www.corp.example.com/upcoming-aquisitions/the-sample-company.egf`, which might tell the third party that Example Corporation is intending to merge with The Sample Company. Implementors might wish to consider allowing administrators to disable this feature for certain subdomains, content types, or schemes.

**Leaking secure URLs.** User agents should not send HTTPS URLs to third-party sites registered as content handlers without the user's informed consent, for the same reason that user agents sometimes avoid sending `Referer`<sup>49</sup> (sic) HTTP headers from secure sites to third-party sites.

**Leaking credentials.** User agents must never send username or password information in the URLs that are escaped and included sent to the handler sites. User agents may even avoid attempting to pass to Web-based handlers the URLs of resources that are known to require authentication to access, as such sites would be unable to access the resources in question without prompting the user for credentials themselves (a practice that would require the user to know whether to trust the third-party handler, a decision many users are unable to make or even understand).

**Interface interference.** User agents should be prepared to handle intentionally long arguments to the methods. For example, if the user interface exposed consists of an "accept" button and a "deny" button, with the "accept" binding containing the name of the handler, it's important that a long name not cause the "deny" button to be pushed off the screen.

**Fingerprinting users.** Since a site can detect if it has attempted to register a particular handler or not, whether or not the user responds, the mechanism can be used to store data. User agents are therefore strongly urged to treat registrations in the same manner as cookies: clearing cookies for a site should also clear all registrations for that site, and disabling cookies for a site should also disable registrations.

#### 8.6.1.3.2 Sample user interface

*This section is non-normative.*

A simple implementation of this feature for a desktop Web browser might work as follows.

The `registerContentHandler()`<sup>50</sup> method could display a modal dialog box:

**Content Handler Registration**

 **This Web page:**  
 Kittens at work - http://kittens.example.org/  
**...would like permission to handle files of type:**  
 application/x-meowmeow  
**using the following Web-based application:**  
 Kittens-at-work displayer  
 http://kittens.example.org/?show=%s  
**Do you trust the administrators of the "kittens.example.org" domain?**

Trust kittens.example.org     Cancel

In this dialog box, "Kittens at work" is the title of the page that invoked the method, "http://kittens.example.org/" is the URL of that page, "application/x-meowmeow" is the string that was passed to the [registerContentHandler\(\)](#) method as its first argument (*mimeType*), "http://kittens.example.org/?show=%s" was the second argument (*url*), and "Kittens-at-work displayer" was the third argument (*title*).  
 If the user clicks the Cancel button, then nothing further happens. If the user clicks the "Trust" button, then the handler is remembered.  
 When the user then attempts to fetch a URL that uses the "application/x-meowmeow" [MIME type](#), then it might display a dialog as follows:

**Unknown File Type**

 **You have attempted to access:**  
 data:application/x-meowmeow;base64,S2l0dGVucyBhcmUgdGhlIGN1dGVzdCE%3D  
**How would you like FerretBrowser to handle this resource?**

Contact the FerretBrowser plugin registry to see if there is an official way to handle this resource.  
 Pass this URL to a local application:  
 [no application selected]      
 Pass this URL to the "Kittens-at-work displayер" application at "kittens.example.org".  
 Always do this for resources using the "application/x-meowmeow" type in future.

Ok     Cancel

In this dialog, the third option is the one that was primed by the site registering itself earlier.

If the user does select that option, then the browser, in accordance with the requirements described in the previous two sections, will redirect the user to "http://kittens.example.org/?show=data%3Aapplication/x-meowmeow;base64,S2l0dGVucyBhcmUgdGhlIGN1dGVzdCE%253D".

The [registerProtocolHandler\(\)](#) method would work equivalently, but for schemes instead of unknown content types.

#### 8.6.1.4 Manually releasing the storage mutex

IDL

```
[NoInterfaceObject]
interface NavigatorStorageUtils {
 readonly attribute boolean cookieEnabled;
 void yieldForStorageUpdates();
};
```

Note

**window.navigator.cookieEnabled**

Returns false if setting a cookie will be ignored, and true otherwise.

**window.navigator.yieldForStorageUpdates()**

If a script uses the [document.cookie](#) API, or the [localStorage](#) API, the browser will block other scripts from accessing cookies or storage until the first script finishes.

Calling the [navigator.yieldForStorageUpdates\(\)](#) method tells the user agent to unblock any other scripts that may be blocked, even though the script hasn't returned.

Values of cookies and items in the [Storage](#) objects of [localStorage](#) attributes can change after calling this method, whence its name.

The **cookieEnabled** attribute must return true if the user agent attempts to handle cookies according to the cookie specification, and false if it ignores cookie change requests. [\[COOKIES\]](#)

The **yieldForStorageUpdates()** method, when invoked, must, if the [storage mutex](#) is owned by the [event loop](#) of the [task](#) that resulted in the method being called, release the [storage mutex](#) so that it is once again free. Otherwise, it must do nothing.

#### 8.6.1.5 Plugins

IDL

```
[NoInterfaceObject]
interface NavigatorPlugins {
 [SameObject] readonly attribute PluginArray plugins;
 [SameObject] readonly attribute MimeTypeArray mimeTypes;
 readonly attribute boolean javaEnabled;
};

interface PluginArray {
 void refresh(optional boolean reload = false);
 readonly attribute unsigned long length;
 getter Plugin? item(unsigned long index);
 getter Plugin? namedItem(DOMString name);
};

interface MimeTypeArray {
 readonly attribute unsigned long length;
 getter MimeType? item(unsigned long index);
 getter MimeType? namedItem(DOMString name);
};
```

```

};

interface Plugin {
 readonly attribute DOMString name;
 readonly attribute DOMString description;
 readonly attribute DOMString filename;
 readonly attribute unsigned long length;
 getter MimeType? item(unsigned long index);
 getter MimeType? namedItem(DOMString name);
};

interface MimeType {
 readonly attribute DOMString type;
 readonly attribute DOMString description;
 readonly attribute DOMString suffixes; // comma-separated
 readonly attribute Plugin enabledPlugin;
};

```

### Note

`window.navigatorp858.pluginsp870.refreshp871([ refresh ])`

Updates the lists of supported plugins and MIME types for this page, and reloads the page if the lists have changed.

`window.navigatorp858.pluginsp870.lengthp870`

Returns the number of plugins, represented by Plugin<sup>p869</sup> objects, that the user agent reports.

`plugin = window.navigatorp858.pluginsp870.itemp870(index)`

`window.navigatorp858.pluginsp870[index]`

Returns the specified Plugin<sup>p869</sup> object.

`plugin = window.navigatorp858.pluginsp870.itemp870(name)`

`window.navigatorp858.pluginsp870[name]`

Returns the Plugin<sup>p869</sup> object for the plugin with the given name.

`window.navigatorp858.mimeTypesp870.lengthp871`

Returns the number of MIME types, represented by MimeType<sup>p869</sup> objects, supported by the plugins that the user agent reports.

`mimeType = window.navigatorp858.mimeTypesp870.itemp871(index)`

`window.navigatorp858.mimeTypesp870[index]`

Returns the specified MimeType<sup>p869</sup> object.

`mimeType = window.navigatorp858.mimeTypesp870.itemp871(name)`

`window.navigatorp858.mimeTypesp870[name]`

Returns the MimeType<sup>p869</sup> object for the given MIME type.

`plugin.namep872`

Returns the plugin's name.

`plugin.descriptionp872`

Returns the plugin's description.

`plugin.filenamep872`

Returns the plugin library's filename, if applicable on the current platform.

`plugin.lengthp872`

Returns the number of MIME types, represented by MimeType<sup>p869</sup> objects, supported by the plugin.

```

mimeType = plugin . itemp872(index)
plugin[index]
 Returns the specified MimeTypep869 object.

mimeType = plugin . itemp872(name)
plugin[name]
 Returns the MimeTypep869 object for the given MIME type.

mimeType . typep872
 Returns the MIME type.

mimeType . descriptionp872
 Returns the MIME type's description.

mimeType . suffixesp872
 Returns the MIME type's typical file extensions, in a comma-separated list.

mimeType . enabledPluginp872
 Returns the Pluginp869 object that implements this MIME type.

window . navigatorp858 . javaEnabledp873
 Returns true if there's a plugin that supports the MIME type "application/x-java-vm".

```

The `navigator.plugins` attribute must return a [PluginArray<sup>p868</sup>](#) object.

The `navigator.mimeTypes` attribute must return a [MimeTypeArray<sup>p868</sup>](#) object.

A [PluginArray<sup>p868</sup>](#) object represents none, some, or all of the [plugins<sup>p43</sup>](#) supported by the user agent, each of which is represented by a [Plugin<sup>p869</sup>](#) object. Each of these [Plugin<sup>p869</sup>](#) objects may be **hidden plugins**. A [hidden plugin<sup>p870</sup>](#) can't be enumerated, but can still be inspected by using its name.

**Note** *The fewer [plugins<sup>p43</sup>](#) are represented by the [PluginArray<sup>p868</sup>](#) object, and of those, the more that are [hidden<sup>p870</sup>](#), the more the user's privacy will be protected. Each exposed plugin increases the number of bits that can be derived for fingerprinting. Hiding a plugin helps, but unless it is an extremely rare plugin, it is likely that a site attempting to derive the list of plugins can still determine whether the plugin is supported or not by probing for it by name (the names of popular plugins are widely known). Therefore not exposing a plugin at all is preferred. Unfortunately, many legacy sites use this feature to determine, for example, which plugin to use to play video. Not exposing any plugins at all might therefore not be entirely plausible.*

The [PluginArray<sup>p868</sup>](#) objects created by a user agent must not be [live<sup>p43</sup>](#). The set of plugins represented by the objects must not change once an object is created, except when it is updated by the [refresh\(\)<sup>p871</sup>](#) method.

Each [plugin<sup>p43</sup>](#) represented by a [PluginArray<sup>p868</sup>](#) can support a number of [MIME types<sup>p42</sup>](#). For each such [plugin<sup>p43</sup>](#), the user agent must pick one or more of these [MIME types<sup>p42</sup>](#) to be those that are **explicitly supported**.

**Note** *The [explicitly supported<sup>p870</sup>](#) [MIME types<sup>p42</sup>](#) of a [plugin<sup>p43</sup>](#) are those that are exposed through the [Plugin<sup>p869</sup>](#) and [MimeTypeArray<sup>p868</sup>](#) interfaces. As with [plugins<sup>p43</sup>](#) themselves, any variation between users regarding what is exposed allows sites to fingerprint users. User agents are therefore encouraged to expose the same [MIME types<sup>p42</sup>](#) for all users of a [plugin<sup>p43</sup>](#), regardless of the actual types supported... at least, within the constraints imposed by compatibility with legacy content.*

The [supported property indices<sup>p49</sup>](#) of a [PluginArray<sup>p868</sup>](#) object are the numbers from zero to the number of non-[hidden<sup>p870</sup>](#) [plugins<sup>p43</sup>](#) represented by the object, if any.

The `length` attribute must return the number of non-[hidden<sup>p870</sup>](#) [plugins<sup>p43</sup>](#) represented by the object.

The `item()` method of a [PluginArray<sup>p868</sup>](#) object must return null if the argument is not one of the object's [supported property indices<sup>p49</sup>](#), otherwise must return the result of running the following steps, using the method's argument as `index`:

1. Let *list* be the [Plugin](#)<sup>p869</sup> objects representing the non-hidden<sup>p870</sup> [plugins](#)<sup>p43</sup> represented by the [PluginArray](#)<sup>p868</sup> object.
2. Sort *list* alphabetically by the [name](#)<sup>p872</sup> of each [Plugin](#)<sup>p869</sup>.
3. Return the *indexth* entry in *list*.

**Note** *It is important for privacy<sup>p30</sup> that the order of plugins not leak additional information, e.g. the order in which plugins were installed.*

The [supported property names](#)<sup>p49</sup> of a [PluginArray](#)<sup>p868</sup> object are the values of the [name](#)<sup>p872</sup> attributes of all the [Plugin](#)<sup>p869</sup> objects represented by the [PluginArray](#)<sup>p868</sup> object. The properties exposed in this way must be [unenumerable](#)<sup>p49</sup>.

The [namedItem\(\)](#) method of a [PluginArray](#)<sup>p868</sup> object must return null if the argument is not one of the object's [supported property names](#)<sup>p49</sup>, and otherwise must return the [Plugin](#)<sup>p869</sup> object, of those represented by the [PluginArray](#)<sup>p868</sup> object, that has a [name](#)<sup>p872</sup> equal to the method's argument.

The [refresh\(\)](#) method of the [PluginArray](#)<sup>p868</sup> object of a [Navigator](#)<sup>p858</sup> object, when invoked, must check to see if any [plugins](#)<sup>p43</sup> have been installed or reconfigured since the user agent created the [PluginArray](#)<sup>p868</sup> object. If so, and the method's argument is true, then the user agent must act as if the [location.reload\(\)](#)<sup>p789</sup> method was called instead. Otherwise, the user agent must update the [PluginArray](#)<sup>p868</sup> object and [MimeTypeArray](#)<sup>p868</sup> object created for attributes of that [Navigator](#)<sup>p858</sup> object, and the [Plugin](#)<sup>p869</sup> and [MimeType](#)<sup>p869</sup> objects created for those [PluginArray](#)<sup>p868</sup> and [MimeTypeArray](#)<sup>p868</sup> objects, using the same [Plugin](#)<sup>p869</sup> objects for cases where the [name](#)<sup>p872</sup> is the same, and the same [MimeType](#)<sup>p869</sup> objects for cases where the [type](#)<sup>p872</sup> is the same, and creating new objects for cases where there were no matching objects immediately prior to the [refresh\(\)](#)<sup>p871</sup> call. Old [Plugin](#)<sup>p869</sup> and [MimeType](#)<sup>p869</sup> objects must continue to return the same values that they had prior to the update, though naturally now the data is stale and may appear inconsistent (for example, an old [MimeType](#)<sup>p869</sup> entry might list as its [enabledPlugin](#)<sup>p872</sup> a [Plugin](#)<sup>p869</sup> object that no longer lists that [MimeType](#)<sup>p869</sup> as a supported [MimeType](#)<sup>p869</sup>).

A [MimeTypeArray](#)<sup>p868</sup> object represents the [MIME types](#)<sup>p42</sup> explicitly supported<sup>p870</sup> by [plugins](#)<sup>p43</sup> supported by the user agent, each of which is represented by a [MimeType](#)<sup>p869</sup> object.

The [MimeTypeArray](#)<sup>p868</sup> objects created by a user agent must not be [live](#)<sup>p43</sup>. The set of MIME types represented by the objects must not change once an object is created, except when it is updated by the [PluginArray](#)<sup>p868</sup> object's [refresh\(\)](#)<sup>p871</sup> method.

The [supported property indices](#)<sup>p49</sup> of a [MimeTypeArray](#)<sup>p868</sup> object are the numbers from zero to the number of [MIME types](#)<sup>p42</sup> explicitly supported<sup>p870</sup> by non-hidden<sup>p870</sup> [plugins](#)<sup>p43</sup> represented by the corresponding [PluginArray](#)<sup>p868</sup> object, if any.

The [length](#) attribute must return the number of [MIME types](#)<sup>p42</sup> explicitly supported<sup>p870</sup> by non-hidden<sup>p870</sup> [plugins](#)<sup>p43</sup> represented by the corresponding [PluginArray](#)<sup>p868</sup> object, if any.

The [item\(\)](#) method of a [MimeTypeArray](#)<sup>p868</sup> object must return null if the argument is not one of the object's [supported property indices](#)<sup>p49</sup>, otherwise must return the result of running the following steps, using the method's argument as *index*:

1. Let *list* be the [MimeType](#)<sup>p869</sup> objects representing the [MIME types](#)<sup>p42</sup> explicitly supported<sup>p870</sup> by non-hidden<sup>p870</sup> [plugins](#)<sup>p43</sup> represented by the corresponding [PluginArray](#)<sup>p868</sup> object, if any.
2. Sort *list* alphabetically by the [type](#)<sup>p872</sup> of each [MimeType](#)<sup>p869</sup>.
3. Return the *indexth* entry in *list*.

**Note** *It is important for privacy<sup>p30</sup> that the order of MIME types not leak additional information, e.g. the order in which plugins were installed.*

The [supported property names](#)<sup>p49</sup> of a [MimeTypeArray](#)<sup>p868</sup> object are the values of the [type](#)<sup>p872</sup> attributes of all the [MimeType](#)<sup>p869</sup> objects represented by the [MimeTypeArray](#)<sup>p868</sup> object. The properties exposed in this way must be [unenumerable](#)<sup>p49</sup>.

The [namedItem\(\)](#) method of a [MimeTypeArray](#)<sup>p868</sup> object must return null if the argument is not one of the object's [supported property names](#)<sup>p49</sup>, and otherwise must return the [MimeType](#)<sup>p869</sup> object that has a [type](#)<sup>p872</sup> equal to the method's argument.

A [Plugin](#)<sup>p869</sup> object represents a [plugin](#)<sup>p43</sup>. It has several attributes to provide details about the plugin, and can be enumerated to obtain the list of [MIME types](#)<sup>p42</sup> that it [explicitly supports](#)<sup>p870</sup>.

The [Plugin](#)<sup>p869</sup> objects created by a user agent must not be [live](#)<sup>p43</sup>. The set of MIME types represented by the objects, and the values of the objects' attributes, must not change once an object is created, except when updated by the [PluginArray](#)<sup>p868</sup> object's [refresh\(\)](#)<sup>p871</sup> method.

The **reported MIME types** for a [Plugin](#)<sup>p869</sup> object are the [MIME types](#)<sup>p42</sup> [explicitly supported](#)<sup>p870</sup> by the corresponding [plugin](#)<sup>p43</sup> when this object was last created or updated by [PluginArray.refresh\(\)](#)<sup>p871</sup>, whichever happened most recently.

The [supported property indices](#)<sup>p49</sup> of a [Plugin](#)<sup>p869</sup> object are the numbers from zero to the number of [reported MIME types](#)<sup>p872</sup>.

The [length](#) attribute must return the number of [reported MIME types](#)<sup>p872</sup>.

The [item\(\)](#) method of a [Plugin](#)<sup>p869</sup> object must return null if the argument is not one of the object's [supported property indices](#)<sup>p49</sup>, and otherwise must return the result of running the following steps, using the method's argument as *index*:

1. Let *list* be the [MimeType](#)<sup>p869</sup> objects representing the [reported MIME types](#)<sup>p872</sup>.
2. Sort *list* alphabetically by the [type](#)<sup>p872</sup> of each [MimeType](#)<sup>p869</sup>.
3. Return the *index*th entry in *list*.

**Note** It is important for privacy<sup>p30</sup> that the order of MIME types not leak additional information, e.g. the order in which plugins were installed.

The [supported property names](#)<sup>p49</sup> of a [Plugin](#)<sup>p869</sup> object are the values of the [type](#)<sup>p872</sup> attributes of the [MimeType](#)<sup>p869</sup> objects representing the [reported MIME types](#)<sup>p872</sup>. The properties exposed in this way must be [unenumerable](#)<sup>p49</sup>.

The [namedItem\(\)](#) method of a [Plugin](#)<sup>p869</sup> object must return null if the argument is not one of the object's [supported property names](#)<sup>p49</sup>, and otherwise must return the [MimeType](#)<sup>p869</sup> object that has a [type](#)<sup>p872</sup> equal to the method's argument.

The [name](#) attribute must return the [plugin](#)<sup>p43</sup>'s name.

The [description](#) and [filename](#) attributes must return user-agent-defined (or, in all likelihood, [plugin](#)<sup>p43</sup>-defined) strings. In each case, the same string must be returned each time, except that the strings returned may change when the [PluginArray.refresh\(\)](#)<sup>p871</sup> method updates the object.

**⚠ Warning!** If the values returned by the [description](#)<sup>p872</sup> or [filename](#)<sup>p872</sup> attributes vary between versions of a [plugin](#)<sup>p43</sup>, they can be used both as a fingerprinting vector and, even more importantly, as a trivial way to determine what security vulnerabilities a [plugin](#)<sup>p43</sup> (and thus a browser) may have. It is thus highly recommended that the [description](#)<sup>p872</sup> attribute just return the same value as the [name](#)<sup>p872</sup> attribute, and that the [filename](#)<sup>p872</sup> attribute return the empty string.

A [MimeType](#)<sup>p869</sup> object represents a [MIME type](#)<sup>p42</sup> that is, or was, [explicitly supported](#)<sup>p870</sup> by a [plugin](#)<sup>p43</sup>.

The [MimeType](#)<sup>p869</sup> objects created by a user agent must not be [live](#)<sup>p43</sup>. The values of the objects' attributes must not change once an object is created, except when updated by the [PluginArray](#)<sup>p868</sup> object's [refresh\(\)](#)<sup>p871</sup> method.

The [type](#) attribute must return the [valid MIME type with no parameters](#)<sup>p42</sup> describing the [MIME type](#)<sup>p42</sup>.

The [description](#) and [suffixes](#) attributes must return user-agent-defined (or, in all likelihood, [plugin](#)<sup>p43</sup>-defined) strings. In each case, the same string must be returned each time, except that the strings returned may change when the [PluginArray.refresh\(\)](#)<sup>p871</sup> method updates the object.

**⚠ Warning!** If the values returned by the [description](#)<sup>p872</sup> or [suffixes](#)<sup>p872</sup> attributes vary between versions of a [plugin](#)<sup>p43</sup>, they can be used both as a fingerprinting vector and, even more importantly, as a trivial way to determine what security vulnerabilities a [plugin](#)<sup>p43</sup> (and thus a browser) may have. It is thus highly recommended that the [description](#)<sup>p872</sup> attribute just return the same value as the [type](#)<sup>p872</sup> attribute, and that the [suffixes](#)<sup>p872</sup> attribute return the empty string.

**Note** Commas in the [suffixes](#)<sup>p872</sup> attribute are interpreted as separating subsequent filename extensions, as in "htm,html".

The [enabledPlugin](#) attribute must return the [Plugin](#)<sup>p869</sup> object that represents the [plugin](#)<sup>p43</sup> that [explicitly supported](#)<sup>p870</sup> the [MIME type](#)<sup>p42</sup> that this [MimeType](#)<sup>p869</sup> object represents when this object was last created or updated by [PluginArray.refresh\(\)](#)<sup>p871</sup>, whichever happened most recently.

The `navigator.javaEnabled` attribute must return true if the user agent supports a [plugin<sup>p43</sup>](#) that supports the [MIME type<sup>p42</sup>](#) "application/x-java-vm"; otherwise it must return false.

## 8.6.2 The [External<sup>p873</sup>](#) interface

The `external` attribute of the [Window<sup>p768</sup>](#) interface must return an instance of the [External<sup>p873</sup>](#) interface.

IDL

```
interface External {
 void AddSearchProvider(DOMString engineURL);
 unsigned long IsSearchProviderInstalled(DOMString engineURL);
};
```

Note *For historical reasons, members on this interface are capitalized.*

Note

`window.externalp873.AddSearchProviderp873(url)`

Adds the search engine described by the OpenSearch description document at `url`. [\[OPENSEARCH\]<sup>p1151</sup>](#)

The OpenSearch description document has to be on the same server as the script that calls this method.

`installed = window.externalp873.IsSearchProviderInstalledp873(url)`

Returns a value based on comparing `url` to the URLs of the results pages of the installed search engines.

**0**

None of the installed search engines match `url`.

**1**

One or more installed search engines match `url`, but none are the user's default search engine.

**2**

The user's default search engine matches `url`.

The `url` is compared to the URLs of the results pages of the installed search engines using a prefix match. Only results pages on the same domain as the script that calls this method are checked.

Note *Another way of exposing search engines using OpenSearch description documents is using a [link<sup>p141</sup>](#) element with the [search<sup>p256</sup>](#) link type.*

The `AddSearchProvider()` method, when invoked, must run the following steps:

1. Optionally, abort these steps. User agents may implement the method as a stub method that never does anything, or may arbitrarily ignore invocations with particular arguments for security, privacy, or usability reasons.
2. [Resolve<sup>p82</sup>](#) the value of the method's first argument relative to the [API base URL<sup>p829</sup>](#) specified by the [entry settings object<sup>p831</sup>](#).
3. If this fails, abort these steps.
4. Process the resulting [absolute URL<sup>p48</sup>](#) as the [URL<sup>p48</sup>](#) to an OpenSearch description document. [\[OPENSEARCH\]<sup>p1151</sup>](#)

The `IsSearchProviderInstalled()` method, when invoked, must run the following steps:

1. Optionally, return 0 and abort these steps. User agents may implement the method as a stub method that never returns a non-zero value, or may arbitrarily ignore invocations with particular arguments for security, privacy, or usability reasons.
2. If the [origin<sup>p776</sup>](#) specified by the [entry settings object<sup>p831</sup>](#) is an opaque identifier (i.e. it has no host component), then return 0 and abort these steps.
3. Let `host1` be the host component of the [origin<sup>p776</sup>](#) specified by the [entry settings object<sup>p831</sup>](#).

4. [Resolve](#)<sup>p82</sup> the `scriptURL` argument relative to the [API base URL](#)<sup>p829</sup> specified by the [entry settings object](#)<sup>p831</sup>.
5. If this fails, return 0 and abort these steps.
6. Let `host2` be the [host](#)<sup>p48</sup> component of the resulting [parsed URL](#)<sup>p48</sup>.
7. If the longest suffix in the Public Suffix List that matches the end of `host1` is different than the longest suffix in the Public Suffix List that matches the end of `host2`, then return 0 and abort these steps. [\[PSL\]](#)<sup>p151</sup>
  - If the next domain component of `host1` and `host2` after their common suffix are not the same, then return 0 and abort these steps.
8. Let `search engines` be the list of search engines known by the user agent and made available to the user by the user agent for which the resulting [absolute URL](#)<sup>p48</sup> is a [prefix match](#)<sup>p58</sup> of the search engine's [URL](#)<sup>p48</sup>, if any. For search engines registered using OpenSearch description documents, the [URL](#)<sup>p48</sup> of the search engine corresponds to the URL given in a `Url` element whose `rel` attribute is "results" (the default). [\[OPENSEARCH\]](#)<sup>p151</sup>
9. If `search engines` is empty, return 0 and abort these steps.
10. If the user's default search engine (as determined by the user agent) is one of the search engines in `search engines`, then return 2 and abort these steps.
11. Return 1.

## 8.7 Images

Spec bugs: [22705](#)

IDL

```
[Exposed=(Window,Worker)]
interface ImageBitmap {
 readonly attribute unsigned long width;
 readonly attribute unsigned long height;
};

typedef (HTMLImageElement or
 HTMLVideoElement or
 HTMLCanvasElement or
 Blob or
 ImageData or
 CanvasRenderingContext2D or
 ImageBitmap) ImageBitmapSource;

[NoInterfaceObject, Exposed=(Window,Worker)]
interface ImageBitmapFactories {
 Promise<ImageBitmap> createImageBitmap(ImageBitmapSource image);
 Promise<ImageBitmap> createImageBitmap(ImageBitmapSource image, long sx, long sy, long sw, long sh);
};
Window implements ImageBitmapFactories;
WorkerGlobalScope implements ImageBitmapFactories;
```

An [ImageBitmap](#)<sup>p874</sup> object represents a bitmap image that can be painted to a canvas without undue latency.

**Note** *The exact judgement of what is undue latency of this is left up to the implementer, but in general if making use of the bitmap requires network I/O, or even local disk I/O, then the latency is probably undue; whereas if it only requires a blocking read from a GPU or system RAM, the latency is probably acceptable.*

Note

`promise = Window . createImageBitmapp875(image [, sx, sy, sw, sh ])`

Takes `image`, which can be an `imgp272` element, `videop317`, or `canvasp607` element, a `Blobp52` object, an `ImageDatap616` object, a `CanvasRenderingContext2Dp613` object, or another `ImageBitmapp874` object, and returns a `Promisep51` that is resolved when a new `ImageBitmapp874` is created.

If no `ImageBitmapp874` object can be constructed, for example because the provided `image` data is not actually an image, then the promise is rejected instead.

If `sx`, `sy`, `sw`, and `sh` arguments are provided, the source image is cropped to the given pixels, with any pixels missing in the original replaced by transparent black. These coordinates are in the source image's pixel coordinate space, *not* in CSS pixels.

Rejects the promise with an `InvalidStateErrorp50` exception if the source image is not in a valid state (e.g. an `imgp272` element that hasn't finished loading, or a `CanvasRenderingContext2Dp613` object whose bitmap data has zero length along one or both dimensions, or an `ImageDatap616` object whose data is `datap660` attribute has been `neuteredp98`). Rejects the promise with a `SecurityErrorp50` exception if the script is not allowed to access the image data of the source image (e.g. a `videop317` that is `CORS-cross-originp87`, or a `canvasp607` being drawn on by a script in a worker from another `originp776`).

`imageBitmap . widthp878`

Returns the intrinsic width of the image, in CSS pixels.

`imageBitmap . heightp878`

Returns the intrinsic height of the image, in CSS pixels.

An `ImageBitmapp874` object always has associated bitmap data, with a width and a height. However, it is possible for this data to be corrupted. If an `ImageBitmapp874` object's media data can be decoded without errors, it is said to be **fully decodable**.

An `ImageBitmapp874` object can be obtained from a variety of different objects, using the `createImageBitmap()` method. When invoked, the method must act as follows:

#### If `image` is an `imgp272` element

1. If either the `sw` or `sh` arguments are specified but zero, return a promise rejected with an `IndexSizeErrorp50` exception and abort these steps.
2. If the `imgp272` element is not `completely availablep274`, then return a promise rejected with an `InvalidStateErrorp50` exception and abort these steps.
3. If the `originp776` of the `imgp272` element's image is not the `same originp778` as the `originp776` specified by the `entry settings objectp831`, then return a promise rejected with a `SecurityErrorp50` exception and abort these steps.
4. If the `imgp272` element's media data is not a bitmap (e.g. it's a vector graphic), then return a promise rejected with an `InvalidStateErrorp50` exception and abort these steps.
5. Create a new `ImageBitmapp874` object.
6. Let the `ImageBitmapp874` object's bitmap data be a copy of the `imgp272` element's media data, `cropped to the source rectanglep877`. If this is an animated image, the `ImageBitmapp874` object's bitmap data must only be taken from the default image of the animation (the one that the format defines is to be used when animation is not supported or is disabled), or, if there is no such image, the first frame of the animation.
7. Return a new `Promisep51`, but continue running these steps `in parallelp41`.
8. `Resolvep51` the `Promisep51` with the new `ImageBitmapp874` object as the value.

#### If `image` is a `videop317` element

1. If either the `sw` or `sh` arguments are specified but zero, return a promise rejected with an `IndexSizeErrorp50` exception and abort these steps.
2. If the `videop317` element's `networkStatep331` attribute is `NETWORK_EMPTYp331`, then return a promise rejected with an `InvalidStateErrorp50` exception and abort these steps.

3. If the [origin](#)<sup>p776</sup> of the [video](#)<sup>p317</sup> element is not the [same origin](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> specified by the [entry settings object](#)<sup>p831</sup>, then return a promise rejected with a [SecurityError](#)<sup>p50</sup> exception and abort these steps.
4. If the [video](#)<sup>p317</sup> element's [readyState](#)<sup>p345</sup> attribute is either [HAVE NOTHING](#)<sup>p343</sup> or [HAVE METADATA](#)<sup>p343</sup>, then return a promise rejected with an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
5. Create a new [ImageBitmap](#)<sup>p874</sup> object.
6. Let the [ImageBitmap](#)<sup>p874</sup> object's bitmap data be a copy of the frame at the [current playback position](#)<sup>p342</sup>, at the [media resource](#)<sup>p328</sup>'s [intrinsic width](#)<sup>p319</sup> and [intrinsic height](#)<sup>p319</sup> (i.e. after any aspect-ratio correction has been applied), [cropped to the source rectangle](#)<sup>p877</sup>.
7. Return a new [Promise](#)<sup>p51</sup>, but continue running these steps [in parallel](#)<sup>p41</sup>.
8. [Resolve](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup> with the new [ImageBitmap](#)<sup>p874</sup> object as the value.

If *image* is a [canvas](#)<sup>p607</sup> element

1. If either the *sw* or *sh* arguments are specified but zero, return a promise rejected with an [IndexSizeError](#)<sup>p50</sup> exception and abort these steps.
2. If the [canvas](#)<sup>p607</sup> element's bitmap data does not have its [origin-clean](#)<sup>p609</sup> flag set, then return a promise rejected with an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
3. If the [canvas](#)<sup>p607</sup> element's bitmap has either a horizontal dimension or a vertical dimension equal to zero, then return a promise rejected with an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
4. Create a new [ImageBitmap](#)<sup>p874</sup> object.
5. Let the [ImageBitmap](#)<sup>p874</sup> object's bitmap data be a copy of the [canvas](#)<sup>p607</sup> element's bitmap data, [cropped to the source rectangle](#)<sup>p877</sup>.
6. Return a new [Promise](#)<sup>p51</sup>, but continue running these steps [in parallel](#)<sup>p41</sup>.
7. [Resolve](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup> with the new [ImageBitmap](#)<sup>p874</sup> object as the value.

If *image* is a [Blob](#)<sup>p52</sup> object

1. If either the *sw* or *sh* arguments are specified but zero, return a promise rejected with an [IndexSizeError](#)<sup>p50</sup> exception and abort these steps.
2. If the [Blob](#)<sup>p52</sup> object has been disabled through the [close\(\)](#)<sup>p52</sup> method, then return a promise rejected with an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
3. Return a new [Promise](#)<sup>p51</sup>, but continue running these steps [in parallel](#)<sup>p41</sup>.
4. Read the [Blob](#)<sup>p52</sup> object's data. If an [error occurs during reading of the object](#)<sup>p52</sup>, then [reject](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup>'s associated [resolver](#)<sup>p51</sup>, with null as the value, and abort these steps.
5. Apply the [image sniffing rules](#) to determine the file format of the image data, with MIME type of the [Blob](#)<sup>p52</sup> (as given by the [Blob](#)<sup>p52</sup> object's [type](#)<sup>p52</sup> attribute) giving the official type.
6. If the image data is not in a supported file format (e.g. it's not actually an image at all), or if the image data is corrupted in some fatal way such that the image dimensions cannot be obtained, then [reject](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup>'s associated [resolver](#)<sup>p51</sup>, with null as the value, and abort these steps.
7. Create a new [ImageBitmap](#)<sup>p874</sup> object.
8. Let the [ImageBitmap](#)<sup>p874</sup> object's bitmap data be the image data read from the [Blob](#)<sup>p52</sup> object, [cropped to the source rectangle](#)<sup>p877</sup>. If this is an animated image, the [ImageBitmap](#)<sup>p874</sup> object's bitmap data must only be taken from the default image of the animation (the one that the format defines is to be used when animation is not supported or is disabled), or, if there is no such image, the first frame of the animation.
9. [Resolve](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup> with the new [ImageBitmap](#)<sup>p874</sup> object as the value.

#### If *image* is an [ImageData](#)<sup>p616</sup> object

1. If either the *sw* or *sh* arguments are specified but zero, return a promise rejected with an [IndexSizeError](#)<sup>p50</sup> exception and abort these steps.
2. If the *image* object's [data](#)<sup>p660</sup> attribute has been [neutered](#)<sup>p98</sup>, return a promise rejected with an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
3. Create a new [ImageBitmap](#)<sup>p874</sup> object.
4. Let the [ImageBitmap](#)<sup>p874</sup> object's bitmap data be the image data given by the [ImageData](#)<sup>p616</sup> object, [cropped to the source rectangle](#)<sup>p877</sup>.
5. Return a new [Promise](#)<sup>p51</sup>, but continue running these steps [in parallel](#)<sup>p41</sup>.
6. [Resolve](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup> with the new [ImageBitmap](#)<sup>p874</sup> object as the value.

#### If *image* is a [CanvasRenderingContext2D](#)<sup>p613</sup> object

1. If either the *sw* or *sh* arguments are specified but zero, return a promise rejected with an [IndexSizeError](#)<sup>p50</sup> exception and abort these steps.
2. If the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [scratch bitmap](#)<sup>p617</sup> does not have its [origin-clean](#)<sup>p609</sup> flag set, then return a promise rejected with an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
3. If the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [scratch bitmap](#)<sup>p617</sup> has either a horizontal dimension or a vertical dimension equal to zero, then return a promise rejected with an [InvalidStateError](#)<sup>p50</sup> exception and abort these steps.
4. Create a new [ImageBitmap](#)<sup>p874</sup> object.
5. Let the [ImageBitmap](#)<sup>p874</sup> object's bitmap data be a copy of the [CanvasRenderingContext2D](#)<sup>p613</sup> object's [scratch bitmap](#)<sup>p617</sup>, [cropped to the source rectangle](#)<sup>p877</sup>.
6. Return a new [Promise](#)<sup>p51</sup>, but continue running these steps [in parallel](#)<sup>p41</sup>.
7. [Resolve](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup> with the new [ImageBitmap](#)<sup>p874</sup> object as the value.

#### If *image* is an [ImageBitmap](#)<sup>p874</sup> object

1. If either the *sw* or *sh* arguments are specified but zero, return a promise rejected with an [IndexSizeError](#)<sup>p50</sup> exception and abort these steps.
2. Create a new [ImageBitmap](#)<sup>p874</sup> object.
3. Let the [ImageBitmap](#)<sup>p874</sup> object's bitmap data be a copy of the *image* argument's bitmap data, [cropped to the source rectangle](#)<sup>p877</sup>.
4. Return a new [Promise](#)<sup>p51</sup>, but continue running these steps [in parallel](#)<sup>p41</sup>.
5. [Resolve](#)<sup>p51</sup> the [Promise](#)<sup>p51</sup> with the new [ImageBitmap](#)<sup>p874</sup> object as the value.

When the steps above require that the user agent **crop bitmap data to the source rectangle**, the user agent must run the following steps:

1. Let *input* be the image data being cropped.
2. If the *sx*, *sy*, *sw*, and *sh* arguments are omitted, return *input*.
3. Place *input* on an infinite transparent black grid plane, positioned so that its top left corner is at the origin of the plane, with the *x*-coordinate increasing to the right, and the *y*-coordinate increasing down, and with each pixel in the *input* image data occupying a cell on the plane's grid.
4. Let *output* be the rectangle on the plane denoted by the rectangle whose corners are the four points  $(sx, sy)$ ,  $(sx+sw, sy)$ ,  $(sx+sw, sy+sh)$ ,  $(sx, sy+sh)$ .

**Note** *If either sw or sh are negative, then the top-left corner of this rectangle will be to the left or above the (sx, sy) point. If any of the pixels on this rectangle are outside the area where the input bitmap was placed, then they will be transparent black in output.*

## 5. Return *output*.

The **width** attribute must return the [ImageBitmap<sup>p874</sup>](#) object's width, in CSS pixels.

The **height** attribute must return the [ImageBitmap<sup>p874</sup>](#) object's height, in CSS pixels.

### Example

Using this API, a sprite sheet can be pre-cut and prepared:

```
var sprites = {};
function loadMySprites() {
 var image = new Image();
 image.src = 'mysprites.png';
 var resolver;
 var promise = new Promise(function (arg) { resolver = arg });
 image.onload = function () {
 resolver(Promise.all(
 createImageBitmap(image, 0, 0, 40, 40).then(function (image) { sprites.woman = image }),
 createImageBitmap(image, 40, 0, 40, 40).then(function (image) { sprites.man = image }),
 createImageBitmap(image, 80, 0, 40, 40).then(function (image) { sprites.tree = image }),
 createImageBitmap(image, 0, 40, 40, 40).then(function (image) { sprites.hut = image }),
 createImageBitmap(image, 40, 40, 40, 40).then(function (image) { sprites.apple = image }),
 createImageBitmap(image, 80, 40, 40, 40).then(function (image) { sprites.snake = image })
));
 };
 return promise;
}

function runDemo() {
 var canvas = document.querySelector('canvas#demo');
 var context = canvas.getContext('2d');
 context.drawImage(sprites.tree, 30, 10);
 context.drawImage(sprites.snake, 70, 10);
}

loadMySprites().then(runDemo);
```

Spec bugs: [27710](#)

## 8.8 Animation Frames

Each [Document<sup>p102</sup>](#) has a **list of animation frame callbacks**, which must be initially empty, and an **animation frame callback identifier**, which is a number which must initially be zero.

When the **requestAnimationFrame()** method is called, the user agent must run the following steps:

1. Let *document* be [the Window object's Document object<sup>p762</sup>](#).
2. Increment *document*'s **animation frame callback identifier<sup>p878</sup>** by one.
3. Append the method's argument to *document*'s **list of animation frame callbacks<sup>p878</sup>**, associated with *document*'s **animation frame callback identifier<sup>p878</sup>**'s current value.
4. Return *document*'s **animation frame callback identifier<sup>p878</sup>**'s current value.

When the **cancelAnimationFrame()** method is called, the user agent must run the following steps:

1. Let *document* be [the Window object's Document object<sup>p762</sup>](#).
2. Find the entry in *document*'s **list of animation frame callbacks<sup>p878</sup>** that is associated with the value given by the method's argument.
3. If there is such an entry, remove it from *document*'s **list of animation frame callbacks<sup>p878</sup>**.

When the user agent is to **run the animation frame callbacks** for a [Document<sup>p102</sup>](#) *doc* with a timestamp *now*, it must run the following steps:

1. Let *callbacks* be a list of the entries in *doc*'s [list of animation frame callbacks<sup>p878</sup>](#), in the order in which they were added to the list.
2. Set *doc*'s [list of animation frame callbacks<sup>p878</sup>](#) to the empty list.
3. For each entry in *callbacks*, in order: [invoke the callback](#), passing *now* as the only argument, and if an exception is thrown, [report the exception<sup>p833</sup>](#). [\[WEBIDL\]<sup>p1154</sup>](#)

## 9 Communication

### 9.1 The `MessageEvent`<sup>p880</sup> interfaces

Spec bugs: 27128

Messages in [server-sent events](#)<sup>p881</sup>, [Web sockets](#)<sup>p891</sup>, [cross-document messaging](#)<sup>p898</sup>, [channel messaging](#)<sup>p901</sup>, and [broadcast channels](#)<sup>p908</sup> use the `MessageEvent`<sup>p880</sup> interface for their [message](#)<sup>p1144</sup> events:

IDL

```
[Constructor(DOMString type, optional MessageEventInit eventInitDict), Exposed=(Window,Worker)]
interface MessageEvent : Event {
 readonly attribute any data;
 readonly attribute DOMString origin;
 readonly attribute DOMString lastEventId;
 readonly attribute (WindowProxy or MessagePort)? source;
 readonly attribute MessagePort[]? ports;

 void initMessageEvent(DOMString typeArg, boolean canBubbleArg, boolean cancelableArg, any dataArg,
 DOMString originArg, DOMString lastEventIdArg, (WindowProxy or MessagePort) sourceArg,
 sequence<MessagePort>? portsArg);
};

dictionary MessageEventInit : EventInit {
 any data;
 DOMString origin;
 DOMString lastEventId;
 (WindowProxy or MessagePort)? source;
 sequence<MessagePort> ports;
};
```

Note

`event.data`<sup>p880</sup>

Returns the data of the message.

`event.origin`<sup>p880</sup>

Returns the origin of the message, for [server-sent events](#)<sup>p881</sup> and [cross-document messaging](#)<sup>p898</sup>.

`event.lastEventId`<sup>p880</sup>

Returns the [last event ID string](#)<sup>p883</sup>, for [server-sent events](#)<sup>p881</sup>.

`event.source`<sup>p881</sup>

Returns the [WindowProxy](#)<sup>p775</sup> of the source window, for [cross-document messaging](#)<sup>p898</sup>, and the [MessagePort](#)<sup>p904</sup> being attached, in the [connect](#)<sup>p1144</sup> event fired at [SharedWorkerGlobalScope](#)<sup>p924</sup> objects.

`event.ports`<sup>p881</sup>

Returns the [MessagePort](#)<sup>p904</sup> array sent with the message, for [cross-document messaging](#)<sup>p898</sup> and [channel messaging](#)<sup>p901</sup>.

The `data` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the message being sent.

The `origin` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to the empty string. It represents, in [server-sent events](#)<sup>p881</sup> and [cross-document messaging](#)<sup>p898</sup>, the [origin](#)<sup>p776</sup> of the document that sent the message (typically the scheme, hostname, and port of the document, but not its path or fragment identifier).

The `lastEventId` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to the empty string. It represents, in [server-sent events](#)<sup>p881</sup>, the [last event ID string](#)<sup>p883</sup> of the event source.

The `source` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents, in [cross-document messaging](#)<sup>p898</sup>, the [WindowProxy](#)<sup>p775</sup> of the [browsing context](#)<sup>p762</sup> of the [Window](#)<sup>p768</sup> object from which the message came; and in the [connect](#)<sup>p1144</sup> events used by [shared workers](#)<sup>p924</sup>, the newly connecting [MessagePort](#)<sup>p904</sup>.

The `ports` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents, in [cross-document messaging](#)<sup>p898</sup> and [channel messaging](#)<sup>p901</sup>, the [MessagePort](#)<sup>p904</sup> array being sent, if any.

The `initMessageEvent()` method must initialise the event in a manner analogous to the similarly-named [initEvent\(\)](#)<sup>p51</sup> method. [\[DOM\]](#)<sup>p1149</sup>

## 9.2 Server-sent events

### 9.2.1 Introduction

*This section is non-normative.*

To enable servers to push data to Web pages over HTTP or using dedicated server-push protocols, this specification introduces the [EventSource](#)<sup>p882</sup> interface.

Using this API consists of creating an [EventSource](#)<sup>p882</sup> object and registering an event listener.

Support:	
Chrome	6+
IE	None
Chrome for Android	40+
Firefox	6+
iOS Safari	4.0-4.1+
Android Browser	4.4+
UC Browser for Android	9.9+
Opera Mini	None
Safari	5+
Opera	11+
IE Mobile	None
Firefox for Android	33+

Source: [caniuse.com](#)

```
var source = new EventSource('updates.cgi');
source.onmessage = function (event) {
 alert(event.data);
};
```

On the server-side, the script ("updates.cgi" in this case) sends messages in the following form, with the [text/event-stream](#)<sup>p889</sup> MIME type:

```
data: This is the first message.

data: This is the second message, it
data: has two lines.

data: This is the third message.
```

Authors can separate events by using different event types. Here is a stream that has two event types, "add" and "remove":

```
event: add
data: 73857293

event: remove
data: 2153

event: add
data: 113411
```

The script to handle such a stream would look like this (where `addHandler` and `removeHandler` are functions that take one argument, the event):

```
var source = new EventSource('updates.cgi');
source.addEventListener('add', addHandler, false);
source.addEventListener('remove', removeHandler, false);
```

The default event type is "message".

Event streams are always decoded as UTF-8. There is no way to specify another character encoding.

Event stream requests can be redirected using HTTP 301 and 307 redirects as with normal HTTP requests. Clients will reconnect if the connection is closed; a client can be told to stop reconnecting using the HTTP 204 No Content response code.

Using this API rather than emulating it using [XMLHttpRequest<sup>p52</sup>](#) or an [iframe<sup>p299</sup>](#) allows the user agent to make better use of network resources in cases where the user agent implementor and the network operator are able to coordinate in advance. Amongst other benefits, this can result in significant savings in battery life on portable devices. This is discussed further in the section below on [connectionless push<sup>p888</sup>](#).

## 9.2.2 The [EventSource<sup>p882</sup>](#) interface

IDL

```
[Constructor(DOMString url, optional EventSourceInit eventSourceInitDict), Exposed=(Window,Worker)]
interface EventSource : EventTarget {
 readonly attribute DOMString url;
 readonly attribute boolean withCredentials;

 // ready state
 const unsigned short CONNECTING = 0;
 const unsigned short OPEN = 1;
 const unsigned short CLOSED = 2;
 readonly attribute unsigned short readyState;

 // networking
 attribute EventHandler onopen;
 attribute EventHandler onmessage;
 attribute EventHandler onerror;
 void close();
};

dictionary EventSourceInit {
 boolean withCredentials = false;
};
```

The [EventSource\(\)](#) constructor takes one or two arguments. The first specifies the [URL<sup>p48</sup>](#) to which to connect. The second specifies the settings, if any, in the form of an [EventSourceInit<sup>p882</sup>](#) dictionary. When the [EventSource\(\)<sup>p882</sup>](#) constructor is invoked, the UA must run these steps:

1. [Resolve<sup>p82</sup>](#) the [URL<sup>p48</sup>](#) specified in the first argument, relative to the [API base URL<sup>p829</sup>](#) specified by the [entry settings object<sup>p831</sup>](#).
2. If the previous step failed, then throw a [SyntaxError<sup>p50</sup>](#) exception and abort these steps.
3. Create a new [EventSource<sup>p882</sup>](#) object.
4. Let *CORS mode* be [Anonymous<sup>p87</sup>](#).
5. If the second argument is present, and the [withCredentials<sup>p882</sup>](#) dictionary member has the value true, then set *CORS mode* to [Use Credentials<sup>p87</sup>](#) and initialise the new [EventSource<sup>p882</sup>](#) object's [withCredentials<sup>p883</sup>](#) attribute to true.
6. Return the new [EventSource<sup>p882</sup>](#) object, but continue these steps [in parallel<sup>p41</sup>](#).
7. Do a [potentially CORS-enabled fetch<sup>p87</sup>](#) of the resulting [absolute URL<sup>p48</sup>](#) using the [referrer source<sup>p829</sup>](#) specified by the [entry settings object<sup>p831</sup>](#), with the *mode* being *CORS mode*, and the *origin* being the [origin<sup>p776</sup>](#) specified by the [entry settings object<sup>p831</sup>](#), and process the resource obtained in this fashion, if any, as described below.

**Note** *The definition of the [fetching<sup>p84</sup>](#) algorithm (which is used by CORS) is such that if the browser is already fetching the resource identified by the given [absolute URL<sup>p48</sup>](#), that connection can be reused, instead of a new connection being established. All messages received up to this point are dispatched immediately, in this case.*

The [url](#) attribute must return the [absolute URL<sup>p48</sup>](#) that resulted from [resolving<sup>p82</sup>](#) the value that was passed to the constructor.

The `withCredentials` attribute must return the value to which it was last initialised. When the object is created, it must be initialised to false.

The `readyState` attribute represents the state of the connection. It can have the following values:

#### **`CONNECTING` (numeric value 0)**

The connection has not yet been established, or it was closed and the user agent is reconnecting.

#### **`OPEN` (numeric value 1)**

The user agent has an open connection and is dispatching events as it receives them.

#### **`CLOSED` (numeric value 2)**

The connection is not open, and the user agent is not trying to reconnect. Either there was a fatal error or the `close()`<sup>p883</sup> method was invoked.

When the object is created its `readyState`<sup>p883</sup> must be set to `CONNECTING`<sup>p883</sup> (0). The rules given below for handling the connection define when the value changes.

The `close()` method must abort any instances of the `fetch`<sup>p84</sup> algorithm started for this `EventSource`<sup>p882</sup> object, and must set the `readyState`<sup>p883</sup> attribute to `CLOSED`<sup>p883</sup>.

The following are the `event handlers`<sup>p839</sup> (and their corresponding `event handler event types`<sup>p839</sup>) that must be supported, as `event handler IDL attributes`<sup>p839</sup>, by all objects implementing the `EventSource`<sup>p882</sup> interface:

<code>Event handler</code> <sup>p839</sup>	<code>Event handler event type</code> <sup>p839</sup>
<code>onopen</code>	<code>open</code> <sup>p1144</sup>
<code>onmessage</code>	<code>message</code> <sup>p1144</sup>
<code>onerror</code>	<code>error</code> <sup>p1144</sup>

In addition to the above, each `EventSource`<sup>p882</sup> object has the following associated with it:

- A **reconnection time**, in milliseconds. This must initially be a user-agent-defined value, probably in the region of a few seconds.
- A **last event ID string**. This must initially be the empty string.

These values are not currently exposed on the interface.

### 9.2.3 Processing model

The resource indicated in the argument to the `EventSource`<sup>p882</sup> constructor is `fetched`<sup>p84</sup> when the constructor is run.

For HTTP connections, the `Accept`<sup>p48</sup> header may be included; if included, it must contain only formats of event framing that are supported by the user agent (one of which must be `text/event-stream`<sup>p889</sup>, as described below).

If the event source's `last event ID string`<sup>p883</sup> is not the empty string, then a `Last-Event-ID`<sup>p890</sup> HTTP header must be included with the request, whose value is the value of the event source's `last event ID string`<sup>p883</sup>, encoded as UTF-8.

User agents should use the `Cache-Control: no-cache`<sup>p49</sup> header in requests to bypass any caches for requests of event sources. (This header is not a `custom request header`<sup>p49</sup>, so the user agent will still use the CORS `simple cross-origin request`<sup>p49</sup> mechanism.) User agents should ignore HTTP cache headers in the response, never caching event sources.

As data is received, the `tasks`<sup>p834</sup> queued by the `networking task source`<sup>p839</sup> to handle the data must act as follows.

HTTP 200 OK responses with a `Content-Type`<sup>p86</sup> header specifying the type `text/event-stream`<sup>p889</sup>, ignoring any `MIME type`<sup>p42</sup> parameters, must be processed line by line [as described below](#)<sup>p885</sup>.

When a successful response with a supported `MIME type`<sup>p42</sup> is received, such that the user agent begins parsing the contents of the stream, the user agent must [announce the connection](#)<sup>p884</sup>.

The [task](#)<sup>p834</sup> that the [networking task source](#)<sup>p839</sup> places on the [task queue](#)<sup>p834</sup> once the [fetching algorithm](#)<sup>p84</sup> for such a resource (with the correct [MIME type](#)<sup>p42</sup>) has completed must cause the user agent to [reestablish the connection](#)<sup>p884</sup> [in parallel](#)<sup>p41</sup>. This applies whether the connection is closed gracefully or unexpectedly (but does not apply when the [fetch](#)<sup>p84</sup> algorithm is canceled by the user agent, e.g. in response to `window.stop()`<sup>p772</sup>, since in those cases the final [task](#)<sup>p834</sup> is actually discarded). It doesn't apply for the error conditions listed below except where explicitly specified.

HTTP 200 OK responses that have a [Content-Type](#)<sup>p86</sup> specifying an unsupported type, or that have no [Content-Type](#)<sup>p86</sup> at all, must cause the user agent to [fail the connection](#)<sup>p884</sup>.

HTTP 305 Use Proxy, 401 Unauthorized, and 407 Proxy Authentication Required should be treated transparently as for any other subresource.

HTTP 301 Moved Permanently, 302 Found, 303 See Other, and 307 Temporary Redirect responses are handled by the [fetching](#)<sup>p84</sup> and CORS algorithms. In the case of 301 redirects, the user agent must also remember the new URL so that subsequent requests for this resource for this [EventSource](#)<sup>p882</sup> object start with the URL given for the last 301 seen for requests for this object.

Network errors that prevents the connection from being established in the first place (e.g. DNS errors), must cause the user agent to [reestablish the connection](#)<sup>p884</sup> [in parallel](#)<sup>p41</sup>.

Any other HTTP response code not listed here, as well as the cancelation of the [fetch](#)<sup>p84</sup> algorithm by the user agent (e.g. in response to `window.stop()`<sup>p772</sup> or the user canceling the network connection manually) must cause the user agent to [fail the connection](#)<sup>p884</sup>.

For non-HTTP protocols, UAs should act in equivalent ways.

When a user agent is to **announce the connection**, the user agent must [queue a task](#)<sup>p835</sup> which, if the [readyState](#)<sup>p883</sup> attribute is set to a value other than [CLOSED](#)<sup>p883</sup>, sets the [readyState](#)<sup>p883</sup> attribute to [OPEN](#)<sup>p883</sup> and [fires a simple event](#)<sup>p846</sup> named [open](#)<sup>p1144</sup> at the [EventSource](#)<sup>p882</sup> object.

When a user agent is to **reestablish the connection**, the user agent must run the following steps. These steps are run [in parallel](#)<sup>p41</sup>, not as part of a [task](#)<sup>p834</sup>. (The tasks that it queues, of course, are run like normal tasks and not themselves [in parallel](#)<sup>p41</sup>.)

1. [Queue a task](#)<sup>p835</sup> to run the following steps:
  1. If the [readyState](#)<sup>p883</sup> attribute is set to [CLOSED](#)<sup>p883</sup>, abort the task.
  2. Set the [readyState](#)<sup>p883</sup> attribute to [CONNECTING](#)<sup>p883</sup>.
  3. [Fire a simple event](#)<sup>p846</sup> named [error](#)<sup>p1144</sup> at the [EventSource](#)<sup>p882</sup> object.
2. Wait a delay equal to the reconnection time of the event source.
3. Optionally, wait some more. In particular, if the previous attempt failed, then user agents might introduce an exponential backoff delay to avoid overloading a potentially already overloaded server. Alternatively, if the operating system has reported that there is no network connectivity, user agents might wait for the operating system to announce that the network connection has returned before retrying.
4. Wait until the aforementioned task has run, if it has not yet run.
5. [Queue a task](#)<sup>p835</sup> to run the following steps:
  1. If the [readyState](#)<sup>p883</sup> attribute is not set to [CONNECTING](#)<sup>p883</sup>, abort these steps.
  2. Perform a [potentially CORS-enabled fetch](#)<sup>p87</sup> of the [absolute URL](#)<sup>p48</sup> of the event source resource, using the same [referrer source](#), and with the same [mode](#) and [origin](#), as those used in the original request triggered by the [EventSource\(\)](#)<sup>p882</sup> constructor, and process the resource obtained in this fashion, if any, as described earlier in this section.

When a user agent is to **fail the connection**, the user agent must [queue a task](#)<sup>p835</sup> which, if the [readyState](#)<sup>p883</sup> attribute is set to a value other than [CLOSED](#)<sup>p883</sup>, sets the [readyState](#)<sup>p883</sup> attribute to [CLOSED](#)<sup>p883</sup> and [fires a simple event](#)<sup>p846</sup> named [error](#)<sup>p1144</sup> at the [EventSource](#)<sup>p882</sup> object. Once the user agent has [failed the connection](#)<sup>p884</sup>, it does **not attempt to reconnect!**

The [task source](#)<sup>p835</sup> for any [tasks](#)<sup>p834</sup> that are [queued](#)<sup>p835</sup> by [EventSource](#)<sup>p882</sup> objects is the **remote event task source**.

## 9.2.4 Parsing an event stream

This event stream format's [MIME type](#)<sup>p42</sup> is [text/event-stream](#)<sup>p889</sup>.

The event stream format is as described by the `stream` production of the following ABNF, the character set for which is Unicode. [\[ABNF\]](#)<sup>p1148</sup>

```
stream = [bom] *event
event = *(comment / field) end-of-line
comment = colon *any-char end-of-line
field = 1*name-char [colon [space] *any-char] end-of-line
end-of-line = (cr lf / cr / lf)

; characters
lf = %x000A ; U+000A LINE FEED (LF)
cr = %x000D ; U+000D CARRIAGE RETURN (CR)
space = %x0020 ; U+0020 SPACE
colon = %x003A ; U+003A COLON (:)
bom = %xFEFF ; U+FEFF BYTE ORDER MARK
name-char = %x0000-0009 / %x000B-000C / %x000E-0039 / %x003B-10FFFF
 ; a Unicode character other than U+000A LINE FEED (LF), U+000D CARRIAGE RETURN (CR), or
U+003A COLON (:)
any-char = %x0000-0009 / %x000B-000C / %x000E-10FFFF
 ; a Unicode character other than U+000A LINE FEED (LF) or U+000D CARRIAGE RETURN (CR)
```

Event streams in this format must always be encoded as UTF-8. [\[ENCODING\]](#)<sup>p1150</sup>

Lines must be separated by either a U+000D CARRIAGE RETURN U+000A LINE FEED (CRLF) character pair, a single U+000A LINE FEED (LF) character, or a single U+000D CARRIAGE RETURN (CR) character.

Since connections established to remote servers for such resources are expected to be long-lived, UAs should ensure that appropriate buffering is used. In particular, while line buffering with lines are defined to end with a single U+000A LINE FEED (LF) character is safe, block buffering or line buffering with different expected line endings can cause delays in event dispatch.

## 9.2.5 Interpreting an event stream

Streams must be decoded using the [UTF-8 decode](#)<sup>p47</sup> algorithm.

**Note** *The [UTF-8 decode](#)<sup>p47</sup> algorithm strips one leading UTF-8 Byte Order Mark (BOM), if any.*

The stream must then be parsed by reading everything line by line, with a U+000D CARRIAGE RETURN U+000A LINE FEED (CRLF) character pair, a single U+000A LINE FEED (LF) character not preceded by a U+000D CARRIAGE RETURN (CR) character, and a single U+000D CARRIAGE RETURN (CR) character not followed by a U+000A LINE FEED (LF) character being the ways in which a line can end.

When a stream is parsed, a *data* buffer, an *event type* buffer, and a *last event ID* buffer must be associated with it. They must be initialised to the empty string

Lines must be processed, in the order they are received, as follows:

↪ **If the line is empty (a blank line)**

[Dispatch the event](#)<sup>p886</sup>, as defined below.

↪ **If the line starts with a U+003A COLON character (:)**

Ignore the line.

↪ **If the line contains a U+003A COLON character (:)**

Collect the characters on the line before the first U+003A COLON character (:), and let *field* be that string.

Collect the characters on the line after the first U+003A COLON character (:), and let *value* be that string. If *value* starts with a U+0020 SPACE character, remove it from *value*.

[Process the field](#)<sup>b886</sup> using the steps described below, using *field* as the field name and *value* as the field value.

↪ **Otherwise, the string is not empty but does not contain a U+003A COLON character (:)**

[Process the field](#)<sup>b886</sup> using the steps described below, using the whole line as the field name, and the empty string as the field value.

Once the end of the file is reached, any pending data must be discarded. (If the file ends in the middle of an event, before the final empty line, the incomplete event is not dispatched.)

The steps to **process the field** given a field name and a field value depend on the field name, as given in the following list. Field names must be compared literally, with no case folding performed.

↪ **If the field name is "event"**

Set the *event type* buffer to field value.

↪ **If the field name is "data"**

Append the field value to the *data* buffer, then append a single U+000A LINE FEED (LF) character to the *data* buffer.

↪ **If the field name is "id"**

Set the *last event ID* buffer to the field value.

↪ **If the field name is "retry"**

If the field value consists of only [ASCII digits](#)<sup>p58</sup>, then interpret the field value as an integer in base ten, and set the event stream's [reconnection time](#)<sup>p883</sup> to that integer. Otherwise, ignore the field.

↪ **Otherwise**

The field is ignored.

When the user agent is required to **dispatch the event**, the user agent must process the *data* buffer, the *event type* buffer, and the *last event ID* buffer using steps appropriate for the user agent.

For Web browsers, the appropriate steps to [dispatch the event](#)<sup>b886</sup> are as follows:

1. Set the [last event ID string](#)<sup>p883</sup> of the event source to the value of the *last event ID* buffer. The buffer does not get reset, so the [last event ID string](#)<sup>p883</sup> of the event source remains set to this value until the next time it is set by the server.
2. If the *data* buffer is an empty string, set the *data* buffer and the *event type* buffer to the empty string and abort these steps.
3. If the *data* buffer's last character is a U+000A LINE FEED (LF) character, then remove the last character from the *data* buffer.
4. Create an event that uses the [MessageEvent](#)<sup>p880</sup> interface, with the event type [message](#)<sup>p1144</sup>, which does not bubble, is not cancelable, and has no default action. The [data](#)<sup>p880</sup> attribute must be initialised to the value of the *data* buffer, the [origin](#)<sup>p880</sup> attribute must be initialised to the [Unicode serialisation](#)<sup>p778</sup> of the [origin](#)<sup>p776</sup> of the event stream's final URL (i.e. the URL after redirects), and the [lastEventId](#)<sup>p880</sup> attribute must be initialised to the [last event ID string](#)<sup>p883</sup> of the event source. This event is not [trusted](#)<sup>p43</sup>.
5. If the *event type* buffer has a value other than the empty string, change the [type](#)<sup>p51</sup> of the newly created event to equal the value of the *event type* buffer.
6. Set the *data* buffer and the *event type* buffer to the empty string.
7. [Queue a task](#)<sup>p835</sup> which, if the [readyState](#)<sup>p883</sup> attribute is set to a value other than [CLOSED](#)<sup>p883</sup>, [dispatches](#)<sup>p43</sup> the newly created event at the [EventSource](#)<sup>p882</sup> object.

**Note** *If an event doesn't have an "id" field, but an earlier event did set the event source's [last event ID string](#)<sup>p883</sup>, then the event's [lastEventId](#)<sup>p880</sup> field will be set to the value of whatever the last seen "id" field was.*

For other user agents, the appropriate steps to [dispatch the event](#)<sup>b886</sup> are implementation dependent, but at a minimum they must set the *data* and *event type* buffers to the empty string before returning.

**Example**

The following event stream, once followed by a blank line:

```
data: YHOO
data: +2
data: 10
```

...would cause an event [message<sup>p1144</sup>](#) with the interface [MessageEvent<sup>p880</sup>](#) to be dispatched on the [EventSource<sup>p882</sup>](#) object. The event's [data<sup>p880</sup>](#) attribute would contain the string "YHOO\n+2\n10" (where "\n" represents a newline).

This could be used as follows:

```
var stocks = new EventSource("http://stocks.example.com/ticker.php");
stocks.onmessage = function (event) {
 var data = event.data.split('\n');
 updateStocks(data[0], data[1], data[2]);
};
```

...where `updateStocks()` is a function defined as:

```
function updateStocks(symbol, delta, value) { ... }
```

...or some such.

### Example

The following stream contains four blocks. The first block has just a comment, and will fire nothing. The second block has two fields with names "data" and "id" respectively; an event will be fired for this block, with the data "first event", and will then set the last event ID to "1" so that if the connection died between this block and the next, the server would be sent a [Last-Event-ID<sup>p890</sup>](#) header with the value "1". The third block fires an event with data "second event", and also has an "id" field, this time with no value, which resets the last event ID to the empty string (meaning no [Last-Event-ID<sup>p890</sup>](#) header will now be sent in the event of a reconnection being attempted). Finally, the last block just fires an event with the data " third event" (with a single leading space character). Note that the last still has to end with a blank line, the end of the stream is not enough to trigger the dispatch of the last event.

```
: test stream

data: first event
id: 1

data:second event
id

data: third event
```

### Example

The following stream fires two events:

```
data

data
data

data:
```

The first block fires events with the data set to the empty string, as would the last block if it was followed by a blank line. The middle block fires an event with the data set to a single newline character. The last block is discarded because it is not followed by a blank line.

### Example

The following stream fires two identical events:

```
data:test

data: test
```

This is because the space after the colon is ignored if present.

## 9.2.6 Authoring notes

Legacy proxy servers are known to, in certain cases, drop HTTP connections after a short timeout. To protect against such proxy servers, authors can include a comment line (one starting with a ';' character) every 15 seconds or so.

Authors wishing to relate event source connections to each other or to specific documents previously served might find that relying on IP addresses doesn't work, as individual clients can have multiple IP addresses (due to having multiple proxy servers) and individual IP addresses can have multiple clients (due to sharing a proxy server). It is better to include a unique identifier in the document when it is served and then pass that identifier as part of the URL when the connection is established.

Authors are also cautioned that HTTP chunking can have unexpected negative effects on the reliability of this protocol. Where possible, chunking should be disabled for serving event streams unless the rate of messages is high enough for this not to matter.

Clients that support HTTP's per-server connection limitation might run into trouble when opening multiple pages from a site if each page has an [EventSource<sup>p882</sup>](#) to the same domain. Authors can avoid this using the relatively complex mechanism of using unique domain names per connection, or by allowing the user to enable or disable the [EventSource<sup>p882</sup>](#) functionality on a per-page basis, or by sharing a single [EventSource<sup>p882</sup>](#) object using a [shared worker<sup>p924</sup>](#).

## 9.2.7 Connectionless push and other features

User agents running in controlled environments, e.g. browsers on mobile handsets tied to specific carriers, may offload the management of the connection to a proxy on the network. In such a situation, the user agent for the purposes of conformance is considered to include both the handset software and the network proxy.

### Example

For example, a browser on a mobile device, after having established a connection, might detect that it is on a supporting network and request that a proxy server on the network take over the management of the connection. The timeline for such a situation might be as follows:

1. Browser connects to a remote HTTP server and requests the resource specified by the author in the [EventSource<sup>p882</sup>](#) constructor.
2. The server sends occasional messages.
3. In between two messages, the browser detects that it is idle except for the network activity involved in keeping the TCP connection alive, and decides to switch to sleep mode to save power.
4. The browser disconnects from the server.
5. The browser contacts a service on the network, and requests that that service, a "push proxy", maintain the connection instead.
6. The "push proxy" service contacts the remote HTTP server and requests the resource specified by the author in the [EventSource<sup>p882</sup>](#) constructor (possibly including a [Last-Event-ID<sup>p890</sup>](#) HTTP header, etc).
7. The browser allows the mobile device to go to sleep.
8. The server sends another message.
9. The "push proxy" service uses a technology such as OMA push to convey the event to the mobile device, which wakes only enough to process the event and then returns to sleep.

This can reduce the total data usage, and can therefore result in considerable power savings.

As well as implementing the existing API and [text/event-stream<sup>p889</sup>](#) wire format as defined by this specification and in more distributed ways as described above, formats of event framing defined by [other applicable specifications<sup>p56</sup>](#) may be supported. This specification does not define how they are to be parsed or processed.

## 9.2.8 Garbage collection

While an `EventSource`<sup>p882</sup> object's `readyState`<sup>p883</sup> is `CONNECTING`<sup>p883</sup>, and the object has one or more event listeners registered for `open`<sup>p1144</sup>, `message`<sup>p1144</sup> or `error`<sup>p1144</sup> events, there must be a strong reference from the `Window`<sup>p768</sup> or `WorkerGlobalScope`<sup>p923</sup> object that the `EventSource`<sup>p882</sup> object's constructor was invoked from to the `EventSource`<sup>p882</sup> object itself.

While an `EventSource`<sup>p882</sup> object's `readyState`<sup>p883</sup> is `OPEN`<sup>p883</sup>, and the object has one or more event listeners registered for `message`<sup>p1144</sup> or `error`<sup>p1144</sup> events, there must be a strong reference from the `Window`<sup>p768</sup> or `WorkerGlobalScope`<sup>p923</sup> object that the `EventSource`<sup>p882</sup> object's constructor was invoked from to the `EventSource`<sup>p882</sup> object itself.

While there is a task queued by an `EventSource`<sup>p882</sup> object on the `remote event task source`<sup>p884</sup>, there must be a strong reference from the `Window`<sup>p768</sup> or `WorkerGlobalScope`<sup>p923</sup> object that the `EventSource`<sup>p882</sup> object's constructor was invoked from to that `EventSource`<sup>p882</sup> object.

If a user agent is to **forcibly close** an `EventSource`<sup>p882</sup> object (this happens when a `Document`<sup>p102</sup> object goes away permanently), the user agent must abort any instances of the `fetch`<sup>p84</sup> algorithm started for this `EventSource`<sup>p882</sup> object, and must set the `readyState`<sup>p883</sup> attribute to `CLOSED`<sup>p883</sup>.

If an `EventSource`<sup>p882</sup> object is garbage collected while its connection is still open, the user agent must abort any instance of the `fetch`<sup>p84</sup> algorithm opened by this `EventSource`<sup>p882</sup>.

**Note** It's possible for one active network connection to be shared by multiple `EventSource`<sup>p882</sup> objects and their `fetch`<sup>p84</sup> algorithms, which is why the above is phrased in terms of aborting the `fetch`<sup>p84</sup> algorithm and not the actual underlying download.

## 9.2.9 Implementation advice

*This section is non-normative.*

User agents are strongly urged to provide detailed diagnostic information about `EventSource`<sup>p882</sup> objects and their related network connections in their development consoles, to aid authors in debugging code using this API.

For example, a user agent could have a panel displaying all the `EventSource`<sup>p882</sup> objects a page has created, each listing the constructor's arguments, whether there was a network error, what the CORS status of the connection is and what headers were sent by the client and received from the server to lead to that status, the messages that were received and how they were parsed, and so forth.

Implementations are especially encouraged to report detailed information to their development consoles whenever an `error`<sup>p1144</sup> event is fired, since little to no information can be made available in the events themselves.

## 9.2.10 IANA considerations

### 9.2.10.1 `text/event-stream`

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

`text`

**Subtype name:**

`event-stream`

**Required parameters:**

No parameters

**Optional parameters:**

`charset`

The `charset` parameter may be provided. The parameter's value must be "`utf-8`". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

**Encoding considerations:**

8bit (always UTF-8)

**Security considerations:**

An event stream from an origin distinct from the origin of the content consuming the event stream can result in information leakage. To avoid this, user agents are required to apply CORS semantics. [\[FETCH\]<sup>p1150</sup>](#)

Event streams can overwhelm a user agent; a user agent is expected to apply suitable restrictions to avoid depleting local resources because of an overabundance of information from an event stream.

Servers can be overwhelmed if a situation develops in which the server is causing clients to reconnect rapidly. Servers should use a 5xx status code to indicate capacity problems, as this will prevent conforming clients from reconnecting automatically.

**Interoperability considerations:**

Rules for processing both conforming and non-conforming content are defined in this specification.

**Published specification:**

This document is the relevant specification.

**Applications that use this media type:**

Web browsers and tools using Web services.

**Additional information:****Magic number(s):**

No sequence of bytes can uniquely identify an event stream.

**File extension(s):**

No specific file extensions are recommended for this type.

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

This format is only expected to be used by dynamic open-ended streams served using HTTP or a similar protocol. Finite resources are not expected to be labeled with this type.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

Fragment identifiers have no meaning with [text/event-stream<sup>p889</sup>](#) resources.

**9.2.10.2 `Last-Event-ID`**

This section describes a header for registration in the Permanent Message Header Field Registry. [\[RFC3864\]<sup>p1152</sup>](#)

**Header field name:**

Last-Event-ID

**Applicable protocol:**

http

**Status:**

standard

**Author/Change controller:**

W3C

**Specification document(s):**

This document is the relevant specification.

## Related information:

None.

## 9.3 Web sockets

### 9.3.1 Introduction

This section is non-normative.

To enable Web applications to maintain bidirectional communications with server-side processes, this specification introduces the `WebSocket` interface.

**Note** *This interface does not allow for raw access to the underlying network. For example, this interface could not be used to interact with a client without proxying messages through a custom server.*

Spec bugs:	<a href="#">12212</a>
Support:

### 9.3.2 The `WebSocket`<sup>p891</sup> interface

IDL

```
enum BinaryType { "blob", "arraybuffer" };
[Constructor(DOMString url, optional (DOMString or DOMString[]) protocols), Exposed=(Window,Worker)]
interface WebSocket : EventTarget {
 readonly attribute DOMString url;

 // ready state
 const unsigned short CONNECTING = 0;
 const unsigned short OPEN = 1;
 const unsigned short CLOSING = 2;
 const unsigned short CLOSED = 3;
 readonly attribute unsigned short readyState;
 readonly attribute unsigned long bufferedAmount;

 // networking
 attribute EventHandler onopen;
 attribute EventHandler onerror;
 attribute EventHandler onclose;
 readonly attribute DOMString extensions;
 readonly attribute DOMString protocol;
 void close([Clamp] optional unsigned short code, optional USVString reason);

 // messaging
 attribute EventHandler onmessage;
 attribute BinaryType binaryType;
 void send(USVString data);
 void send(Blob data);
 void send(ArrayBuffer data);
 void send(ArrayBufferView data);
};
```

The `WebSocket(url, protocols)` constructor takes one or two arguments. The first argument, `url`, specifies the `URL`<sup>p48</sup> to which to connect. The second, `protocols`, if present, is either a string or an array of strings. If it is a string, it is equivalent to an array consisting of just that string; if it is omitted, it is equivalent to the empty array. Each string in the array is a subprotocol name. The connection will only be established if the server reports that it has selected one of these subprotocols. The subprotocol names must all be strings that match the requirements for elements that comprise the value of `Sec-WebSocket-Protocol`<sup>p54</sup> fields as defined by the WebSocket protocol specification. [\[WSP\]](#)<sup>p1154</sup> Spec bugs: [26967](#), [27554](#)

When the `WebSocket()`<sup>p891</sup> constructor is invoked, the UA must run these steps:

- Parse a WebSocket URL's components<sup>p897</sup> from the `url` argument, to obtain `host`, `port`, `resource name`, and `secure`. If this fails, throw a `SyntaxError`<sup>b50</sup> exception and abort these steps. [WSP]<sup>b1154</sup>
- If `secure` is false but the `origin`<sup>p776</sup> specified by the `entry settings object`<sup>b831</sup> has a scheme component that is itself a secure protocol, e.g. HTTPS, then throw a `SecurityError`<sup>b50</sup> exception and abort these steps.
- If `port` is a port to which the user agent is configured to block access, then throw a `SecurityError`<sup>b50</sup> exception and abort these steps. (User agents typically block access to well-known ports like SMTP.)  
Access to ports 80 and 443 should not be blocked, including the unlikely cases when `secure` is false but `port` is 443 or `secure` is true but `port` is 80.
- If `protocols` is absent, let `protocols` be an empty array.  
Otherwise, if `protocols` is present and a string, let `protocols` instead be an array consisting of just that string.
- If any of the values in `protocols` occur more than once or otherwise fail to match the requirements for elements that comprise the value of `Sec-WebSocket-Protocol`<sup>p54</sup> fields as defined by the WebSocket protocol specification, then throw a `SyntaxError`<sup>b50</sup> exception and abort these steps. [WSP]<sup>b1154</sup>
- Let `origin` be the `ASCII serialisation`<sup>p778</sup> of the `origin`<sup>p776</sup> specified by the `entry settings object`<sup>b831</sup>, converted to ASCII lowercase<sup>p58</sup>.
- Return a new `WebSocket`<sup>p891</sup> object, but continue these steps `in parallel`<sup>p41</sup>.
- Let the new object's `client-specified protocols` be the values (if any) given in `protocols`.
- Establish a WebSocket connection<sup>p54</sup> given the set (`host`, `port`, `resource name`, `secure`), along with the `protocols` list, an empty list for the extensions, and `origin`. The `headers to send appropriate cookies`<sup>p54</sup> must be a `Cookie`<sup>b49</sup> header whose value is the `cookie-string`<sup>b49</sup> computed from the user's cookie store and the URL `url`; for these purposes this is *not* a "non-HTTP" API. [WSP]<sup>b1154</sup> [COOKIES]<sup>b1148</sup>

When the user agent `validates the server's response`<sup>p54</sup> during the "establish a WebSocket connection<sup>p54</sup>" algorithm, if the status code received from the server is not 101 (e.g. it is a redirect), the user agent must `fail the WebSocket connection`<sup>p54</sup>.

**Following HTTP procedures here could introduce serious security problems in a Web browser context. For example, consider a host with a WebSocket server at one path and an open HTTP redirector at another. Suddenly, any script that can be given a particular WebSocket URL can be tricked into communicating to (and potentially sharing secrets with) any host on the Internet, even if the script checks that the URL has the right hostname.**

**Note** If the establish a WebSocket connection<sup>p54</sup> algorithm fails, it triggers the `fail the WebSocket connection`<sup>p54</sup> algorithm, which then invokes the `close the WebSocket connection`<sup>p54</sup> algorithm, which then establishes that the WebSocket connection is closed<sup>p54</sup>, which fires the `close`<sup>p1144</sup> event as described below<sup>p896</sup>.

The `url` attribute must return the result of `resolving`<sup>p82</sup> the `URL`<sup>p48</sup> that was passed to the constructor, with the URL character encoding set to UTF-8. (It doesn't matter what it is resolved relative to, since we already know it is an `absolute URL`<sup>p48</sup>.)

The `readyState` attribute represents the state of the connection. It can have the following values:

#### **CONNECTING (numeric value 0)**

The connection has not yet been established.

#### **OPEN (numeric value 1)**

The WebSocket connection is established<sup>p54</sup> and communication is possible.

#### **CLOSING (numeric value 2)**

The connection is going through the closing handshake, or the `close()`<sup>p893</sup> method has been invoked.

#### **CLOSED (numeric value 3)**

The connection has been closed or could not be opened.

When the object is created its `readyState`<sup>p892</sup> must be set to `CONNECTING`<sup>p892</sup> (0).

The `extensions` attribute must initially return the empty string. After [the WebSocket connection is established<sup>p54</sup>](#), its value might change, as defined below.

**Note** [The `extensions`<sup>p893</sup> attribute returns the extensions selected by the server, if any. \(Currently this will only ever be the empty string.\)](#)

The `protocol` attribute must initially return the empty string. After [the WebSocket connection is established](#), its value might change, as defined below.

**Note** [The `protocol`<sup>p893</sup> attribute returns the subprotocol selected by the server, if any. It can be used in conjunction with the array form of the constructor's second argument to perform subprotocol negotiation.](#)

The `close()` method must run the following steps:

1. If the method's first argument is present but is neither an integer equal to 1000 nor an integer in the range 3000 to 4999, throw an [InvalidAccessError<sup>p50</sup>](#) exception and abort these steps.

2. If the method's second argument is present, then run these substeps:

1. Let `raw reason` be the method's second argument.

2. Let `reason` be the result of encoding `raw reason` as UTF-8.

3. If `reason` is longer than 123 bytes, then throw a [SyntaxError<sup>p50</sup>](#) exception and abort these steps. [\[ENCODING\]<sup>p1150</sup>](#)

3. Run the first matching steps from the following list:

- ↪ If the `readyState`<sup>p892</sup> attribute is in the [CLOSING<sup>p892</sup>](#) (2) or [CLOSED<sup>p892</sup>](#) (3) state

Do nothing.

**Note** [The connection is already closing or is already closed. If it has not already, a \[close<sup>p1144</sup>\]\(#\) event will eventually fire as described below<sup>p896</sup>.](#)

- ↪ If the WebSocket connection is not yet [established<sup>p54</sup>](#) [\[WSP\]<sup>p1154</sup>](#)

[Fail the WebSocket connection<sup>p54</sup>](#) and set the `readyState`<sup>p892</sup> attribute's value to [CLOSING<sup>p892</sup>](#) (2). [\[WSP\]<sup>p1154</sup>](#)

**Note** [The fail the WebSocket connection<sup>p54</sup> algorithm invokes the \[close the WebSocket connection<sup>p54</sup>\]\(#\) algorithm, which then establishes that the WebSocket connection is closed<sup>p54</sup>, which fires the \[close<sup>p1144</sup>\]\(#\) event as described below<sup>p896</sup>.](#)

- ↪ If the WebSocket closing handshake has not yet been [started<sup>p54</sup>](#) [\[WSP\]<sup>p1154</sup>](#)

[Start the WebSocket closing handshake<sup>p54</sup>](#) and set the `readyState`<sup>p892</sup> attribute's value to [CLOSING<sup>p892</sup>](#) (2). [\[WSP\]<sup>p1154</sup>](#)

If the first argument is present, then the status code to use in the WebSocket Close message must be the integer given by the first argument. [\[WSP\]<sup>p1154</sup>](#)

If the second argument is also present, then `reason` must be provided in the Close message after the status code. [\[ENCODING\]<sup>p1150</sup>](#) [\[WSP\]<sup>p1154</sup>](#)

**Note** [The start the WebSocket closing handshake<sup>p54</sup> algorithm eventually invokes the \[close the WebSocket connection<sup>p54</sup>\]\(#\) algorithm, which then establishes that the WebSocket connection is closed<sup>p54</sup>, which fires the \[close<sup>p1144</sup>\]\(#\) event as described below<sup>p896</sup>.](#)

- ↪ Otherwise

Set the `readyState`<sup>p892</sup> attribute's value to [CLOSING<sup>p892</sup>](#) (2).

**Note** [The WebSocket closing handshake is started<sup>p54</sup>, and will eventually invoke the \[close the WebSocket connection<sup>p54</sup>\]\(#\) algorithm, which will establish that the WebSocket connection is closed<sup>p54</sup>, and thus the \[close<sup>p1144</sup>\]\(#\) event will fire, as described below<sup>p896</sup>.](#)

**Note** [The `close\(\)`<sup>p893</sup> method does not discard previously sent messages before starting the WebSocket closing handshake — even if, in practice, the user agent is still busy sending those messages, the handshake will only start after the messages are sent.](#)

The `bufferedAmount` attribute must return the number of bytes of application data (UTF-8 text and binary data) that have been queued using `send()`<sup>p894</sup> but that, as of the last time the `event loop`<sup>p834</sup> reached `step 1`<sup>p836</sup>, had not yet been transmitted to the network. (This thus includes any text sent during the execution of the current task, regardless of whether the user agent is able to transmit text in the background `in parallel`<sup>p841</sup> with script execution.) This does not include framing overhead incurred by the protocol, or buffering done by the operating system or network hardware. If the connection is closed, this attribute's value will only increase with each call to the `send()`<sup>p894</sup> method (the number does not reset to zero once the connection closes).

### Example

In this simple example, the `bufferedAmount`<sup>p894</sup> attribute is used to ensure that updates are sent either at the rate of one update every 50ms, if the network can handle that rate, or at whatever rate the network *can* handle, if that is too fast.

```
var socket = new WebSocket('ws://game.example.com:12010/updates');
socket.onopen = function () {
 setInterval(function() {
 if (socket.bufferedAmount == 0)
 socket.send(getUpdateData());
 }, 50);
};
```

The `bufferedAmount`<sup>p894</sup> attribute can also be used to saturate the network without sending the data at a higher rate than the network can handle, though this requires more careful monitoring of the value of the attribute over time.

When a `WebSocket`<sup>p891</sup> object is created, its `binaryType` IDL attribute must be set to the string "`blob`"<sup>p894</sup>. On getting, it must return the last value it was set to. On setting, the user agent must set the IDL attribute to the new value.

**Note** *This attribute allows authors to control how binary data is exposed to scripts. By setting the attribute to "`blob`", binary data is returned in `Blob`<sup>p52</sup> form; by setting it to "`arraybuffer`", it is returned in `ArrayBuffer`<sup>p50</sup> form. User agents can use this as a hint for how to handle incoming binary data: if the attribute is set to "`blob`"<sup>p894</sup>, it is safe to spool it to disk, and if it is set to "`arraybuffer`"<sup>p894</sup>, it is likely more efficient to keep the data in memory. Naturally, user agents are encouraged to use more subtle heuristics to decide whether to keep incoming data in memory or not, e.g. based on how big the data is or how common it is for a script to change the attribute at the last minute. This latter aspect is important in particular because it is quite possible for the attribute to be changed after the user agent has received the data but before the user agent has fired the event for it.*

The `send(data)` method transmits data using the connection. If the `readyState`<sup>p892</sup> attribute is `CONNECTING`<sup>p892</sup>, it must throw an `InvalidStateError`<sup>p50</sup> exception. Otherwise, the user agent must run the appropriate set of steps from the following list:

#### If the argument is a string

If [the WebSocket connection is established](#)<sup>p54</sup> and [the WebSocket closing handshake has not yet started](#)<sup>p54</sup>, then the user agent must [send a WebSocket Message](#)<sup>p54</sup> comprised of the `data` argument using a text frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full](#)<sup>p896</sup> and then [close the WebSocket connection](#)<sup>p54</sup>. Any invocation of this method with a string argument that does not throw an exception must increase the `bufferedAmount`<sup>p894</sup> attribute by the number of bytes needed to express the argument as UTF-8. [\[UNICODE\]](#)<sup>p1153</sup> [\[ENCODING\]](#)<sup>p1150</sup> [\[WSP\]](#)<sup>p1154</sup>

#### If the argument is a `Blob`<sup>p52</sup> object

If [the WebSocket connection is established](#)<sup>p54</sup>, and [the WebSocket closing handshake has not yet started](#)<sup>p54</sup>, then the user agent must [send a WebSocket Message](#)<sup>p54</sup> comprised of `data` using a binary frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full](#)<sup>p896</sup> and then [close the WebSocket connection](#)<sup>p54</sup>. The data to be sent is the raw data represented by the `Blob`<sup>p52</sup> object. Any invocation of this method with a `Blob`<sup>p52</sup> argument that does not throw an exception must increase the `bufferedAmount`<sup>p894</sup> attribute by the size of the `Blob`<sup>p52</sup> object's raw data, in bytes. [\[WSP\]](#)<sup>p1154</sup> [\[FILEAPI\]](#)<sup>p1150</sup>

#### If the argument is an `ArrayBuffer`<sup>p50</sup> object

If [the WebSocket connection is established](#)<sup>p54</sup>, and [the WebSocket closing handshake has not yet started](#)<sup>p54</sup>, then the user agent must [send a WebSocket Message](#)<sup>p54</sup> comprised of `data` using a binary frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full](#)<sup>p896</sup> and then [close the WebSocket connection](#)<sup>p54</sup>. The data to be sent is the data stored in the buffer described by the `ArrayBuffer`<sup>p50</sup> object. Any invocation of this method with an `ArrayBuffer`<sup>p50</sup> argument that does not throw an exception must increase the `bufferedAmount`<sup>p894</sup> attribute by the length of the `ArrayBuffer`<sup>p50</sup> in bytes. [\[WSP\]](#)<sup>p1154</sup> [\[ECMA262\]](#)<sup>p1150</sup>

If the argument is an object that matches the [ArrayBufferView<sup>p50</sup>](#) type definition

If [the WebSocket connection is established<sup>p54</sup>](#), and [the WebSocket closing handshake has not yet started<sup>p54</sup>](#), then the user agent must [send a WebSocket Message<sup>p54</sup>](#) comprised of [data](#) using a binary frame opcode; if the data cannot be sent, e.g. because it would need to be buffered but the buffer is full, the user agent must [flag the WebSocket as full<sup>p896</sup>](#) and then [close the WebSocket connection<sup>p54</sup>](#). The data to be sent is the data stored in the section of the buffer described by the [ArrayBuffer<sup>p50</sup>](#) object that [data](#) references. Any invocation of this method with this kind of argument that does not throw an exception must increase the [bufferedAmount<sup>p894</sup>](#) attribute by the length of [data](#)'s buffer in bytes. [\[WSP\]<sup>p1154</sup>](#) [\[ECMA262\]<sup>p1150</sup>](#)

The following are the [event handlers<sup>p839</sup>](#) (and their corresponding [event handler event types<sup>p839</sup>](#)) that must be supported, as [event handler IDL attributes<sup>p839</sup>](#), by all objects implementing the [WebSocket<sup>p891</sup>](#) interface:

Event handler <sup>p839</sup>	Event handler event type <sup>p839</sup>
<code>onopen</code>	<a href="#">open<sup>p1144</sup></a>
<code>onmessage</code>	<a href="#">message<sup>p1144</sup></a>
<code>onerror</code>	<a href="#">error<sup>p1144</sup></a>
<code>onclose</code>	<a href="#">close<sup>p1144</sup></a>

### 9.3.3 Feedback from the protocol

When [the WebSocket connection is established<sup>p54</sup>](#), the user agent must [queue a task<sup>p835</sup>](#) to run these steps:

1. If the [WebSocket<sup>p891</sup>](#) object's [client-specified protocols<sup>p892</sup>](#) was not an empty list, but the [subprotocol in use<sup>p54</sup>](#) is the null value, then [fail the WebSocket connection<sup>p54</sup>](#), set the [readyState<sup>p892</sup>](#) attribute's value to [CLOSING<sup>p892</sup>](#) (2), and abort these steps. [\[WSP\]<sup>p1154</sup>](#)
2. Change the [readyState<sup>p892</sup>](#) attribute's value to [OPEN<sup>p892</sup>](#) (1).
3. Change the [extensions<sup>p893</sup>](#) attribute's value to the [extensions in use<sup>p54</sup>](#), if is not the null value. [\[WSP\]<sup>p1154</sup>](#)
4. Change the [protocol<sup>p893</sup>](#) attribute's value to the [subprotocol in use<sup>p54</sup>](#), if is not the null value. [\[WSP\]<sup>p1154</sup>](#)
5. Act as if the user agent had [received a set-cookie-string<sup>p49</sup>](#) consisting of the [cookies set during the server's opening handshake<sup>p54</sup>](#), for the URL [url](#) given to the [WebSocket \(\)<sup>p891</sup>](#) constructor. [\[COOKIES\]<sup>p1148</sup>](#) [\[ENCODING\]<sup>p1150</sup>](#) [\[WSP\]<sup>p1154</sup>](#)
6. [Fire a simple event<sup>p846</sup>](#) named [open<sup>p1144</sup>](#) at the [WebSocket<sup>p891</sup>](#) object.

When [a WebSocket message has been received<sup>p54</sup>](#) with type [type](#) and data [data](#), the user agent must [queue a task<sup>p835</sup>](#) to follow these steps: [\[WSP\]<sup>p1154</sup>](#)

1. If the [readyState<sup>p892</sup>](#) attribute's value is not [OPEN<sup>p892</sup>](#) (1), then abort these steps.
2. Let [event](#) be a newly created [trusted<sup>p43</sup>](#) event that uses the [MessageEvent<sup>p880</sup>](#) interface, with the event type [message<sup>p1144</sup>](#), which does not bubble, is not cancelable, and has no default action.
3. Initialise [event](#)'s [origin<sup>p880</sup>](#) attribute to the [Unicode serialisation<sup>p778</sup>](#) of the [origin<sup>p776</sup>](#) of the [URL<sup>p48</sup>](#) that was passed to the [WebSocket<sup>p891</sup>](#) object's constructor.
4. If [type](#) indicates that the data is Text, then initialise [event](#)'s [data<sup>p880</sup>](#) attribute to [data](#).  
If [type](#) indicates that the data is Binary, and [binaryType<sup>p894</sup>](#) is set to "blob<sup>p894</sup>", then initialise [event](#)'s [data<sup>p880</sup>](#) attribute to a new [Blob<sup>p52</sup>](#) object that represents [data](#) as its raw data. [\[FILEAPI\]<sup>p1150</sup>](#)  
If [type](#) indicates that the data is Binary, and [binaryType<sup>p894</sup>](#) is set to "arraybuffer<sup>p894</sup>", then initialise [event](#)'s [data<sup>p880</sup>](#) attribute to a new [ArrayBuffer<sup>p50</sup>](#) object whose contents are [data](#). [\[ECMA262\]<sup>p1150</sup>](#)
5. [Dispatch<sup>p43</sup>](#) [event](#) at the [WebSocket<sup>p891</sup>](#) object.

**Note** User agents are encouraged to check if they can perform the above steps efficiently before they run the task, picking tasks from other task queues<sup>p834</sup> while they prepare the buffers if not. For example, if the [binaryType<sup>p894</sup>](#) attribute was set to "blob<sup>p894</sup>" when the data arrived,

and the user agent spooled all the data to disk, but just before running the above [task<sup>p834</sup>](#) for this particular message the script switched [binaryType<sup>p894</sup>](#) to "[arraybuffer<sup>p894</sup>](#)", the user agent would want to page the data back to RAM before running this [task<sup>p834</sup>](#) so as to avoid stalling the main thread while it created the [ArrayBuffer<sup>p50</sup>](#) object.

### Example

Here is an example of how to define a handler for the [message<sup>p1144</sup>](#) event in the case of text frames:

```
mysocket.onmessage = function (event) {
 if (event.data == 'on') {
 turnLampOn();
 } else if (event.data == 'off') {
 turnLampOff();
 }
};
```

The protocol here is a trivial one, with the server just sending "on" or "off" messages.

When [the WebSocket closing handshake is started<sup>p54</sup>](#), the user agent must [queue a task<sup>p835</sup>](#) to change the [readyState<sup>p892</sup>](#) attribute's value to [CLOSING<sup>p892</sup>](#) (2). (If the [close\(\)<sup>p893</sup>](#) method was called, the [readyState<sup>p892</sup>](#) attribute's value will already be set to [CLOSING<sup>p892</sup>](#) (2) when this task runs.) [\[WSP\]<sup>p1154</sup>](#)

When [the WebSocket connection is closed<sup>p54</sup>](#), possibly *cleanly*, the user agent must [queue a task<sup>p835</sup>](#) to run the following substeps:

1. Change the [readyState<sup>p892</sup>](#) attribute's value to [CLOSED<sup>p892</sup>](#) (3).
2. If the user agent was required to [fail the WebSocket connection<sup>p54</sup>](#), or if the [the WebSocket connection was closed<sup>p54</sup>](#) after being flagged as full, [fire a simple event<sup>p846</sup>](#) named [error](#) at the [WebSocket<sup>p891</sup>](#) object. [\[WSP\]<sup>p1154</sup>](#)
3. Create a [trusted<sup>p43</sup>](#) event that uses the [CloseEvent<sup>p897</sup>](#) interface, with the event type [close<sup>p1144</sup>](#), which does not bubble, is not cancelable, has no default action, whose [wasClean<sup>p898</sup>](#) attribute is initialised to true if the connection closed *cleanly* and false otherwise, whose [code<sup>p898</sup>](#) attribute is initialised to [the WebSocket connection close code<sup>p54</sup>](#), and whose [reason<sup>p898</sup>](#) attribute is initialised to the result of applying the [UTF-8 decoder<sup>p47</sup>](#) to [the WebSocket connection close reason<sup>p54</sup>](#), and [dispatch<sup>p43</sup>](#) the event at the [WebSocket<sup>p891</sup>](#) object. [\[WSP\]<sup>p1154</sup>](#)

**User agents must not convey any failure information to scripts in a way that would allow a script to distinguish the following situations:**

- A server whose host name could not be resolved.
- A server to which packets could not successfully be routed.
- A server that refused the connection on the specified port.
- A server that failed to correctly perform a TLS handshake (e.g., the server certificate can't be verified).
- A server that did not complete the opening handshake (e.g. because it was not a WebSocket server).
- A WebSocket server that sent a correct opening handshake, but that specified options that caused the client to drop the connection (e.g. the server specified a subprotocol that the client did not offer).
- A WebSocket server that abruptly closed the connection after successfully completing the opening handshake.

In all of these cases, the [the WebSocket connection close code<sup>p54</sup>](#) would be 1006, as required by the WebSocket Protocol specification. [\[WSP\]<sup>p1154</sup>](#)

Allowing a script to distinguish these cases would allow a script to probe the user's local network in preparation for an attack.

Note

In particular, this means the code 1015 is not used by the user agent (unless the server erroneously uses it in its close frame, of course).

The [task source<sup>p835</sup>](#) for all [tasks<sup>p834</sup>](#) queued<sup>p835</sup> in this section is the **WebSocket task source**.

### 9.3.4 Ping and Pong frames

The WebSocket protocol specification defines Ping and Pong frames that can be used for keep-alive, heart-beats, network status probing, latency instrumentation, and so forth. These are not currently exposed in the API.

User agents may send ping and unsolicited pong frames as desired, for example in an attempt to maintain local network NAT mappings, to detect failed connections, or to display latency metrics to the user. User agents must not use pings or unsolicited pongs to aid the server; it is assumed that servers will solicit pongs whenever appropriate for the server's needs.

### 9.3.5 Parsing WebSocket URLs

The steps to **parse a WebSocket URL's components** from a string *url* are as follows. These steps return either a *host*, a *port*, a *resource name*, and a *secure* flag, or they fail.

1. If the *url* string is not an [absolute URL<sup>p48</sup>](#), then fail this algorithm.
2. [Resolve<sup>p82</sup>](#) the *url* string, with the URL character encoding set to UTF-8. [\[ENCODING\]<sup>p1150</sup>](#)  
**Note** *It doesn't matter what it is resolved relative to, since we already know it is an absolute URL<sup>p48</sup> at this point.*
3. If the resulting [parsed URL<sup>p48</sup>](#) does not have a [scheme<sup>p48</sup>](#) component whose value is either "ws" or "wss", then fail this algorithm.
4. If the resulting [parsed URL<sup>p48</sup>](#) has a non-null [fragment<sup>p48</sup>](#) component, then fail this algorithm.
5. If the [scheme<sup>p48</sup>](#) component of the resulting [parsed URL<sup>p48</sup>](#) is "ws", set *secure* to false; otherwise, the [scheme<sup>p48</sup>](#) component is "wss", set *secure* to true.
6. Let *host* be the value of the resulting [parsed URL<sup>p48</sup>](#)'s [host<sup>p48</sup>](#) component.
7. If the resulting [parsed URL<sup>p48</sup>](#) has a [port<sup>p48</sup>](#) component that is not the empty string, then let *port* be that component's value; otherwise, there is no explicit *port*.
8. If there is no explicit *port*, then: if *secure* is false, let *port* be 80, otherwise let *port* be 443.
9. Let *resource name* be the value of the resulting [parsed URL<sup>p48</sup>](#)'s [path<sup>p48</sup>](#) component (which might be empty).
10. If *resource name* is the empty string, set it to a single character U+002F SOLIDUS (/).
11. If the resulting [parsed URL<sup>p48</sup>](#) has a non-null [query<sup>p48</sup>](#) component, then append a single U+003F QUESTION MARK character (?) to *resource name*, followed by the value of the [query<sup>p48</sup>](#) component.
12. Return *host*, *port*, *resource name*, and *secure*.

### 9.3.6 The [CloseEvent<sup>p897</sup>](#) interfaces

**IDL**

```
[Constructor(DOMString type, optional CloseEventInit eventInitDict), Exposed=(Window,Worker)]
interface CloseEvent : Event {
 readonly attribute boolean wasClean;
 readonly attribute unsigned short code;
 readonly attribute DOMString reason;
};

dictionary CloseEventInit : EventInit {
 boolean wasClean;
 unsigned short code;
 DOMString reason;
};
```

The `wasClean` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to false. It represents whether the connection closed cleanly or not.

The `code` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to zero. It represents the WebSocket connection close code provided by the server.

The `reason` attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to empty string. It represents the WebSocket connection close reason provided by the server.

### 9.3.7 Garbage collection

A `WebSocket` object whose `readyState` attribute's value was set to `CONNECTING` (0) as of the last time the `event loop` reached `step 1` must not be garbage collected if there are any event listeners registered for `open` events, `message` events, `error` events, or `close` events.

A `WebSocket` object whose `readyState` attribute's value was set to `OPEN` (1) as of the last time the `event loop` reached `step 1` must not be garbage collected if there are any event listeners registered for `message` events, `error`, or `close` events.

A `WebSocket` object whose `readyState` attribute's value was set to `CLOSING` (2) as of the last time the `event loop` reached `step 1` must not be garbage collected if there are any event listeners registered for `error` or `close` events.

A `WebSocket` object with `an established connection` that has data queued to be transmitted to the network must not be garbage collected. [WSP]<sup>p1154</sup>

If a `WebSocket` object is garbage collected while its connection is still open, the user agent must `start the WebSocket closing handshake`, with no status code for the Close message. [WSP]<sup>p1154</sup>

If a user agent is to `make disappear` a `WebSocket` object (this happens when a `Document` object goes away), the user agent must follow the first appropriate set of steps from the following list:

- ↪ If the `WebSocket connection is not yet established` [WSP]<sup>p1154</sup>  
`Fail the WebSocket connection`. [WSP]<sup>p1154</sup>
- ↪ If the `WebSocket closing handshake has not yet been started` [WSP]<sup>p1154</sup>  
`Start the WebSocket closing handshake`, with the status code to use in the WebSocket Close message being 1001. [WSP]<sup>p1154</sup>
- ↪ Otherwise

Do nothing.

## 9.4 Cross-document messaging

Web browsers, for security and privacy reasons, prevent documents in different domains from affecting each other; that is, cross-disallowed.

While this is an important security feature, it prevents pages from different domains from communicating even when those pages do. This section introduces a messaging system that allows documents to communicate with each other regardless of their source domain, designed to not enable cross-site scripting attacks.

**Note** This API `has some privacy implications` that may not be immediately obvious.

Support:	
Chrome	4+
IE (limited)	8+
Chrome for Android	40+
Firefox	3+
iOS Safari	3.2+
Android Browser	2.1+
UC Browser for Android	9.9+
Opera Mini	5.0-8.0+
Safari	4+
Opera	9.5-9.6+
IE Mobile (limited)	10+
Firefox for Android	33+

Source: caniuse.com

The `task source` for the `tasks` in `cross-document messaging` is the **posted message task source**.

## 9.4.1 Introduction

This section is non-normative.

### Example

For example, if document A contains an `iframe`<sup>p299</sup> element that contains document B, and script in document A calls `postMessage()`<sup>p900</sup> on the `Window`<sup>p768</sup> object of document B, then a message event will be fired on that object, marked as originating from the `Window`<sup>p768</sup> of document A. The script in document A might look like:

```
var o = document.getElementsByTagName('iframe')[0];
o.contentWindow.postMessage('Hello world', 'http://b.example.org/');
```

To register an event handler for incoming events, the script would use `addEventListener()` (or similar mechanisms). For example, the script in document B might look like:

```
window.addEventListener('message', receiver, false);
function receiver(e) {
 if (e.origin == 'http://example.com') {
 if (e.data == 'Hello world') {
 e.source.postMessage('Hello', e.origin);
 } else {
 alert(e.data);
 }
 }
}
```

This script first checks the domain is the expected domain, and then looks at the message, which it either displays to the user, or responds to by sending a message back to the document which sent the message in the first place.

## 9.4.2 Security

### 9.4.2.1 Authors

**Use of this API requires extra care to protect users from hostile entities abusing a site for their own purposes.**

Authors should check the `origin`<sup>p880</sup> attribute to ensure that messages are only accepted from domains that they expect to receive messages from. Otherwise, bugs in the author's message handling code could be exploited by hostile sites.

Furthermore, even after checking the `origin`<sup>p880</sup> attribute, authors should also check that the data in question is of the expected format. Otherwise, if the source of the event has been attacked using a cross-site scripting flaw, further unchecked processing of information sent using the `postMessage()`<sup>p900</sup> method could result in the attack being propagated into the receiver.

Authors should not use the wildcard keyword (\*) in the `targetOrigin` argument in messages that contain any confidential information, as otherwise there is no way to guarantee that the message is only delivered to the recipient to which it was intended.

Authors who accept messages from any origin are encouraged to consider the risks of a denial-of-service attack. An attacker could send a high volume of messages; if the receiving page performs expensive computation or causes network traffic to be sent for each such message, the attacker's message could be multiplied into a denial-of-service attack. Authors are encouraged to employ rate limiting (only accepting a certain number of messages per minute) to make such attacks impractical.

### 9.4.2.2 User agents

The integrity of this API is based on the inability for scripts of one `origin`<sup>p776</sup> to post arbitrary events (using `dispatchEvent()` or otherwise) to objects in other origins (those that are not the `same`<sup>p778</sup>).

**Note** Implementors are urged to take extra care in the implementation of this feature. It allows authors to transmit information from one domain to another domain, which is normally disallowed for security reasons. It also requires that UAs be careful to allow access to certain properties but not others.

User agents are also encouraged to consider rate-limiting message traffic between different [origins](#), to protect naïve sites from denial-of-service attacks.

#### 9.4.3 Posting messages

Spec bugs: [18242](#)

**Note**

`window.postMessage(message, targetOrigin [, transfer])`

Posts a message to the given window. Messages can be structured objects, e.g. nested objects and arrays, can contain JavaScript values (strings, numbers, [Date](#) objects, etc), and can contain certain data objects such as [File](#), [Blob](#), [FileList](#), and [ArrayBuffer](#) objects.

Objects listed in *transfer* are transferred, not just cloned, meaning that they are no longer usable on the sending side.

If the origin of the target window doesn't match the given origin, the message is discarded, to avoid information leakage. To send the message to the target regardless of origin, set the target origin to "\*". To restrict the message to same-origin targets only, without needing to explicitly state the origin, set the target origin to "/".

Throws a [DataCloneError](#) exception if *transfer* array contains duplicate objects or if *message* could not be cloned.

**Note** When posting a message to a [Window](#) of a [browsing context](#) that has just been navigated to a new [Document](#) is likely to result in the message not receiving its intended recipient: the scripts in the target [browsing context](#) have to have had time to set up listeners for the messages. Thus, for instance, in situations where a message is to be sent to the [Window](#) of newly created child [iframe](#), authors are advised to have the child [Document](#) post a message to their parent announcing their readiness to receive messages, and for the parent to wait for this message before beginning posting messages.

When a script invokes the `postMessage(message, targetOrigin, transfer)` method (with two or three arguments) on a [Window](#) object, the user agent must follow these steps:

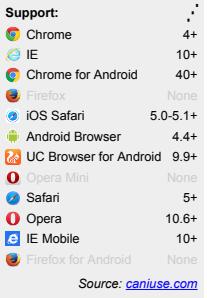

1. If the value of the *targetOrigin* argument is neither a single U+002A ASTERISK character (\*), a single U+002F SOLIDUS character (/), nor an [absolute URL](#), then throw a [SyntaxError](#) exception and abort the overall set of steps.
2. Let *new ports* be an empty array.
3. Let *transfer map* be an empty association list of [Transferable](#) objects to placeholder objects.
4. If the method was invoked with a third argument *transfer*, run these substeps:
  1. If any object is listed in *transfer* more than once, or any of the [Transferable](#) objects listed in *transfer* are marked as [neutered](#), then throw a [DataCloneError](#) exception and abort these steps.
  2. For each object *x* in *transfer* in turn, add a mapping from *x* to a new unique placeholder object created for *x* to *transfer map*, and if *x* is a [MessagePort](#) object, also append the placeholder object to the *new ports* array.
5. Let *message clone* be the result of obtaining a [structured clone](#) of the *message* argument, with *transfer map* as the *transfer map*. If this throws an exception, then throw that exception and abort these steps.
6. If the method was invoked with a third argument *transfer*, run these substeps:
  1. Let *new owner* be the [environment settings object](#) of the [Window](#) object on which the method was invoked.
  2. For each object *x* in *transfer* in turn, obtain a new object *y* by [transferring](#) the object *x* to *new owner*, and replace the placeholder object that was created for the object *x* by the new object *y* wherever the placeholder exists (i.e. in *message clone* and in *new ports*).
7. Make *new ports* into a [read only](#) array.

8. Return from the `postMessage()` method, but `in parallel` continue running these steps.
9. If the `targetOrigin` argument is a single literal U+002F SOLIDUS character (/), and the `Document` of the `Window` object on which the method was invoked does not have the `same origin` as the `responsible document` specified by the `entry settings object`, then abort these steps silently.  
Otherwise, if the `targetOrigin` argument is an `absolute URL`, and the `Document` of the `Window` object on which the method was invoked does not have the `same origin` as `targetOrigin`, then abort these steps silently.  
Otherwise, the `targetOrigin` argument is a single literal U+002A ASTERISK character (\*), and no origin check is made.
10. Create a `trusted` event that uses the `MessageEvent` interface, with the event type `message`, which does not bubble, is not cancelable, and has no default action. The `data` attribute must be initialised to the value of `message clone`, the `origin` attribute must be initialised to the `Unicode serialisation` of the `origin` specified by the `incumbent settings object`, the `source` attribute must be initialised to the `WindowProxy` object corresponding to the `global object` (a `Window` object) specified by the `incumbent settings object`, and the `ports` attribute must be initialised to the `new ports array`.
11. Queue a task to dispatch the event created in the previous step at the `Window` object on which the method was invoked. The `task source` for this task is the `posted message task source`.

## 9.5 Channel messaging

### 9.5.1 Introduction

*This section is non-normative.*

To enable independent pieces of code (e.g. running in different `browsing contexts`) to communicate directly, authors can use `messaging`.  

Support:	
Chrome	4+
IE	10+
Chrome for Android	40+
Firefox	None
iOS Safari	5.0-5.1+
Android Browser	4.4+
UC Browser for Android	9.9+
Opera Mini	None
Safari	5+
Opera	10.6+
IE Mobile	10+
Firefox for Android	None

Source: [caniuse.com](http://caniuse.com)

Communication channels in this mechanism are implemented as two-ways pipes, with a port at each end. Messages sent in one at the other port, and vice-versa. Messages are delivered as DOM events, without interrupting or blocking running tasks.

To create a connection (two "entangled" ports), the `MessageChannel()` constructor is called:

```
var channel = new MessageChannel();
```

One of the ports is kept as the local port, and the other port is sent to the remote code, e.g. using `postMessage()`:

```
otherWindow.postMessage('hello', 'http://example.com', [channel.port2]);
```

To send messages, the `postMessage()` method on the port is used:

```
channel.port1.postMessage('hello');
```

To receive messages, one listens to `message` events:

```
channel.port1.onmessage = handleMessage;
function handleMessage(event) {
 // message is in event.data
 // ...
}
```

Data sent on a port can be structured data; for example here an array of strings is passed on a `MessagePort`:

```
port1.postMessage(['hello', 'world']);
```

### 9.5.1.1 Examples

*This section is non-normative.*

Example

In this example, two JavaScript libraries are connected to each other using [MessagePort](#)<sup>p904</sup>s. This allows the libraries to later be hosted in different frames, or in [Worker](#)<sup>p929</sup> objects, without any change to the APIs.

```
<script src="contacts.js"></script> <!-- exposes a contacts object -->
<script src="compose-mail.js"></script> <!-- exposes a composer object -->
<script>
 var channel = new MessageChannel();
 composer.addContactsProvider(channel.port1);
 contacts.registerConsumer(channel.port2);
</script>
```

Here's what the "addContactsProvider()" function's implementation could look like:

```
function addContactsProvider(port) {
 port.onmessage = function (event) {
 switch (event.data.messageType) {
 'search-result': handleSearchResult(event.data.results); break;
 'search-done': handleSearchDone(); break;
 'search-error': handleSearchError(event.data.message); break;
 // ...
 }
 };
}
```

Alternatively, it could be implemented as follows:

```
function addContactsProvider(port) {
 port.addEventListener('message', function (event) {
 if (event.data.messageType == 'search-result')
 handleSearchResult(event.data.results);
 });
 port.addEventListener('message', function (event) {
 if (event.data.messageType == 'search-done')
 handleSearchDone();
 });
 port.addEventListener('message', function (event) {
 if (event.data.messageType == 'search-error')
 handleSearchError(event.data.message);
 });
 // ...
 port.start();
}
```

The key difference is that when using [addEventListener\(\)](#)<sup>p51</sup>, the [start\(\)](#)<sup>p906</sup> method must also be invoked. When using [onmessage](#)<sup>p907</sup>, the call to [start\(\)](#)<sup>p906</sup> is implied.

The [start\(\)](#)<sup>p906</sup> method, whether called explicitly or implicitly (by setting [onmessage](#)<sup>p907</sup>), starts the flow of messages: messages posted on message ports are initially paused, so that they don't get dropped on the floor before the script has had a chance to set up its handlers.

### 9.5.1.2 Ports as the basis of an object-capability model on the Web

*This section is non-normative.*

Ports can be viewed as a way to expose limited capabilities (in the object-capability model sense) to other actors in the system. This can either be a weak capability system, where the ports are merely used as a convenient model within a particular origin, or as a strong capability model, where they are provided by one origin *provider* as the only mechanism by which another origin *consumer* can effect change in or obtain information from *provider*.

For example, consider a situation in which a social Web site embeds in one `iframe`<sup>p299</sup> the user's e-mail contacts provider (an address book site, from a second origin), and in a second `iframe`<sup>p299</sup> a game (from a third origin). The outer social site and the game in the second `iframe`<sup>p299</sup> cannot access anything inside the first `iframe`<sup>p299</sup>; together they can only:

- `Navigate`<sup>p791</sup> the `iframe`<sup>p299</sup> to a new `URL`<sup>p48</sup>, such as the same `URL`<sup>p48</sup> but with a different fragment identifier, causing the `Window`<sup>p768</sup> in the `iframe`<sup>p299</sup> to receive a `hashchange`<sup>p1144</sup> event.
- Resize the `iframe`<sup>p299</sup>, causing the `Window`<sup>p768</sup> in the `iframe`<sup>p299</sup> to receive a `resize`<sup>p53</sup> event.
- Send a `message`<sup>p1144</sup> event to the `Window`<sup>p768</sup> in the `iframe`<sup>p299</sup> using the `window.postMessage()`<sup>p900</sup> API.

The contacts provider can use these methods, most particularly the third one, to provide an API that can be accessed by other origins to manipulate the user's address book. For example, it could respond to a message "add-contact Guillaume Tell <tell@pomme.example.net>" by adding the given person and e-mail address to the user's address book.

To avoid any site on the Web being able to manipulate the user's contacts, the contacts provider might only allow certain trusted sites, such as the social site, to do this.

Now suppose the game wanted to add a contact to the user's address book, and that the social site was willing to allow it to do so on its behalf, essentially "sharing" the trust that the contacts provider had with the social site. There are several ways it could do this; most simply, it could just proxy messages between the game site and the contacts site. However, this solution has a number of difficulties: it requires the social site to either completely trust the game site not to abuse the privilege, or it requires that the social site verify each request to make sure it's not a request that it doesn't want to allow (such as adding multiple contacts, reading the contacts, or deleting them); it also requires some additional complexity if there's ever the possibility of multiple games simultaneously trying to interact with the contacts provider.

Using message channels and `MessagePort`<sup>p904</sup> objects, however, all of these problems can go away. When the game tells the social site that it wants to add a contact, the social site can ask the contacts provider not for it to add a contact, but for the *capability* to add a single contact. The contacts provider then creates a pair of `MessagePort`<sup>p904</sup> objects, and sends one of them back to the social site, who forwards it on to the game. The game and the contacts provider then have a direct connection, and the contacts provider knows to only honor a single "add contact" request, nothing else. In other words, the game has been granted the capability to add a single contact.

#### 9.5.1.3 Ports as the basis of abstracting out service implementations

*This section is non-normative.*

Continuing the example from the previous section, consider the contacts provider in particular. While an initial implementation might have simply used `XMLHttpRequest`<sup>p52</sup> objects in the service's `iframe`<sup>p299</sup>, an evolution of the service might instead want to use a `shared worker`<sup>p930</sup> with a single `WebSocket`<sup>p891</sup> connection.

If the initial design used `MessagePort`<sup>p904</sup> objects to grant capabilities, or even just to allow multiple simultaneous independent sessions, the service implementation can switch from the `XMLHttpRequest`<sup>p52</sup>s-in-each-`iframe`<sup>p299</sup> model to the shared-`WebSocket`<sup>p891</sup> model without changing the API at all: the ports on the service provider side can all be forwarded to the shared worker without it affecting the users of the API in the slightest.

#### 9.5.2 Message channels

**IDL**

```
[Constructor, Exposed=(Window,Worker)]
interface MessageChannel {
 readonly attribute MessagePort port1;
 readonly attribute MessagePort port2;
};
```

**Note**

```
channel = new MessageChannel();
```

Returns a new `MessageChannel`<sup>p903</sup> object with two new `MessagePort`<sup>p904</sup> objects.

`channel.port1p904`

Returns the first [MessagePort<sup>p904</sup>](#) object.

`channel.port2p904`

Returns the second [MessagePort<sup>p904</sup>](#) object.

When the [MessageChannel\(\)](#) constructor is called, it must run the following algorithm:

1. Create a new [MessagePort object<sup>p905</sup>](#) whose [owner<sup>p905</sup>](#) is the [incumbent settings object<sup>p831</sup>](#), and let *port1* be that object.
2. Create a new [MessagePort object<sup>p905</sup>](#) whose [owner<sup>p905</sup>](#) is the [incumbent settings object<sup>p831</sup>](#), and let *port2* be that object.
3. [Entangle<sup>p905</sup>](#) the *port1* and *port2* objects.
4. Instantiate a new [MessageChannel<sup>p903</sup>](#) object, and let *channel* be that object.
5. Let the [port1<sup>p904</sup>](#) attribute of the *channel* object be *port1*.
6. Let the [port2<sup>p904</sup>](#) attribute of the *channel* object be *port2*.
7. Return *channel*.

The *port1* and *port2* attributes must return the values they were assigned when the [MessageChannel<sup>p903</sup>](#) object was created.

### 9.5.3 Message ports

Each channel has two message ports. Data sent through one port is received by the other port, and vice versa.

IDL

```
[Exposed=(Window,Worker)]
interface MessagePort : EventTarget {
 void postMessage(any message, optional sequence<Transferable> transfer);
 void start();
 void close();

 // event handlers
 attribute EventHandler onmessage;
};

// MessagePort implements Transferable;
```

Note

`port.postMessagep906(message [, transfer])`

Posts a message through the channel. Objects listed in *transfer* are transferred, not just cloned, meaning that they are no longer usable on the sending side.

Throws a [DataCloneError<sup>p50</sup>](#) exception if *transfer* array contains duplicate objects or the source or target ports, or if *message* could not be cloned.

`port.startp906()`

Begins dispatching messages received on the port.

`port.closep907()`

Disconnects the port, so that it is no longer active.

Each [MessagePort<sup>p904</sup>](#) object can be entangled with another (a symmetric relationship). Each [MessagePort<sup>p904</sup>](#) object also has a [task source<sup>p835</sup>](#) called the [port message queue](#), initially empty. A [port message queue<sup>p904</sup>](#) can be enabled or disabled, and is initially disabled. Once enabled, a

port can never be disabled again (though messages in the queue can get moved to another queue or removed altogether, which has much the same effect). A [MessagePort](#) also has a **has been shipped** flag, which must initially be false, and an **owner**, which is a [settings object](#) set when the object is created, as described below.

When a port's [port message queue](#) is enabled, the [event loop](#) must use it as one of its [task sources](#). When a port's [owner](#) specifies a [responsible event loop](#) that is a [browsing context](#) event loop, all [tasks](#) queued on its [port message queue](#) must be associated with the [responsible document](#) specified by the port's [owner](#).

**Note** If the port's [owner](#) specifies a [responsible document](#) that is [fully active](#), but the event listeners all have scripts whose [settings objects](#) specify [responsible documents](#) that are not [fully active](#), then the messages will be lost.

Each [event loop](#) has a [task source](#) called the [unshipped port message queue](#). This is a virtual [task source](#): it must act as if it contained the [tasks](#) of each [port message queue](#) of each [MessagePort](#) whose [has been shipped](#) flag is false, whose [port message queue](#) is enabled, and whose [owner](#) specifies that [event loop](#) as the [responsible event loop](#), in the order in which they were added to their respective [task source](#). When a [task](#) would be removed from the [unshipped port message queue](#), it must instead be removed from its [port message queue](#).

When a [MessagePort](#)'s [has been shipped](#) flag is false, its [port message queue](#) must be ignored for the purposes of the [event loop](#). (The [unshipped port message queue](#) is used instead.)

**Note** The [has been shipped](#) flag is set to true when a port, its twin, or the object it was cloned from, is or has been transferred. When a [MessagePort](#)'s [has been shipped](#) flag is true, its [port message queue](#) acts as a first-class [task source](#), unaffected to any [unshipped port message queue](#).

When the user agent is to **create a new MessagePort object** with a particular [settings object](#) as its **owner**, it must instantiate a new [MessagePort](#) object, and let its [owner](#) be **owner**.

When the user agent is to **entangle** two [MessagePort](#) objects, it must run the following steps:

1. If one of the ports is already entangled, then disentangle it and the port that it was entangled with.

**Note** If those two previously entangled ports were the two ports of a [MessageChannel](#) object, then that [MessageChannel](#) object no longer represents an actual channel: the two ports in that object are no longer entangled.

2. Associate the two ports to be entangled, so that they form the two parts of a new channel. (There is no [MessageChannel](#) object that represents this channel.)

Two ports *A* and *B* that have gone through this step are now said to be entangled; one is entangled to the other, and vice versa.

**Note** While this specification describes this process as instantaneous, implementations are more likely to implement it via message passing. As with all algorithms, the key is "merely" that the end result be indistinguishable, in a black-box sense, from the specification.

When the user agent is to **clone a port** *original port*, with the clone being owned by **owner**, it must run the following steps, which return a new [MessagePort](#) object. These steps must be run atomically.

1. Set *original port*'s [has been shipped](#) flag to true.
2. **Create a new MessagePort object** whose [owner](#) is **owner**, and let *new port* be that object.
3. Set *new port*'s [has been shipped](#) flag to true.
4. Move all the [tasks](#) that are to fire [message](#) events in the [port message queue](#) of *original port* to the [port message queue](#) of *new port*, if any, leaving the *new port*'s [port message queue](#) in its initial disabled state, and, if the *new port*'s [owner](#) specifies a [responsible event loop](#) that is a [browsing context](#) event loop, associating the moved [tasks](#) with the [responsible document](#) specified by *new port*'s [owner](#).

5. If the *original port* is entangled with another port, then run these substeps:

1. Let the *remote port* be the port with which the *original port* is entangled.
2. Set *remote port*'s [has been shipped](#) flag to true.
3. **Entangle** the *remote port* and *new port* objects. The *original port* object will be disentangled by this process.

6. Return *new port*. It is the clone.

To [transfer<sup>p98</sup>](#) a [MessagePort<sup>p904</sup>](#) object *old* to a new owner *owner*, a user agent must [clone<sup>p905</sup>](#) the *old* object with the clone being owned by *owner*, thus obtaining *new*, must [neuter<sup>p98</sup>](#) the *old* port, and must finally return *new*.

The [postMessage\(\)](#) method, when called on a port *source port*, must cause the user agent to run the following steps:

1. Let *target port* be the port with which *source port* is entangled, if any.
2. Let *doomed* be false. It is set to true if a condition is detected that will make this message cause the port to be unusable; specifically, if the message contains *target port* as one of the objects being [transferred<sup>p98</sup>](#). (This condition cannot necessarily be detected when the method is called.)
3. Let *new ports* be an empty array.
4. Let *transfer map* be an empty association list of [Transferable<sup>p98</sup>](#) objects to placeholder objects.
5. If the method was invoked with a second argument *transfer*, run these substeps:
  1. If any object is listed in *transfer* more than once, or any of the [Transferable<sup>p98</sup>](#) objects listed in *transfer* are marked as [neutered<sup>p98</sup>](#), then throw a [DataCloneError<sup>p50</sup>](#) exception and abort these steps.
  2. If any of the objects in *transfer* are the *source port*, then throw a [DataCloneError<sup>p50</sup>](#) exception and abort these steps.
  3. If any of the objects in *transfer* are the *target port*, if any, then let *doomed* be true, and optionally report to a developer console that the target port was posted to itself, causing the communication channel to be lost.
  4. For each object *x* in *transfer* in turn, add a mapping from *x* to a new unique placeholder object created for *x* to *transfer map*, and if *x* is a [MessagePort<sup>p904</sup>](#) object, also append the placeholder object to the *new ports* array.
6. Let *message clone* be the result of obtaining a [structured clone<sup>p98</sup>](#) of the *message* argument, with *transfer map* as the *transfer map*. If this throws an exception, then throw that exception and abort these steps.
7. If the method was invoked with a second argument *transfer*, run these substeps:
  1. Let *new owner* be the [owner<sup>p905</sup>](#) of *target port*, if there is a *target port* and *doomed* is false, or else some arbitrary owner. (This *new owner* is used when transferring objects below. If there is no *target port*, or if the *target port* is one of the objects being [transferred<sup>p98</sup>](#), the [Transferable<sup>p98</sup>](#) objects given in the second argument, if any, are still [transferred<sup>p98</sup>](#), but since they are then discarded, it doesn't matter where they are transferred to.)
  2. For each object *x* in *transfer* in turn, obtain a new object *y* by [transferring<sup>p98</sup>](#) the object *x* to *new owner*, and replace the placeholder object that was created for the object *x* by the new object *y* wherever the placeholder exists (i.e. in *message clone* and in *new ports*).
  8. Make *new ports* into a [read only<sup>p49</sup>](#) array.
  9. If there is no *target port* (i.e. if *source port* is not entangled), or if *doomed* is true, then abort these steps.
  10. Create an event *e* that uses the [MessageEvent<sup>p880</sup>](#) interface, with the name [message<sup>p1144</sup>](#), which does not bubble, is not cancelable, and has no default action.
  11. Let the [data<sup>p880</sup>](#) attribute of *e* be initialised to the value of *message clone*.
  12. Let the [ports<sup>p881</sup>](#) attribute of *e* be initialised to the *new ports* array.
  13. Add a [task<sup>p834</sup>](#) that runs the following steps to the [port message queue<sup>p904</sup>](#) of *target port*:
    1. Let *target* be the [MessagePort<sup>p904</sup>](#) in whose [port message queue<sup>p904</sup>](#) the event *e* now finds itself.
    2. [Dispatch<sup>p43</sup>](#) *e* at *target*.

The [start\(\)](#) method must enable its port's [port message queue<sup>p904</sup>](#), if it is not already enabled.

The `close()` method, when called on a port *local port* that is entangled with another port, must cause the user agent to disentangle the two ports. If the method is called on a port that is not entangled, then the method must do nothing.

The following are the [event handlers<sup>p839</sup>](#) (and their corresponding [event handler event types<sup>p839</sup>](#)) that must be supported, as [event handler IDL attributes<sup>p839</sup>](#), by all objects implementing the [MessagePort<sup>p904</sup>](#) interface:

<a href="#">Event handler<sup>p839</sup></a>	<a href="#">Event handler event type<sup>p839</sup></a>
<a href="#">onmessage</a>	<a href="#">message<sup>p1144</sup></a>

The first time a [MessagePort<sup>p904</sup>](#) object's [onmessage<sup>p907</sup>](#) IDL attribute is set, the port's [port message queue<sup>p904</sup>](#) must be enabled, as if the [start\(\)<sup>p906</sup>](#) method had been called.

#### 9.5.4 Broadcasting to many ports

The API described in this section is controversial, as, in an attempt to solve an architectural memory leak, it instead exposes the details of Garbage Collection. This is a lose-lose scenario. A better solution is really needed here.

Broadcasting to many ports is in principle relatively simple: keep an array of [MessagePort<sup>p904</sup>](#) objects to send messages to, and iterate through the array to send a message. However, this has one rather unfortunate effect: it prevents the ports from being garbage collected, even if the other side has gone away.

To avoid this problem, the [PortCollection<sup>p907</sup>](#) object can be used. It acts as an opaque array of [MessagePort<sup>p904</sup>](#) objects, thus allowing the objects to be garbage collected when they stop being relevant, while still allowing scripts to iterate over the [MessagePort<sup>p904</sup>](#) objects.

**IDL**

```
[Constructor, Exposed=(Window,Worker)]
interface PortCollection {
 void add(MessagePort port);
 void remove(MessagePort port);
 void clear();
 void iterate(PortCollectionCallback callback);
};

callback PortCollectionCallback = void (MessagePort port);
```

#### Note

`portCollection = new PortCollectionp908()`  
Returns a new empty [PortCollection<sup>p907</sup>](#) object.

`portCollection . addp908(port)`  
Adds *port* to the collection, if it isn't already present.

`portCollection . removep908(port)`  
Removes *port* from the collection, if it is present.

`portCollection . clearp908()`  
Removes all ports from the collection.

`portCollection . iteratep908(callback)`  
Calls *callback* for each port in the collection.

A [PortCollection<sup>p907</sup>](#) object has an initially empty [list of ports](#). When a [MessagePort<sup>p904</sup>](#) object in a [list of ports<sup>p907</sup>](#) is garbage collected, it must be silently removed from that [list of ports<sup>p907</sup>](#). Objects in a [list of ports<sup>p907</sup>](#) are ordered chronologically by the time at which they were most

recently added; the least-recently added [MessagePort](#) object is the first in the list, and the most-recently added [MessagePort](#) is the last in the list.

The [PortCollection\(\)](#) constructor must return a new [PortCollection](#) object (with an empty [list of ports](#)).

The [add\(\)](#) method must add the [MessagePort](#) given by the argument to the [PortCollection](#) object's [list of ports](#), unless the [MessagePort](#) is already in the [list of ports](#), in which case the method does nothing. (Calling this method with a port already in the list does not move the port to the end of the list.)

The [remove\(\)](#) method must remove the [MessagePort](#) given by the argument from the [PortCollection](#) object's [list of ports](#), unless the [MessagePort](#) is not in the [list of ports](#), in which case the method does nothing.

The [clear\(\)](#) method must remove all [MessagePort](#) objects from the [PortCollection](#) object's [list of ports](#), returning it to the initial empty state. If the [list of ports](#) is already empty, the method does nothing.

The [iterate\(\)](#) method must invoke its [PortCollectionCallback](#) argument once for each [MessagePort](#) object in the object's [list of ports](#), in the order defined above, with each invocation being passed the corresponding [MessagePort](#) object as the callback's sole argument.

## 9.5.5 Ports and garbage collection

When a [MessagePort](#) object *o* is entangled, user agents must either act as if *o*'s entangled [MessagePort](#) object has a strong reference to *o*, or as if the [global object](#) specified by *o*'s [owner](#) has a strong reference to *o*.

**Note** *Thus, a message port can be received, given an event listener, and then forgotten, and so long as that event listener could receive a message, the channel will be maintained.*

*Of course, if this was to occur on both sides of the channel, then both ports could be garbage collected, since they would not be reachable from live code, despite having a strong reference to each other.*

Furthermore, a [MessagePort](#) object must not be garbage collected while there exists an event referenced by a [task](#) in a [task queue](#) that is to be dispatched on that [MessagePort](#) object, or while the [MessagePort](#) object's [port message queue](#) is enabled and not empty.

There are no strong references from a [PortCollection](#) object to its [MessagePort](#) objects. (That is in fact the whole point of [PortCollection](#) objects: they allow for [MessagePort](#) objects to be referenced without preventing them from being garbage collected.)

**Note** *Authors are strongly encouraged to explicitly close [MessagePort](#) objects to disentangle them, so that their resources can be recollected. Creating many [MessagePort](#) objects and discarding them without closing them can lead to high transient memory usage since garbage collection is not necessarily performed promptly, especially for [MessagePort](#)'s where garbage collection can involve cross-process coordination.*

## 9.6 Broadcasting to other browsing contexts

Pages on a single [origin](#) opened by the same user in the same user agent but in different unrelated [browsing contexts](#) sometimes send notifications to each other, for example "hey, the user logged in over here, check your credentials again".

For elaborate cases, e.g. to manage locking of shared state, to manage synchronisation of resources between a server and multiple share a [WebSocket](#) connection with a remote host, and so forth, [shared workers](#) are the most appropriate solution.

For simple cases, though, where a shared worker would be an unreasonable overhead, authors can use the simple channel-based mechanism described in this section.

**IDL**

```
[Constructor(DOMString channel), Exposed=(Window,Worker)]
interface BroadcastChannel : EventTarget {
 readonly attribute DOMString name;
 void postMessage(any message);
```

```

void close();
attribute EventHandler onmessage;
};

```

Note

**broadcastChannel = new BroadcastChannel<sup>p909</sup>(channel)**

Returns a new BroadcastChannel<sup>p908</sup> object via which messages for the given channel can be sent and received.

**broadcastChannel . name<sup>p909</sup>**

Returns the channel ID (as passed to the constructor).

**broadcastChannel . postMessage<sup>p909</sup>(message)**

Sends the given message to other BroadcastChannel<sup>p908</sup> objects set up for this channel. Messages can be structured objects, e.g. nested objects and arrays.

**broadcastChannel . close<sup>p910</sup>()**

Closes the BroadcastChannel<sup>p908</sup> object, opening it up to garbage collection.

A BroadcastChannel<sup>p908</sup> object has a **channel name**, a **BroadcastChannel settings object**, and a **closed flag**.

The BroadcastChannel() constructor, when invoked, must create and return a BroadcastChannel<sup>p908</sup> object whose channel name<sup>p909</sup> is the constructor's first argument, whose BroadcastChannel settings object<sup>p909</sup> is the incumbent settings object<sup>p831</sup>, and whose closed flag<sup>p909</sup> is false.

The name attribute must return the channel name<sup>p909</sup>.

The postMessage() method, when invoked on a BroadcastChannel<sup>p908</sup> object *source* with an argument *message*, must run the following steps:

1. Let *source settings* be *source*'s BroadcastChannel settings object<sup>p909</sup>.
2. If *source*'s closed flag<sup>p909</sup> is true, then throw an InvalidStateError<sup>p50</sup> exception and abort these steps.
3. Let *source channel* be *source*'s channel name<sup>p909</sup>.
4. Let *cloned message* be a structured clone<sup>p98</sup> of the *message* argument. If this throws an exception, then rethrow that exception and abort these steps.
5. Let *destinations* be a list of BroadcastChannel<sup>p908</sup> objects that match the following criteria:
  - Their BroadcastChannel settings object<sup>p909</sup> specifies either:
    - a global object<sup>p829</sup> that is a Window<sup>b768</sup> object and a responsible document<sup>p829</sup> that is fully active<sup>p763</sup>, or
    - a global object<sup>p829</sup> that is a WorkerGlobalScope<sup>b923</sup> object whose closing<sup>p925</sup> flag is false and whose worker<sup>p929</sup> is a suspendable worker<sup>p925</sup>.
  - Their BroadcastChannel settings object<sup>p909</sup> specifies an origin<sup>b776</sup> that is the same origin<sup>p778</sup> as the origin<sup>b776</sup> specified by *source settings*.
  - Their channel name<sup>p909</sup> is a case-sensitive<sup>p58</sup> match for *source channel*.
  - Their closed flag<sup>p909</sup> is false.
6. Remove *source* from *destinations*.
7. Sort *destinations* such that all BroadcastChannel<sup>p908</sup> objects whose BroadcastChannel settings objects<sup>p909</sup> specify the same responsible event loop<sup>p829</sup> are sorted in creation order, oldest first. (This does not define a complete ordering. Within this constraint, user agents may sort the list in any user-agent defined manner.)
8. For each BroadcastChannel<sup>p908</sup> object in *destinations*, queue a task<sup>p835</sup> that runs the following steps:

1. Create an event that uses the [MessageEvent](#)<sup>p880</sup> interface, with the event type [message](#)<sup>p1144</sup>, which does not bubble, is not cancelable, and has no default action. The [data](#)<sup>p880</sup> attribute must be initialised to a [structured clone](#)<sup>p98</sup> of cloned message, and the [origin](#)<sup>p880</sup> attribute must be initialised to the [Unicode serialisation](#)<sup>p778</sup> of the [origin](#)<sup>p776</sup> specified by [source settings](#). This event is not [trusted](#)<sup>p43</sup>.

2. [Dispatch](#)<sup>p43</sup> the event at the [BroadcastChannel](#)<sup>p908</sup> object.

The [tasks](#)<sup>p834</sup> must use the [DOM manipulation task source](#)<sup>p838</sup>, and, for those where the [event loop](#)<sup>p834</sup> specified by the target [BroadcastChannel](#)<sup>p908</sup> object's [BroadcastChannel settings object](#)<sup>p909</sup> is a [browsing context](#)<sup>p762</sup> [event loop](#)<sup>p834</sup>, must be associated with the [responsible document](#)<sup>p829</sup> specified by that target [BroadcastChannel](#)<sup>p908</sup> object's [BroadcastChannel settings object](#)<sup>p909</sup>.

While a [BroadcastChannel](#)<sup>p908</sup> object whose [closed flag](#)<sup>p909</sup> is false has an event listener registered for [message](#)<sup>p1144</sup> events, there must be a strong reference from [global object](#)<sup>p829</sup> specified by the [BroadcastChannel](#)<sup>p908</sup> object's [BroadcastChannel settings object](#)<sup>p909</sup> to the [BroadcastChannel](#)<sup>p908</sup> object itself.

The [close\(\)](#) method must set the [closed flag](#)<sup>p909</sup> of the [BroadcastChannel](#)<sup>p908</sup> object on which it was invoked to true.

**Note** Authors are strongly encouraged to explicitly close [BroadcastChannel](#)<sup>p908</sup> objects when they are no longer needed, so that they can be garbage collected. Creating many [BroadcastChannel](#)<sup>p908</sup> objects and discarding them while leaving them with an event listener and without closing them can lead to an apparent memory leak, since the objects will continue to live for as long as they have an event listener (or until their page or worker is closed).

The following are the [event handlers](#)<sup>p839</sup> (and their corresponding [event handler event types](#)<sup>p839</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p839</sup>, by all objects implementing the [BroadcastChannel](#)<sup>p908</sup> interface:

<a href="#">Event handler</a> <sup>p839</sup>	<a href="#">Event handler event type</a> <sup>p839</sup>
<a href="#">onmessage</a>	<a href="#">message</a> <sup>p1144</sup>

#### Example

Suppose a page wants to know when the user logs out, even when the user does so from another tab at the same site:

```
var authChannel = new BroadcastChannel('auth');
authChannel.onmessage = function (event) {
 if (event.data == 'logout')
 showLogout();
}

function logoutRequested() {
 // called when the user asks us to log them out
 doLogout();
 showLogout();
 authChannel.postMessage('logout');
}

function doLogout() {
 // actually log the user out (e.g. clearing cookies)
 // ...
}

function showLogout() {
 // update the UI to indicate we're logged out
 // ...
}
```

## 10 Web workers

### 10.1 Introduction

#### 10.1.1 Scope

*This section is non-normative.*

This specification defines an API for running scripts in the background independently of any user interface scripts.

This allows for long-running scripts that are not interrupted by scripts that respond to clicks or other user interactions, and allows long tasks to be executed without yielding to keep the page responsive.

Workers (as these background scripts are called herein) are relatively heavy-weight, and are not intended to be used in large numbers. For example, it would be inappropriate to launch one worker for each pixel of a four megapixel image. The examples below show some appropriate uses of workers.

Generally, workers are expected to be long-lived, have a high start-up performance cost, and a high per-instance memory cost.

#### 10.1.2 Examples

*This section is non-normative.*

There are a variety of uses that workers can be put to. The following subsections show various examples of this use.

##### 10.1.2.1 A background number-crunching worker

*This section is non-normative.*

The simplest use of workers is for performing a computationally expensive task without interrupting the user interface.

In this example, the main document spawns a worker to (naïvely) compute prime numbers, and progressively displays the most recently found prime number.

The main page is as follows:

```
<!DOCTYPE HTML>
<html>
 <head>
 <title>Worker example: One-core computation</title>
 </head>
 <body>
 <p>The highest prime number discovered so far is: <output id="result"></output></p>
 <script>
 var worker = new Worker('worker.js');
 worker.onmessage = function (event) {
 document.getElementById('result').textContent = event.data;
 };
 </script>
 </body>
</html>
```

The [Worker \(\)<sup>p929</sup>](#) constructor call creates a worker and returns a [Worker<sup>p929</sup>](#) object representing that worker, which is used to communicate with the worker. That object's [onmessage<sup>p929</sup>](#) event handler allows the code to receive messages from the worker.

The worker itself is as follows:

```
var n = 1;
search: while (true) {
 n += 1;
 for (var i = 2; i <= Math.sqrt(n); i += 1)
 if (n % i == 0)
 continue search;
 // found a prime!
 postMessage(n);
}
```

The bulk of this code is simply an unoptimised search for a prime number. The [postMessage \(\)<sup>p924</sup>](#) method is used to send a message back to the page when a prime is found.

[View this example online.](#)

#### 10.1.2.2 Worker used for background I/O

*This section is non-normative.*

In this example, the main document uses two workers, one for fetching stock updates at regular intervals, and one for performing search queries that the user requests.

The main page is as follows:

```
<!DOCTYPE HTML>
<html>
<head>
 <title>Worker example: Stock ticker</title>
 <script>
 // TICKER
 var symbol = 'GOOG'; // default symbol to watch
 var ticker = new Worker('ticker.js');

 // SEARCHER
 var searcher = new Worker('searcher.js');
 function search(query) {
 searcher.postMessage(query);
 }

 // SYMBOL SELECTION UI
 function select(newSymbol) {
 symbol = newSymbol;
 ticker.postMessage(symbol);
 }
 </script>
 <meta http-equiv="Refresh" content="120; URL=.." />
</head>
<body onload="search('')">
 <p><output id="symbol"></output> <output id="value"></output></p>
 <script>
 ticker.onmessage = function (event) {
 var data = event.data.split(' ');
 document.getElementById('symbol').textContent = data[0];
 document.getElementById('value').textContent = data[1];
 };
 ticker.postMessage(symbol);
 </script>
 <p><label>Search: <input type="text" autofocus oninput="search(this.value)"></label></p>
```

```

<ul id="results">
<script>
 searcher.onmessage = function (event) {
 var data = event.data.split(' ');
 var results = document.getElementById('results');
 while (results.hasChildNodes()) // clear previous results
 results.removeChild(results.firstChild);
 for (var i = 0; i < data.length; i += 1) {
 // add a list item with a button for each result
 var li = document.createElement('li');
 var button = document.createElement('button');
 button.value = data[i];
 button.type = 'button';
 button.onclick = function () { select(this.value); };
 button.textContent = data[i];
 li.appendChild(button);
 results.appendChild(li);
 }
 };
</script>
<p>(The data in this example is not real. Try searching for "Google" or "Apple".)</p>
</body>
</html>

```

The two workers use a common library for performing the actual network calls. This library is as follows:

```

function get(url) {
 try {
 var xhr = new XMLHttpRequest();
 xhr.open('GET', url, false);
 xhr.send();
 return xhr.responseText;
 } catch (e) {
 return ''; // turn all errors into empty results
 }
}

```

The stock updater worker is as follows:

```

importScripts('io.js');
var timer;
var symbol;
function update() {
 postMessage(symbol + ' ' + get('stock.cgi?' + symbol));
 timer = setTimeout(update, 10000);
}
onmessage = function (event) {
 if (timer)
 clearTimeout(timer);
 symbol = event.data;
 update();
};

```

The search query worker is as follows:

```

importScripts('io.js');
onmessage = function (event) {
 postMessage(get('search.cgi?' + event.data));
};

```

[View this example online.](#)

### 10.1.2.3 Shared workers introduction

*This section is non-normative.*

This section introduces shared workers using a Hello World example. Shared workers use slightly different APIs, since each worker can handle multiple connections.

This first example shows how you connect to a worker and how a worker can send a message back to the page when it connects. Received messages are displayed in a log.

Support:	
Chrome	4+
IE	None
Chrome for Android	None
Firefox	29+
iOS Safari	None
Android Browser	None
UC Browser for Android	9.9+
Opera Mini	None
Safari	None
Opera	10.6+
IE Mobile	None
Firefox for Android	33+

Source: [caniuse.com](http://caniuse.com)

Here is the HTML page:

```
<!DOCTYPE HTML>
<title>Shared workers: demo 1</title>
<pre id="log">Log:</pre>
<script>
 var worker = new SharedWorker('test.js');
 var log = document.getElementById('log');
 worker.port.onmessage = function(e) { // note: not worker.onmessage!
 log.textContent += '\n' + e.data;
 }
</script>
```

Here is the JavaScript worker:

```
onconnect = function(e) {
 var port = e.ports[0];
 port.postMessage('Hello World!');
}
```

[View this example online.](#)

This second example extends the first one by changing two things: first, messages are received using `addEventListener()` instead of an [event handler IDL attribute](#)<sup>p839</sup>, and second, a message is sent to the worker, causing the worker to send another message in return. Received messages are again displayed in a log.

Here is the HTML page:

```
<!DOCTYPE HTML>
<title>Shared workers: demo 2</title>
<pre id="log">Log:</pre>
<script>
 var worker = new SharedWorker('test.js');
 var log = document.getElementById('log');
 worker.port.addEventListener('message', function(e) {
 log.textContent += '\n' + e.data;
 }, false);
 worker.port.start(); // note: need this when using addEventListener
 worker.port.postMessage('ping');
</script>
```

Here is the JavaScript worker:

```
onconnect = function(e) {
 var port = e.ports[0];
 port.postMessage('Hello World!');
 port.onmessage = function(e) {
 port.postMessage('pong'); // not e.ports[0].postMessage!
 // e.target.postMessage('pong'); would work also
 }
}
```

[View this example online.](#)

Finally, the example is extended to show how two pages can connect to the same worker; in this case, the second page is merely in an [iframe](#)<sup>p299</sup> on the first page, but the same principle would apply to an entirely separate page in a separate [top-level browsing context](#)<sup>p763</sup>.

Here is the outer HTML page:

```
<!DOCTYPE HTML>
<title>Shared workers: demo 3</title>
<pre id="log">Log:</pre>
<script>
 var worker = new SharedWorker('test.js');
 var log = document.getElementById('log');
 worker.port.addEventListener('message', function(e) {
 log.textContent += '\n' + e.data;
 }, false);
 worker.port.start();
 worker.port.postMessage('ping');
</script>
<iframe src="inner.html"></iframe>
```

Here is the inner HTML page:

```
<!DOCTYPE HTML>
<title>Shared workers: demo 3 inner frame</title>
<pre id=log>Inner log:</pre>
<script>
 var worker = new SharedWorker('test.js');
 var log = document.getElementById('log');
 worker.port.onmessage = function(e) {
 log.textContent += '\n' + e.data;
 }
</script>
```

Here is the JavaScript worker:

```
var count = 0;
onconnect = function(e) {
 count += 1;
 var port = e.ports[0];
 port.postMessage('Hello World! You are connection #' + count);
 port.onmessage = function(e) {
 port.postMessage('pong');
 }
}
```

[View this example online.](#)

#### 10.1.2.4 Shared state using a shared worker

*This section is non-normative.*

In this example, multiple windows (viewers) can be opened that are all viewing the same map. All the windows share the same map information, with a single worker coordinating all the viewers. Each viewer can move around independently, but if they set any data on the map, all the viewers are updated.

The main page isn't interesting, it merely provides a way to open the viewers:

```

<!DOCTYPE HTML>
<html>
<head>
<title>Workers example: Multiviewer</title>
<script>
function openViewer() {
 window.open('viewer.html');
}
</script>
</head>
<body>
<p><button type=button onclick="openViewer()">Open a new viewer</button></p>
<p>Each viewer opens in a new window. You can have as many viewers as you like, they all view the same data.</p>
</body>
</html>

```

The viewer is more involved:

```

<!DOCTYPE HTML>
<html>
<head>
<title>Workers example: Multiviewer viewer</title>
<script>
var worker = new SharedWorker('worker.js', 'core');

// CONFIGURATION
function configure(event) {
 if (event.data.substr(0, 4) != 'cfg ') return;
 var name = event.data.substr(4).split(' ', 1)[0];
 // update display to mention our name is name
 document.getElementsByName('h1')[0].textContent += ' ' + name;
 // no longer need this listener
 worker.port.removeEventListener('message', configure, false);
}
worker.port.addEventListener('message', configure, false);

// MAP
function paintMap(event) {
 if (event.data.substr(0, 4) != 'map ') return;
 var data = event.data.substr(4).split(',');
 // display tiles data[0] .. data[8]
 var canvas = document.getElementById('map');
 var context = canvas.getContext('2d');
 for (var y = 0; y < 3; y += 1) {
 for (var x = 0; x < 3; x += 1) {
 var tile = data[y * 3 + x];
 if (tile == '0')
 context.fillStyle = 'green';
 else
 context.fillStyle = 'maroon';
 context.fillRect(x * 50, y * 50, 50, 50);
 }
 }
}
worker.port.addEventListener('message', paintMap, false);

// PUBLIC CHAT
function updatePublicChat(event) {
 if (event.data.substr(0, 4) != 'txt ') return;

```

```

var name = event.data.substr(4).split(' ', 1)[0];
var message = event.data.substr(4 + name.length + 1);
// display "<name> message" in public chat
var public = document.getElementById('public');
var p = document.createElement('p');
var n = document.createElement('button');
n.textContent = '<' + name + '> ';
n.onclick = function () { worker.port.postMessage('msg ' + name); };
p.appendChild(n);
var m = document.createElement('span');
m.textContent = message;
p.appendChild(m);
public.appendChild(p);
}
worker.port.addEventListener('message', updatePublicChat, false);

// PRIVATE CHAT
function startPrivateChat(event) {
 if (event.data.substr(0, 4) != 'msg ') return;
 var name = event.data.substr(4).split(' ', 1)[0];
 var port = event.ports[0];
 // display a private chat UI
 var ul = document.getElementById('private');
 var li = document.createElement('li');
 var h3 = document.createElement('h3');
 h3.textContent = 'Private chat with ' + name;
 li.appendChild(h3);
 var div = document.createElement('div');
 var addMessage = function(name, message) {
 var p = document.createElement('p');
 var n = document.createElement('strong');
 n.textContent = '<' + name + '> ';
 p.appendChild(n);
 var t = document.createElement('span');
 t.textContent = message;
 p.appendChild(t);
 div.appendChild(p);
 };
 port.onmessage = function (event) {
 addMessage(name, event.data);
 };
 li.appendChild(div);
 var form = document.createElement('form');
 var p = document.createElement('p');
 var input = document.createElement('input');
 input.size = 50;
 p.appendChild(input);
 p.appendChild(document.createTextNode(' '));
 var button = document.createElement('button');
 button.textContent = 'Post';
 p.appendChild(button);
 form.onsubmit = function () {
 port.postMessage(input.value);
 addMessage('me', input.value);
 input.value = '';
 return false;
 };
 form.appendChild(p);
 li.appendChild(form);
 ul.appendChild(li);
}

```

```

worker.port.addEventListener('message', startPrivateChat, false);

worker.port.start();
</script>
</head>
<body>
<h1>Viewer</h1>
<h2>Map</h2>
<p><canvas id="map" height=150 width=150></canvas></p>
<p>
<button type=button onclick="worker.port.postMessage('mov left')">Left</button>
<button type=button onclick="worker.port.postMessage('mov up')">Up</button>
<button type=button onclick="worker.port.postMessage('mov down')">Down</button>
<button type=button onclick="worker.port.postMessage('mov right')">Right</button>
<button type=button onclick="worker.port.postMessage('set 0')">Set 0</button>
<button type=button onclick="worker.port.postMessage('set 1')">Set 1</button>
</p>
<h2>Public Chat</h2>
<div id="public"></div>
<form onsubmit="worker.port.postMessage('txt ' + message.value); message.value = ''; return false;">
<p>
<input type="text" name="message" size="50">
<button>Post</button>
</p>
</form>
<h2>Private Chat</h2>
<ul id="private">
</body>
</html>

```

There are several key things worth noting about the way the viewer is written.

**Multiple listeners.** Instead of a single message processing function, the code here attaches multiple event listeners, each one performing a quick check to see if it is relevant for the message. In this example it doesn't make much difference, but if multiple authors wanted to collaborate using a single port to communicate with a worker, it would allow for independent code instead of changes having to all be made to a single event handling function.

Registering event listeners in this way also allows you to unregister specific listeners when you are done with them, as is done with the `configure()` method in this example.

Finally, the worker:

```

var nextName = 0;
function getNextName() {
 // this could use more friendly names
 // but for now just return a number
 return nextName++;
}

var map = [
 [0, 0, 0, 0, 0, 0, 0],
 [1, 1, 0, 1, 0, 1, 1],
 [0, 1, 0, 1, 0, 0, 0],
 [0, 1, 0, 1, 0, 1, 1],
 [0, 0, 0, 1, 0, 0, 0],
 [1, 0, 0, 1, 1, 1, 1],
 [1, 1, 0, 1, 1, 0, 1],
];
;

function wrapX(x) {
 if (x < 0) return wrapX(x + map[0].length);
}

```

```

if (x >= map[0].length) return wrapX(x - map[0].length);
return x;
}

function wrapY(y) {
if (y < 0) return wrapY(y + map.length);
if (y >= map[0].length) return wrapY(y - map.length);
return y;
}

function wrap(val, min, max) {
if (val < min)
return val + (max-min)+1;
if (val > max)
return val - (max-min)-1;
return val;
}

function sendMapData(viewer) {
var data = '';
for (var y = viewer.y-1; y <= viewer.y+1; y += 1) {
for (var x = viewer.x-1; x <= viewer.x+1; x += 1) {
if (data != '')
data += ',';
data += map[wrap(y, 0, map[0].length-1)][wrap(x, 0, map.length-1)];
}
}
viewer.port.postMessage('map ' + data);
}

var viewers = {};
onconnect = function (event) {
var name = getNextName();
event.ports[0]._data = { port: event.ports[0], name: name, x: 0, y: 0, };
viewers[name] = event.ports[0]._data;
event.ports[0].postMessage('cfg ' + name);
event.ports[0].onmessage = getMessage;
sendMapData(event.ports[0]._data);
};

function getMessage(event) {
switch (event.data.substr(0, 4)) {
case 'mov':
var direction = event.data.substr(4);
var dx = 0;
var dy = 0;
switch (direction) {
case 'up': dy = -1; break;
case 'down': dy = 1; break;
case 'left': dx = -1; break;
case 'right': dx = 1; break;
}
event.target._data.x = wrapX(event.target._data.x + dx);
event.target._data.y = wrapY(event.target._data.y + dy);
sendMapData(event.target._data);
break;
case 'set':
var value = event.data.substr(4);
map[event.target._data.y][event.target._data.x] = value;
for (var viewer in viewers)
sendMapData(viewers[viewer]);
}
}

```

```

 break;
 case 'txt':
 var name = event.target._data.name;
 var message = event.data.substr(4);
 for (var viewer in viewers)
 viewers[viewer].port.postMessage('txt ' + name + ' ' + message);
 break;
 case 'msg':
 var party1 = event.target._data;
 var party2 = viewers[event.data.substr(4).split(' ', 1)[0]];
 if (party2) {
 var channel = new MessageChannel();
 party1.port.postMessage('msg ' + party2.name, [channel.port1]);
 party2.port.postMessage('msg ' + party1.name, [channel.port2]);
 }
 break;
 }
}

```

**Connecting to multiple pages.** The script uses the [onconnect](#)<sup>p924</sup> event listener to listen for multiple connections.

**Direct channels.** When the worker receives a "msg" message from one viewer naming another viewer, it sets up a direct connection between the two, so that the two viewers can communicate directly without the worker having to proxy all the messages.

[View this example online.](#)

### 10.1.2.5 Delegation

*This section is non-normative.*

With multicore CPUs becoming prevalent, one way to obtain better performance is to split computationally expensive tasks amongst multiple workers. In this example, a computationally expensive task that is to be performed for every number from 1 to 10,000,000 is farmed out to ten subworkers.

The main page is as follows, it just reports the result:

```

<!DOCTYPE HTML>
<html>
<head>
 <title>Worker example: Multicore computation</title>
</head>
<body>
 <p>Result: <output id="result"></output></p>
 <script>
 var worker = new Worker('worker.js');
 worker.onmessage = function (event) {
 document.getElementById('result').textContent = event.data;
 };
 </script>
</body>
</html>

```

The worker itself is as follows:

```

// settings
var num_workers = 10;
var items_per_worker = 1000000;

// start the workers
var result = 0;

```

```

var pending_workers = num_workers;
for (var i = 0; i < num_workers; i += 1) {
 var worker = new Worker('core.js');
 worker.postMessage(i * items_per_worker);
 worker.postMessage((i+1) * items_per_worker);
 worker.onmessage = storeResult;
}

// handle the results
function storeResult(event) {
 result += 1*event.data;
 pending_workers -= 1;
 if (pending_workers <= 0)
 postMessage(result); // finished!
}

```

It consists of a loop to start the subworkers, and then a handler that waits for all the subworkers to respond.

The subworkers are implemented as follows:

```

var start;
onmessage = getStart;
function getStart(event) {
 start = 1*event.data;
 onmessage = getEnd;
}

var end;
function getEnd(event) {
 end = 1*event.data;
 onmessage = null;
 work();
}

function work() {
 var result = 0;
 for (var i = start; i < end; i += 1) {
 // perform some complex calculation here
 result += 1;
 }
 postMessage(result);
 close();
}

```

They receive two numbers in two events, perform the computation for the range of numbers thus specified, and then report the result back to the parent.

[View this example online.](#)

## 10.1.3 Tutorials

### 10.1.3.1 Creating a dedicated worker

*This section is non-normative.*

Creating a worker requires a URL to a JavaScript file. The [Worker\(\)](#)<sup>b929</sup> constructor is invoked with the URL to that file as its only argument; a worker is then created and returned:

```
var worker = new Worker('helper.js');
```

### 10.1.3.2 Communicating with a dedicated worker

*This section is non-normative.*

Dedicated workers use [MessagePort](#)<sup>p904</sup> objects behind the scenes, and thus support all the same features, such as sending structured data, transferring binary data, and transferring other ports.

To receive messages from a dedicated worker, use the [onmessage](#)<sup>p929</sup> event handler IDL attribute<sup>p839</sup> on the [Worker](#)<sup>p929</sup> object:

```
worker.onmessage = function (event) { ... };
```

You can also use the [addEventListener\(\)](#)<sup>p51</sup> method.

**Note** *The implicit [MessagePort](#)<sup>p904</sup> used by dedicated workers has its [port message queue](#)<sup>p904</sup> implicitly enabled when it is created, so there is no equivalent to the [MessagePort](#)<sup>p904</sup> interface's [start\(\)](#)<sup>p906</sup> method on the [Worker](#)<sup>p929</sup> interface.*

To send data to a worker, use the [postMessage\(\)](#)<sup>p929</sup> method. Structured data can be sent over this communication channel. To send [ArrayBuffer](#)<sup>p50</sup> objects efficiently (by transferring them rather than cloning them), list them in an array in the second argument.

```
worker.postMessage({
 operation: 'find-edges',
 input: buffer, // an ArrayBuffer object
 threshold: 0.6,
}, [buffer]);
```

To receive a message inside the worker, the [onmessage](#)<sup>p924</sup> event handler IDL attribute<sup>p839</sup> is used.

```
onmessage = function (event) { ... };
```

You can again also use the [addEventListener\(\)](#)<sup>p51</sup> method.

In either case, the data is provided in the event object's [data](#)<sup>p880</sup> attribute.

To send messages back, you again use [postMessage\(\)](#)<sup>p924</sup>. It supports the structured data in the same manner.

```
postMessage(event.data.input, [event.data.input]); // transfer the buffer back
```

### 10.1.3.3 Shared workers

*This section is non-normative.*

Shared workers are identified by the URL of the script used to create it, optionally with an explicit name. The name allows multiple instances of a particular shared worker to be started.

Shared workers are scoped by [origin](#)<sup>p776</sup>. Two different sites using the same names will not collide. However, if a page tries to use the same shared worker name as another page on the same site, but with a different script URL, it will fail.

Creating shared workers is done using the [SharedWorker\(\)](#)<sup>p930</sup> constructor. This constructor takes the URL to the script to use for its first argument, and the name of the worker, if any, as the second argument.

```
var worker = new SharedWorker('service.js');
```

Communicating with shared workers is done with explicit [MessagePort](#)<sup>p904</sup> objects. The object returned by the [SharedWorker\(\)](#)<sup>p930</sup> constructor holds a reference to the port on its [port](#)<sup>p930</sup> attribute.

```
worker.port.onmessage = function (event) { ... };
worker.port.postMessage('some message');
worker.port.postMessage({ foo: 'structured', bar: ['data', 'also', 'possible']});
```

Inside the shared worker, new clients of the worker are announced using the [connect](#)<sup>p1144</sup> event. The port for the new client is given by the event object's [source](#)<sup>p881</sup> attribute.

```

onconnect = function (event) {
 var newPort = event.source;
 // set up a listener
 newPort.onmessage = function (event) { ... };
 // send a message back to the port
 newPort.postMessage('ready!'); // can also send structured data, of course
};

}

```

## 10.2 Infrastructure

There are two kinds of workers; dedicated workers, and shared workers. Dedicated workers, once created, are linked to their creator; but message ports can be used to communicate from a dedicated worker to multiple other browsing contexts or workers. Shared workers, on the other hand, are named, and once created any script running in the same [origin<sup>p776</sup>](#) can obtain a reference to that worker and communicate with it.

### 10.2.1 The global scope

The global scope is the "inside" of a worker.

#### 10.2.1.1 The [WorkerGlobalScope<sup>p923</sup>](#) common interface

Spec bugs: [26319](#)

IDL	<pre> [Exposed=Worker] interface WorkerGlobalScope : EventTarget {   readonly attribute WorkerGlobalScope self;   readonly attribute WorkerLocation location;    void close();   attribute OnErrorEventHandler onerror;   attribute EventHandler onlanguagechange;   attribute EventHandler onoffline;   attribute EventHandler ononline;    // also has additional members in a partial interface }; </pre>
-----	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Spec bugs: [27497](#)

The **self** attribute must return the [WorkerGlobalScope<sup>p923</sup>](#) object itself.

The **location** attribute must return the [WorkerLocation<sup>p933</sup>](#) object created for the [WorkerGlobalScope<sup>p923</sup>](#) object when the worker was created. It represents the [absolute URL<sup>p48</sup>](#) of the script that was used to initialise the worker, after any redirects.

When a script invokes the **close()** method on a [WorkerGlobalScope<sup>p923</sup>](#) object, the user agent must run the following steps (atomically):

1. Discard any [tasks<sup>p834</sup>](#) that have been added to the [WorkerGlobalScope<sup>p923</sup>](#) object's [event loop<sup>p834</sup>](#)'s [task queues<sup>p834</sup>](#).
2. Set the worker's [WorkerGlobalScope<sup>p923</sup>](#) object's [closing<sup>p925</sup>](#) flag to true. (This prevents any further tasks from being queued.)

The following are the [event handlers<sup>p839</sup>](#) (and their corresponding [event handler event types<sup>p839</sup>](#)) that must be supported, as [event handler IDL attributes<sup>p839</sup>](#), by objects implementing the [WorkerGlobalScope<sup>p923</sup>](#) interface:

<a href="#">Event handler<sup>p839</sup></a>	<a href="#">Event handler event type<sup>p839</sup></a>
<a href="#">onerror</a>	<a href="#">error<sup>p1144</sup></a>
<a href="#">onlanguagechange</a>	<a href="#">languagechange<sup>p1144</sup></a>

<a href="#">Event handler</a> <sup>p839</sup>	<a href="#">Event handler event type</a> <sup>p839</sup>
<a href="#">onoffline</a>	<a href="#">offline</a> <sup>p1144</sup>
<a href="#">ononline</a>	<a href="#">online</a> <sup>p1144</sup>

**Note** For [data: URLs](#), this is the [origin](#)<sup>p776</sup> specified by the [entry settings object](#)<sup>p831</sup> when the constructor was called. For other [URLs](#)<sup>p48</sup>, this is the [origin](#)<sup>p776</sup> of the value of the [absolute URL](#)<sup>p48</sup> given in the worker's [location](#)<sup>p923</sup> attribute.

### 10.2.1.2 Dedicated workers and the [DedicatedWorkerGlobalScope](#)<sup>p924</sup> interface

**IDL**

```
[Global=(Worker,DedicatedWorker),Exposed=DedicatedWorker]
/*sealed*/ interface DedicatedWorkerGlobalScope : WorkerGlobalScope {
 void postMessage(any message, optional sequence<Transferable> transfer);
 attribute EventHandler onmessage;
};
```

[DedicatedWorkerGlobalScope](#)<sup>p924</sup> objects act as if they had an implicit [MessagePort](#)<sup>p904</sup> associated with them. This port is part of a channel that is set up when the worker is created, but it is not exposed. This object must never be garbage collected before the [DedicatedWorkerGlobalScope](#)<sup>p924</sup> object.

All messages received by that port must immediately be retargeted at the [DedicatedWorkerGlobalScope](#)<sup>p924</sup> object.

The [postMessage\(\)](#) method on [DedicatedWorkerGlobalScope](#)<sup>p924</sup> objects must act as if, when invoked, it immediately invoked [the method of the same name](#)<sup>p906</sup> on the port, with the same arguments, and returned the same return value.

The following are the [event handlers](#)<sup>p839</sup> (and their corresponding [event handler event types](#)<sup>p839</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p839</sup>, by objects implementing the [DedicatedWorkerGlobalScope](#)<sup>p924</sup> interface:

<a href="#">Event handler</a> <sup>p839</sup>	<a href="#">Event handler event type</a> <sup>p839</sup>
<a href="#">onmessage</a>	<a href="#">message</a> <sup>p1144</sup>

For the purposes of the [application cache](#)<sup>p809</sup> networking model, a dedicated worker is an extension of the [cache host](#)<sup>p810</sup> from which it was created.

### 10.2.1.3 Shared workers and the [SharedWorkerGlobalScope](#)<sup>p924</sup> interface

**IDL**

```
[Global=(Worker,SharedWorker),Exposed=SharedWorker]
/*sealed*/ interface SharedWorkerGlobalScope : WorkerGlobalScope {
 readonly attribute DOMString name;
 readonly attribute ApplicationCache applicationCache;
 attribute EventHandler onconnect;
};
```

Shared workers receive message ports through [connect](#)<sup>p1144</sup> events on their [SharedWorkerGlobalScope](#)<sup>p924</sup> object for each connection.

The [name](#) attribute must return the value it was assigned when the [SharedWorkerGlobalScope](#)<sup>p924</sup> object was created by the "[run a worker](#)"<sup>p926</sup> algorithm. Its value represents the name that can be used to obtain a reference to the worker using the [SharedWorker](#)<sup>p930</sup> constructor.

The following are the [event handlers](#)<sup>p839</sup> (and their corresponding [event handler event types](#)<sup>p839</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p839</sup>, by objects implementing the [SharedWorkerGlobalScope](#)<sup>p924</sup> interface:

<a href="#">Event handler</a> <sup>p839</sup>	<a href="#">Event handler event type</a> <sup>p839</sup>
<a href="#">onconnect</a>	<a href="#">connect</a> <sup>p1144</sup>

For the purposes of the [application cache](#)<sup>p809</sup> networking model, a shared worker is its own [cache host](#)<sup>p810</sup>. The "[run a worker](#)"<sup>p926</sup> algorithm takes care of associating the worker with an [application cache](#)<sup>p809</sup>.

**Note** The [applicationCache<sup>p825</sup>](#) attribute returns the [ApplicationCache<sup>p824</sup>](#) object for the worker.

### 10.2.2 The event loop

Each [WorkerGlobalScope<sup>p923</sup>](#) object has a distinct [event loop<sup>p834</sup>](#), separate from those used by [units of related similar-origin browsing contexts<sup>p765</sup>](#). This [event loop<sup>p834</sup>](#) has no associated [browsing context<sup>p762</sup>](#), and its [task queues<sup>p834</sup>](#) only have events, callbacks, and networking activity as [tasks<sup>p834</sup>](#). These [event loops<sup>p834</sup>](#) are created by the [run a worker<sup>p926</sup>](#) algorithm.

Each [WorkerGlobalScope<sup>p923</sup>](#) object also has a **closing** flag, which must initially be false, but which can get set to true by the algorithms in the processing model section below.

Once the [WorkerGlobalScope<sup>p923</sup>](#)'s [closing<sup>p925</sup>](#) flag is set to true, the [event loop<sup>p834</sup>](#)'s [task queues<sup>p834</sup>](#) must discard any further [tasks<sup>p834</sup>](#) that would be added to them (tasks already on the queue are unaffected except where otherwise specified). Effectively, once the [closing<sup>p925</sup>](#) flag is true, timers stop firing, notifications for all pending background operations are dropped, etc.

### 10.2.3 The worker's lifetime

Workers communicate with other workers and with [browsing contexts<sup>p762</sup>](#) through [message channels<sup>p901</sup>](#) and their [MessagePort<sup>p904</sup>](#) objects.

Each [WorkerGlobalScope<sup>p923</sup>](#) *worker global scope* has a list of **the worker's ports**, which consists of all the [MessagePort<sup>p904</sup>](#) objects that are entangled with another port and that have one (but only one) port owned by *worker global scope*. This list includes the implicit [MessagePort<sup>p904</sup>](#) in the case of [dedicated workers<sup>p924</sup>](#).

Each [WorkerGlobalScope<sup>p923</sup>](#) also has a list of **the worker's workers**. Initially this list is empty; it is populated when the worker creates or obtains further workers.

Finally, each [WorkerGlobalScope<sup>p923</sup>](#) also has a list of **the worker's Documents**. Initially this list is empty; it is populated when the worker is created.

Whenever a [Document<sup>p102</sup>](#) *d* is added to the worker's [Documents](#), the user agent must, for each worker *q* in the list of [the worker's workers<sup>p925</sup>](#) whose list of [the worker's Documents<sup>p925</sup>](#) does not contain *d*, add *d* to *q*'s [WorkerGlobalScope](#) owner's list of the worker's [Documents<sup>p925</sup>](#).

Whenever a [Document<sup>p102</sup>](#) object is [discarded<sup>p773</sup>](#), it must be removed from the list of [the worker's Documents<sup>p925</sup>](#) of each worker whose list contains that [Document<sup>p102</sup>](#).

Given a [settings object<sup>p829</sup>](#) *o* when creating or obtaining a worker, the **list of relevant Document objects to add** depends on the type of [global object<sup>p829</sup>](#) specified by *o*'s. If *o* specifies a [global object<sup>p829</sup>](#) that is a [WorkerGlobalScope<sup>p923</sup>](#) object (i.e. if we are creating a nested worker), then the relevant [Document<sup>p102</sup>](#)'s are the [the worker's Documents<sup>p925</sup>](#) of the [global object<sup>p829</sup>](#) specified by *o*. Otherwise, *o* specifies a [global object<sup>p829</sup>](#) that is a [Window<sup>p768</sup>](#) object, and the relevant [Document<sup>p102</sup>](#) is just the [responsible document<sup>p829</sup>](#) specified by *o*.

A worker is said to be a **permissible worker** if its list of [the worker's Documents<sup>p925</sup>](#) is not empty, or if its list has been empty for no more than a short user-agent-defined timeout value, its [WorkerGlobalScope<sup>p923</sup>](#) is actually a [SharedWorkerGlobalScope<sup>p924</sup>](#) object (i.e. the worker is a shared worker), and the user agent has a [browsing context<sup>p762</sup>](#) whose [Document<sup>p102</sup>](#) is not complete loaded.

**Note** The second part of this definition allows a shared worker to survive for a short time while a page is loading, in case that page is going to contact the shared worker again. This can be used by user agents as a way to avoid the cost of restarting a shared worker used by a site when the user is navigating from page to page within that site.

A worker is said to be an **active needed worker** if any of the [Document<sup>p102</sup>](#) objects in [the worker's Documents<sup>p925</sup>](#) are [fully active<sup>p763</sup>](#).

A worker is said to be a **protected worker** if it is an [active needed worker<sup>p925</sup>](#) and either it has outstanding timers, database transactions, or network connections, or its list of [the worker's ports<sup>p925</sup>](#) is not empty, or its [WorkerGlobalScope<sup>p923</sup>](#) is actually a [SharedWorkerGlobalScope<sup>p924</sup>](#) object (i.e. the worker is a shared worker).

A worker is said to be a **suspendable worker** if it is not an [active needed worker<sup>p925</sup>](#) but it is a [permissible worker<sup>p925</sup>](#).

#### 10.2.4 Processing model

When a user agent is to **run a worker** for a script with [URL<sup>p48</sup>](#) *url*, an [environment settings object<sup>p829</sup>](#) *settings object*, and a [referrer source<sup>p829</sup>](#) *parent referrer source* it must run the following steps:

1. Create a separate parallel execution environment (i.e. a separate thread or process or equivalent construct), and run the rest of these steps in that context.

For the purposes of timing APIs, this is the **official moment of creation** of the worker.

2. Let *worker global scope* be the [global object<sup>p829</sup>](#) specified by *settings object*.
3. If *worker global scope* is actually a [SharedWorkerGlobalScope<sup>p924</sup>](#) object (i.e. the worker is a shared worker), and there are any [relevant application caches<sup>p810</sup>](#) that are identified by a manifest URL with the [same origin<sup>p778</sup>](#) as *url* and that have *url* as one of their entries, *not* excluding entries marked as [foreign<sup>p809</sup>](#), then associate the *worker global scope* with the [most appropriate application cache<sup>p810</sup>](#) of those that match.
4. Attempt to [fetch<sup>p84</sup>](#) the resource identified by *url*, from the [origin<sup>p776</sup>](#) specified by *settings object*, using *parent referrer source* as the *referrer source* (not using the [referrer source<sup>p829</sup>](#) specified by *settings object*!), and with the *blocking* flag set and the *force same-origin* flag set.

If the attempt fails, then for each [Worker<sup>p929</sup>](#) or [SharedWorker<sup>p930</sup>](#) object associated with *worker global scope*, [queue a task<sup>p835</sup>](#) to [fire a simple event<sup>p846</sup>](#) named [error<sup>p1144</sup>](#) at that object. Abort these steps.

If the attempt succeeds, then let *source* be the result of running the [UTF-8 decode<sup>p47</sup>](#) algorithm on the script resource.

Let *language* be JavaScript.

**Note** As with [script<sup>p591</sup>](#) elements, the MIME type of the script is ignored. Unlike with [script<sup>p591</sup>](#) elements, there is no way to override the type. It's always assumed to be JavaScript.

5. In the newly created execution environment, create a [JavaScript global environment<sup>p50</sup>](#) whose *global object* is *worker global scope*. If *worker global scope* is a [DedicatedWorkerGlobalScope<sup>p924</sup>](#) object, then this is a [dedicated worker environment<sup>p828</sup>](#). Otherwise, *worker global scope* is a [SharedWorkerGlobalScope<sup>p924</sup>](#) object, and this is a [shared worker environment<sup>p828</sup>](#). (In either case, by definition, it is a [worker environment<sup>p828</sup>](#).)
6. Let *script* be a new [script<sup>p828</sup>](#).

Obtain the appropriate [script execution environment<sup>p829</sup>](#) for the scripting language *language* from *settings object*.

Parse/compile/initialise *source* using that [script execution environment<sup>p829</sup>](#), as appropriate for *language*, and thus obtain a [code entry-point<sup>p828</sup>](#). If the script was not compiled successfully, let the [code entry-point<sup>p828</sup>](#) be a no-op script, and act as if a corresponding uncaught script error had occurred.

Let *script*'s [settings object<sup>p829</sup>](#) be *settings object*.

7. **Closing orphan workers:** Start monitoring the worker such that no sooner than it stops being a [protected worker<sup>p925</sup>](#), and no later than it stops being a [permissible worker<sup>p925</sup>](#), *worker global scope*'s [closing<sup>p925</sup>](#) flag is set to true.
8. **Suspending workers:** Start monitoring the worker, such that whenever *worker global scope*'s [closing<sup>p925</sup>](#) flag is false and the worker is a [suspendable worker<sup>p925</sup>](#), the user agent suspends execution of script in that worker until such time as either the [closing<sup>p925</sup>](#) flag switches to true or the worker stops being a [suspendable worker<sup>p925</sup>](#).
9. [Jump<sup>p830</sup>](#) to the [script<sup>p828</sup>](#)'s [code entry-point<sup>p828</sup>](#), and let that run until it either returns, fails to catch an exception, or gets prematurely aborted by the "[kill a worker<sup>p927</sup>](#)" or "[terminate a worker<sup>p927</sup>](#)" algorithms defined below.
10. If *worker global scope* is actually a [DedicatedWorkerGlobalScope<sup>p924</sup>](#) object (i.e. the worker is a dedicated worker), then enable the [port message queue<sup>p904</sup>](#) of the worker's implicit port.
11. **Event loop:** Run the [responsible event loop<sup>p829</sup>](#) specified by *settings object* until it is destroyed.

**Note** The handling of events or the execution of callbacks by [tasks<sup>p834</sup>](#) run by the [event loop<sup>p834</sup>](#) might get prematurely aborted by the "[kill a worker<sup>p927</sup>](#)" or "[terminate a worker<sup>p927</sup>](#)" algorithms defined below.

**Note** The worker processing model remains on this step until the event loop is destroyed, which happens after the [closing<sup>p925</sup>](#) flag is set to true, as described in the [event loop<sup>p834</sup>](#) processing model.

12. Empty the worker global scope's [list of active timers](#)<sup>p852</sup>.
13. Disentangle all the ports in the list of [the worker's ports](#)<sup>p925</sup>.
14. Empty the worker's list of [the worker's Documents](#)<sup>p925</sup>.

When a user agent is to **kill a worker** it must run the following steps in parallel with the worker's main loop (the "[run a worker](#)" processing model defined above):

1. Set the worker's [WorkerGlobalScope](#)<sup>p923</sup> object's [closing](#)<sup>p925</sup> flag to true.
2. If there are any [tasks](#)<sup>p834</sup> queued in the [WorkerGlobalScope](#)<sup>p923</sup> object's [event loop](#)<sup>p834</sup>'s [task queues](#)<sup>p834</sup>, discard them without processing them.
3. Wait a user-agent-defined amount of time.
4. Abort the script currently running in the worker.

User agents may invoke the "[kill a worker](#)" processing model on a worker at any time, e.g. in response to user requests, in response to CPU quota management, or when a worker stops being an [active needed worker](#)<sup>p925</sup> if the worker continues executing even after its [closing](#)<sup>p925</sup> flag was set to true.

When a user agent is to **terminate a worker** it must run the following steps in parallel with the worker's main loop (the "[run a worker](#)" processing model defined above):

1. Set the worker's [WorkerGlobalScope](#)<sup>p923</sup> object's [closing](#)<sup>p925</sup> flag to true.
2. If there are any [tasks](#)<sup>p834</sup> queued in the [WorkerGlobalScope](#)<sup>p923</sup> object's [event loop](#)<sup>p834</sup>'s [task queues](#)<sup>p834</sup>, discard them without processing them.
3. Abort the script currently running in the worker.
4. If the worker's [WorkerGlobalScope](#)<sup>p923</sup> object is actually a [DedicatedWorkerGlobalScope](#)<sup>p924</sup> object (i.e. the worker is a dedicated worker), then empty the [port message queue](#)<sup>p904</sup> of the port that the worker's implicit port is entangled with.

The [task source](#)<sup>p835</sup> for the tasks mentioned above is the [DOM manipulation task source](#)<sup>p838</sup>.

### 10.2.5 Runtime script errors

Whenever an uncaught runtime script error occurs in one of the worker's scripts, if the error did not occur while handling a previous script error, the user agent must [report the error](#)<sup>p833</sup> for that [script](#)<sup>p828</sup>, with the position (line number and column number) where the error occurred, using the [WorkerGlobalScope](#)<sup>p923</sup> object as the target.

For shared workers, if the error is still [not handled](#)<sup>p833</sup> afterwards, the error may be reported to the user.

For dedicated workers, if the error is still [not handled](#)<sup>p833</sup> afterwards, the user agent must [queue a task](#)<sup>p835</sup> to [fire](#)<sup>p43</sup> a [trusted](#)<sup>p43</sup> event that uses the [ErrorEvent](#)<sup>p834</sup> interface, with the name [error](#)<sup>p1144</sup>, that doesn't bubble and is cancelable, with its [message](#)<sup>p834</sup>, [filename](#)<sup>p834</sup>, [lineno](#)<sup>p834</sup>, [colno](#)<sup>p834</sup>, attributes initialised appropriately, and with the [error](#)<sup>p834</sup> attribute initialised to null, at the [Worker](#)<sup>p929</sup> object associated with the worker. If the event is not canceled, the user agent must act as if the uncaught runtime script error had occurred in the global scope that the [Worker](#)<sup>p929</sup> object is in, thus repeating the entire runtime script error reporting process one level up.

If the implicit port connecting the worker to its [Worker](#)<sup>p929</sup> object has been disentangled (i.e. if the parent worker has been terminated), then the user agent must act as if the [Worker](#)<sup>p929</sup> object had no [error](#)<sup>p1144</sup> event handler and as if that worker's [onerror](#)<sup>p923</sup> attribute was null, but must otherwise act as described above.

**Note** *Thus, error reports propagate up to the chain of dedicated workers up to the original [Document](#)<sup>p102</sup>, even if some of the workers along this chain have been terminated and garbage collected.*

The [task source](#)<sup>p835</sup> for the task mentioned above is the [DOM manipulation task source](#)<sup>p838</sup>.

## 10.2.6 Creating workers

### 10.2.6.1 The [AbstractWorker](#)<sup>p928</sup> abstract interface

IDL

```
[NoInterfaceObject, Exposed=(Window,Worker)]
interface AbstractWorker {
 attribute EventHandler onerror;
};
```

The following are the [event handlers](#)<sup>p839</sup> (and their corresponding [event handler event types](#)<sup>p839</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p839</sup>, by objects implementing the [AbstractWorker](#)<sup>p928</sup> interface:

Event handler <sup>p839</sup>	Event handler event type <sup>p839</sup>
onerror	error <sup>p1144</sup>

Spec bugs: [27143](#)

### 10.2.6.2 Script settings for workers

When the user agent is required to **set up a worker environment settings object**, given a *worker global scope* and a [URL](#)<sup>p48</sup> *script address* it must run the following steps:

1. Let *inherited responsible browsing context* be the [responsible browsing context](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup>.
2. Let *inherited origin* be the [origin](#)<sup>p776</sup> specified by the [incumbent settings object](#)<sup>p831</sup>.
3. Let *worker event loop* be a newly created [event loop](#)<sup>p834</sup>.
4. Let *settings object* be a new [environment settings object](#)<sup>p829</sup> whose algorithms are defined as follows:

#### The [script execution environments](#)<sup>p829</sup>

When the [environment settings object](#)<sup>p829</sup> is created, for each language supported by the user agent, create an appropriate execution environment as defined by the relevant specification.

When a [script execution environment](#)<sup>p829</sup> is needed, return the appropriate one from those created when the [environment settings object](#)<sup>p829</sup> was created.

**Note** Currently, workers only support JavaScript, so only a JavaScript execution environment is actually needed here.

#### The [global object](#)<sup>p829</sup>

Return *worker global scope*.

#### The [responsible browsing context](#)<sup>p829</sup>

Return *inherited responsible browsing context*.

#### The [responsible event loop](#)<sup>p829</sup>

Return *worker event loop*.

#### The [responsible document](#)<sup>p829</sup>

Not applicable (the [responsible event loop](#)<sup>p829</sup> is not a [browsing context](#)<sup>p762</sup> [event loop](#)<sup>p834</sup>).

#### The [referrer source](#)<sup>p829</sup>

Return *script address*.

#### The [API URL character encoding](#)<sup>p829</sup>

Return UTF-8.

### The API base URL<sup>p829</sup>

Return *script address*.

### The origin<sup>p776</sup> and effective script origin<sup>p776</sup>

Return *inherited origin*.

5. Return *settings object*.

## 10.2.6.3 Dedicated workers and the Worker<sup>p929</sup> interface

**IDL**

```
[Constructor(DOMString scriptURL), Exposed=(Window,Worker)]
interface Worker : EventTarget {
 void terminate();

 void postMessage(any message, optional sequence<Transferable> transfer);
 attribute EventHandler onmessage;
};

Worker implements AbstractWorker;
```

The `terminate()` method, when invoked, must cause the "[terminate a worker<sup>p927</sup>](#)" algorithm to be run on the worker with which the object is associated.

Worker<sup>p929</sup> objects act as if they had an implicit MessagePort<sup>p904</sup> associated with them. This port is part of a channel that is set up when the worker is created, but it is not exposed. This object must never be garbage collected before the Worker<sup>p929</sup> object.

All messages received by that port must immediately be retargeted at the Worker<sup>p929</sup> object.

The `postMessage()` method on Worker<sup>p929</sup> objects must act as if, when invoked, it immediately invoked [the method of the same name<sup>p906</sup>](#) on the port, with the same arguments, and returned the same return value.

### Example

The `postMessage()`<sup>p929</sup> method's first argument can be structured data:

```
worker.postMessage({opcode: 'activate', device: 1938, parameters: [23, 102]});
```

The following are the event handlers<sup>p839</sup> (and their corresponding event handler event types<sup>p839</sup>) that must be supported, as event handler IDL attributes<sup>p839</sup>, by objects implementing the Worker<sup>p929</sup> interface:

Event handler <sup>p839</sup>	Event handler event type <sup>p839</sup>
onmessage	message <sup>p1144</sup>

When the Worker (scriptURL) constructor is invoked, the user agent must run the following steps:

1. The user agent may throw a SecurityError<sup>p50</sup> exception and abort these steps if the request violates a policy decision (e.g. if the user agent is configured to not allow the page to start dedicated workers).
2. Resolve<sup>p82</sup> the scriptURL argument relative to the API base URL<sup>p829</sup> specified by the entry settings object<sup>p831</sup> when the method was invoked.
3. If this fails, throw a SyntaxError<sup>p50</sup> exception and abort these steps.
4. Let worker URL be the resulting absolute URL<sup>p48</sup>.
5. If the scheme<sup>p48</sup> component of worker URL is not "data", and the origin<sup>p776</sup> of worker URL is not the same<sup>p778</sup> as the origin<sup>p776</sup> specified by the incumbent settings object<sup>p831</sup>, then throw a SecurityError<sup>p50</sup> exception and abort these steps.

**Note** For example, scripts can be external files with the same scheme, host, and port as the original page, or data: URLs, or same-origin blob: URLs. Thus, an https: page couldn't start workers using scripts with http: URLs. [\[FILEAPI\]<sup>p1150</sup>](#).

6. Create a new [DedicatedWorkerGlobalScope](#)<sup>p924</sup> object. Let *worker global scope* be this new object.
7. [Set up a worker environment settings object](#)<sup>p928</sup> with *worker global scope* and *worker URL*, and let *settings object* be the result.
8. Create a new [Worker](#)<sup>b929</sup> object, associated with *worker global scope*. Let *worker* be this new object.
9. [Create a new MessagePort object](#)<sup>b905</sup> whose *owner*<sup>p905</sup> is the [incumbent settings object](#)<sup>p831</sup>. Let this be the *outside port*.
10. Associate the *outside port* with *worker*.
11. [Create a new MessagePort object](#)<sup>b905</sup> whose *owner*<sup>p905</sup> is *settings object*. Let *inside port* be this new object.
12. Associate *inside port* with *worker global scope*.
13. [Entangle](#)<sup>b905</sup> *outside port* and *inside port*.
14. Return *worker*, and run the following steps [in parallel](#)<sup>p41</sup>.
15. Enable *outside port's port message queue*<sup>p904</sup>.
16. Let *docs* be the [list of relevant Document objects to add](#)<sup>p925</sup> given the [incumbent settings object](#)<sup>p831</sup>.
17. [Add to worker global scope's list of the worker's Documents](#)<sup>p925</sup> the [Document](#)<sup>p102</sup> objects in *docs*.
18. If the [global object](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup> is a [WorkerGlobalScope](#)<sup>p923</sup> object (i.e. we are creating a nested worker), add *worker global scope* to the list of [the worker's workers](#)<sup>p925</sup> of the [WorkerGlobalScope](#)<sup>p923</sup> object that is the [global object](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup>.
19. [Run a worker](#)<sup>p926</sup> for the script with [URL](#)<sup>p48</sup> *worker URL*, the [environment settings object](#)<sup>p829</sup> *settings object*, and with the [referrer source](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup>.

#### 10.2.6.4 Shared workers and the [SharedWorker](#)<sup>b930</sup> interface

Spec bugs: [27793](#)

IDL

```
[Constructor(DOMString scriptURL, optional DOMString name), Exposed=(Window,Worker)]
interface SharedWorker : EventTarget {
 readonly attribute MessagePort port;
};

SharedWorker implements AbstractWorker;
```

The [port](#) attribute must return the value it was assigned by the object's constructor. It represents the [MessagePort](#)<sup>p904</sup> for communicating with the shared worker.

When the [SharedWorker\(scriptURL, name\)](#) constructor is invoked, the user agent must run the following steps:

1. The user agent may throw a [SecurityError](#)<sup>p50</sup> exception and abort these steps if the request violates a policy decision (e.g. if the user agent is configured to not allow the page to start shared workers).
2. [Resolve](#)<sup>p82</sup> the *scriptURL* argument.
3. If this fails, throw a [SyntaxError](#)<sup>p50</sup> exception and abort these steps.
4. Let *scriptURL* be the resulting [absolute URL](#)<sup>p48</sup> and *parsed scriptURL* be the resulting [parsed URL](#)<sup>p48</sup>.
5. Let *name* be the value of the second argument, or the empty string if the second argument was omitted.
6. If the [scheme](#)<sup>p48</sup> component of *parsed scriptURL* is not "[data](#)", and the [origin](#)<sup>p776</sup> of *scriptURL* is not the [same](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> specified by the [incumbent settings object](#)<sup>p831</sup>, then throw a [SecurityError](#)<sup>p50</sup> exception and abort these steps.

**Note** *Thus, scripts must either be external files with the same scheme, host, and port as the original page, or [data: URLs](#). For example, an [https:](#) page couldn't start workers using scripts with [http:](#) URLs.*

7. Let *docs* be the [list of relevant Document objects to add](#)<sup>p925</sup> given the [incumbent settings object](#)<sup>p831</sup>.
8. Execute the following substeps atomically:

1. Create a new [SharedWorker](#)<sup>p930</sup> object, which will shortly be associated with a [SharedWorkerGlobalScope](#)<sup>p924</sup> object. Let this [SharedWorker](#)<sup>p930</sup> object be *worker*.
2. [Create a new MessagePort object](#)<sup>p905</sup> whose [owner](#)<sup>p905</sup> is the [incumbent settings object](#)<sup>p831</sup>. Let this be the *outside port*.
3. Assign *outside port* to the [port](#)<sup>p930</sup> attribute of *worker*.
4. Let *worker global scope* be null.
5. If *name* is not the empty string and there exists a [SharedWorkerGlobalScope](#)<sup>p924</sup> object whose [closing](#)<sup>p925</sup> flag is false, whose [name](#)<sup>p924</sup> attribute is exactly equal to *name*, and that is the [global object](#)<sup>p829</sup> specified by an [environment settings object](#)<sup>p829</sup> that specifies as its [origin](#)<sup>p776</sup> the [same origin](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> of *scriptURL*, then let *worker global scope* be that [SharedWorkerGlobalScope](#)<sup>p924</sup> object.

Otherwise, if *name* is the empty string and there exists a [SharedWorkerGlobalScope](#)<sup>p924</sup> object whose [closing](#)<sup>p925</sup> flag is false, whose [name](#)<sup>p924</sup> attribute is the empty string, and whose [location](#)<sup>p923</sup> attribute represents an [absolute URL](#)<sup>p48</sup> that is exactly equal to *scriptURL*, then let *worker global scope* be that [SharedWorkerGlobalScope](#)<sup>p924</sup> object.

6. If *worker global scope* is not null, but the user agent has been configured to disallow communication between the worker represented by the *worker global scope* and the [scripts](#)<sup>p828</sup> whose [settings objects](#)<sup>p829</sup> are the [incumbent settings object](#)<sup>p831</sup>, then set *worker global scope* to null.

**Note** For example, a user agent could have a development mode that isolates a particular [top-level browsing context](#)<sup>p763</sup> from all other pages, and scripts in that development mode could be blocked from connecting to shared workers running in the normal browser mode.

7. If *worker global scope* is not null, then run these steps:

1. If *worker global scope's* [location](#)<sup>p923</sup> attribute represents an [absolute URL](#)<sup>p48</sup> that is not exactly equal to *scriptURL*, then throw a [URLMismatchError](#)<sup>p50</sup> exception and abort all these steps.
2. Associate *worker* with *worker global scope*.
3. Let *settings object* be the [environment settings object](#)<sup>p829</sup> whose [global object](#)<sup>p829</sup> is *worker global scope*.
4. [Create a new MessagePort object](#)<sup>p905</sup> whose [owner](#)<sup>p905</sup> is *settings object*. Let this be the *inside port*.
5. [Entangle](#)<sup>p905</sup> *outside port* and *inside port*.
6. Create a [trusted](#)<sup>p43</sup> event that uses the [MessageEvent](#)<sup>p880</sup> interface, with the name [connect](#)<sup>p1144</sup>, which does not bubble, is not cancelable, has no default action, has a [data](#)<sup>p880</sup> attribute whose value is initialised to the empty string, has a [ports](#)<sup>p881</sup> attribute whose value is initialised to a [read only](#)<sup>p49</sup> array containing only the newly created port, and has a [source](#)<sup>p881</sup> attribute whose value is initialised to the newly created port, and [queue a task](#)<sup>p835</sup> to [dispatch](#)<sup>p43</sup> the event at *worker global scope*.
7. [Add to worker global scope's list of the worker's Documents](#)<sup>p925</sup> the [Document](#)<sup>p102</sup> objects in *docs*.
8. If the [global object](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup> is a [WorkerGlobalScope](#)<sup>p923</sup> object, add *worker global scope* to the list of [the worker's workers](#)<sup>p925</sup> of the [WorkerGlobalScope](#)<sup>p923</sup> object that is the [global object](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup>.
9. Return *worker* and abort all these steps.
10. Create a new [SharedWorkerGlobalScope](#)<sup>p924</sup> object. Let *worker global scope* be this new object.
11. Set the [name](#)<sup>p924</sup> attribute of *worker global scope* to *name*.
12. [Create a new MessagePort object](#)<sup>p905</sup> whose [owner](#)<sup>p905</sup> is *settings object*. Let *inside port* be this new object.
13. [Entangle](#)<sup>p905</sup> *outside port* and *inside port*.
14. Return *worker* and perform the remaining steps [in parallel](#)<sup>p41</sup>.

10. Create a [trusted](#)<sup>b43</sup> event that uses the [MessageEvent](#)<sup>p880</sup> interface, with the name [connect](#)<sup>p1144</sup>, which does not bubble, is not cancelable, has no default action, has a [data](#)<sup>p880</sup> attribute whose value is initialised to the empty string, has a [ports](#)<sup>p881</sup> attribute whose value is initialised to a [read only](#)<sup>p49</sup> array containing only the newly created port, and has a [source](#)<sup>p881</sup> attribute whose value is initialised to the newly created port, and [queue a task](#)<sup>p835</sup> to [dispatch](#)<sup>p43</sup> the event at *worker global scope*.
11. [Add to worker global scope's list of the worker's Documents](#)<sup>p925</sup> the [Document](#)<sup>p102</sup> objects in *docs*.
12. If the [global object](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup> is a [WorkerGlobalScope](#)<sup>p923</sup> object, add *worker global scope* to the list of [the worker's workers](#)<sup>p925</sup> of the [WorkerGlobalScope](#)<sup>p923</sup> object that is the [global object](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup>.
13. [Run a worker](#)<sup>p926</sup> for the script with [URL](#)<sup>p48</sup> *scriptURL*, the [environment settings object](#)<sup>p829</sup> *settings object*, and with the [referrer source](#)<sup>p829</sup> specified by the [incumbent settings object](#)<sup>p831</sup>.

The [task source](#)<sup>p835</sup> for the tasks mentioned above is the [DOM manipulation task source](#)<sup>p838</sup>.

## 10.3 APIs available to workers

[Exposed=Worker]

```
partial interface WorkerGlobalScope { // not obsolete
 void importScripts(DOMString... urls);
 readonly attribute WorkerNavigator navigator;
};

WorkerGlobalScope implements WindowTimers;
WorkerGlobalScope implements WindowBase64;
```

### 10.3.1 Importing scripts and libraries

Spec bugs: [27276](#)

When a script invokes the [importScripts\(urls\)](#) method on a [WorkerGlobalScope](#)<sup>p923</sup> object, the user agent must run the following steps:

1. If there are no arguments, return without doing anything. Abort these steps.
2. Let *settings object* be the [incumbent settings object](#)<sup>p831</sup>.
3. [Resolve](#)<sup>p82</sup> each argument.
4. If any fail, throw a [SyntaxError](#)<sup>p50</sup> exception and abort these steps.
5. Attempt to [fetch](#)<sup>p84</sup> each resource identified by the resulting [absolute URLs](#)<sup>p48</sup>, from the [origin](#)<sup>p776</sup> specified by *settings object*, using the [referrer source](#)<sup>p829</sup> specified by *settings object*, and with the *blocking flag* set.
6. For each argument in turn, in the order given, starting with the first one, run these substeps:
  1. Wait for the fetching attempt for the corresponding resource to complete.

If the fetching attempt failed (e.g. the server returned a 4xx or 5xx status code [or equivalent](#)<sup>p83</sup>, or there was a DNS error), throw a [NetworkError](#)<sup>p50</sup> exception and abort all these steps.

If the attempt succeeds, then let *source* be the result of running the [UTF-8 decode](#)<sup>p47</sup> algorithm on the script resource.

Let *language* be JavaScript.

**Note** As with the worker's script, the script here is always assumed to be JavaScript, regardless of the MIME type.

2. [Create a script](#)<sup>p832</sup> using *source* as the script source, the [URL](#)<sup>p48</sup> from which *source* was obtained, *language* as the scripting language, and *settings object* as the [environment settings object](#)<sup>p829</sup>.
- If the script came from a resource whose [URL](#)<sup>p48</sup> does not have the [same origin](#)<sup>p778</sup> as the [origin](#)<sup>p776</sup> specified by the [incumbent settings object](#)<sup>p831</sup>, then pass the *muted errors* flag to the [create a script](#)<sup>p832</sup> algorithm as well.

Let the newly created `script`<sup>p828</sup> run until it either returns, fails to parse, fails to catch an exception, or gets prematurely aborted by the "[kill a worker](#)"<sup>p927</sup> or "[terminate a worker](#)"<sup>p927</sup> algorithms defined above.

If it failed to parse, then throw an ECMAScript `SyntaxError`<sup>p50</sup> exception and abort all these steps. [[ECMA262](#)]<sup>p1150</sup>

If an exception was thrown or if the script was prematurely aborted, then abort all these steps, letting the exception or aborting continue to be processed by the calling `script`.

If the "[kill a worker](#)"<sup>p927</sup> or "[terminate a worker](#)"<sup>p927</sup> algorithms abort the script then abort all these steps.

### 10.3.2 The `WorkerNavigator`<sup>p933</sup> object

The `navigator` attribute of the `WorkerGlobalScope`<sup>p923</sup> interface must return an instance of the `WorkerNavigator`<sup>p933</sup> interface, which represents the identity and state of the user agent (the client):

IDL

```
[Exposed=Worker]
interface WorkerNavigator {};
WorkerNavigator implements NavigatorID;
WorkerNavigator implements NavigatorLanguage;
WorkerNavigator implements NavigatorOnLine;
```

### 10.3.3 Worker locations

IDL

```
[Exposed=Worker]
interface WorkerLocation {};
WorkerLocation implements URLUtilsReadOnly;
```

A `WorkerLocation`<sup>p933</sup> object represents an [absolute URL](#)<sup>p48</sup> set at its creation.

The `WorkerLocation`<sup>p933</sup> interface supports the `URLUtilsReadOnly`<sup>p48</sup> interface. [[URL](#)]<sup>p1153</sup>

When the object is created, the user agent must invoke the element's `URLUtilsReadOnly`<sup>p48</sup> interface's [set the input](#)<sup>p48</sup> algorithm with the [absolute URL](#)<sup>p48</sup> that the `WorkerLocation`<sup>p933</sup> object represents as the given value.

The element's `URLUtilsReadOnly`<sup>p48</sup> interface's [get the base](#)<sup>p48</sup> algorithm must return null.

# 11 Web storage

## 11.1 Introduction

*This section is non-normative.*

This specification introduces two related mechanisms, similar to HTTP session cookies, for storing name-value pairs on the client side.

[[COOKIES](#)<sup>p1148</sup>

The first is designed for scenarios where the user is carrying out a single transaction, but could be carrying out multiple transactions in different windows at the same time.

Cookies don't really handle this case well. For example, a user could be buying plane tickets in two different windows, using the same site. If the site used cookies to keep track of which ticket the user was buying, then as the user clicked from page to page in both windows, the ticket currently being purchased would "leak" from one window to the other, potentially causing the user to buy two tickets for the same flight without really noticing.

To address this, this specification introduces the [sessionStorage](#)<sup>p936</sup> IDL attribute. Sites can add data to the session storage, and it will be accessible to any page from the same site opened in that window.

### Example

For example, a page could have a checkbox that the user ticks to indicate that he wants insurance:

```
<label>
 <input type="checkbox" onchange="sessionStorage.insurance = checked ? 'true' : ''">
 I want insurance on this trip.
</label>
```

A later page could then check, from script, whether the user had checked the checkbox or not:

```
if (sessionStorage.insurance) { ... }
```

If the user had multiple windows opened on the site, each one would have its own individual copy of the session storage object.

The second storage mechanism is designed for storage that spans multiple windows, and lasts beyond the current session. In particular, Web applications may wish to store megabytes of user data, such as entire user-authored documents or a user's mailbox, on the client side for performance reasons.

Again, cookies do not handle this case well, because they are transmitted with every request.

The [localStorage](#)<sup>p936</sup> IDL attribute is used to access a page's local storage area.

### Example

The site at example.com can display a count of how many times the user has loaded its page by putting the following at the bottom of its page:

```
<p>
 You have viewed this page
 an untold number of
 time(s).
</p>
<script>
 if (!localStorage.pageLoadCount)
 localStorage.pageLoadCount = 0;
 localStorage.pageLoadCount = parseInt(localStorage.pageLoadCount) + 1;
 document.getElementById('count').textContent = localStorage.pageLoadCount;
</script>
```

Each site has its own separate storage area.

## 11.2 The API

### 11.2.1 The `Storage`<sup>p935</sup> interface

IDL

```
interface Storage {
 readonly attribute unsigned long length;
 DOMString? key(unsigned long index);
 getter DOMString? getItem(DOMString key);
 setter creator void setItem(DOMString key, DOMString value);
 deleter void removeItem(DOMString key);
 void clear();
};
```

Support:	
Chrome	4+
IE	8+
Chrome for Android	40+
Firefox	3.5+
iOS Safari	3.2+
Android Browser	2.1+
UC Browser for Android	9.9+
Opera Mini	None
Safari	4+
Opera	10.5+
IE Mobile	10+
Firefox for Android	33+

Source: caniuse.com

Each `Storage`<sup>p935</sup> object provides access to a list of key/value pairs, which are sometimes called items. Keys are strings. Any string (including the empty string) is a valid key. Values are similarly strings.

Each `Storage`<sup>p935</sup> object is associated with a list of key/value pairs when it is created, as defined in the sections on the `sessionStorage`<sup>p936</sup> and `localStorage`<sup>p936</sup> attributes. Multiple separate objects implementing the `Storage`<sup>p935</sup> interface can all be associated with the same list of key/value pairs simultaneously.

The `length` attribute must return the number of key/value pairs currently present in the list associated with the object.

The `key(n)` method must return the name of the *n*th key in the list. The order of keys is user-agent defined, but must be consistent within an object so long as the number of keys doesn't change. (Thus, `adding`<sup>p935</sup> or `removing`<sup>p935</sup> a key may change the order of the keys, but merely changing the value of an existing key must not.) If *n* is greater than or equal to the number of key/value pairs in the object, then this method must return null.

The `supported property names`<sup>p49</sup> on a `Storage`<sup>p935</sup> object are the keys of each key/value pair currently present in the list associated with the object, in the order that the keys were last added to the storage area.

The `getItem(key)` method must return the current value associated with the given `key`. If the given `key` does not exist in the list associated with the object then this method must return null.

The `setItem(key, value)` method must first check if a key/value pair with the given `key` already exists in the list associated with the object.

If it does not, then a new key/value pair must be added to the list, with the given `key` and with its value set to `value`.

If the given `key` does exist in the list, and its value is not equal to `value`, then it must have its value updated to `value`. If its previous value is equal to `value`, then the method must do nothing.

If it couldn't set the new value, the method must throw a `QuotaExceededError`<sup>p50</sup> exception. (Setting could fail if, e.g., the user has disabled storage for the site, or if the quota has been exceeded.)

The `removeItem(key)` method must cause the key/value pair with the given `key` to be removed from the list associated with the object, if it exists. If no item with that key exists, the method must do nothing.

The `setItem()`<sup>p935</sup> and `removeItem()`<sup>p935</sup> methods must be atomic with respect to failure. In the case of failure, the method does nothing. That is, changes to the data storage area must either be successful, or the data storage area must not be changed at all.

The `clear()` method must atomically cause the list associated with the object to be emptied of all key/value pairs, if there are any. If there are none, then the method must do nothing.

**Note** When the `setItem()`<sup>p935</sup>, `removeItem()`<sup>p935</sup>, and `clear()`<sup>p935</sup> methods are invoked, events are fired on the `Window`<sup>p768</sup> objects of other `Document`<sup>p102</sup>s that can access the newly stored or removed data, as defined in the sections on the `sessionStorage`<sup>p936</sup> and `localStorage`<sup>p936</sup> attributes.

**Note** This specification does not require that the above methods wait until the data has been physically written to disk. Only consistency in what different scripts accessing the same underlying list of key/value pairs see is required.

## 11.2.2 The `sessionStorage`<sup>p936</sup> attribute

IDL

```
[NoInterfaceObject]
interface WindowSessionStorage {
 readonly attribute Storage sessionStorage;
};

Window implements WindowSessionStorage;
```

The `sessionStorage` attribute represents the set of storage areas specific to the current [top-level browsing context](#)<sup>p763</sup>.

Each [top-level browsing context](#)<sup>p763</sup> has a unique set of session storage areas, one for each [origin](#)<sup>p776</sup>.

User agents should not expire data from a browsing context's session storage areas, but may do so when the user requests that such data be deleted, or when the UA detects that it has limited storage space, or for security reasons. User agents should always avoid deleting data while a script that could access that data is running. When a top-level browsing context is destroyed (and therefore permanently inaccessible to the user) the data stored in its session storage areas can be discarded with it, as the API described in this specification provides no way for that data to ever be subsequently retrieved.

**Note** *The lifetime of a browsing context can be unrelated to the lifetime of the actual user agent process itself, as the user agent may support resuming sessions after a restart.*

When a new [Document](#)<sup>p102</sup> is created in a [browsing context](#)<sup>p762</sup> which has a [top-level browsing context](#)<sup>p763</sup>, the user agent must check to see if that [top-level browsing context](#)<sup>p763</sup> has a session storage area for that document's [origin](#)<sup>p776</sup>. If it does, then that is the [Document](#)<sup>p102</sup>'s assigned session storage area. If it does not, a new storage area for that document's [origin](#)<sup>p776</sup> must be created, and then *that* is the [Document](#)<sup>p102</sup>'s assigned session storage area. A [Document](#)<sup>p102</sup>'s assigned storage area does not change during the lifetime of a [Document](#)<sup>p102</sup>.

**Note** *In the case of an [iframe](#)<sup>p299</sup> being moved to another [Document](#)<sup>p102</sup>, the nested browsing context is destroyed and a new one created.*

The `sessionStorage`<sup>p936</sup> attribute must return a `Storage`<sup>p935</sup> object associated with the [Document](#)<sup>p102</sup>'s assigned session storage area, if any, or null if there isn't one. Each [Document](#)<sup>p102</sup> object must have a separate object for its [Window](#)<sup>p768</sup>'s `sessionStorage`<sup>p936</sup> attribute.

When a new [top-level browsing context](#)<sup>p763</sup> is created by cloning an existing [browsing context](#)<sup>p762</sup>, the new browsing context must start with the same session storage areas as the original, but the two sets must from that point on be considered separate, not affecting each other in any way.

When a new [top-level browsing context](#)<sup>p763</sup> is created by a [script](#)<sup>p828</sup> in an existing [browsing context](#)<sup>p762</sup>, or by the user following a link in an existing browsing context, or in some other way related to a specific [Document](#)<sup>p102</sup>, and the creation is not [a new start for session storage](#)<sup>p767</sup>, then the session storage area of the [origin](#)<sup>p776</sup> of that [Document](#)<sup>p102</sup> must be copied into the new browsing context when it is created. From that point on, however, the two session storage areas must be considered separate, not affecting each other in any way.

When the `setItem()`<sup>p935</sup>, `removeItem()`<sup>p935</sup>, and `clear()`<sup>p935</sup> methods are called on a `Storage`<sup>p935</sup> object x that is associated with a session storage area, if the methods did not throw an exception or "do nothing" as defined above, then for every [Document](#)<sup>p102</sup> object whose [Window](#)<sup>p768</sup> object's `sessionStorage`<sup>p936</sup> attribute's `Storage`<sup>p935</sup> object is associated with the same storage area, other than x, [send a storage notification](#)<sup>p937</sup>.

## 11.2.3 The `localStorage`<sup>p936</sup> attribute

IDL

```
[NoInterfaceObject]
interface WindowLocalStorage {
 readonly attribute Storage localStorage;
};

Window implements WindowLocalStorage;
```

The `localStorage` object provides a `Storage`<sup>p935</sup> object for an [origin](#)<sup>p776</sup>.

User agents must have a set of local storage areas, one for each [origin](#)<sup>p776</sup>.

User agents should expire data from the local storage areas only for security reasons or when requested to do so by the user. User agents *should* always avoid deleting data while a script that could access that data is running.

When the `localStorage`<sup>p936</sup> attribute is accessed, the user agent must run the following steps, which are known as the **Storage object initialisation steps**:

1. The user agent may throw a `SecurityError`<sup>p50</sup> exception and abort these steps instead of returning a `Storage`<sup>p935</sup> object if the request violates a policy decision (e.g. if the user agent is configured to not allow the page to persist data).
2. If the `Document`<sup>p102</sup>'s `origin`<sup>p776</sup> is not a scheme/host/port tuple, then throw a `SecurityError`<sup>p50</sup> exception and abort these steps.
3. Check to see if the user agent has allocated a local storage area for the `origin`<sup>p776</sup> of the `Document`<sup>p102</sup> of the `Window`<sup>p768</sup> object on which the attribute was accessed. If it has not, create a new storage area for that `origin`<sup>p776</sup>.
4. Return the `Storage`<sup>p935</sup> object associated with that origin's local storage area. Each `Document`<sup>p102</sup> object must have a separate object for its `Window`<sup>p768</sup>'s `localStorage`<sup>p936</sup> attribute.

When the `setItem()`<sup>p935</sup>, `removeItem()`<sup>p935</sup>, and `clear()`<sup>p935</sup> methods are called on a `Storage`<sup>p935</sup> object `x` that is associated with a local storage area, if the methods did not throw an exception or "do nothing" as defined above, then for every `Document`<sup>p102</sup> object whose `Window`<sup>p768</sup> object's `localStorage`<sup>p936</sup> attribute's `Storage`<sup>p935</sup> object is associated with the same storage area, other than `x`, [send a storage notification](#)<sup>p937</sup>.

Whenever the properties of a `localStorage`<sup>p936</sup> attribute's `Storage`<sup>p935</sup> object are to be examined, returned, set, or deleted, whether as part of a direct property access, when checking for the presence of a property, during property enumeration, when determining the number of properties present, or as part of the execution of any of the methods or attributes defined on the `Storage`<sup>p935</sup> interface, the user agent must first [obtain the storage mutex](#)<sup>p838</sup>.

#### 11.2.4 The `storage`<sup>p1145</sup> event

The `storage`<sup>p1145</sup> event is fired on a `Document`<sup>p102</sup>'s `Window`<sup>p768</sup> object when a storage area changes, as described in the previous two sections ([for session storage](#)<sup>p936</sup>, [for local storage](#)<sup>p937</sup>).

When a user agent is to [send a storage notification](#) for a `Document`<sup>p102</sup>, the user agent must [queue a task](#)<sup>p835</sup> to [fire](#)<sup>p43</sup> a [trusted](#)<sup>p43</sup> event with the name `storage`<sup>p935</sup>, which does not bubble and is not cancelable, and which uses the `StorageEvent`<sup>p937</sup> interface, at the `Document`<sup>p102</sup> object's `Window`<sup>p768</sup> object.

**Note** Such a `Document`<sup>p102</sup> object is not necessarily [fully active](#)<sup>p763</sup>, but events fired on such objects are ignored by the [event loop](#)<sup>p834</sup> until the `Document`<sup>p102</sup> becomes [fully active](#)<sup>p763</sup> again.

The `task source`<sup>p835</sup> for these tasks is the [DOM manipulation task source](#)<sup>p838</sup>.

If the event is being fired due to an invocation of the `setItem()`<sup>p935</sup> or `removeItem()`<sup>p935</sup> methods, the event must have its `key`<sup>p938</sup> attribute initialised to the name of the key in question, its `oldValue`<sup>p938</sup> attribute initialised to the old value of the key in question, or null if the key is newly added, and its `newValue`<sup>p938</sup> attribute initialised to the new value of the key in question, or null if the key was removed.

Otherwise, if the event is being fired due to an invocation of the `clear()`<sup>p935</sup> method, the event must have its `key`<sup>p938</sup>, `oldValue`<sup>p938</sup>, and `newValue`<sup>p938</sup> attributes initialised to null.

In addition, the event must have its `url`<sup>p938</sup> attribute initialised to [the address of the document](#) whose `Storage`<sup>p935</sup> object was affected; and its `storageArea`<sup>p938</sup> attribute initialised to the `Storage`<sup>p935</sup> object from the `Window`<sup>p768</sup> object of the target `Document`<sup>p102</sup> that represents the same kind of `Storage`<sup>p935</sup> area as was affected (i.e. session or local).

##### 11.2.4.1 The `StorageEvent`<sup>p937</sup> interface

**IDL**

```
[Constructor(DOMString type, optional StorageEventInit eventInitDict)]
interface StorageEvent : Event {
 readonly attribute DOMString? key;
 readonly attribute DOMString? oldValue;
 readonly attribute DOMString? newValue;
 readonly attribute DOMString url;
```

```

readonly attribute Storage? storageArea;
};

dictionary StorageEventInit : EventInit {
 DOMString? key;
 DOMString? oldValue;
 DOMString? newValue;
 DOMString url;
 Storage? storageArea;
};

```

The **key** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the key being changed.

The **oldValue** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the old value of the key being changed.

The **newValue** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the new value of the key being changed.

The **url** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to the empty string. It represents the address of the document whose key changed.

The **storageArea** attribute must return the value it was initialised to. When the object is created, this attribute must be initialised to null. It represents the Storage<sup>b935</sup> object that was affected.

### 11.2.5 Threads

Because of the use<sup>p937</sup> of the storage mutex<sup>b835</sup>, multiple browsing contexts will be able to access the local storage areas simultaneously in such a manner that scripts cannot detect any concurrent script execution.

Thus, the length<sup>p935</sup> attribute of a Storage<sup>b935</sup> object, and the value of the various properties of that object, cannot change while a script is executing, other than in a way that is predictable by the script itself.

### 11.3 Disk space

User agents should limit the total amount of space allowed for storage areas, because hostile authors could otherwise use this feature to exhaust the user's available disk space.

User agents should guard against sites storing data under their origin's other affiliated sites, e.g. storing up to the limit in a1.example.com, a2.example.com, a3.example.com, etc, circumventing the main example.com storage limit.

User agents may prompt the user when quotas are reached, allowing the user to grant a site more space. This enables sites to store many user-created documents on the user's computer, for instance.

User agents should allow users to see how much space each domain is using.

A mostly arbitrary limit of five megabytes per origin<sup>p776</sup> is suggested. Implementation feedback is welcome and will be used to update this suggestion in the future.

For predictability, quotas should be based on the uncompressed size of data stored.

## 11.4 Privacy

### 11.4.1 User tracking

A third-party advertiser (or any entity capable of getting content distributed to multiple sites) could use a unique identifier stored in its local storage area to track a user across multiple sessions, building a profile of the user's interests to allow for highly targeted advertising. In conjunction with a site that is aware of the user's real identity (for example an e-commerce site that requires authenticated credentials), this could allow oppressive groups to target individuals with greater accuracy than in a world with purely anonymous Web usage.

There are a number of techniques that can be used to mitigate the risk of user tracking:

#### Blocking third-party storage

User agents may restrict access to the [localStorage](#)<sup>p936</sup> objects to scripts originating at the domain of the [active document](#)<sup>p762</sup> of the [top-level browsing context](#)<sup>p763</sup>, for instance denying access to the API for pages from other domains running in [iframe](#)<sup>p299</sup>s.

#### Epiring stored data

User agents may, possibly in a manner configured by the user, automatically delete stored data after a period of time.

For example, a user agent could be configured to treat third-party local storage areas as session-only storage, deleting the data once the user had closed all the [browsing contexts](#)<sup>p762</sup> that could access it.

This can restrict the ability of a site to track a user, as the site would then only be able to track the user across multiple sessions when he authenticates with the site itself (e.g. by making a purchase or logging in to a service).

However, this also reduces the usefulness of the API as a long-term storage mechanism. It can also put the user's data at risk, if the user does not fully understand the implications of data expiration.

#### Treating persistent storage as cookies

If users attempt to protect their privacy by clearing cookies without also clearing data stored in the local storage area, sites can defeat those attempts by using the two features as redundant backup for each other. User agents should present the interfaces for clearing these in a way that helps users to understand this possibility and enables them to delete data in all persistent storage features simultaneously.

[\[COOKIES\]](#)<sup>p1148</sup>

#### Site-specific white-listing of access to local storage areas

User agents may allow sites to access session storage areas in an unrestricted manner, but require the user to authorise access to local storage areas.

#### Origin-tracking of stored data

User agents may record the [origins](#)<sup>p776</sup> of sites that contained content from third-party origins that caused data to be stored.

If this information is then used to present the view of data currently in persistent storage, it would allow the user to make informed decisions about which parts of the persistent storage to prune. Combined with a blacklist ("delete this data and prevent this domain from ever storing data again"), the user can restrict the use of persistent storage to sites that he trusts.

#### Shared blacklists

User agents may allow users to share their persistent storage domain blacklists.

This would allow communities to act together to protect their privacy.

While these suggestions prevent trivial use of this API for user tracking, they do not block it altogether. Within a single domain, a site can continue to track the user during a session, and can then pass all this information to the third party along with any identifying information (names, credit card numbers, addresses) obtained by the site. If a third party cooperates with multiple sites to obtain such information, a profile can still be created.

However, user tracking is to some extent possible even with no cooperation from the user agent whatsoever, for instance by using session identifiers in URLs, a technique already commonly used for innocuous purposes but easily repurposed for user tracking (even retroactively). This information can then be shared with other sites, using visitors' IP addresses and other user-specific data (e.g. user-agent headers and configuration settings) to combine separate sessions into coherent user profiles.

## 11.4.2 Sensitivity of data

User agents should treat persistently stored data as potentially sensitive; it's quite possible for e-mails, calendar appointments, health records, or other confidential documents to be stored in this mechanism.

To this end, user agents should ensure that when deleting data, it is promptly deleted from the underlying storage.

## 11.5 Security

### 11.5.1 DNS spoofing attacks

Because of the potential for DNS spoofing attacks, one cannot guarantee that a host claiming to be in a certain domain really is from that domain. To mitigate this, pages can use TLS. Pages using TLS can be sure that only the user, software working on behalf of the user, and other pages using TLS that have certificates identifying them as being from the same domain, can access their storage areas.

### 11.5.2 Cross-directory attacks

Different authors sharing one host name, for example users hosting content on the now defunct [geocities.com](#), all share one local storage object. There is no feature to restrict the access by pathname. Authors on shared hosts are therefore urged to avoid using these features, as it would be trivial for other authors to read the data and overwrite it.

**Note** *Even if a path-restriction feature was made available, the usual DOM scripting security model would make it trivial to bypass this protection and access the data from any path.*

### 11.5.3 Implementation risks

The two primary risks when implementing these persistent storage features are letting hostile sites read information from other domains, and letting hostile sites write information that is then read from other domains.

Letting third-party sites read data that is not supposed to be read from their domain causes *information leakage*. For example, a user's shopping wishlist on one domain could be used by another domain for targeted advertising; or a user's work-in-progress confidential documents stored by a word-processing site could be examined by the site of a competing company.

Letting third-party sites write data to the persistent storage of other domains can result in *information spoofing*, which is equally dangerous. For example, a hostile site could add items to a user's wishlist; or a hostile site could set a user's session identifier to a known ID that the hostile site can then use to track the user's actions on the victim site.

Thus, strictly following the [origin<sup>b776</sup>](#) model described in this specification is important for user security.

## 12 The HTML syntax

**Note** This section only describes the rules for resources labeled with an [HTML MIME type<sup>p42</sup>](#). Rules for XML resources are discussed in the section below entitled "[The XHTML syntax<sup>p1054</sup>](#)".

### 12.1 Writing HTML documents

This section only applies to documents, authoring tools, and markup generators. In particular, it does not apply to conformance checkers; conformance checkers must use the requirements given in the next section ("parsing HTML documents").

Documents must consist of the following parts, in the given order:

1. Optionally, a single U+FEFF BYTE ORDER MARK (BOM) character.
2. Any number of [comments<sup>p952</sup>](#) and [space characters<sup>p58</sup>](#).
3. A [DOCTYPE<sup>p941</sup>](#).
4. Any number of [comments<sup>p952</sup>](#) and [space characters<sup>p58</sup>](#).
5. The root element, in the form of an [html<sup>p137</sup>](#) [element<sup>p942</sup>](#).
6. Any number of [comments<sup>p952</sup>](#) and [space characters<sup>p58</sup>](#).

The various types of content mentioned above are described in the next few sections.

In addition, there are some restrictions on how [character encoding declarations<sup>p153</sup>](#) are to be serialised, as discussed in the section on that topic.

**Note** Space characters before the root [html<sup>p137</sup>](#) element, and space characters at the start of the [html<sup>p137</sup>](#) element and before the [head<sup>p138</sup>](#) element, will be dropped when the document is parsed; space characters after the root [html<sup>p137</sup>](#) element will be parsed as if they were at the end of the [body<sup>p157</sup>](#) element. Thus, space characters around the root element do not round-trip.

*It is suggested that newlines be inserted after the DOCTYPE, after any comments that are before the root element, after the [html<sup>p137</sup>](#) element's start tag (if it is not omitted<sup>p946</sup>), and after any comments that are inside the [html<sup>p137</sup>](#) element but before the [head<sup>p138</sup>](#) element.*

Many strings in the HTML syntax (e.g. the names of elements and their attributes) are case-insensitive, but only for [uppercase ASCII letters<sup>p58</sup>](#) and [lowercase ASCII letters<sup>p58</sup>](#). For convenience, in this section this is just referred to as "case-insensitive".

#### 12.1.1 The DOCTYPE

Spec bugs: [25232](#)

A **DOCTYPE** is a required preamble.

**Note** DOCTYPES are required for legacy reasons. When omitted, browsers tend to use a different rendering mode that is incompatible with some specifications. Including the DOCTYPE in a document ensures that the browser makes a best-effort attempt at following the relevant specifications.

A DOCTYPE must consist of the following components, in this order:

1. A string that is an [ASCII case-insensitive<sup>p58</sup>](#) match for the string "<!DOCTYPE".
2. One or more [space characters<sup>p58</sup>](#).
3. A string that is an [ASCII case-insensitive<sup>p58</sup>](#) match for the string "html".
4. Optionally, a [DOCTYPE legacy string<sup>p942</sup>](#) or an [obsolete permitted DOCTYPE string<sup>p942</sup>](#) (defined below).
5. Zero or more [space characters<sup>p58</sup>](#).
6. A U+003E GREATER-THAN SIGN character (>).

**Note** In other words, <!DOCTYPE html>, case-insensitively.

For the purposes of HTML generators that cannot output HTML markup with the short DOCTYPE "<!DOCTYPE html>", a **DOCTYPE legacy string** may be inserted into the DOCTYPE (in the position defined above). This string must consist of:

1. One or more [space characters](#)<sup>p58</sup>.
2. A string that is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "SYSTEM".
3. One or more [space characters](#)<sup>p58</sup>.
4. A U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (the *quote mark*).
5. The literal string "[about:legacy-compat](#)<sup>p82</sup>".
6. A matching U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (i.e. the same character as in the earlier step labeled *quote mark*).

**Note** *In other words*, <!DOCTYPE html SYSTEM "about:legacy-compat"> or <!DOCTYPE html SYSTEM 'about:legacy-compat'>, [case-insensitively except for the part in single or double quotes](#).

The [DOCTYPE legacy string](#)<sup>p942</sup> should not be used unless the document is generated from a system that cannot output the shorter string.

To help authors transition from HTML4 and XHTML1, an **obsolete permitted DOCTYPE string** can be inserted into the DOCTYPE (in the position defined above). This string must consist of:

1. One or more [space characters](#)<sup>p58</sup>.
2. A string that is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "PUBLIC".
3. One or more [space characters](#)<sup>p58</sup>.
4. A U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (the *first quote mark*).
5. The string from one of the cells in the first column of the table below. The row to which this cell belongs is the *selected row*.
6. A matching U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (i.e. the same character as in the earlier step labeled *first quote mark*).
7. If the cell in the second column of the *selected row* is not blank, one or more [space characters](#)<sup>p58</sup>.
8. If the cell in the second column of the *selected row* is not blank, a U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (the *third quote mark*).
9. If the cell in the second column of the *selected row* is not blank, the string from the cell in the second column of the *selected row*.
10. If the cell in the second column of the *selected row* is not blank, a matching U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (i.e. the same character as in the earlier step labeled *third quote mark*).

Allowed values for public and system identifiers in an [obsolete permitted DOCTYPE string](#)<sup>p942</sup>.

Public identifier	System identifier
-//W3C//DTD HTML 4.0//EN	
-//W3C//DTD HTML 4.0//EN	<a href="http://www.w3.org/TR/REC-html40/strict.dtd">http://www.w3.org/TR/REC-html40/strict.dtd</a>
-//W3C//DTD HTML 4.01//EN	
-//W3C//DTD HTML 4.01//EN	<a href="http://www.w3.org/TR/html4/strict.dtd">http://www.w3.org/TR/html4/strict.dtd</a>
-//W3C//DTD XHTML 1.0 Strict//EN	<a href="http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd</a>
-//W3C//DTD XHTML 1.1//EN	<a href="http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd">http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd</a>

A [DOCTYPE](#)<sup>p941</sup> containing an [obsolete permitted DOCTYPE string](#)<sup>p942</sup> is an **obsolete permitted DOCTYPE**. Authors should not use [obsolete permitted DOCTYPES](#)<sup>p942</sup>, as they are unnecessarily long.

## 12.1.2 Elements

There are five different kinds of **elements**: [void elements](#)<sup>p942</sup>, [raw text elements](#)<sup>p942</sup>, [escapable raw text elements](#)<sup>p943</sup>, [foreign elements](#)<sup>p943</sup>, and [normal elements](#)<sup>p943</sup>.

### Void elements

[area](#)<sup>p390</sup>, [base](#)<sup>p140</sup>, [br](#)<sup>p242</sup>, [col](#)<sup>p407</sup>, [embed](#)<sup>p307</sup>, [hr](#)<sup>p190</sup>, [img](#)<sup>p272</sup>, [input](#)<sup>p452</sup>, [keygen](#)<sup>p513</sup>, [link](#)<sup>p141</sup>, [menuitem](#)<sup>p574</sup>, [meta](#)<sup>p145</sup>, [param](#)<sup>p316</sup>, [source](#)<sup>p322</sup>, [track](#)<sup>p324</sup>, [wbr](#)<sup>p243</sup>

### Raw text elements

[script](#)<sup>p591</sup>, [style](#)<sup>p154</sup>

## **escapable raw text elements**

[textarea<sup>p508</sup>](#), [title<sup>p139</sup>](#)

## **Foreign elements**

Elements from the [MathML namespace<sup>p101</sup>](#) and the [SVG namespace<sup>p101</sup>](#).

## **Normal elements**

All other allowed [HTML elements<sup>p42</sup>](#) are normal elements.

**Tags** are used to delimit the start and end of elements in the markup. [Raw text<sup>p942</sup>](#), [escapable raw text<sup>p943</sup>](#), and [normal<sup>p943</sup>](#) elements have a [start tag<sup>p944</sup>](#) to indicate where they begin, and an [end tag<sup>p944</sup>](#) to indicate where they end. The start and end tags of certain [normal elements<sup>p943</sup>](#) can be [omitted<sup>p946</sup>](#), as described below in the section on [optional tags<sup>p946</sup>](#). Those that cannot be omitted must not be omitted. [Void elements<sup>p942</sup>](#) only have a start tag; end tags must not be specified for [void elements<sup>p942</sup>](#). [Foreign elements<sup>p943</sup>](#) must either have a start tag and an end tag, or a start tag that is marked as self-closing, in which case they must not have an end tag.

The [contents<sup>p113</sup>](#) of the element must be placed between just after the start tag (which [might be implied, in certain cases<sup>p946</sup>](#)) and just before the end tag (which again, [might be implied in certain cases<sup>p946</sup>](#)). The exact allowed contents of each individual element depend on the [content model<sup>p113</sup>](#) of that element, as described earlier in this specification. Elements must not contain content that their content model disallows. In addition to the restrictions placed on the contents by those content models, however, the five types of elements have additional *syntactic* requirements.

[Void elements<sup>p942</sup>](#) can't have any contents (since there's no end tag, no content can be put between the start tag and the end tag).

[Raw text elements<sup>p942</sup>](#) can have [text<sup>p951</sup>](#), though it has [restrictions<sup>p951</sup>](#) described below.

[Escapable raw text elements<sup>p943</sup>](#) can have [text<sup>p951</sup>](#) and [character references<sup>p951</sup>](#), but the text must not contain an [ambiguous ampersand<sup>p952</sup>](#). There are also [further restrictions<sup>p951</sup>](#) described below.

[Foreign elements<sup>p943</sup>](#) whose start tag is marked as self-closing can't have any contents (since, again, as there's no end tag, no content can be put between the start tag and the end tag). [Foreign elements<sup>p943</sup>](#) whose start tag is *not* marked as self-closing can have [text<sup>p951</sup>](#), [character references<sup>p951</sup>](#), [CDATA sections<sup>p952</sup>](#), other [elements<sup>p942</sup>](#), and [comments<sup>p952</sup>](#), but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand<sup>p952</sup>](#).

**Note** The HTML syntax does not support namespace declarations, even in [foreign elements<sup>p943</sup>](#).

For instance, consider the following HTML fragment:

```
<p>
 <svg>
 <metadata>
 <!-- this is invalid -->
 <cdr:license xmlns:cdr="http://www.example.com/cdr/metadata" name="MIT"/>
 </metadata>
 </svg>
</p>
```

The innermost element, `cdr:license`, is actually in the SVG namespace, as the "xmlns:cdr" attribute has no effect (unlike in XML). In fact, as the comment in the fragment above says, the fragment is actually non-conforming. This is because the SVG specification does not define any elements called "cdr:license" in the SVG namespace.

[Normal elements<sup>p943</sup>](#) can have [text<sup>p951</sup>](#), [character references<sup>p951</sup>](#), other [elements<sup>p942</sup>](#), and [comments<sup>p952</sup>](#), but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand<sup>p952</sup>](#). Some [normal elements<sup>p943</sup>](#) also have [yet more restrictions<sup>p950</sup>](#) on what content they are allowed to hold, beyond the restrictions imposed by the content model and those described in this paragraph. Those restrictions are described below.

Tags contain a **tag name**, giving the element's name. HTML elements all have names that only use [alphanumeric ASCII characters<sup>p59</sup>](#). In the HTML syntax, tag names, even those for [foreign elements<sup>p943</sup>](#), may be written with any mix of lower- and uppercase letters that, when converted to all-lowercase, matches the element's tag name; tag names are case-insensitive.

### 12.1.2.1 Start tags

**Start tags** must have the following format:

1. The first character of a start tag must be a U+003C LESS-THAN SIGN character (<).
2. The next few characters of a start tag must be the element's [tag name](#)<sup>p943</sup>.
3. If there are to be any attributes in the next step, there must first be one or more [space characters](#)<sup>p58</sup>.
4. Then, the start tag may have a number of attributes, the [syntax for which](#)<sup>p944</sup> is described below. Attributes must be separated from each other by one or more [space characters](#)<sup>p58</sup>.
5. After the attributes, or after the [tag name](#)<sup>p943</sup> if there are no attributes, there may be one or more [space characters](#)<sup>p58</sup>. (Some attributes are required to be followed by a space. See the [attributes section](#)<sup>p944</sup> below.)
6. Then, if the element is one of the [void elements](#)<sup>p942</sup>, or if the element is a [foreign element](#)<sup>p943</sup>, then there may be a single U+002F SOLIDUS character (/). This character has no effect on [void elements](#)<sup>p942</sup>, but on [foreign elements](#)<sup>p943</sup> it marks the start tag as self-closing.
7. Finally, start tags must be closed by a U+003E GREATER-THAN SIGN character (>).

### 12.1.2.2 End tags

**End tags** must have the following format:

1. The first character of an end tag must be a U+003C LESS-THAN SIGN character (<).
2. The second character of an end tag must be a U+002F SOLIDUS character (/).
3. The next few characters of an end tag must be the element's [tag name](#)<sup>p943</sup>.
4. After the tag name, there may be one or more [space characters](#)<sup>p58</sup>.
5. Finally, end tags must be closed by a U+003E GREATER-THAN SIGN character (>).

### 12.1.2.3 Attributes

**Attributes** for an element are expressed inside the element's start tag.

Attributes have a name and a value. **Attribute names** must consist of one or more characters other than the [space characters](#)<sup>p58</sup>, U+0000 NULL, U+0022 QUOTATION MARK ("), U+0027 APOSTROPHE ('), U+003E GREATER-THAN SIGN (>), U+002F SOLIDUS (/), and U+003D EQUALS SIGN (=) characters, the [control characters](#)<sup>p58</sup>, and any characters that are not defined by Unicode. In the HTML syntax, attribute names, even those for [foreign elements](#)<sup>p943</sup>, may be written with any mix of lower- and uppercase letters that are an [ASCII case-insensitive](#)<sup>p58</sup> match for the attribute's name.

**Attribute values** are a mixture of [text](#)<sup>p951</sup> and [character references](#)<sup>p951</sup>, except with the additional restriction that the text cannot contain an [ambiguous ampersand](#)<sup>p952</sup>.

Attributes can be specified in four different ways:

#### Empty attribute syntax

Just the [attribute name](#)<sup>p944</sup>. The value is implicitly the empty string.

**Example** In the following example, the [disabled](#)<sup>p530</sup> attribute is given with the empty attribute syntax:

```
<input disabled>
```

If an attribute using the empty attribute syntax is to be followed by another attribute, then there must be a [space character](#)<sup>p58</sup> separating the two.

## Unquoted attribute value syntax

The [attribute name](#)<sup>p944</sup>, followed by zero or more [space characters](#)<sup>p58</sup>, followed by a single U+003D EQUALS SIGN character, followed by zero or more [space characters](#)<sup>p58</sup>, followed by the [attribute value](#)<sup>p944</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal [space characters](#)<sup>p58</sup>, any U+0022 QUOTATION MARK characters ("), U+0027 APOSTROPHE characters ('), U+003D EQUALS SIGN characters (=), U+003C LESS-THAN SIGN characters (<), U+003E GREATER-THAN SIGN characters (>), or U+0060 GRAVE ACCENT characters (`), and must not be the empty string.

**Example** In the following example, the [value](#)<sup>p457</sup> attribute is given with the unquoted attribute value syntax:

```
<input value=yes>
```

If an attribute using the unquoted attribute syntax is to be followed by another attribute or by the optional U+002F SOLIDUS character (/) allowed in step 6 of the [start tag](#)<sup>p944</sup> syntax above, then there must be a [space character](#)<sup>p58</sup> separating the two.

## Single-quoted attribute value syntax

The [attribute name](#)<sup>p944</sup>, followed by zero or more [space characters](#)<sup>p58</sup>, followed by a single U+003D EQUALS SIGN character, followed by zero or more [space characters](#)<sup>p58</sup>, followed by a single U+0027 APOSTROPHE character ('), followed by the [attribute value](#)<sup>p944</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal U+0027 APOSTROPHE characters ('), and finally followed by a second single U+0027 APOSTROPHE character (').

**Example** In the following example, the [type](#)<sup>p454</sup> attribute is given with the single-quoted attribute value syntax:

```
<input type='checkbox'>
```

If an attribute using the single-quoted attribute syntax is to be followed by another attribute, then there must be a [space character](#)<sup>p58</sup> separating the two.

## Double-quoted attribute value syntax

The [attribute name](#)<sup>p944</sup>, followed by zero or more [space characters](#)<sup>p58</sup>, followed by a single U+003D EQUALS SIGN character, followed by zero or more [space characters](#)<sup>p58</sup>, followed by a single U+0022 QUOTATION MARK character ("), followed by the [attribute value](#)<sup>p944</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal U+0022 QUOTATION MARK characters ("), and finally followed by a second single U+0022 QUOTATION MARK character (").

**Example** In the following example, the [name](#)<sup>p529</sup> attribute is given with the double-quoted attribute value syntax:

```
<input name="be evil">
```

If an attribute using the double-quoted attribute syntax is to be followed by another attribute, then there must be a [space character](#)<sup>p58</sup> separating the two.

There must never be two or more attributes on the same start tag whose names are an [ASCII case-insensitive](#)<sup>p58</sup> match for each other.

When a [foreign element](#)<sup>p943</sup> has one of the namespaced attributes given by the local name and namespace of the first and second cells of a row from the following table, it must be written using the name given by the third cell from the same row.

Local name	Namespace	Attribute name
actuate	<a href="#">XLink namespace</a> <sup>p101</sup>	xlink:actuate
arcrole	<a href="#">XLink namespace</a> <sup>p101</sup>	xlink:arcrole
href	<a href="#">XLink namespace</a> <sup>p101</sup>	xlink:href
role	<a href="#">XLink namespace</a> <sup>p101</sup>	xlink:role
show	<a href="#">XLink namespace</a> <sup>p101</sup>	xlink:show
title	<a href="#">XLink namespace</a> <sup>p101</sup>	xlink:title
type	<a href="#">XLink namespace</a> <sup>p101</sup>	xlink:type
base	<a href="#">XML namespace</a> <sup>p101</sup>	xml:base
lang	<a href="#">XML namespace</a> <sup>p101</sup>	xml:lang
space	<a href="#">XML namespace</a> <sup>p101</sup>	xml:space
xmlns	<a href="#">XMLNS namespace</a> <sup>p101</sup>	xmlns
xlink	<a href="#">XMLNS namespace</a> <sup>p101</sup>	xmlns:xlink

No other namespaced attribute can be expressed in [the HTML syntax](#)<sup>p941</sup>.

**Note** Whether the attributes in the table above are conforming or not is defined by other specifications (e.g. the SVG and MathML specifications); this section only describes the syntax rules if the attributes are serialised using the HTML syntax.

#### 12.1.2.4 Optional tags

Certain tags can be omitted.

**Note** Omitting an element's [start tag](#)<sup>p944</sup> in the situations described below does not mean the element is not present; it is implied, but it is still there. For example, an HTML document always has a root [html](#)<sup>p137</sup> element, even if the string `<html>` doesn't appear anywhere in the markup.

An [html](#)<sup>p137</sup> element's [start tag](#)<sup>p944</sup> may be omitted if the first thing inside the [html](#)<sup>p137</sup> element is not a [comment](#)<sup>p952</sup>.

##### Example

For example, in the following case it's ok to remove the "`<html>`" tag:

```
<!DOCTYPE HTML>
<html>
 <head>
 <title>Hello</title>
 </head>
 <body>
 <p>Welcome to this example.</p>
 </body>
</html>
```

Doing so would make the document look like this:

```
<!DOCTYPE HTML>

<head>
 <title>Hello</title>
</head>
<body>
 <p>Welcome to this example.</p>
</body>
</html>
```

This has the exact same DOM. In particular, note that white space around the root element is ignored by the parser. The following example would also have the exact same DOM:

```
<!DOCTYPE HTML><head>
 <title>Hello</title>
</head>
<body>
 <p>Welcome to this example.</p>
</body>
</html>
```

However, in the following example, removing the start tag moves the comment to before the [html](#)<sup>p137</sup> element:

```
<!DOCTYPE HTML>
<html>
 <!-- where is this comment in the DOM? -->
 <head>
 <title>Hello</title>
 </head>
 <body>
```

```

<p>Welcome to this example.</p>
</body>
</html>

```

With the tag removed, the document actually turns into the same as this:

```

<!DOCTYPE HTML>
<!-- where is this comment in the DOM? -->
<html>
 <head>
 <title>Hello</title>
 </head>
 <body>
 <p>Welcome to this example.</p>
 </body>
</html>

```

This is why the tag can only be removed if it is not followed by a comment: removing the tag when there is a comment there changes the document's resulting parse tree. Of course, if the position of the comment does not matter, then the tag can be omitted, as if the comment had been moved to before the start tag in the first place.

An [html](#) element's [end tag](#) may be omitted if the [html](#) element is not immediately followed by a [comment](#).

A [head](#) element's [start tag](#) may be omitted if the element is empty, or if the first thing inside the [head](#) element is an element.

A [head](#) element's [end tag](#) may be omitted if the [head](#) element is not immediately followed by a [space character](#) or a [comment](#).

A [body](#) element's [start tag](#) may be omitted if the element is empty, or if the first thing inside the [body](#) element is not a [space character](#) or a [comment](#), except if the first thing inside the [body](#) element is a [meta](#), [link](#), [script](#), [style](#), or [template](#) element.

A [body](#) element's [end tag](#) may be omitted if the [body](#) element is not immediately followed by a [comment](#).

### Example

Note that in the example above, the [head](#) element start and end tags, and the [body](#) element start tag, can't be omitted, because they are surrounded by white space:

```

<!DOCTYPE HTML>
<html>
 <head>
 <title>Hello</title>
 </head>
 <body>
 <p>Welcome to this example.</p>
 </body>
</html>

```

(The [body](#) and [html](#) element end tags could be omitted without trouble; any spaces after those get parsed into the [body](#) element anyway.)

Usually, however, white space isn't an issue. If we first remove the white space we don't care about:

```

<!DOCTYPE HTML><html><head><title>Hello</title></head><body><p>Welcome to this
example.</p></body></html>

```

Then we can omit a number of tags without affecting the DOM:

```

<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.</p>

```

At that point, we can also add some white space back:

```

<!DOCTYPE HTML>
<title>Hello</title>
<p>Welcome to this example.</p>

```

This would be equivalent to this document, with the omitted tags shown in their parser-implied positions; the only white space text node that results from this is the newline at the end of the `head`<sup>p138</sup> element:

```
<!DOCTYPE HTML>
<html><head><title>Hello</title>
</head><body><p>Welcome to this example.</p></body></html>
```

An `li`<sup>p198</sup> element's end tag<sup>p944</sup> may be omitted if the `li`<sup>p198</sup> element is immediately followed by another `li`<sup>p198</sup> element or if there is no more content in the parent element.

A `dt`<sup>p201</sup> element's end tag<sup>p944</sup> may be omitted if the `dt`<sup>p201</sup> element is immediately followed by another `dt`<sup>p201</sup> element or a `dd`<sup>p202</sup> element.

A `dd`<sup>p202</sup> element's end tag<sup>p944</sup> may be omitted if the `dd`<sup>p202</sup> element is immediately followed by another `dd`<sup>p202</sup> element or a `dt`<sup>p201</sup> element, or if there is no more content in the parent element.

A `p`<sup>p187</sup> element's end tag<sup>p944</sup> may be omitted if the `p`<sup>p187</sup> element is immediately followed by an `address`<sup>b175</sup>, `article`<sup>p159</sup>, `aside`<sup>p166</sup>, `blockquote`<sup>p193</sup>, `details`<sup>p567</sup>, `div`<sup>p207</sup>, `dl`<sup>p199</sup>, `fieldset`<sup>b524</sup>, `figcaption`<sup>p205</sup>, `figure`<sup>p202</sup>, `footer`<sup>b173</sup>, `form`<sup>p447</sup>, `h1`<sup>b168</sup>, `h2`<sup>b168</sup>, `h3`<sup>p168</sup>, `h4`<sup>p168</sup>, `h5`<sup>p168</sup>, `h6`<sup>p168</sup>, `header`<sup>p171</sup>, `hgroup`<sup>p170</sup>, `hr`<sup>p190</sup>, `main`<sup>p205</sup>, `menu`<sup>p571</sup>, `nav`<sup>p163</sup>, `ol`<sup>p195</sup>, `p`<sup>p187</sup>, `pre`<sup>p191</sup>, `section`<sup>p161</sup>, `table`<sup>p398</sup>, or `ul`<sup>p197</sup>, element, or if there is no more content in the parent element and the parent element is an HTML element<sup>p42</sup> that is not an `a`<sup>b208</sup>, `audio`<sup>p321</sup>, `del`<sup>p262</sup>, `ins`<sup>p260</sup>, `map`<sup>p389</sup>, `noscript`<sup>p602</sup>, or `video`<sup>p317</sup> element.

### Example

We can thus simplify the earlier example further:

```
<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.</p>
```

An `rt`<sup>p225</sup> element's end tag<sup>p944</sup> may be omitted if the `rt`<sup>p225</sup> element is immediately followed by an `rt`<sup>p225</sup> or `rp`<sup>p225</sup> element, or if there is no more content in the parent element.

An `rp`<sup>p225</sup> element's end tag<sup>p944</sup> may be omitted if the `rp`<sup>p225</sup> element is immediately followed by an `rt`<sup>p225</sup> or `rp`<sup>p225</sup> element, or if there is no more content in the parent element.

An `optgroup`<sup>p504</sup> element's end tag<sup>p944</sup> may be omitted if the `optgroup`<sup>p504</sup> element is immediately followed by another `optgroup`<sup>p504</sup> element, or if there is no more content in the parent element.

An `option`<sup>p505</sup> element's end tag<sup>p944</sup> may be omitted if the `option`<sup>p505</sup> element is immediately followed by another `option`<sup>p505</sup> element, or if it is immediately followed by an `optgroup`<sup>p504</sup> element, or if there is no more content in the parent element.

A `colgroup`<sup>p406</sup> element's start tag<sup>p944</sup> may be omitted if the first thing inside the `colgroup`<sup>p406</sup> element is a `col`<sup>p407</sup> element, and if the element is not immediately preceded by another `colgroup`<sup>p406</sup> element whose end tag<sup>p944</sup> has been omitted. (It can't be omitted if the element is empty.)

A `colgroup`<sup>p406</sup> element's end tag<sup>p944</sup> may be omitted if the `colgroup`<sup>p406</sup> element is not immediately followed by a space character<sup>p58</sup> or a comment<sup>p952</sup>.

A `caption`<sup>p405</sup> element's end tag<sup>p944</sup> may be omitted if the `caption`<sup>p405</sup> element is not immediately followed by a space character<sup>p58</sup> or a comment<sup>p952</sup>.

A `thead`<sup>p409</sup> element's end tag<sup>p944</sup> may be omitted if the `thead`<sup>p409</sup> element is immediately followed by a `tbody`<sup>p408</sup> or `tfoot`<sup>p410</sup> element.

A `tbody`<sup>p408</sup> element's start tag<sup>p944</sup> may be omitted if the first thing inside the `tbody`<sup>p408</sup> element is a `tr`<sup>p411</sup> element, and if the element is not immediately preceded by a `tbody`<sup>p408</sup>, `thead`<sup>p409</sup>, or `tfoot`<sup>p410</sup> element whose end tag<sup>p944</sup> has been omitted. (It can't be omitted if the element is empty.)

A `tbody`<sup>p408</sup> element's end tag<sup>p944</sup> may be omitted if the `tbody`<sup>p408</sup> element is immediately followed by a `tbody`<sup>p408</sup> or `tfoot`<sup>p410</sup> element, or if there is no more content in the parent element.

A `tfoot`<sup>p410</sup> element's end tag<sup>p944</sup> may be omitted if the `tfoot`<sup>p410</sup> element is immediately followed by a `tbody`<sup>p408</sup> element, or if there is no more content in the parent element.

A `tr`<sup>p411</sup> element's end tag<sup>p944</sup> may be omitted if the `tr`<sup>p411</sup> element is immediately followed by another `tr`<sup>p411</sup> element, or if there is no more content in the parent element.

A td<sup>p412</sup> element's end tag<sup>p944</sup> may be omitted if the td<sup>p412</sup> element is immediately followed by a td<sup>p412</sup> or th<sup>p414</sup> element, or if there is no more content in the parent element.

A th<sup>p414</sup> element's end tag<sup>p944</sup> may be omitted if the th<sup>p414</sup> element is immediately followed by a td<sup>p412</sup> or th<sup>p414</sup> element, or if there is no more content in the parent element.

### Example

The ability to omit all these table-related tags makes table markup much terser.

Take this example:

```
<table>
 <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)</caption>
 <colgroup><col><col><col></colgroup>
 <thead>
 <tr>
 <th>Function</th>
 <th>Control Unit</th>
 <th>Central Station</th>
 </tr>
 </thead>
 <tbody>
 <tr>
 <td>Headlights</td>
 <td>✓</td>
 <td>✓</td>
 </tr>
 <tr>
 <td>Interior Lights</td>
 <td>✓</td>
 <td>✓</td>
 </tr>
 <tr>
 <td>Electric locomotive operating sounds</td>
 <td>✓</td>
 <td>✓</td>
 </tr>
 <tr>
 <td>Engineer's cab lighting</td>
 <td></td>
 <td>✓</td>
 </tr>
 <tr>
 <td>Station Announcements - Swiss</td>
 <td></td>
 <td>✓</td>
 </tr>
 </tbody>
</table>
```

The exact same table, modulo some white space differences, could be marked up as follows:

```
<table>
 <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)</caption>
 <colgroup><col><col><col></colgroup>
 <thead>
 <tr>
 <th>Function
 <th>Control Unit
 <th>Central Station
 </tr>
 <tbody>
```

```

<tr>
 <td>Headlights
 <td>✓
 <td>✓
<tr>
 <td>Interior Lights
 <td>✓
 <td>✓
<tr>
 <td>Electric locomotive operating sounds
 <td>✓
 <td>✓
<tr>
 <td>Engineer's cab lighting
 <td>
 <td>✓
<tr>
 <td>Station Announcements - Swiss
 <td>
 <td>✓
</table>

```

Since the cells take up much less room this way, this can be made even terser by having each row on one line:

```

<table>
 <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)
 <colgroup><col><col><col>
 <thead>
 <tr> <th>Function <th>Control Unit <th>Central Station
 <tbody>
 <tr> <td>Headlights <td>✓ <td>✓
 <tr> <td>Interior Lights <td>✓ <td>✓
 <tr> <td>Electric locomotive operating sounds <td>✓ <td>✓
 <tr> <td>Engineer's cab lighting <td> <td>✓
 <tr> <td>Station Announcements - Swiss <td> <td>✓
 </table>

```

The only differences between these tables, at the DOM level, is with the precise position of the (in any case semantically-neutral) white space.

**However**, a [start tag<sup>p944</sup>](#) must never be omitted if it has any attributes.

### Example

Returning to the earlier example with all the white space removed and then all the optional tags removed:

```
<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.
```

If the [body<sup>p157</sup>](#) element in this example had to have a [class<sup>p128</sup>](#) attribute and the [html<sup>p137</sup>](#) element had to have a [lang<sup>p123</sup>](#) attribute, the markup would have to become:

```
<!DOCTYPE HTML><html lang="en"><title>Hello</title><body class="demo"><p>Welcome to this example.
```

### Note

*This section assumes that the document is conforming, in particular, that there are no [content model<sup>p113</sup>](#) violations. Omitting tags in the fashion described in this section in a document that does not conform to the [content models<sup>p113</sup>](#) described in this specification is likely to result in unexpected DOM differences (this is, in part, what the content models are designed to avoid).*

## 12.1.2.5 Restrictions on content models

For historical reasons, certain elements have extra restrictions beyond even the restrictions given by their content model.

A `table`<sup>p398</sup> element must not contain `tr`<sup>p411</sup> elements, even though these elements are technically allowed inside `table`<sup>p398</sup> elements according to the content models described in this specification. (If a `tr`<sup>p411</sup> element is put inside a `table`<sup>p398</sup> in the markup, it will in fact imply a `tbody`<sup>p408</sup> start tag before it.)

A single `newline`<sup>p951</sup> may be placed immediately after the `start tag`<sup>p944</sup> of `pre`<sup>p191</sup> and `textarea`<sup>p508</sup> elements. This does not affect the processing of the element. The otherwise optional `newline`<sup>p951</sup> *must* be included if the element's contents themselves start with a `newline`<sup>p951</sup> (because otherwise the leading newline in the contents would be treated like the optional newline, and ignored).

#### Example

The following two `pre`<sup>b191</sup> blocks are equivalent:

```
<pre>Hello</pre>

<pre>
Hello</pre>
```

### 12.1.2.6 Restrictions on the contents of raw text and escapable raw text elements

The text in `raw text`<sup>p942</sup> and `escapable raw text elements`<sup>p943</sup> must not contain any occurrences of the string "</" (U+003C LESS-THAN SIGN, U+002F SOLIDUS) followed by characters that case-insensitively match the tag name of the element followed by one of U+0009 CHARACTER TABULATION (tab), U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), U+0020 SPACE, U+003E GREATER-THAN SIGN (>), or U+002F SOLIDUS (/).

### 12.1.3 Text

**Text** is allowed inside elements, attribute values, and comments. Extra constraints are placed on what is and what is not allowed in text based on where the text is to be put, as described in the other sections.

#### 12.1.3.1 Newlines

**Newlines** in HTML may be represented either as U+000D CARRIAGE RETURN (CR) characters, U+000A LINE FEED (LF) characters, or pairs of U+000D CARRIAGE RETURN (CR), U+000A LINE FEED (LF) characters in that order.

Where `character references`<sup>p951</sup> are allowed, a character reference of a U+000A LINE FEED (LF) character (but not a U+000D CARRIAGE RETURN (CR) character) also represents a `newline`<sup>p951</sup>.

### 12.1.4 Character references

In certain cases described in other sections, `text`<sup>p951</sup> may be mixed with **character references**. These can be used to escape characters that couldn't otherwise legally be included in `text`<sup>p951</sup>.

Character references must start with a U+0026 AMPERSAND character (&). Following this, there are three possible kinds of character references:

#### Named character references

The ampersand must be followed by one of the names given in the `named character references`<sup>p1044</sup> section, using the same case. The name must be one that is terminated by a U+003B SEMICOLON character (;).

#### Decimal numeric character reference

The ampersand must be followed by a U+0023 NUMBER SIGN character (#), followed by one or more `ASCII digits`<sup>p58</sup>, representing a base-ten integer that corresponds to a Unicode code point that is allowed according to the definition below. The digits must then be followed by a U+003B SEMICOLON character (;).

#### Hexadecimal numeric character reference

The ampersand must be followed by a U+0023 NUMBER SIGN character (#), which must be followed by either a U+0078 LATIN SMALL LETTER X character (x) or a U+0058 LATIN CAPITAL LETTER X character (X), which must then be followed by one or more `ASCII hex`

[digits](#)<sup>p59</sup>, representing a hexadecimal integer that corresponds to a Unicode code point that is allowed according to the definition below. The digits must then be followed by a U+003B SEMICOLON character (;).

The numeric character reference forms described above are allowed to reference any Unicode code point other than U+0000, U+000D, permanently undefined Unicode characters (noncharacters), surrogates (U+D800–U+DFFF), and [control characters](#)<sup>p58</sup> other than [space characters](#)<sup>p58</sup>.

An **ambiguous ampersand** is a U+0026 AMPERSAND character (&) that is followed by one or more [alphanumeric ASCII characters](#)<sup>p59</sup>, followed by a U+003B SEMICOLON character (;), where these characters do not match any of the names given in the [named character references](#)<sup>p1044</sup> section.

## 12.1.5 CDATA sections

**CDATA sections** must consist of the following components, in this order:

1. The string "<! [CDATA [".
2. Optionally, [text](#)<sup>p951</sup>, with the additional restriction that the text must not contain the string "]]>".
3. The string "]]>".

### Example

CDATA sections can only be used in foreign content (MathML or SVG). In this example, a CDATA section is used to escape the contents of an [ms](#)<sup>p395</sup> element:

```
<p>You can add a string to a number, but this stringifies the number:</p>
<math>
<ms><! [CDATA [x<y]]></ms>
<mo>+</mo>
<mn>3</mn>
<mo>=</mo>
<ms><! [CDATA [x<y3]]></ms>
</math>
```

## 12.1.6 Comments

**Comments** must start with the four character sequence U+003C LESS-THAN SIGN, U+0021 EXCLAMATION MARK, U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS (<! --). Following this sequence, the comment may have [text](#)<sup>p951</sup>, with the additional restriction that the text must not start with a single U+003E GREATER-THAN SIGN character (>), nor start with a U+002D HYPHEN-MINUS character (-) followed by a U+003E GREATER-THAN SIGN (>) character, nor contain two consecutive U+002D HYPHEN-MINUS characters (--), nor end with a U+002D HYPHEN-MINUS character (-). Finally, the comment must be ended by the three character sequence U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS, U+003E GREATER-THAN SIGN (-->).

## 12.2 Parsing HTML documents

Spec bugs: [24892](#)

This section only applies to user agents, data mining tools, and conformance checkers.

**Note** The rules for parsing XML documents into DOM trees are covered by the next section, entitled "[The XHTML syntax](#)<sup>p1054</sup>".

User agents must use the parsing rules described in this section to generate the DOM trees from [text/html](#)<sup>p1116</sup> resources. Together, these rules define what is referred to as the **HTML parser**.

**Note** While the HTML syntax described in this specification bears a close resemblance to SGML and XML, it is a separate language with its own parsing rules.

*Some earlier versions of HTML (in particular from HTML2 to HTML4) were based on SGML and used SGML parsing rules. However, few (if any) web browsers ever implemented true SGML parsing for HTML documents; the only user agents to strictly handle HTML as an SGML application have historically been validators. The resulting confusion — with validators claiming documents to have one representation while widely deployed Web browsers interoperably implemented a different representation — has wasted decades of productivity. This version of HTML thus returns to a non-SGML basis.*

*Authors interested in using SGML tools in their authoring pipeline are encouraged to use XML tools and the XML serialisation of HTML.*

This specification defines the parsing rules for HTML documents, whether they are syntactically correct or not. Certain points in the parsing algorithm are said to be **parse errors**. The error handling for parse errors is well-defined (that's the processing rules described throughout this specification), but user agents, while parsing an HTML document, may [abort the parser<sup>p1033</sup>](#) at the first [parse error<sup>p953</sup>](#) that they encounter for which they do not wish to apply the rules described in this specification.

Conformance checkers must report at least one parse error condition to the user if one or more parse error conditions exist in the document and must not report parse error conditions if none exist in the document. Conformance checkers may report more than one parse error condition if more than one parse error condition exists in the document.

**Note** *Parse errors are only errors with the syntax of HTML. In addition to checking for parse errors, conformance checkers will also verify that the document obeys all the other conformance requirements described in this specification.*

For the purposes of conformance checkers, if a resource is determined to be in [the HTML syntax<sup>p941</sup>](#), then it is an [HTML document<sup>p51</sup>](#).

**Note** *As stated in the terminology section<sup>p42</sup>, references to [element types<sup>p42</sup>](#) that do not explicitly specify a namespace always refer to elements in the [HTML namespace<sup>p101</sup>](#). For example, if the spec talks about "a [menuitem<sup>p574</sup>](#) element", then that is an element with the local name "menuitem", the namespace "<http://www.w3.org/1999/xhtml>", and the interface [HTMLMenuItemElement<sup>p574</sup>](#). Where possible, references to such elements are hyperlinked to their definition.*

### 12.2.1 Overview of the parsing model

The input to the HTML parsing process consists of a stream of [Unicode code points](#)<sup>p44</sup>, which is passed through a [tokenization](#)<sup>p965</sup> stage followed by a [tree construction](#)<sup>b993</sup> stage. The output is a [Document](#)<sup>p102</sup> object.

**Note** Implementations that [do not support scripting](#)<sup>p46</sup> do not have to actually create a DOM [Document](#)<sup>p102</sup> object, but the DOM tree in such cases is still used as the model for the rest of the specification.

In the common case, the data handled by the tokenization stage comes from the network, but it can also come from [script](#)<sup>p848</sup> running in the user agent, e.g. using the [document.write\(\)](#)<sup>p851</sup> API.

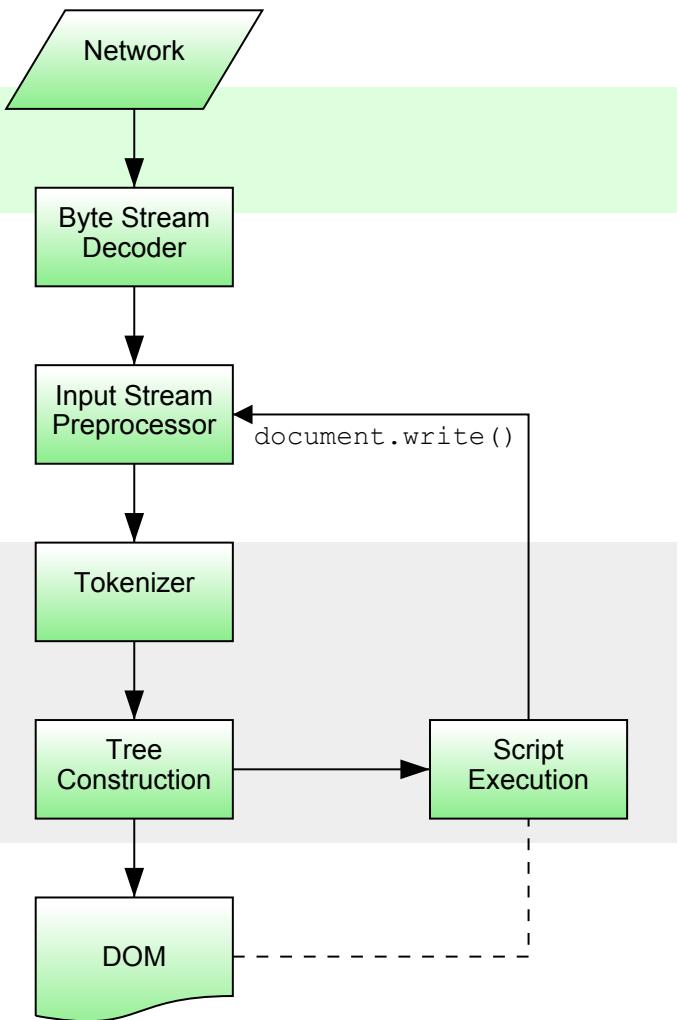

There is only one set of states for the tokenizer stage and the tree construction stage, but the tree construction stage is reentrant, meaning that while the tree construction stage is handling one token, the tokenizer might be resumed, causing further tokens to be emitted and processed before the first token's processing is complete.

#### Example

In the following example, the tree construction stage will be called upon to handle a "p" start tag token while handling the "script" end tag token:

```
...
<script>
 document.write('<p>');
</script>
...
```

To handle these cases, parsers have a **script nesting level**, which must be initially set to zero, and a **parser pause flag**, which must be initially set to false.

### 12.2.2 The input byte stream

The stream of Unicode code points that comprises the input to the tokenization stage will be initially seen by the user agent as a stream of bytes (typically coming over the network or from the local file system). The bytes encode the actual characters according to a particular *character encoding*, which the user agent uses to decode the bytes into characters.

**Note** For XML documents, the algorithm user agents are required to use to determine the character encoding is given by the XML specification. This section does not apply to XML documents. [\[XML\]](#)<sup>p1154</sup>

Usually, the [encoding sniffing algorithm](#)<sup>p955</sup> defined below is used to determine the character encoding.

Given a character encoding, the bytes in the [input byte stream](#)<sup>p954</sup> must be converted to Unicode code points for the tokenizer's [input stream](#)<sup>p960</sup>, as described by the rules for that encoding's [decoder](#)<sup>p47</sup>.

**Note** Bytes or sequences of bytes in the original byte stream that did not conform to the Encoding standard (e.g. invalid UTF-8 byte sequences in a UTF-8 input byte stream) are errors that conformance checkers are expected to report. [\[ENCODING\]](#)<sup>p1150</sup>

**Note** Leading Byte Order Marks (BOMs) are not stripped by the decoder algorithms, they are stripped by the algorithm below.

**⚠ Warning!** The decoder algorithms describe how to handle invalid input; for security reasons, it is imperative that those rules be followed precisely. Differences in how invalid byte sequences are handled can result in, amongst other problems, script injection vulnerabilities ("XSS").

When the HTML parser is decoding an input byte stream, it uses a character encoding and a **confidence**. The confidence is either *tentative*, *certain*, or *irrelevant*. The encoding used, and whether the confidence in that encoding is *tentative* or *certain*, is [used during the parsing<sup>p1003</sup>](#) to determine whether to [change the encoding<sup>p960</sup>](#). If no encoding is necessary, e.g. because the parser is operating on a Unicode stream and doesn't have to use a character encoding at all, then the [confidence<sup>p955</sup>](#) is *irrelevant*.

**Note** Some algorithms feed the parser by directly adding characters to the [input stream<sup>p960</sup>](#) rather than adding bytes to the [input byte stream<sup>p954</sup>](#).

### 12.2.2.1 Parsing with a known character encoding

When the HTML parser is to operate on an input byte stream that has a **known definite encoding**, then the character encoding is that encoding and the [confidence<sup>p955</sup>](#) is *certain*.

### 12.2.2.2 Determining the character encoding

In some cases, it might be impractical to unambiguously determine the encoding before parsing the document. Because of this, this specification provides for a two-pass mechanism with an optional pre-scan. Implementations are allowed, as described below, to apply a simplified parsing algorithm to whatever bytes they have available before beginning to parse the document. Then, the real parser is started, using a tentative encoding derived from this pre-parse and other out-of-band metadata. If, while the document is being loaded, the user agent discovers a character encoding declaration that conflicts with this information, then the parser can get reinvoked to perform a parse of the document with the real encoding.

User agents must use the following algorithm, called the **encoding sniffing algorithm**, to determine the character encoding to use when decoding a document in the first pass. This algorithm takes as input any out-of-band metadata available to the user agent (e.g. the [Content-Type metadata<sup>p86</sup>](#) Spec bugs: 18396 of the document) and all the bytes available so far, and returns a character encoding and a [confidence<sup>p955</sup>](#) that is either *tentative* or *certain*.

1. If the user has explicitly instructed the user agent to override the document's character encoding with a specific encoding, optionally return that encoding with the [confidence<sup>p955</sup>](#) *certain* and abort these steps.

**Note** Typically, user agents remember such user requests across sessions, and in some cases apply them to documents in [iframe<sup>p299</sup>](#)s as well.

2. The user agent may wait for more bytes of the resource to be available, either in this step or at any later step in this algorithm. For instance, a user agent might wait 500ms or 1024 bytes, whichever came first. In general preparing the source to find the encoding improves performance, as it reduces the need to throw away the data structures used when parsing upon finding the encoding information. However, if the user agent delays too long to obtain data to determine the encoding, then the cost of the delay could outweigh any performance improvements from the preparse.

**Note** The authoring conformance requirements for character encoding declarations limit them to only appearing in the first 1024 bytes<sup>p153</sup>. User agents are therefore encouraged to use the prescan algorithm below (as invoked by these steps) on the first 1024 bytes, but not to stall beyond that.

3. For each of the rows in the following table, starting with the first one and going down, if there are as many or more bytes available than the number of bytes in the first column, and the first bytes of the file match the bytes given in the first column, then return the encoding given in the cell in the second column of that row, with the [confidence<sup>p955</sup>](#) *certain*, and abort these steps:

Bytes in Hexadecimal	Encoding
FE FF	Big-endian UTF-16
FF FE	Little-endian UTF-16
EF BB BF	UTF-8

**Note** This step looks for Unicode Byte Order Marks (BOMs).

**Note** That this step happens before the next one honoring the HTTP [Content-Type<sup>p86</sup>](#) header is a [willful violation<sup>p26</sup>](#) of the HTTP specification, motivated by a desire to be maximally compatible with legacy content. [\[HTTP\]<sup>p1150</sup>](#)

4. If the transport layer specifies a character encoding, and it is supported, return that encoding with the [confidence<sup>p955</sup>](#) *certain*, and abort these steps.

5. Optionally prescan the byte stream to determine its encoding<sup>p957</sup>. The end condition is that the user agent decides that scanning further bytes would not be efficient. User agents are encouraged to only prescan the first 1024 bytes. User agents may decide that scanning any bytes is not efficient, in which case these substeps are entirely skipped.

The aforementioned algorithm either aborts unsuccessfully or returns a character encoding. If it returns a character encoding, then this algorithm must be aborted, returning the same encoding, with [confidence<sup>p955</sup>](#) tentative.

6. If the [HTML parser<sup>p952</sup>](#) for which this algorithm is being run is associated with a [Document<sup>p102</sup>](#) that is itself in a [nested browsing context<sup>p763</sup>](#), run these substeps:
1. Let *new document* be the [Document<sup>p102</sup>](#) with which the [HTML parser<sup>p952</sup>](#) is associated.
  2. Let *parent document* be the [Document<sup>p102</sup>](#) through which *new document* is nested<sup>b763</sup> (the [active document<sup>p762</sup>](#) of the [parent browsing context<sup>b763</sup>](#) of *new document*).
  3. If *parent document*'s [origin<sup>p776</sup>](#) is not the [same origin<sup>p778</sup>](#) as *new document*'s [origin<sup>p776</sup>](#), then abort these substeps.
  4. If *parent document*'s [character encoding<sup>p51</sup>](#) is not an [ASCII-compatible character encoding<sup>p44</sup>](#), then abort these substeps.
  5. Return *parent document*'s [character encoding<sup>p51</sup>](#), with the [confidence<sup>b955</sup>](#) tentative, and abort the [encoding sniffing algorithm<sup>p955</sup>](#)'s steps.
7. Otherwise, if the user agent has information on the likely encoding for this page, e.g. based on the encoding of the page when it was last visited, then return that encoding, with the [confidence<sup>p955</sup>](#) tentative, and abort these steps.
8. The user agent may attempt to autodetect the character encoding from applying frequency analysis or other algorithms to the data stream. Such algorithms may use information about the resource other than the resource's contents, including the address of the resource. If autodetection succeeds in determining a character encoding, and that encoding is a supported encoding, then return that encoding, with the [confidence<sup>b955</sup>](#) tentative, and abort these steps. [\[UNIVCHARDET\]<sup>p1153</sup>](#)

**Note** *User agents are generally discouraged from attempting to autodetect encodings for resources obtained over the network, since doing so involves inherently non-interoperable heuristics. Attempting to detect encodings based on an HTML document's preamble is especially tricky since HTML markup typically uses only ASCII characters, and HTML documents tend to begin with a lot of markup rather than with text content.*

**Note** *The UTF-8 encoding has a highly detectable bit pattern. Files from the local file system that contain bytes with values greater than 0x7F which match the UTF-8 pattern are very likely to be UTF-8, while documents with byte sequences that do not match it are very likely not. When a user agent can examine the whole file, rather than just the preamble, detecting for UTF-8 specifically can be especially effective. [\[PPUTF8\]<sup>p1151</sup>](#) [\[UTF8DET\]<sup>p1154</sup>](#)*

9. Otherwise, return an implementation-defined or user-specified default character encoding, with the [confidence<sup>p955</sup>](#) tentative.

In controlled environments or in environments where the encoding of documents can be prescribed (for example, for user agents intended for dedicated use in new networks), the comprehensive [UTF-8](#) encoding is suggested.

In other environments, the default encoding is typically dependent on the user's locale (an approximation of the languages, and thus often encodings, of the pages that the user is likely to frequent). The following table gives suggested defaults based on the user's locale, for compatibility with legacy content. Locales are identified by BCP 47 language tags. [\[BCP47\]<sup>p1148</sup>](#) [\[ENCODING\]<sup>p1150</sup>](#)

Locale language	Suggested default encoding
ar	Arabic
ba	Bashkir
be	Belarusian
bg	Bulgarian
cs	Czech
el	Greek
et	Estonian
fa	Persian
he	Hebrew
hr	Croatian
hu	Hungarian
ja	Japanese
kk	Kazakh

Locale language	Suggested default encoding
ko	Korean
ku	Kurdish
ky	Kyrgyz
lt	Lithuanian
lv	Latvian
mk	Macedonian
pl	Polish
ru	Russian
sah	Yakut
sk	Slovak
sl	Slovenian
sr	Serbian
tg	Tajik
th	Thai
tr	Turkish
tt	Tatar
uk	Ukrainian
vi	Vietnamese
zh-CN	Chinese (People's Republic of China)
zh-TW	Chinese (Taiwan)
All other locales	windows-1252

The contents of this table are derived from the intersection of Windows, Chrome, and Firefox defaults.

The [document's character encoding](#)<sup>p51</sup> must immediately be set to the value returned from this algorithm, at the same time as the user agent uses the returned value to select the decoder to use for the input byte stream.

When an algorithm requires a user agent to **prescan a byte stream to determine its encoding**, given some defined *end condition*, then it must run the following steps. These steps either abort unsuccessfully or return a character encoding. If at any point during these steps (including during instances of the [get an attribute](#)<sup>p958</sup> algorithm invoked by this one) the user agent either runs out of bytes (meaning the *position* pointer created in the first step below goes beyond the end of the byte stream obtained so far) or reaches its *end condition*, then abort the [prescan a byte stream to determine its encoding](#)<sup>p957</sup> algorithm unsuccessfully.

1. Let *position* be a pointer to a byte in the input byte stream, initially pointing at the first byte.
2. *Loop*: If *position* points to:
  - ↪ **A sequence of bytes starting with: 0x3C 0x21 0x2D 0x2D (ASCII '<!--')**  
Advance the *position* pointer so that it points at the first 0x3E byte which is preceded by two 0x2D bytes (i.e. at the end of an ASCII '--> sequence) and comes after the 0x3C byte that was found. (The two 0x2D bytes can be the same as those in the '<!--' sequence.)
  - ↪ **A sequence of bytes starting with: 0x3C, 0x4D or 0x6D, 0x45 or 0x65, 0x54 or 0x74, 0x41 or 0x61, and one of 0x09, 0x0A, 0x0C, 0x0D, 0x20, 0x2F (case-insensitive ASCII '<meta' followed by a space or slash)**
    1. Advance the *position* pointer so that it points at the next 0x09, 0x0A, 0x0C, 0x0D, 0x20, or 0x2F byte (the one in sequence of characters matched above).
    2. Let *attribute list* be an empty list of strings.
    3. Let *got pragma* be false.
    4. Let *need pragma* be null.
    5. Let *charset* be the null value (which, for the purposes of this algorithm, is distinct from an unrecognised encoding or the empty string).
    6. *Attributes*: [Get an attribute](#)<sup>p958</sup> and its value. If no attribute was sniffed, then jump to the *processing* step below.

7. If the attribute's name is already in *attribute list*, then return to the step labeled *attributes*.
8. Add the attribute's name to *attribute list*.
9. Run the appropriate step from the following list, if one applies:
  - ↪ **If the attribute's name is "http-equiv"**  
If the attribute's value is "content-type", then set *got pragma* to true.
  - ↪ **If the attribute's name is "content"**  
Apply the [algorithm for extracting a character encoding from a meta element](#)<sup>p86</sup>, giving the attribute's value as the string to parse. If a character encoding is returned, and if *charset* is still set to null, let *charset* be the encoding returned, and set *need pragma* to true.
  - ↪ **If the attribute's name is "charset"**  
Let *charset* be the result of [getting an encoding](#) from the attribute's value, and set *need pragma* to false.
10. Return to the step labeled *attributes*.
11. *Processing*: If *need pragma* is null, then jump to the step below labeled *next byte*.
12. If *need pragma* is true but *got pragma* is false, then jump to the step below labeled *next byte*.
13. If *charset* is [a UTF-16 encoding](#)<sup>p44</sup>, change the value of *charset* to UTF-8.
14. If *charset* is the x-user-defined encoding, change the value of *charset* to Windows-1252. [\[ENCODING\]](#)<sup>p1150</sup>
15. If *charset* is not a supported character encoding, then jump to the step below labeled *next byte*.
16. Abort the [prescan a byte stream to determine its encoding](#)<sup>p957</sup> algorithm, returning the encoding given by *charset*.

- ↪ **A sequence of bytes starting with a 0x3C byte (ASCII <), optionally a 0x2F byte (ASCII /), and finally a byte in the range 0x41-0x5A or 0x61-0x7A (an ASCII letter)**
  1. Advance the *position* pointer so that it points at the next 0x09 (ASCII TAB), 0x0A (ASCII LF), 0x0C (ASCII FF), 0x0D (ASCII CR), 0x20 (ASCII space), or 0x3E (ASCII >) byte.
  2. Repeatedly [get an attribute](#)<sup>p958</sup> until no further attributes can be found, then jump to the step below labeled *next byte*.

- ↪ **A sequence of bytes starting with: 0x3C 0x21 (ASCII '<!')**
- ↪ **A sequence of bytes starting with: 0x3C 0x2F (ASCII '</')**
- ↪ **A sequence of bytes starting with: 0x3C 0x3F (ASCII '<?')**

Advance the *position* pointer so that it points at the first 0x3E byte (ASCII >) that comes after the 0x3C byte that was found.

- ↪ **Any other byte**

Do nothing with that byte.

3. *Next byte*: Move *position* so it points at the next byte in the input byte stream, and return to the step above labeled *loop*.

When the [prescan a byte stream to determine its encoding](#)<sup>p957</sup> algorithm says to **get an attribute**, it means doing this:

1. If the byte at *position* is one of 0x09 (ASCII TAB), 0x0A (ASCII LF), 0x0C (ASCII FF), 0x0D (ASCII CR), 0x20 (ASCII space), or 0x2F (ASCII /) then advance *position* to the next byte and redo this step.
2. If the byte at *position* is 0x3E (ASCII >), then abort the [get an attribute](#)<sup>p958</sup> algorithm. There isn't one.
3. Otherwise, the byte at *position* is the start of the attribute name. Let *attribute name* and *attribute value* be the empty string.
4. Process the byte at *position* as follows:

- ↪ **If it is 0x3D (ASCII =), and the *attribute name* is longer than the empty string**

Advance *position* to the next byte and jump to the step below labeled *value*.

- ↪ If it is 0x09 (ASCII TAB), 0x0A (ASCII LF), 0x0C (ASCII FF), 0x0D (ASCII CR), or 0x20 (ASCII space)
  - Jump to the step below labeled spaces.
- ↪ If it is 0x2F (ASCII /) or 0x3E (ASCII >)
  - Abort the [get an attribute<sup>p958</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.
- ↪ If it is in the range 0x41 (ASCII A) to 0x5A (ASCII Z)
  - Append the Unicode character with code point  $b+0x20$  to *attribute name* (where  $b$  is the value of the byte at *position*). (This converts the input to lowercase.)
- ↪ Anything else
  - Append the Unicode character with the same code point as the value of the byte at *position* to *attribute name*. (It doesn't actually matter how bytes outside the ASCII range are handled here, since only ASCII characters can contribute to the detection of a character encoding.)

5. Advance *position* to the next byte and return to the previous step.
6. Spaces: If the byte at *position* is one of 0x09 (ASCII TAB), 0x0A (ASCII LF), 0x0C (ASCII FF), 0x0D (ASCII CR), or 0x20 (ASCII space) then advance *position* to the next byte, then, repeat this step.
7. If the byte at *position* is not 0x3D (ASCII =), abort the [get an attribute<sup>p958</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.
8. Advance *position* past the 0x3D (ASCII =) byte.
9. Value: If the byte at *position* is one of 0x09 (ASCII TAB), 0x0A (ASCII LF), 0x0C (ASCII FF), 0x0D (ASCII CR), or 0x20 (ASCII space) then advance *position* to the next byte, then, repeat this step.
10. Process the byte at *position* as follows:

- ↪ If it is 0x22 (ASCII ") or 0x27 (ASCII ')
  1. Let  $b$  be the value of the byte at *position*.
  2. *Quote loop*: Advance *position* to the next byte.
  3. If the value of the byte at *position* is the value of  $b$ , then advance *position* to the next byte and abort the "get an attribute" algorithm. The attribute's name is the value of *attribute name*, and its value is the value of *attribute value*.
  4. Otherwise, if the value of the byte at *position* is in the range 0x41 (ASCII A) to 0x5A (ASCII Z), then append a Unicode character to *attribute value* whose code point is 0x20 more than the value of the byte at *position*.
  5. Otherwise, append a Unicode character to *attribute value* whose code point is the same as the value of the byte at *position*.
  6. Return to the step above labeled *quote loop*.

- ↪ If it is 0x3E (ASCII >)
  - Abort the [get an attribute<sup>p958</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.
- ↪ If it is in the range 0x41 (ASCII A) to 0x5A (ASCII Z)
  - Append the Unicode character with code point  $b+0x20$  to *attribute value* (where  $b$  is the value of the byte at *position*). Advance *position* to the next byte.
- ↪ Anything else
  - Append the Unicode character with the same code point as the value of the byte at *position* to *attribute value*. Advance *position* to the next byte.

11. Process the byte at *position* as follows:
  - ↪ If it is 0x09 (ASCII TAB), 0x0A (ASCII LF), 0x0C (ASCII FF), 0x0D (ASCII CR), 0x20 (ASCII space), or 0x3E (ASCII >)
    - Abort the [get an attribute<sup>p958</sup>](#) algorithm. The attribute's name is the value of *attribute name* and its value is the value of *attribute value*.
  - ↪ If it is in the range 0x41 (ASCII A) to 0x5A (ASCII Z)
    - Append the Unicode character with code point  $b+0x20$  to *attribute value* (where  $b$  is the value of the byte at *position*).

#### ↪ Anything else

Append the Unicode character with the same code point as the value of the byte at *position* to *attribute value*.

12. Advance *position* to the next byte and return to the previous step.

For the sake of interoperability, user agents should not use a pre-scan algorithm that returns different results than the one described above. (But, if you do, please at least let us know, so that we can improve this algorithm and benefit everyone...)

### 12.2.2.3 Character encodings

User agents must support the encodings defined in the WHATWG Encoding standard. User agents should not support other encodings.

User agents must not support the CESU-8, UTF-7, BOCU-1 and SCSU encodings. [CESU8]<sup>p1148</sup> [UTF7]<sup>p1154</sup> [BOCU1]<sup>p1148</sup> [SCSU]<sup>p1153</sup>

Support for encodings based on EBCDIC is especially discouraged. This encoding is rarely used for publicly-facing Web content. Support for UTF-32 is also especially discouraged. This encoding is rarely used, and frequently implemented incorrectly.

**Note** *This specification does not make any attempt to support EBCDIC-based encodings and UTF-32 in its algorithms; support and use of these encodings can thus lead to unexpected behaviour in implementations of this specification.*

### 12.2.2.4 Changing the encoding while parsing

When the parser requires the user agent to **change the encoding**, it must run the following steps. This might happen if the [encoding sniffing algorithm](#)<sup>p955</sup> described above failed to find a character encoding, or if it found a character encoding that was not the actual encoding of the file.

1. If the encoding that is already being used to interpret the input stream is [a UTF-16 encoding](#)<sup>p44</sup>, then set the [confidence](#)<sup>p955</sup> to *certain* and abort these steps. The new encoding is ignored; if it was anything but the same encoding, then it would be clearly incorrect.
2. If the new encoding is [a UTF-16 encoding](#)<sup>p44</sup>, change it to UTF-8.
3. If the new encoding is the x-user-defined encoding, change it to Windows-1252. [ENCODING1]<sup>p1150</sup>
4. If the new encoding is identical or equivalent to the encoding that is already being used to interpret the input stream, then set the [confidence](#)<sup>p955</sup> to *certain* and abort these steps. This happens when the encoding information found in the file matches what the [encoding sniffing algorithm](#)<sup>p955</sup> determined to be the encoding, and in the second pass through the parser if the first pass found that the encoding sniffing algorithm described in the earlier section failed to find the right encoding.
5. If all the bytes up to the last byte converted by the current decoder have the same Unicode interpretations in both the current encoding and the new encoding, and if the user agent supports changing the converter on the fly, then the user agent may change to the new converter for the encoding on the fly. Set the [document's character encoding](#)<sup>p51</sup> and the encoding used to convert the input stream to the new encoding, set the [confidence](#)<sup>p955</sup> to *certain*, and abort these steps.
6. Otherwise, [navigate](#)<sup>p791</sup> to the document again, with [replacement enabled](#)<sup>p802</sup>, and using the same [source browsing context](#)<sup>p791</sup>, but this time skip the [encoding sniffing algorithm](#)<sup>p955</sup> and instead just set the encoding to the new encoding and the [confidence](#)<sup>p955</sup> to *certain*. Whenever possible, this should be done without actually contacting the network layer (the bytes should be re-parsed from memory), even if, e.g., the document is marked as not being cacheable. If this is not possible and contacting the network layer would involve repeating a request that uses a method other than HTTP GET ([or equivalent](#)<sup>p83</sup> for non-HTTP URLs), then instead set the [confidence](#)<sup>p955</sup> to *certain* and ignore the new encoding. The resource will be misinterpreted. User agents may notify the user of the situation, to aid in application development.

**Note** *This algorithm is only invoked when a new encoding is found declared on a [meta](#)<sup>p145</sup> element.*

Spec bugs: 27413

### 12.2.2.5 Preprocessing the input stream

The **input stream** consists of the characters pushed into it as the [input byte stream](#)<sup>p954</sup> is decoded or from the various APIs that directly manipulate the input stream.

One leading U+FEFF BYTE ORDER MARK character must be ignored if any are present in the [input stream](#)<sup>p960</sup>.

**Note** The requirement to strip a U+FEFF BYTE ORDER MARK character regardless of whether that character was used to determine the byte order is a [willful violation<sup>p26</sup>](#) of Unicode, motivated by a desire to increase the resilience of user agents in the face of naive transcoders.

Any occurrences of any characters in the ranges U+0001 to U+0008, U+000E to U+001F, U+007F to U+009F, U+FDD0 to U+FDEF, and characters U+000B, U+FFE, U+FFF, U+1FFE, U+1FFF, U+2FFE, U+2FFF, U+3FFF, U+3FFF, U+4FFE, U+4FFF, U+5FFF, U+5FFF, U+6FFF, U+6FFF, U+7FFF, U+7FFF, U+8FFF, U+8FFF, U+9FFF, U+9FFF, U+AFFF, U+AFFF, U+BFFF, U+BFFF, U+CFFF, U+CFFF, U+DFFF, U+DFFF, U+EFFF, U+EFFF, U+FFFF, U+FFFF, U+10FFF, and U+10FFF are [parse errors<sup>p953</sup>](#). These are all [control characters<sup>p58</sup>](#) or permanently undefined Unicode characters (noncharacters).

Any [character<sup>p44</sup>](#) that is not a [Unicode character<sup>p44</sup>](#), i.e. any isolated surrogate, is a [parse error<sup>p953</sup>](#). (These can only find their way into the input stream via script APIs such as [document.write\(\)<sup>p851</sup>](#).)

U+000D CARRIAGE RETURN (CR) characters and U+000A LINE FEED (LF) characters are treated specially. Any LF character that immediately follows a CR character must be ignored, and all CR characters must then be converted to LF characters. Thus, newlines in HTML DOMs are represented by LF characters, and there are never any CR characters in the input to the [tokenization<sup>p965</sup>](#) stage.

The **next input character** is the first character in the [input stream<sup>p960</sup>](#) that has not yet been **consumed** or explicitly ignored by the requirements in this section. Initially, the [next input character<sup>p961</sup>](#) is the first character in the input. The **current input character** is the last character to have been *consumed*.

The **insertion point** is the position (just before a character or just before the end of the input stream) where content inserted using [document.write\(\)<sup>p851</sup>](#) is actually inserted. The insertion point is relative to the position of the character immediately after it, it is not an absolute offset into the input stream. Initially, the insertion point is undefined.

The "EOF" character in the tables below is a conceptual character representing the end of the [input stream<sup>p960</sup>](#). If the parser is a [script-created parser<sup>p849</sup>](#), then the end of the [input stream<sup>p960</sup>](#) is reached when an **explicit "EOF" character** (inserted by the [document.close\(\)<sup>p850</sup>](#) method) is consumed. Otherwise, the "EOF" character is not a real character in the stream, but rather the lack of any further characters.

**Note** The handling of U+0000 NULL characters varies based on where the characters are found. In general, they are ignored except where doing so could plausibly introduce an attack vector. This handling is, by necessity, spread across both the tokenization stage and the tree construction stage.

## 12.2.3 Parse state

### 12.2.3.1 The insertion mode

The **insertion mode** is a state variable that controls the primary operation of the tree construction stage.

Initially, the [insertion mode<sup>p961</sup>](#) is "[initial<sup>p999</sup>](#)". It can change to "[before html<sup>p1001</sup>](#)", "[before head<sup>p1002</sup>](#)", "[in head<sup>p1002</sup>](#)", "[in head noscript<sup>p1004</sup>](#)", "[after head<sup>p1005</sup>](#)", "[in body<sup>p1006</sup>](#)", "[text<sup>p1017</sup>](#)", "[in table<sup>p1018</sup>](#)", "[in table text<sup>p1020</sup>](#)", "[in caption<sup>p1020</sup>](#)", "[in column group<sup>p1021</sup>](#)", "[in table body<sup>p1022</sup>](#)", "[in row<sup>p1023</sup>](#)", "[in cell<sup>p1024</sup>](#)", "[in select<sup>p1025</sup>](#)", "[in select in table<sup>p1026</sup>](#)", "[in template<sup>p1027</sup>](#)", "[after body<sup>p1028</sup>](#)", "[in frameset<sup>p1028</sup>](#)", "[after frameset<sup>p1029</sup>](#)", "[after after body<sup>p1029</sup>](#)", and "[after after frameset<sup>p1030</sup>](#)" during the course of the parsing, as described in the [tree construction<sup>p983</sup>](#) stage. The insertion mode affects how tokens are processed and whether CDATA sections are supported.

Several of these modes, namely "[in head<sup>p1002</sup>](#)", "[in body<sup>p1006</sup>](#)", "[in table<sup>p1018</sup>](#)", and "[in select<sup>p1025</sup>](#)", are special, in that the other modes defer to them at various times. When the algorithm below says that the user agent is to do something "**using the rules for the *m* insertion mode**", where *m* is one of these modes, the user agent must use the rules described under the *m* [insertion mode<sup>p961</sup>](#)'s section, but must leave the [insertion mode<sup>p961</sup>](#) unchanged unless the rules in *m* themselves switch the [insertion mode<sup>p961</sup>](#) to a new value.

When the insertion mode is switched to "[text<sup>p1017</sup>](#)" or "[in table text<sup>p1020</sup>](#)", the **original insertion mode** is also set. This is the insertion mode to which the tree construction stage will return.

Similarly, to parse nested [template<sup>p604</sup>](#) elements, a **stack of template insertion modes** is used. It is initially empty. The **current template insertion mode** is the insertion mode that was most recently added to the [stack of template insertion modes<sup>p961</sup>](#). The algorithms in the sections below will *push* insertion modes onto this stack, meaning that the specified insertion mode is to be added to the stack, and *pop* insertion modes from the stack, which means that the most recently added insertion mode must be removed from the stack.

When the steps below require the UA to **reset the insertion mode appropriately**, it means the UA must follow these steps:

1. Let *last* be false.
2. Let *node* be the last node in the [stack of open elements](#)<sup>p962</sup>.
3. *Loop*: If *node* is the first node in the stack of open elements, then set *last* to true, and, if the parser was originally created as part of the [HTML fragment parsing algorithm](#)<sup>p1043</sup> ([fragment case](#)<sup>p1043</sup>), set *node* to the [context](#)<sup>p1043</sup> element passed to that algorithm.
4. If *node* is a [select](#)<sup>p498</sup> element, run these substeps:
  1. If *last* is true, jump to the step below labeled *done*.
  2. Let *ancestor* be *node*.
  3. *Loop*: If *ancestor* is the first node in the [stack of open elements](#)<sup>p962</sup>, jump to the step below labeled *done*.
  4. Let *ancestor* be the node before *ancestor* in the [stack of open elements](#)<sup>p962</sup>.
  5. If *ancestor* is a [template](#)<sup>p604</sup> node, jump to the step below labeled *done*.
  6. If *ancestor* is a [table](#)<sup>p398</sup> node, switch the [insertion mode](#)<sup>p961</sup> to "[in select in table](#)<sup>p1026</sup>" and abort these steps.
  7. Jump back to the step labeled *loop*.
  8. *Done*: Switch the [insertion mode](#)<sup>p961</sup> to "[in select](#)<sup>p1026</sup>" and abort these steps.
5. If *node* is a [td](#)<sup>p412</sup> or [th](#)<sup>p414</sup> element and *last* is false, then switch the [insertion mode](#)<sup>p961</sup> to "[in cell](#)<sup>p1024</sup>" and abort these steps.
6. If *node* is a [tr](#)<sup>p411</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to "[in row](#)<sup>p1023</sup>" and abort these steps.
7. If *node* is a [tbody](#)<sup>p408</sup>, [thead](#)<sup>p409</sup>, or [tfoot](#)<sup>p410</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to "[in table body](#)<sup>p1022</sup>" and abort these steps.
8. If *node* is a [caption](#)<sup>p405</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to "[in caption](#)<sup>p1020</sup>" and abort these steps.
9. If *node* is a [colgroup](#)<sup>p406</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to "[in column group](#)<sup>p1021</sup>" and abort these steps.
10. If *node* is a [table](#)<sup>p398</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to "[in table](#)<sup>p1018</sup>" and abort these steps.
11. If *node* is a [template](#)<sup>p604</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to the [current template insertion mode](#)<sup>p961</sup> and abort these steps.
12. If *node* is a [head](#)<sup>p138</sup> element and *last* is false, then switch the [insertion mode](#)<sup>p961</sup> to "[in head](#)<sup>p1002</sup>" and abort these steps.
13. If *node* is a [body](#)<sup>p157</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to "[in body](#)<sup>p1006</sup>" and abort these steps.
14. If *node* is a [frameset](#)<sup>p1104</sup> element, then switch the [insertion mode](#)<sup>p961</sup> to "[in frameset](#)<sup>p1028</sup>" and abort these steps. ([fragment case](#)<sup>p1043</sup>)
15. If *node* is an [html](#)<sup>p137</sup> element, run these substeps:
  1. If the [head element pointer](#)<sup>p965</sup> is null, switch the [insertion mode](#)<sup>p961</sup> to "[before head](#)<sup>p1002</sup>" and abort these steps. ([fragment case](#)<sup>p1043</sup>)
  2. Otherwise, the [head element pointer](#)<sup>p965</sup> is not null, switch the [insertion mode](#)<sup>p961</sup> to "[after head](#)<sup>p1005</sup>" and abort these steps.
16. If *last* is true, then switch the [insertion mode](#)<sup>p961</sup> to "[in body](#)<sup>p1006</sup>" and abort these steps. ([fragment case](#)<sup>p1043</sup>)
17. Let *node* now be the node before *node* in the [stack of open elements](#)<sup>p962</sup>.
18. Return to the step labeled *loop*.

### 12.2.3.2 The stack of open elements

Initially, the **stack of open elements** is empty. The stack grows downwards; the topmost node on the stack is the first one added to the stack, and the bottommost node of the stack is the most recently added node in the stack (notwithstanding when the stack is manipulated in a random access fashion as part of [the handling for misnested tags](#)<sup>p1015</sup>).

**Note** The "[before html](#)<sup>p1001</sup>" [insertion mode](#)<sup>p961</sup> creates the [html](#)<sup>p137</sup> root element node, which is then added to the stack.

**Note** In the [fragment case](#)<sup>p1043</sup>, the [stack of open elements](#)<sup>p962</sup> is initialised to contain an [html](#)<sup>p137</sup> element that is created as part of [that algorithm](#)<sup>p1043</sup>. (The [fragment case](#)<sup>p1043</sup> skips the "before html"<sup>p1001</sup> insertion mode<sup>p961</sup>.)

The [html](#)<sup>p137</sup> node, however it is created, is the topmost node of the stack. It only gets popped off the stack when the parser [finishes](#)<sup>p1033</sup>.

The **current node** is the bottommost node in this [stack of open elements](#)<sup>p962</sup>.

The **adjusted current node** is the [context](#)<sup>p1043</sup> element if the parser was created by the [HTML fragment parsing algorithm](#)<sup>p1043</sup> and the [stack of open elements](#)<sup>p962</sup> has only one element in it ([fragment case](#)<sup>p1043</sup>); otherwise, the [adjusted current node](#)<sup>p963</sup> is the [current node](#)<sup>p963</sup>. Spec bugs: [27314](#)

Elements in the [stack of open elements](#)<sup>p962</sup> fall into the following categories:

### Special

The following elements have varying levels of special parsing rules: HTML's [address](#)<sup>p175</sup>, [applet](#)<sup>p1101</sup>, [area](#)<sup>p390</sup>, [article](#)<sup>p159</sup>, [aside](#)<sup>p166</sup>, [base](#)<sup>p140</sup>, [basefont](#)<sup>b1096</sup>, [bgsound](#)<sup>p1096</sup>, [blockquote](#)<sup>p193</sup>, [body](#)<sup>p157</sup>, [br](#)<sup>p242</sup>, [button](#)<sup>b495</sup>, [caption](#)<sup>p405</sup>, [center](#)<sup>p1096</sup>, [col](#)<sup>p407</sup>, [colgroup](#)<sup>p406</sup>, [dd](#)<sup>p202</sup>, [details](#)<sup>p567</sup>, [dir](#)<sup>p1096</sup>, [div](#)<sup>p207</sup>, [dl](#)<sup>p199</sup>, [dt](#)<sup>p201</sup>, [embed](#)<sup>p307</sup>, [fieldset](#)<sup>p524</sup>, [figcaption](#)<sup>p205</sup>, [figure](#)<sup>p202</sup>, [footer](#)<sup>p173</sup>, [form](#)<sup>p447</sup>, [frame](#)<sup>p1105</sup>, [frameset](#)<sup>p1104</sup>, [h1](#)<sup>p168</sup>, [h2](#)<sup>p168</sup>, [h3](#)<sup>p168</sup>, [h4](#)<sup>p168</sup>, [h5](#)<sup>p168</sup>, [h6](#)<sup>p168</sup>, [head](#)<sup>p138</sup>, [header](#)<sup>p171</sup>, [hgroup](#)<sup>p170</sup>, [hr](#)<sup>p190</sup>, [html](#)<sup>p137</sup>, [iframe](#)<sup>p299</sup>, [img](#)<sup>p272</sup>, [input](#)<sup>p452</sup>, [isindex](#)<sup>p1096</sup>, [li](#)<sup>p198</sup>, [link](#)<sup>p141</sup>, [listing](#)<sup>p1096</sup>, [main](#)<sup>p205</sup>, [marquee](#)<sup>p1102</sup>, [menu](#)<sup>p571</sup>, [menuitem](#)<sup>p574</sup>, [meta](#)<sup>p145</sup>, [nav](#)<sup>p163</sup>, [noembed](#)<sup>p1096</sup>, [noframes](#)<sup>p1096</sup>, [noscript](#)<sup>p602</sup>, [object](#)<sup>p310</sup>, [ol](#)<sup>p195</sup>, [p](#)<sup>p187</sup>, [param](#)<sup>p316</sup>, [plaintext](#)<sup>p1096</sup>, [pre](#)<sup>p191</sup>, [script](#)<sup>p591</sup>, [section](#)<sup>p161</sup>, [select](#)<sup>p498</sup>, [source](#)<sup>p322</sup>, [style](#)<sup>p154</sup>, [summary](#)<sup>p571</sup>, [table](#)<sup>p398</sup>, [tbody](#)<sup>p408</sup>, [td](#)<sup>p412</sup>, [template](#)<sup>p604</sup>, [textarea](#)<sup>b508</sup>, [tfoot](#)<sup>p410</sup>, [th](#)<sup>p414</sup>, [thead](#)<sup>p409</sup>, [title](#)<sup>p139</sup>, [tr](#)<sup>p411</sup>, [track](#)<sup>p324</sup>, [ul](#)<sup>p197</sup>, [wbr](#)<sup>p243</sup>, and [xmp](#)<sup>p1096</sup>; MathML's [mi](#)<sup>p395</sup>, [mo](#)<sup>p395</sup>, [mn](#)<sup>p395</sup>, [ms](#)<sup>p395</sup>, [mtext](#)<sup>p395</sup>, and [annotation-xml](#)<sup>p395</sup>; and SVG's [foreignObject](#), [desc](#), and [title](#).

### Formatting

The following HTML elements are those that end up in the [list of active formatting elements](#)<sup>p964</sup>: [a](#)<sup>p208</sup>, [b](#)<sup>b236</sup>, [big](#)<sup>p1096</sup>, [code](#)<sup>p231</sup>, [em](#)<sup>p210</sup>, [font](#)<sup>p1096</sup>, [i](#)<sup>p235</sup>, [nobr](#)<sup>p1096</sup>, [s](#)<sup>p214</sup>, [small](#)<sup>p212</sup>, [strike](#)<sup>p1096</sup>, [strong](#)<sup>p211</sup>, [tt](#)<sup>p1096</sup>, and [u](#)<sup>p237</sup>.

### Ordinary

All other elements found while parsing an HTML document.

The [stack of open elements](#)<sup>p962</sup> is said to **have an element target node in a specific scope** consisting of a list of element types *list* when the following algorithm terminates in a match state:

1. Initialise *node* to be the [current node](#)<sup>p963</sup> (the bottommost node of the stack).
2. If *node* is the target node, terminate in a match state.
3. Otherwise, if *node* is one of the element types in *list*, terminate in a failure state.
4. Otherwise, set *node* to the previous entry in the [stack of open elements](#)<sup>p962</sup> and return to step 2. (This will never fail, since the loop will always terminate in the previous step if the top of the stack — an [html](#)<sup>p137</sup> element — is reached.)

The [stack of open elements](#)<sup>p962</sup> is said to **have a particular element in scope** when it [has that element in the specific scope](#)<sup>p963</sup> consisting of the following element types:

- [applet](#)<sup>p1101</sup> in the [HTML namespace](#)<sup>p101</sup>
- [caption](#)<sup>p405</sup> in the [HTML namespace](#)<sup>p101</sup>
- [html](#)<sup>p137</sup> in the [HTML namespace](#)<sup>p101</sup>
- [table](#)<sup>p398</sup> in the [HTML namespace](#)<sup>p101</sup>
- [td](#)<sup>p412</sup> in the [HTML namespace](#)<sup>p101</sup>
- [th](#)<sup>p414</sup> in the [HTML namespace](#)<sup>p101</sup>
- [marquee](#)<sup>p1102</sup> in the [HTML namespace](#)<sup>p101</sup>
- [object](#)<sup>p310</sup> in the [HTML namespace](#)<sup>p101</sup>
- [template](#)<sup>p604</sup> in the [HTML namespace](#)<sup>p101</sup>
- [mi](#)<sup>p395</sup> in the [MathML namespace](#)<sup>p101</sup>
- [mo](#)<sup>p395</sup> in the [MathML namespace](#)<sup>p101</sup>
- [mn](#)<sup>p395</sup> in the [MathML namespace](#)<sup>p101</sup>
- [ms](#)<sup>p395</sup> in the [MathML namespace](#)<sup>p101</sup>
- [mtext](#)<sup>p395</sup> in the [MathML namespace](#)<sup>p101</sup>
- [annotation-xml](#)<sup>p395</sup> in the [MathML namespace](#)<sup>p101</sup>
- [foreignObject](#) in the [SVG namespace](#)<sup>p101</sup>
- [desc](#) in the [SVG namespace](#)<sup>p101</sup>
- [title](#) in the [SVG namespace](#)<sup>p101</sup>

The [stack of open elements](#)<sup>p962</sup> is said to **have a particular element in list item scope** when it [has that element in the specific scope](#)<sup>p963</sup> consisting of the following element types:

- All the element types listed above for the [has an element in scope](#)<sup>p963</sup> algorithm.
- [ol](#)<sup>p195</sup> in the [HTML namespace](#)<sup>p101</sup>
- [ul](#)<sup>p197</sup> in the [HTML namespace](#)<sup>p101</sup>

The [stack of open elements](#)<sup>p962</sup> is said to **have a particular element in button scope** when it [has that element in the specific scope](#)<sup>p963</sup> consisting of the following element types:

- All the element types listed above for the [has an element in scope](#)<sup>p963</sup> algorithm.
- [button](#)<sup>p495</sup> in the [HTML namespace](#)<sup>p101</sup>

The [stack of open elements](#)<sup>p962</sup> is said to **have a particular element in table scope** when it [has that element in the specific scope](#)<sup>p963</sup> consisting of the following element types:

- [html](#)<sup>p137</sup> in the [HTML namespace](#)<sup>p101</sup>
- [table](#)<sup>p398</sup> in the [HTML namespace](#)<sup>p101</sup>
- [template](#)<sup>p604</sup> in the [HTML namespace](#)<sup>p101</sup>

The [stack of open elements](#)<sup>p962</sup> is said to **have a particular element in select scope** when it [has that element in the specific scope](#)<sup>p963</sup> consisting of all element types *except* the following:

- [optgroup](#)<sup>p504</sup> in the [HTML namespace](#)<sup>p101</sup>
- [option](#)<sup>p505</sup> in the [HTML namespace](#)<sup>p101</sup>

Nothing happens if at any time any of the elements in the [stack of open elements](#)<sup>p962</sup> are moved to a new location in, or removed from, the [Document](#)<sup>p102</sup> tree. In particular, the stack is not changed in this situation. This can cause, amongst other strange effects, content to be appended to nodes that are no longer in the DOM.

**Note** *In some cases (namely, when [closing misnested formatting elements](#)<sup>p1015</sup>), the stack is manipulated in a random-access fashion.*

### 12.2.3.3 The list of active formatting elements

Initially, the **list of active formatting elements** is empty. It is used to handle mis-nested [formatting element tags](#)<sup>p963</sup>.

The list contains elements in the [formatting](#)<sup>p963</sup> category, and [markers](#)<sup>p964</sup>. The **markers** are inserted when entering [applet](#)<sup>p1101</sup> elements, buttons, [object](#)<sup>p310</sup> elements, marquees, table cells, and table captions, and are used to prevent formatting from "leaking" into [applet](#)<sup>p1101</sup> elements, buttons, [object](#)<sup>p310</sup> elements, marquees, and tables.

In addition, each element in the [list of active formatting elements](#)<sup>p964</sup> is associated with the token for which it was created, so that further elements can be created for that token if necessary.

When the steps below require the UA to **push onto the list of active formatting elements** an element *element*, the UA must perform the following steps:

1. If there are already three elements in the [list of active formatting elements](#)<sup>p964</sup> after the last [marker](#)<sup>p964</sup>, if any, or anywhere in the list if there are no [markers](#)<sup>p964</sup>, that have the same tag name, namespace, and attributes as *element*, then remove the earliest such element from the [list of active formatting elements](#)<sup>p964</sup>. For these purposes, the attributes must be compared as they were when the elements were created by the parser; two elements have the same attributes if all their parsed attributes can be paired such that the two attributes in each pair have identical names, namespaces, and values (the order of the attributes does not matter).

**Note** *This is the Noah's Ark clause. But with three per family instead of two.*

2. Add *element* to the [list of active formatting elements](#)<sup>p964</sup>.

When the steps below require the UA to **reconstruct the active formatting elements**, the UA must perform the following steps:

1. If there are no entries in the [list of active formatting elements](#)<sup>p964</sup>, then there is nothing to reconstruct; stop this algorithm.
2. If the last (most recently added) entry in the [list of active formatting elements](#)<sup>p964</sup> is a [marker](#)<sup>p964</sup>, or if it is an element that is in the [stack of open elements](#)<sup>p962</sup>, then there is nothing to reconstruct; stop this algorithm.

3. Let `entry` be the last (most recently added) element in the [list of active formatting elements](#)<sup>p964</sup>.
4. *Rewind*: If there are no entries before `entry` in the [list of active formatting elements](#)<sup>p964</sup>, then jump to the step labeled *create*.
5. Let `entry` be the entry one earlier than `entry` in the [list of active formatting elements](#)<sup>p964</sup>.
6. If `entry` is neither a [marker](#)<sup>p964</sup> nor an element that is also in the [stack of open elements](#)<sup>p962</sup>, go to the step labeled *rewind*.
7. *Advance*: Let `entry` be the element one later than `entry` in the [list of active formatting elements](#)<sup>p964</sup>.
8. *Create*: [Insert an HTML element](#)<sup>p996</sup> for the token for which the element `entry` was created, to obtain `new element`.
9. Replace the entry for `entry` in the list with an entry for `new element`.
10. If the entry for `new element` in the [list of active formatting elements](#)<sup>p964</sup> is not the last entry in the list, return to the step labeled *advance*.

This has the effect of reopening all the formatting elements that were opened in the current body, cell, or caption (whichever is youngest) that haven't been explicitly closed.

**Note** *The way this specification is written, the [list of active formatting elements](#)<sup>p964</sup> always consists of elements in chronological order with the least recently added element first and the most recently added element last (except for while steps 8 to 11 of the above algorithm are being executed, of course).*

When the steps below require the UA to **clear the list of active formatting elements up to the last marker**, the UA must perform the following steps:

1. Let `entry` be the last (most recently added) entry in the [list of active formatting elements](#)<sup>p964</sup>.
2. Remove `entry` from the [list of active formatting elements](#)<sup>p964</sup>.
3. If `entry` was a [marker](#)<sup>p964</sup>, then stop the algorithm at this point. The list has been cleared up to the last [marker](#)<sup>p964</sup>.
4. Go to step 1.

#### 12.2.3.4 The element pointers

Initially, the `head` element pointer and the `form` element pointer are both null.

Once a [head](#)<sup>p138</sup> element has been parsed (whether implicitly or explicitly) the [head element pointer](#)<sup>p965</sup> gets set to point to this node.

The [form element pointer](#)<sup>p965</sup> points to the last [form](#)<sup>p447</sup> element that was opened and whose end tag has not yet been seen. It is used to make form controls associate with forms in the face of dramatically bad markup, for historical reasons. It is ignored inside [template](#)<sup>p604</sup> elements.

#### 12.2.3.5 Other parsing state flags

The **scripting flag** is set to "enabled" if [scripting was enabled](#)<sup>p828</sup> for the [Document](#)<sup>p102</sup> with which the parser is associated when the parser was created, and "disabled" otherwise.

**Note** *The [scripting flag](#)<sup>p965</sup> can be enabled even when the parser was originally created for the [HTML fragment parsing algorithm](#)<sup>p1043</sup>, even though [script](#)<sup>p591</sup> elements don't execute in that case.*

The **frameset-ok** flag is set to "ok" when the parser is created. It is set to "not ok" after certain tokens are seen.

#### 12.2.4 Tokenization

Implementations must act as if they used the following state machine to tokenise HTML. The state machine must start in the [data state](#)<sup>p966</sup>. Most states consume a single character, which may have various side-effects, and either switches the state machine to a new state to *reconsume* the same character, or switches it to a new state to consume the next character, or stays in the same state to consume the next character. Some states

have more complicated behaviour and can consume several characters before switching to another state. In some cases, the tokenizer state is also changed by the tree construction stage.

The exact behaviour of certain states depends on the [insertion mode](#)<sup>p961</sup> and the [stack of open elements](#)<sup>p962</sup>. Certain states also use a **temporary buffer** to track progress.

The output of the tokenization step is a series of zero or more of the following tokens: DOCTYPE, start tag, end tag, comment, character, end-of-file. DOCTYPE tokens have a name, a public identifier, a system identifier, and a **force-quirks flag**. When a DOCTYPE token is created, its name, public identifier, and system identifier must be marked as missing (which is a distinct state from the empty string), and the [force-quirks flag](#)<sup>p966</sup> must be set to *off* (its other state is *on*). Start and end tag tokens have a tag name, a **self-closing flag**, and a list of attributes, each of which has a name and a value. When a start or end tag token is created, its [self-closing flag](#)<sup>p966</sup> must be unset (its other state is that it be set), and its attributes list must be empty. Comment and character tokens have data.

When a token is emitted, it must immediately be handled by the [tree construction](#)<sup>p993</sup> stage. The tree construction stage can affect the state of the tokenization stage, and can insert additional characters into the stream. (For example, the [script](#)<sup>p591</sup> element can result in scripts executing and using the [dynamic markup insertion](#)<sup>p848</sup> APIs to insert characters into the stream being tokenized.)

**Note** *Creating a token and emitting it are distinct actions. It is possible for a token to be created but implicitly abandoned (never emitted), e.g. if the file ends unexpectedly while processing the characters that are being parsed into a start tag token.*

When a start tag token is emitted with its [self-closing flag](#)<sup>p966</sup> set, if the flag is not **acknowledged** when it is processed by the tree construction stage, that is a [parse error](#)<sup>p953</sup>.

When an end tag token is emitted with attributes, that is a [parse error](#)<sup>p953</sup>.

When an end tag token is emitted with its [self-closing flag](#)<sup>p966</sup> set, that is a [parse error](#)<sup>p953</sup>.

An **appropriate end tag token** is an end tag token whose tag name matches the tag name of the last start tag to have been emitted from this tokenizer, if any. If no start tag has been emitted from this tokenizer, then no end tag token is appropriate.

Before each step of the tokenizer, the user agent must first check the [parser pause flag](#)<sup>p954</sup>. If it is true, then the tokenizer must abort the processing of any nested invocations of the tokenizer, yielding control back to the caller.

The tokenizer state machine consists of the states defined in the following subsections.

#### 12.2.4.1 Data state

Consume the [next input character](#)<sup>p961</sup>:

- ↪ **U+0026 AMPERSAND (&)**  
Switch to the [character reference in data state](#)<sup>p966</sup>.
- ↪ **U+003C LESS-THAN SIGN (<)**  
Switch to the [tag open state](#)<sup>p968</sup>.
- ↪ **U+0000 NULL**  
[Parse error](#)<sup>p953</sup>. Emit the [current input character](#)<sup>p961</sup> as a character token.
- ↪ **EOF**  
Emit an end-of-file token.
- ↪ **Anything else**  
Emit the [current input character](#)<sup>p961</sup> as a character token.

#### 12.2.4.2 Character reference in data state

Switch to the [data state](#)<sup>p966</sup>.

Attempt to [consume a character reference](#)<sup>p991</sup>, with no [additional allowed character](#)<sup>p991</sup>.

If nothing is returned, emit a U+0026 AMPERSAND character (&) token.

Otherwise, emit the character tokens that were returned.

#### 12.2.4.3 RCDATA state

Consume the [next input character<sup>p961</sup>](#):

- ↪ **U+0026 AMPERSAND (&)**  
Switch to the [character reference in RCDATA state<sup>p967</sup>](#).
- ↪ **U+003C LESS-THAN SIGN (<)**  
Switch to the [RCDATA less-than sign state<sup>p969</sup>](#).
- ↪ **U+0000 NULL**  
[Parse error<sup>p953</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.
- ↪ **EOF**  
Emit an end-of-file token.
- ↪ **Anything else**  
Emit the [current input character<sup>p961</sup>](#) as a character token.

#### 12.2.4.4 Character reference in RCDATA state

Switch to the [RCDATA state<sup>p967</sup>](#).

Attempt to [consume a character reference<sup>p991</sup>](#), with no [additional allowed character<sup>p991</sup>](#).

If nothing is returned, emit a U+0026 AMPERSAND character (&) token.

Otherwise, emit the character tokens that were returned.

#### 12.2.4.5 RAWTEXT state

Consume the [next input character<sup>p961</sup>](#):

- ↪ **U+003C LESS-THAN SIGN (<)**  
Switch to the [RAWTEXT less-than sign state<sup>p970</sup>](#).
- ↪ **U+0000 NULL**  
[Parse error<sup>p953</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.
- ↪ **EOF**  
Emit an end-of-file token.
- ↪ **Anything else**  
Emit the [current input character<sup>p961</sup>](#) as a character token.

#### 12.2.4.6 Script data state

Consume the [next input character<sup>p961</sup>](#):

- ↪ **U+003C LESS-THAN SIGN (<)**  
Switch to the [script data less-than sign state<sup>p971</sup>](#).

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p961</sup>](#) as a character token.

#### 12.2.4.7 PLAINTEXT state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p961</sup>](#) as a character token.

#### 12.2.4.8 Tag open state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0021 EXCLAMATION MARK (!)**

Switch to the [markup declaration open state<sup>p982</sup>](#).

↪ **U+002F SOLIDUS (/)**

Switch to the [end tag open state<sup>p968</sup>](#).

↪ **Uppercase ASCII letter<sup>p58</sup>**

Create a new start tag token, set its tag name to the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point), then switch to the [tag name state<sup>p969</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ **Lowercase ASCII letter<sup>p58</sup>**

Create a new start tag token, set its tag name to the [current input character<sup>p961</sup>](#), then switch to the [tag name state<sup>p969</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ **U+003F QUESTION MARK (?)**

[Parse error<sup>p953</sup>](#). Switch to the [bogus comment state<sup>p982</sup>](#).

↪ **Anything else**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit a U+003C LESS-THAN SIGN character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.9 End tag open state

Consume the [next input character<sup>p961</sup>](#):

↪ **Uppercase ASCII letter<sup>p58</sup>**

Create a new end tag token, set its tag name to the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point), then switch to the [tag name state<sup>p969</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ **Lowercase ASCII letter<sup>p58</sup>**

Create a new end tag token, set its tag name to the [current input character<sup>p961</sup>](#), then switch to the [tag name state<sup>p969</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ **U+003E GREATER-THAN SIGN (>)**  
Parse error<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>.

↪ **EOF**  
Parse error<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. Reconsume the EOF character.

↪ **Anything else**  
Parse error<sup>p953</sup>. Switch to the [bogus comment state](#)<sup>p982</sup>.

#### 12.2.4.10 Tag name state

Consume the [next input character](#)<sup>p961</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**  
↪ **U+000A LINE FEED (LF)**  
↪ **U+000C FORM FEED (FF)**  
↪ **U+0020 SPACE**

Switch to the [before attribute name state](#)<sup>p977</sup>.

↪ **U+002F SOLIDUS (/)**  
Switch to the [self-closing start tag state](#)<sup>p982</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**  
Switch to the [data state](#)<sup>p966</sup>. Emit the current tag token.

↪ **Uppercase ASCII letter**<sup>p58</sup>

Append the lowercase version of the [current input character](#)<sup>p961</sup> (add 0x0020 to the character's code point) to the current tag token's tag name.

↪ **U+0000 NULL**  
Parse error<sup>p953</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current tag token's tag name.

↪ **EOF**  
Parse error<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Reconsume the EOF character.

↪ **Anything else**  
Append the [current input character](#)<sup>p961</sup> to the current tag token's tag name.

#### 12.2.4.11 RCDATA less-than sign state

Consume the [next input character](#)<sup>p961</sup>:

↪ **U+002F SOLIDUS (/)**  
Set the [temporary buffer](#)<sup>p966</sup> to the empty string. Switch to the [RCDATA end tag open state](#)<sup>p969</sup>.

↪ **Anything else**  
Switch to the [RCDATA state](#)<sup>p967</sup>. Emit a U+003C LESS-THAN SIGN character token. Reconsume the [current input character](#)<sup>p961</sup>.

#### 12.2.4.12 RCDATA end tag open state

Consume the [next input character](#)<sup>p961</sup>:

↪ **Uppercase ASCII letter**<sup>p58</sup>

Create a new end tag token, and set its tag name to the lowercase version of the [current input character](#)<sup>p961</sup> (add 0x0020 to the character's code point). Append the [current input character](#)<sup>p961</sup> to the [temporary buffer](#)<sup>p966</sup>. Finally, switch to the [RCDATA end tag name state](#)<sup>p970</sup>. (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ [Lowercase ASCII letter<sup>b58</sup>](#)

Create a new end tag token, and set its tag name to the [current input character<sup>p961</sup>](#). Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Finally, switch to the [RCDATA end tag name state<sup>p970</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ **Anything else**

Switch to the [RCDATA state<sup>p967</sup>](#). Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.13 RCDATA end tag name state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [before attribute name state<sup>p977</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [self-closing start tag state<sup>p982</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [data state<sup>p966</sup>](#) and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ [Uppercase ASCII letter<sup>b58</sup>](#)

Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).

↪ [Lowercase ASCII letter<sup>b58</sup>](#)

Append the [current input character<sup>p961</sup>](#) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).

↪ **Anything else**

Switch to the [RCDATA state<sup>p967</sup>](#). Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer<sup>p966</sup>](#) (in the order they were added to the buffer). Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.14 RAWTEXT less-than sign state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p966</sup>](#) to the empty string. Switch to the [RAWTEXT end tag open state<sup>p970</sup>](#).

↪ **Anything else**

Switch to the [RAWTEXT state<sup>p967</sup>](#). Emit a U+003C LESS-THAN SIGN character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.15 RAWTEXT end tag open state

Consume the [next input character<sup>p961</sup>](#):

↪ [Uppercase ASCII letter<sup>b58</sup>](#)

Create a new end tag token, and set its tag name to the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point). Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Finally, switch to the [RAWTEXT end tag name state<sup>b971</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ [Lowercase ASCII letter<sup>b58</sup>](#)

Create a new end tag token, and set its tag name to the [current input character<sup>p961</sup>](#). Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Finally, switch to the [RAWTEXT end tag name state<sup>b971</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ [Anything else](#)

Switch to the [RAWTEXT state<sup>b967</sup>](#). Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.16 RAWTEXT end tag name state

Consume the [next input character<sup>p961</sup>](#):

↪ [U+0009 CHARACTER TABULATION \(tab\)](#)

↪ [U+000A LINE FEED \(LF\)](#)

↪ [U+000C FORM FEED \(FF\)](#)

↪ [U+0020 SPACE](#)

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [before attribute name state<sup>b977</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ [U+002F SOLIDUS \(/\)](#)

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [self-closing start tag state<sup>p982</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ [U+003E GREATER-THAN SIGN \(>\)](#)

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [data state<sup>p966</sup>](#) and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ [Uppercase ASCII letter<sup>b58</sup>](#)

Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).

↪ [Lowercase ASCII letter<sup>b58</sup>](#)

Append the [current input character<sup>p961</sup>](#) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).

↪ [Anything else](#)

Switch to the [RAWTEXT state<sup>b967</sup>](#). Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer<sup>p966</sup>](#) (in the order they were added to the buffer). Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.17 Script data less-than sign state

Consume the [next input character<sup>p961</sup>](#):

↪ [U+002F SOLIDUS \(/\)](#)

Set the [temporary buffer<sup>p966</sup>](#) to the empty string. Switch to the [script data end tag open state<sup>p972</sup>](#).

↪ [U+0021 EXCLAMATION MARK \(!\)](#)

Switch to the [script data escape start state<sup>p972</sup>](#). Emit a U+003C LESS-THAN SIGN character token and a U+0021 EXCLAMATION MARK character token.

↪ [Anything else](#)

Switch to the [script data state<sup>p967</sup>](#). Emit a U+003C LESS-THAN SIGN character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.18 Script data end tag open state

Consume the [next input character<sup>p961</sup>](#):

↪ [Uppercase ASCII letter<sup>p58</sup>](#)

Create a new end tag token, and set its tag name to the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point). Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Finally, switch to the [script data end tag name state<sup>p972</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ [Lowercase ASCII letter<sup>p58</sup>](#)

Create a new end tag token, and set its tag name to the [current input character<sup>p961</sup>](#). Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Finally, switch to the [script data end tag name state<sup>p972</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ [Anything else](#)

Switch to the [script data state<sup>p967</sup>](#). Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.19 Script data end tag name state

Consume the [next input character<sup>p961</sup>](#):

↪ [U+0009 CHARACTER TABULATION \(tab\)](#)

↪ [U+000A LINE FEED \(LF\)](#)

↪ [U+000C FORM FEED \(FF\)](#)

↪ [U+0020 SPACE](#)

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [before attribute name state<sup>p977</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ [U+002F SOLIDUS \(/\)](#)

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [self-closing start tag state<sup>p982</sup>](#). Otherwise, treat it as per the "anything else" entry below.

↪ [U+003E GREATER-THAN SIGN \(>\)](#)

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [data state<sup>p966</sup>](#) and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ [Uppercase ASCII letter<sup>p58</sup>](#)

Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).

↪ [Lowercase ASCII letter<sup>p58</sup>](#)

Append the [current input character<sup>p961</sup>](#) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).

↪ [Anything else](#)

Switch to the [script data state<sup>p967</sup>](#). Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer<sup>p966</sup>](#) (in the order they were added to the buffer). Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.20 Script data escape start state

Consume the [next input character<sup>p961</sup>](#):

↪ [U+002D HYPHEN-MINUS \(-\)](#)

Switch to the [script data escape start dash state<sup>p973</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ [Anything else](#)

Switch to the [script data state<sup>p967</sup>](#). Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.21 Script data escape start dash state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash dash state<sup>p973</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **Anything else**

Switch to the [script data state<sup>p967</sup>](#). Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.22 Script data escaped state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash state<sup>p973</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state<sup>p974</sup>](#).

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Switch to the [data state<sup>p966</sup>](#). [Parse error<sup>p953</sup>](#). Reconsume the EOF character.

↪ **Anything else**

Emit the [current input character<sup>p961</sup>](#) as a character token.

#### 12.2.4.23 Script data escaped dash state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash dash state<sup>p973</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state<sup>p974</sup>](#).

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Switch to the [script data escaped state<sup>p973</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.

↪ **Anything else**

Switch to the [script data escaped state<sup>p973</sup>](#). Emit the [current input character<sup>p961</sup>](#) as a character token.

#### 12.2.4.24 Script data escaped dash dash state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state<sup>p974</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [script data state<sup>p967</sup>](#). Emit a U+003E GREATER-THAN SIGN character token.

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Switch to the [script data escaped state<sup>p973</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.

↪ **Anything else**

Switch to the [script data escaped state<sup>p973</sup>](#). Emit the [current input character<sup>p961</sup>](#) as a character token.

#### 12.2.4.25 Script data escaped less-than sign state

Consume the [next input character<sup>p961</sup>](#).

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p966</sup>](#) to the empty string. Switch to the [script data escaped end tag open state<sup>p974</sup>](#).

↪ **Uppercase ASCII letter<sup>p58</sup>**

Set the [temporary buffer<sup>p966</sup>](#) to the empty string. Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the [temporary buffer<sup>p966</sup>](#). Switch to the [script data double escape start state<sup>p975</sup>](#). Emit a U+003C LESS-THAN SIGN character token and the [current input character<sup>p961</sup>](#) as a character token.

↪ **Lowercase ASCII letter<sup>p58</sup>**

Set the [temporary buffer<sup>p966</sup>](#) to the empty string. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Switch to the [script data double escape start state<sup>p975</sup>](#). Emit a U+003C LESS-THAN SIGN character token and the [current input character<sup>p961</sup>](#) as a character token.

↪ **Anything else**

Switch to the [script data escaped state<sup>p973</sup>](#). Emit a U+003C LESS-THAN SIGN character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.26 Script data escaped end tag open state

Consume the [next input character<sup>p961</sup>](#).

↪ **Uppercase ASCII letter<sup>p58</sup>**

Create a new end tag token, and set its tag name to the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point). Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Finally, switch to the [script data escaped end tag name state<sup>p974</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ **Lowercase ASCII letter<sup>p58</sup>**

Create a new end tag token, and set its tag name to the [current input character<sup>p961</sup>](#). Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Finally, switch to the [script data escaped end tag name state<sup>p974</sup>](#). (Don't emit the token yet; further details will be filled in before it is emitted.)

↪ **Anything else**

Switch to the [script data escaped state<sup>p973</sup>](#). Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.27 Script data escaped end tag name state

Consume the [next input character<sup>p961</sup>](#).

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [before attribute name state<sup>p977</sup>](#). Otherwise, treat it as per the "anything else" entry below.
- ↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [self-closing start tag state<sup>p982</sup>](#). Otherwise, treat it as per the "anything else" entry below.
- ↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token<sup>p966</sup>](#), then switch to the [data state<sup>p966</sup>](#) and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.
- ↪ [Uppercase ASCII letter<sup>p58</sup>](#)

Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).
- ↪ [Lowercase ASCII letter<sup>p58</sup>](#)

Append the [current input character<sup>p961</sup>](#) to the current tag token's tag name. Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#).
- ↪ **Anything else**

Switch to the [script data escaped state<sup>p973</sup>](#). Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer<sup>p966</sup>](#) (in the order they were added to the buffer). Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.28 Script data double escape start state

- Consume the [next input character<sup>p961</sup>](#):
- ↪ **U+0009 CHARACTER TABULATION (tab)**
  - ↪ **U+000A LINE FEED (LF)**
  - ↪ **U+000C FORM FEED (FF)**
  - ↪ **U+0020 SPACE**
  - ↪ **U+002F SOLIDUS (/)**
  - ↪ **U+003E GREATER-THAN SIGN (>)**

If the [temporary buffer<sup>p966</sup>](#) is the string "script", then switch to the [script data double escaped state<sup>p975</sup>](#). Otherwise, switch to the [script data escaped state<sup>p973</sup>](#). Emit the [current input character<sup>p961</sup>](#) as a character token.
  - ↪ [Uppercase ASCII letter<sup>p58</sup>](#)

Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the [temporary buffer<sup>p966</sup>](#). Emit the [current input character<sup>p961</sup>](#) as a character token.
  - ↪ [Lowercase ASCII letter<sup>p58</sup>](#)

Append the [current input character<sup>p961</sup>](#) to the [temporary buffer<sup>p966</sup>](#). Emit the [current input character<sup>p961</sup>](#) as a character token.
  - ↪ **Anything else**

Switch to the [script data escaped state<sup>p973</sup>](#). Reconsume the [current input character<sup>p961</sup>](#).

#### 12.2.4.29 Script data double escaped state

- Consume the [next input character<sup>p961</sup>](#):
- ↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data double escaped dash state<sup>p976</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state](#)<sup>p976</sup>. Emit a U+003C LESS-THAN SIGN character token.

↪ **U+0000 NULL**

[Parse error](#)<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

[Parse error](#)<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Reconsume the EOF character.

↪ **Anything else**

Emit the [current input character](#)<sup>p961</sup> as a character token.

#### 12.2.4.30 Script data double escaped dash state

Consume the [next input character](#)<sup>p961</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data double escaped dash dash state](#)<sup>p976</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state](#)<sup>p976</sup>. Emit a U+003C LESS-THAN SIGN character token.

↪ **U+0000 NULL**

[Parse error](#)<sup>p953</sup>. Switch to the [script data double escaped state](#)<sup>p975</sup>. Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

[Parse error](#)<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Reconsume the EOF character.

↪ **Anything else**

Switch to the [script data double escaped state](#)<sup>p975</sup>. Emit the [current input character](#)<sup>p961</sup> as a character token.

#### 12.2.4.31 Script data double escaped dash dash state

Consume the [next input character](#)<sup>p961</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state](#)<sup>p976</sup>. Emit a U+003C LESS-THAN SIGN character token.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [script data state](#)<sup>p967</sup>. Emit a U+003E GREATER-THAN SIGN character token.

↪ **U+0000 NULL**

[Parse error](#)<sup>p953</sup>. Switch to the [script data double escaped state](#)<sup>p975</sup>. Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

[Parse error](#)<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Reconsume the EOF character.

↪ **Anything else**

Switch to the [script data double escaped state](#)<sup>p975</sup>. Emit the [current input character](#)<sup>p961</sup> as a character token.

#### 12.2.4.32 Script data double escaped less-than sign state

Consume the [next input character](#)<sup>p961</sup>:

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer](#)<sup>p966</sup> to the empty string. Switch to the [script data double escape end state](#)<sup>p977</sup>. Emit a U+002F SOLIDUS character token.

↪ **Anything else**

Switch to the [script data double escaped state](#)<sup>p975</sup>. Reconsume the [current input character](#)<sup>p961</sup>.

#### 12.2.4.33 Script data double escape end state

Consume the [next input character](#)<sup>p961</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

↪ **U+002F SOLIDUS (/)**

↪ **U+003E GREATER-THAN SIGN (>)**

If the [temporary buffer](#)<sup>p966</sup> is the string "script", then switch to the [script data escaped state](#)<sup>p973</sup>. Otherwise, switch to the [script data double escaped state](#)<sup>p975</sup>. Emit the [current input character](#)<sup>p961</sup> as a character token.

↪ [\*\*Uppercase ASCII letter\*\*](#)<sup>p58</sup>

Append the lowercase version of the [current input character](#)<sup>p961</sup> (add 0x0020 to the character's code point) to the [temporary buffer](#)<sup>p966</sup>.  
Emit the [current input character](#)<sup>p961</sup> as a character token.

↪ [\*\*Lowercase ASCII letter\*\*](#)<sup>p58</sup>

Append the [current input character](#)<sup>p961</sup> to the [temporary buffer](#)<sup>p966</sup>. Emit the [current input character](#)<sup>p961</sup> as a character token.

↪ **Anything else**

Switch to the [script data double escaped state](#)<sup>p975</sup>. Reconsume the [current input character](#)<sup>p961</sup>.

#### 12.2.4.34 Before attribute name state

Consume the [next input character](#)<sup>p961</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+002F SOLIDUS (/)**

Switch to the [self-closing start tag state](#)<sup>p982</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state](#)<sup>p966</sup>. Emit the current tag token.

↪ [\*\*Uppercase ASCII letter\*\*](#)<sup>p58</sup>

Start a new attribute in the current tag token. Set that attribute's name to the lowercase version of the [current input character](#)<sup>p961</sup> (add 0x0020 to the character's code point), and its value to the empty string. Switch to the [attribute name state](#)<sup>p978</sup>.

↪ **U+0000 NULL**

[Parse error](#)<sup>p953</sup>. Start a new attribute in the current tag token. Set that attribute's name to a U+FFF REPLACEMENT CHARACTER character, and its value to the empty string. Switch to the [attribute name state](#)<sup>p978</sup>.

- ↪ **U+0022 QUOTATION MARK ("")**
- ↪ **U+0027 APOSTROPHE ('')**
- ↪ **U+003C LESS-THAN SIGN (<)**
- ↪ **U+003D EQUALS SIGN (=)**  
<sup>[Parse error<sup>p953</sup>](#)</sup>. Treat it as per the "anything else" entry below.
- ↪ **EOF**  
<sup>[Parse error<sup>p953</sup>](#)</sup>. Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.
- ↪ **Anything else**  
Start a new attribute in the current tag token. Set that attribute's name to the [current input character<sup>p961</sup>](#), and its value to the empty string.  
Switch to the [attribute name state<sup>p978</sup>](#).

#### 12.2.4.35 Attribute name state

Consume the [next input character<sup>p961</sup>](#):

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**  
Switch to the [after attribute name state<sup>p979</sup>](#).
- ↪ **U+002F SOLIDUS (/)**  
Switch to the [self-closing start tag state<sup>p982</sup>](#).
- ↪ **U+003D EQUALS SIGN (=)**  
Switch to the [before attribute value state<sup>p979</sup>](#).
- ↪ **U+003E GREATER-THAN SIGN (>)**  
Switch to the [data state<sup>p966</sup>](#). Emit the current tag token.
- ↪ **Uppercase ASCII letter<sup>p58</sup>**  
Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the current attribute's name.
- ↪ **U+0000 NULL**  
<sup>[Parse error<sup>p953</sup>](#)</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's name.
- ↪ **U+0022 QUOTATION MARK ("")**
- ↪ **U+0027 APOSTROPHE ('')**
- ↪ **U+003C LESS-THAN SIGN (<)**  
<sup>[Parse error<sup>p953</sup>](#)</sup>. Treat it as per the "anything else" entry below.
- ↪ **EOF**  
<sup>[Parse error<sup>p953</sup>](#)</sup>. Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.
- ↪ **Anything else**  
Append the [current input character<sup>p961</sup>](#) to the current attribute's name.

When the user agent leaves the attribute name state (and before emitting the tag token, if appropriate), the complete attribute's name must be compared to the other attributes on the same token; if there is already an attribute on the token with the exact same name, then this is a [parse error<sup>p953</sup>](#) and the new attribute must be removed from the token.

**Note** *If an attribute is so removed from a token, it, and the value that gets associated with it, if any, are never subsequently used by the parser, and are therefore effectively discarded. Removing the attribute in this way does not change its status as the "current attribute" for the purposes of the tokenizer, however.*

#### 12.2.4.36 After attribute name state

Consume the [next input character<sup>p961</sup>](#):

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**
  - Ignore the character.
- ↪ **U+002F SOLIDUS (/)**
  - Switch to the [self-closing start tag state<sup>p982</sup>](#).
- ↪ **U+003D EQUALS SIGN (=)**
  - Switch to the [before attribute value state<sup>p979</sup>](#).
- ↪ **U+003E GREATER-THAN SIGN (>)**
  - Switch to the [data state<sup>p966</sup>](#). Emit the current tag token.
- ↪ **Uppercase ASCII letter<sup>p58</sup>**
  - Start a new attribute in the current tag token. Set that attribute's name to the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point), and its value to the empty string. Switch to the [attribute name state<sup>p978</sup>](#).
- ↪ **U+0000 NULL**
  - [Parse error<sup>p953</sup>](#). Start a new attribute in the current tag token. Set that attribute's name to a U+FFFD REPLACEMENT CHARACTER character, and its value to the empty string. Switch to the [attribute name state<sup>p978</sup>](#).
- ↪ **U+0022 QUOTATION MARK ("")**
- ↪ **U+0027 APOSTROPHE ('')**
- ↪ **U+003C LESS-THAN SIGN (<)**
  - [Parse error<sup>p953</sup>](#). Treat it as per the "anything else" entry below.
- ↪ **EOF**
  - [Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.
- ↪ **Anything else**
  - Start a new attribute in the current tag token. Set that attribute's name to the [current input character<sup>p961</sup>](#), and its value to the empty string. Switch to the [attribute name state<sup>p978</sup>](#).

#### 12.2.4.37 Before attribute value state

Consume the [next input character<sup>p961</sup>](#):

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**
  - Ignore the character.
- ↪ **U+0022 QUOTATION MARK ("")**
  - Switch to the [attribute value \(double-quoted\) state<sup>p980</sup>](#).
- ↪ **U+0026 AMPERSAND (&)**
  - Switch to the [attribute value \(unquoted\) state<sup>p980</sup>](#). Reconsume the [current input character<sup>p961</sup>](#).
- ↪ **U+0027 APOSTROPHE ('')**
  - Switch to the [attribute value \(single-quoted\) state<sup>p980</sup>](#).
- ↪ **U+0000 NULL**
  - [Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value. Switch to the [attribute value \(unquoted\) state<sup>p980</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the current tag token.

↪ **U+003C LESS-THAN SIGN (<)**

↪ **U+003D EQUALS SIGN (=)**

↪ **U+0060 GRAVE ACCENT (`)**

[Parse error<sup>p953</sup>](#). Treat it as per the "anything else" entry below.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.

↪ **Anything else**

Append the [current input character<sup>p961</sup>](#) to the current attribute's value. Switch to the [attribute value \(unquoted\) state<sup>p980</sup>](#).

#### 12.2.4.38 Attribute value (double-quoted) state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0022 QUOTATION MARK ("")**

Switch to the [after attribute value \(quoted\) state<sup>p981</sup>](#).

↪ **U+0026 AMPERSAND (&)**

Switch to the [character reference in attribute value state<sup>p981</sup>](#), with the [additional allowed character<sup>p991</sup>](#) being U+0022 QUOTATION MARK ("").

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.

↪ **Anything else**

Append the [current input character<sup>p961</sup>](#) to the current attribute's value.

#### 12.2.4.39 Attribute value (single-quoted) state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0027 APOSTROPHE ('')**

Switch to the [after attribute value \(quoted\) state<sup>p981</sup>](#).

↪ **U+0026 AMPERSAND (&)**

Switch to the [character reference in attribute value state<sup>p981</sup>](#), with the [additional allowed character<sup>p991</sup>](#) being U+0027 APOSTROPHE ('').

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.

↪ **Anything else**

Append the [current input character<sup>p961</sup>](#) to the current attribute's value.

#### 12.2.4.40 Attribute value (unquoted) state

Consume the [next input character<sup>p961</sup>](#):

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**
  - Switch to the [before attribute name state](#)<sup>p977</sup>.
- ↪ **U+0026 AMPERSAND (&)**
  - Switch to the [character reference in attribute value state](#)<sup>p981</sup>, with the [additional allowed character](#)<sup>p991</sup> being U+003E GREATER-THAN SIGN (>).
- ↪ **U+003E GREATER-THAN SIGN (>)**
  - Switch to the [data state](#)<sup>p966</sup>. Emit the current tag token.
- ↪ **U+0000 NULL**
  - [Parse error](#)<sup>p953</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.
- ↪ **U+0022 QUOTATION MARK ("")**
- ↪ **U+0027 APOSTROPHE ('')**
- ↪ **U+003C LESS-THAN SIGN (<)**
- ↪ **U+003D EQUALS SIGN (=)**
- ↪ **U+0060 GRAVE ACCENT (`)**
  - [Parse error](#)<sup>p953</sup>. Treat it as per the "anything else" entry below.
- ↪ **EOF**
  - [Parse error](#)<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Reconsume the EOF character.
- ↪ **Anything else**
  - Append the [current input character](#)<sup>p961</sup> to the current attribute's value.

#### 12.2.4.41 Character reference in attribute value state

Attempt to [consume a character reference](#)<sup>p991</sup>.

If nothing is returned, append a U+0026 AMPERSAND character (&) to the current attribute's value.

Otherwise, append the returned character tokens to the current attribute's value.

Finally, switch back to the attribute value state that switched into this state.

#### 12.2.4.42 After attribute value (quoted) state

Consume the [next input character](#)<sup>p961</sup>:

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**
  - Switch to the [before attribute name state](#)<sup>p977</sup>.
- ↪ **U+002F SOLIDUS (/)**
  - Switch to the [self-closing start tag state](#)<sup>p982</sup>.
- ↪ **U+003E GREATER-THAN SIGN (>)**
  - Switch to the [data state](#)<sup>p966</sup>. Emit the current tag token.
- ↪ **EOF**
  - [Parse error](#)<sup>p953</sup>. Switch to the [data state](#)<sup>p966</sup>. Reconsume the EOF character.

↪ Anything else

[Parse error<sup>p953</sup>](#). Switch to the [before attribute name state<sup>p977</sup>](#). Reconsume the character.

#### 12.2.4.43 Self-closing start tag state

Consume the [next input character<sup>p961</sup>](#):

↪ U+003E GREATER-THAN SIGN (>)

Set the [self-closing flag<sup>p966</sup>](#) of the current tag token. Switch to the [data state<sup>p966</sup>](#). Emit the current tag token.

↪ EOF

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Reconsume the EOF character.

↪ Anything else

[Parse error<sup>p953</sup>](#). Switch to the [before attribute name state<sup>p977</sup>](#). Reconsume the character.

#### 12.2.4.44 Bogus comment state

Consume every character up to and including the first U+003E GREATER-THAN SIGN character (>) or the end of the file (EOF), whichever comes first. If more than one character was consumed, then emit a comment token whose data is the concatenation of all the characters starting from and including the character that caused the state machine to switch into the bogus comment state, up to and including the character immediately before the last consumed character (i.e. up to the character just before the U+003E or EOF character), but with any U+0000 NULL characters replaced by U+FFFD REPLACEMENT CHARACTER characters. (If the comment was started by the end of the file (EOF), the token is empty. Similarly, the token is empty if it was generated by the string "<!>".)

Switch to the [data state<sup>p966</sup>](#).

If the end of the file was reached, reconsume the EOF character.

#### 12.2.4.45 Markup declaration open state

If the next two characters are both U+002D HYPHEN-MINUS characters (-), consume those two characters, create a comment token whose data is the empty string, and switch to the [comment start state<sup>p982</sup>](#).

Otherwise, if the next seven characters are an [ASCII case-insensitive<sup>b58</sup>](#) match for the word "DOCTYPE", then consume those characters and switch to the [DOCTYPE state<sup>p984</sup>](#).

Otherwise, if there is an [adjusted current node<sup>p963</sup>](#) and it is not an element in the [HTML namespace<sup>p101</sup>](#) and the next seven characters are a [case-sensitive<sup>p58</sup>](#) match for the string "[CDATA[" (the five uppercase letters "CDATA" with a U+005B LEFT SQUARE BRACKET character before and after), then consume those characters and switch to the [CDATA section state<sup>p991</sup>](#).

Otherwise, this is a [parse error<sup>p953</sup>](#). Switch to the [bogus comment state<sup>p982</sup>](#). The next character that is consumed, if any, is the first character that will be in the comment.

#### 12.2.4.46 Comment start state

Consume the [next input character<sup>p961</sup>](#):

↪ U+002D HYPHEN-MINUS (-)

Switch to the [comment start dash state<sup>p983</sup>](#).

↪ U+0000 NULL

[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token. Reconsume the EOF character.

↪ **Anything else**

Append the [current input character<sup>p961</sup>](#) to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

#### 12.2.4.47 Comment start dash state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment end state<sup>p984</sup>](#)

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Append a U+002D HYPHEN-MINUS character (-) and a U+FFFD REPLACEMENT CHARACTER character to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token. Reconsume the EOF character.

↪ **Anything else**

Append a U+002D HYPHEN-MINUS character (-) and the [current input character<sup>p961</sup>](#) to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

#### 12.2.4.48 Comment state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment end dash state<sup>p983</sup>](#)

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the comment token's data.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token. Reconsume the EOF character.

↪ **Anything else**

Append the [current input character<sup>p961</sup>](#) to the comment token's data.

#### 12.2.4.49 Comment end dash state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment end state<sup>p984</sup>](#)

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Append a U+002D HYPHEN-MINUS character (-) and a U+FFFD REPLACEMENT CHARACTER character to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token. Reconsume the EOF character.

↪ Anything else

Append a U+002D HYPHEN-MINUS character (-) and the [current input character<sup>p961</sup>](#) to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

#### 12.2.4.50 Comment end state

Consume the [next input character<sup>p961</sup>](#):

↪ U+003E GREATER-THAN SIGN (>)

Switch to the [data state<sup>p966</sup>](#). Emit the comment token.

↪ U+0000 NULL

[Parse error<sup>p953</sup>](#). Append two U+002D HYPHEN-MINUS characters (-) and a U+FFFD REPLACEMENT CHARACTER character to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

↪ U+0021 EXCLAMATION MARK (!)

[Parse error<sup>p953</sup>](#). Switch to the [comment end bang state<sup>p984</sup>](#).

↪ U+002D HYPHEN-MINUS (-)

[Parse error<sup>p953</sup>](#). Append a U+002D HYPHEN-MINUS character (-) to the comment token's data.

↪ EOF

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token. Reconsume the EOF character.

↪ Anything else

[Parse error<sup>p953</sup>](#). Append two U+002D HYPHEN-MINUS characters (-) and the [current input character<sup>p961</sup>](#) to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

#### 12.2.4.51 Comment end bang state

Consume the [next input character<sup>p961</sup>](#):

↪ U+002D HYPHEN-MINUS (-)

Append two U+002D HYPHEN-MINUS characters (-) and a U+0021 EXCLAMATION MARK character (!) to the comment token's data. Switch to the [comment end dash state<sup>p983</sup>](#).

↪ U+003E GREATER-THAN SIGN (>)

Switch to the [data state<sup>p966</sup>](#). Emit the comment token.

↪ U+0000 NULL

[Parse error<sup>p953</sup>](#). Append two U+002D HYPHEN-MINUS characters (-), a U+0021 EXCLAMATION MARK character (!), and a U+FFFD REPLACEMENT CHARACTER character to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

↪ EOF

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Emit the comment token. Reconsume the EOF character.

↪ Anything else

Append two U+002D HYPHEN-MINUS characters (-), a U+0021 EXCLAMATION MARK character (!), and the [current input character<sup>p961</sup>](#) to the comment token's data. Switch to the [comment state<sup>p983</sup>](#).

#### 12.2.4.52 DOCTYPE state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before DOCTYPE name state<sup>p985</sup>](#).

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Create a new DOCTYPE token. Set its [force-quirks flag<sup>p966</sup>](#) to *on*. Emit the token. Reconsume the EOF character.

↪ **Anything else**

[Parse error<sup>p953</sup>](#). Switch to the [before DOCTYPE name state<sup>p985</sup>](#). Reconsume the character.

#### 12.2.4.53 Before DOCTYPE name state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **Uppercase ASCII letter<sup>p58</sup>**

Create a new DOCTYPE token. Set the token's name to the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point). Switch to the [DOCTYPE name state<sup>p985</sup>](#).

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Create a new DOCTYPE token. Set the token's name to a U+FFFD REPLACEMENT CHARACTER character. Switch to the [DOCTYPE name state<sup>p985</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

[Parse error<sup>p953</sup>](#). Create a new DOCTYPE token. Set its [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit the token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Create a new DOCTYPE token. Set its [force-quirks flag<sup>p966</sup>](#) to *on*. Emit the token. Reconsume the EOF character.

↪ **Anything else**

Create a new DOCTYPE token. Set the token's name to the [current input character<sup>p961</sup>](#). Switch to the [DOCTYPE name state<sup>p985</sup>](#).

#### 12.2.4.54 DOCTYPE name state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [after DOCTYPE name state<sup>p986</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p966</sup>](#). Emit the current DOCTYPE token.

↪ **Uppercase ASCII letter<sup>p58</sup>**

Append the lowercase version of the [current input character<sup>p961</sup>](#) (add 0x0020 to the character's code point) to the current DOCTYPE token's name.

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's name.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token. Reconsume the EOF character.

↪ **Anything else**

Append the [current input character<sup>p961</sup>](#) to the current DOCTYPE token's name.

#### 12.2.4.55 After DOCTYPE name state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p966</sup>](#). Emit the current DOCTYPE token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token. Reconsume the EOF character.

↪ **Anything else**

If the six characters starting from the [current input character<sup>p961</sup>](#) are an [ASCII case-insensitive<sup>p58</sup>](#) match for the word "PUBLIC", then consume those characters and switch to the [after DOCTYPE public keyword state<sup>p986</sup>](#).

Otherwise, if the six characters starting from the [current input character<sup>p961</sup>](#) are an [ASCII case-insensitive<sup>p58</sup>](#) match for the word "SYSTEM", then consume those characters and switch to the [after DOCTYPE system keyword state<sup>p989</sup>](#).

Otherwise, this is a [parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [bogus DOCTYPE state<sup>p991</sup>](#).

#### 12.2.4.56 After DOCTYPE public keyword state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before DOCTYPE public identifier state<sup>p987</sup>](#).

↪ **U+0022 QUOTATION MARK ("")**

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(double-quoted\) state<sup>p987</sup>](#).

↪ **U+0027 APOSTROPHE ('')**

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(single-quoted\) state<sup>p988</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.

↪ EOF

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token. Reconsume the EOF character.

↪ Anything else

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [bogus DOCTYPE state<sup>p991</sup>](#).

#### 12.2.4.57 Before DOCTYPE public identifier state

Consume the [next input character<sup>p961</sup>](#):

↪ U+0009 CHARACTER TABULATION (tab)

↪ U+000A LINE FEED (LF)

↪ U+000C FORM FEED (FF)

↪ U+0020 SPACE

Ignore the character.

↪ U+0022 QUOTATION MARK ("")

Set the DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(double-quoted\) state<sup>p987</sup>](#).

↪ U+0027 APOSTROPHE ('')

Set the DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(single-quoted\) state<sup>p988</sup>](#).

↪ U+003E GREATER-THAN SIGN (>)

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.

↪ EOF

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token. Reconsume the EOF character.

↪ Anything else

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [bogus DOCTYPE state<sup>p991</sup>](#).

#### 12.2.4.58 DOCTYPE public identifier (double-quoted) state

Consume the [next input character<sup>p961</sup>](#):

↪ U+0022 QUOTATION MARK ("")

Switch to the [after DOCTYPE public identifier state<sup>p988</sup>](#).

↪ U+0000 NULL

[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's public identifier.

↪ U+003E GREATER-THAN SIGN (>)

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.

↪ EOF

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token. Reconsume the EOF character.

↪ Anything else

Append the [current input character<sup>p961</sup>](#) to the current DOCTYPE token's public identifier.

#### 12.2.4.59 DOCTYPE public identifier (single-quoted) state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0027 APOSTROPHE (')**

Switch to the [after DOCTYPE public identifier state<sup>p988</sup>](#).

↪ **U+0000 NULL**

[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's public identifier.

↪ **U+003E GREATER-THAN SIGN (>)**

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token.  
Reconsume the EOF character.

↪ **Anything else**

Append the [current input character<sup>p961</sup>](#) to the current DOCTYPE token's public identifier.

#### 12.2.4.60 After DOCTYPE public identifier state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [between DOCTYPE public and system identifiers state<sup>p988</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p966</sup>](#). Emit the current DOCTYPE token.

↪ **U+0022 QUOTATION MARK ("")**

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p990</sup>](#).

↪ **U+0027 APOSTROPHE ('')**

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p990</sup>](#).

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token.  
Reconsume the EOF character.

↪ **Anything else**

[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [bogus DOCTYPE state<sup>p991</sup>](#).

#### 12.2.4.61 Between DOCTYPE public and system identifiers state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p966</sup>](#). Emit the current DOCTYPE token.

- ↪ **U+0022 QUOTATION MARK ("")**  
Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p990</sup>](#).
- ↪ **U+0027 APOSTROPHE ('')**  
Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p990</sup>](#).
- ↪ **EOF**  
[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token. Reconsume the EOF character.
- ↪ **Anything else**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [bogus DOCTYPE state<sup>p991</sup>](#).

#### 12.2.4.62 After DOCTYPE system keyword state

- Consume the [next input character<sup>p961</sup>](#):
- ↪ **U+0009 CHARACTER TABULATION (tab)**
  - ↪ **U+000A LINE FEED (LF)**
  - ↪ **U+000C FORM FEED (FF)**
  - ↪ **U+0020 SPACE**  
Switch to the [before DOCTYPE system identifier state<sup>p989</sup>](#).
  - ↪ **U+0022 QUOTATION MARK ("")**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p990</sup>](#).
  - ↪ **U+0027 APOSTROPHE ('')**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p990</sup>](#).
  - ↪ **U+003E GREATER-THAN SIGN (>)**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.
  - ↪ **EOF**  
[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token. Reconsume the EOF character.
  - ↪ **Anything else**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [bogus DOCTYPE state<sup>p991</sup>](#).

#### 12.2.4.63 Before DOCTYPE system identifier state

- Consume the [next input character<sup>p961</sup>](#):
- ↪ **U+0009 CHARACTER TABULATION (tab)**
  - ↪ **U+000A LINE FEED (LF)**
  - ↪ **U+000C FORM FEED (FF)**
  - ↪ **U+0020 SPACE**  
Ignore the character.
  - ↪ **U+0022 QUOTATION MARK ("")**  
Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p990</sup>](#).

- ↪ **U+0027 APOSTROPHE (')**  
Set the DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p990</sup>](#).
- ↪ **U+003E GREATER-THAN SIGN (>)**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.
- ↪ **EOF**  
[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token.  
Reconsume the EOF character.
- ↪ **Anything else**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [bogus DOCTYPE state<sup>p991</sup>](#).

#### 12.2.4.64 DOCTYPE system identifier (double-quoted) state

- Consume the [next input character<sup>p961</sup>](#):
- ↪ **U+0022 QUOTATION MARK ("')**  
Switch to the [after DOCTYPE system identifier state<sup>p990</sup>](#).
  - ↪ **U+0000 NULL**  
[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's system identifier.
  - ↪ **U+003E GREATER-THAN SIGN (>)**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.
  - ↪ **EOF**  
[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token.  
Reconsume the EOF character.
  - ↪ **Anything else**  
Append the [current input character<sup>p961</sup>](#) to the current DOCTYPE token's system identifier.

#### 12.2.4.65 DOCTYPE system identifier (single-quoted) state

- Consume the [next input character<sup>p961</sup>](#):
- ↪ **U+0027 APOSTROPHE (')**  
Switch to the [after DOCTYPE system identifier state<sup>p990</sup>](#).
  - ↪ **U+0000 NULL**  
[Parse error<sup>p953</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's system identifier.
  - ↪ **U+003E GREATER-THAN SIGN (>)**  
[Parse error<sup>p953</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Switch to the [data state<sup>p966</sup>](#). Emit that DOCTYPE token.
  - ↪ **EOF**  
[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token.  
Reconsume the EOF character.
  - ↪ **Anything else**  
Append the [current input character<sup>p961</sup>](#) to the current DOCTYPE token's system identifier.

#### 12.2.4.66 After DOCTYPE system identifier state

- Consume the [next input character<sup>p961</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p966</sup>](#). Emit the current DOCTYPE token.

↪ **EOF**

[Parse error<sup>p953</sup>](#). Switch to the [data state<sup>p966</sup>](#). Set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*. Emit that DOCTYPE token.

Reconsume the EOF character.

↪ **Anything else**

[Parse error<sup>p953</sup>](#). Switch to the [bogus DOCTYPE state<sup>p991</sup>](#). (This does *not* set the DOCTYPE token's [force-quirks flag<sup>p966</sup>](#) to *on*.)

#### 12.2.4.67 Bogus DOCTYPE state

Consume the [next input character<sup>p961</sup>](#):

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p966</sup>](#). Emit the DOCTYPE token.

↪ **EOF**

Switch to the [data state<sup>p966</sup>](#). Emit the DOCTYPE token. Reconsume the EOF character.

↪ **Anything else**

Ignore the character.

#### 12.2.4.68 CDATA section state

Switch to the [data state<sup>p966</sup>](#).

Consume every character up to the next occurrence of the three character sequence U+005D RIGHT SQUARE BRACKET U+005D RIGHT SQUARE BRACKET U+003E GREATER-THAN SIGN (]]>), or the end of the file (EOF), whichever comes first. Emit a series of character tokens consisting of all the characters consumed except the matching three character sequence at the end (if one was found before the end of the file).

If the end of the file was reached, reconsume the EOF character.

#### 12.2.4.69 Tokenizing character references

This section defines how to **consume a character reference**, optionally with an **additional allowed character**, which, if specified where the algorithm is invoked, adds a character to the list of characters that cause there to not be a character reference.

This definition is used when parsing character references [in text<sup>p966</sup>](#) and [in attributes<sup>p981</sup>](#).

The behaviour depends on the identity of the next character (the one immediately after the U+0026 AMPERSAND character), as follows:

↪ U+0009 CHARACTER TABULATION (tab)

↪ U+000A LINE FEED (LF)

↪ U+000C FORM FEED (FF)

↪ U+0020 SPACE

↪ U+003C LESS-THAN SIGN

↪ U+0026 AMPERSAND

↪ EOF

↪ The [additional allowed character<sup>p991</sup>](#), if there is one

Not a character reference. No characters are consumed, and nothing is returned. (This is not an error, either.)

↪ U+0023 NUMBER SIGN (#)

Consume the U+0023 NUMBER SIGN.

The behaviour further depends on the character after the U+0023 NUMBER SIGN:

↪ U+0078 LATIN SMALL LETTER X

↪ U+0058 LATIN CAPITAL LETTER X

Consume the X.

Follow the steps below, but using [ASCII hex digits<sup>p59</sup>](#).

When it comes to interpreting the number, interpret it as a hexadecimal number.

↪ Anything else

Follow the steps below, but using [ASCII digits<sup>p58</sup>](#).

When it comes to interpreting the number, interpret it as a decimal number.

Consume as many characters as match the range of characters given above ([ASCII hex digits<sup>p59</sup>](#) or [ASCII digits<sup>p58</sup>](#)).

If no characters match the range, then don't consume any characters (and unconsume the U+0023 NUMBER SIGN character and, if appropriate, the X character). This is a [parse error<sup>p953</sup>](#); nothing is returned.

Otherwise, if the next character is a U+003B SEMICOLON, consume that too. If it isn't, there is a [parse error<sup>p953</sup>](#).

If one or more characters match the range, then take them all and interpret the string of characters as a number (either hexadecimal or decimal as appropriate).

If that number is one of the numbers in the first column of the following table, then this is a [parse error<sup>p953</sup>](#). Find the row with that number in the first column, and return a character token for the Unicode character given in the second column of that row.

Number	Unicode character
0x00	U+FFFFD REPLACEMENT CHARACTER
0x80	U+20AC EURO SIGN (€)
0x82	U+201A SINGLE LOW-9 QUOTATION MARK („)
0x83	U+0192 LATIN SMALL LETTER F WITH HOOK (ƒ)
0x84	U+201E DOUBLE LOW-9 QUOTATION MARK („)
0x85	U+2026 HORIZONTAL ELLIPSIS (...)
0x86	U+2020 DAGGER (†)
0x87	U+2021 DOUBLE DAGGER (‡)
0x88	U+02C6 MODIFIER LETTER CIRCUMFLEX ACCENT (^)
0x89	U+2030 PER MILLE SIGN (‰)
0x8A	U+0160 LATIN CAPITAL LETTER S WITH CARON (Š)
0x8B	U+2039 SINGLE LEFT-POINTING ANGLE QUOTATION MARK (‘)
0x8C	U+0152 LATIN CAPITAL LIGATURE OE (Œ)
0x8E	U+017D LATIN CAPITAL LETTER Z WITH CARON (Ž)
0x91	U+2018 LEFT SINGLE QUOTATION MARK (‘)
0x92	U+2019 RIGHT SINGLE QUOTATION MARK (’)
0x93	U+201C LEFT DOUBLE QUOTATION MARK (“)
0x94	U+201D RIGHT DOUBLE QUOTATION MARK (”)

Number		Unicode character
0x95	U+2022	BULLET (•)
0x96	U+2013	EN DASH (–)
0x97	U+2014	EM DASH (—)
0x98	U+02DC	SMALL TILDE (˜)
0x99	U+2122	TRADE MARK SIGN (™)
0x9A	U+0161	LATIN SMALL LETTER S WITH CARON (ſ)
0x9B	U+203A	SINGLE RIGHT-POINTING ANGLE QUOTATION MARK (›)
0x9C	U+0153	LATIN SMALL LIGATURE OE (œ)
0x9E	U+017E	LATIN SMALL LETTER Z WITH CARON (ȝ)
0x9F	U+0178	LATIN CAPITAL LETTER Y WITH DIAERESIS (Ÿ)

Otherwise, if the number is in the range 0xD800 to 0xDFFF or is greater than 0x10FFFF, then this is a [parse error<sup>p953</sup>](#). Return a U+FFFD REPLACEMENT CHARACTER character token.

Otherwise, return a character token for the Unicode character whose code point is that number. Additionally, if the number is in the range 0x0001 to 0x0008, 0x000D to 0x001F, 0x007F to 0x009F, 0xFDD0 to 0xFDEF, or is one of 0x000B, 0xFFFE, 0xFFFF, 0x1FFF, 0x1FFF, 0x2FFE, 0x2FFF, 0x3FFE, 0x3FFF, 0x4FFE, 0x4FFF, 0x5FFE, 0x5FFF, 0x6FFE, 0x6FFF, 0x7FFE, 0x7FFF, 0x8FFE, 0x8FFF, 0x9FFE, 0x9FFF, 0xAFFE, 0xAFFF, 0xBFFE, 0xBFFF, 0xCFFF, 0xCFEE, 0xDFFF, 0xDFFF, 0xEFFF, 0xEFFF, 0xFFFF, 0x10FFF, or 0x10FFF, then this is a [parse error<sup>p953</sup>](#).

#### ↪ Anything else

Consume the maximum number of characters possible, with the consumed characters matching one of the identifiers in the first column of the [named character references<sup>b1044</sup>](#) table (in a [case-sensitive<sup>p58</sup>](#) manner).

If no match can be made, then no characters are consumed, and nothing is returned. In this case, if the characters after the U+0026 AMPERSAND character (&) consist of a sequence of one or more [alphanumeric ASCII characters<sup>p59</sup>](#) followed by a U+003B SEMICOLON character (;), then this is a [parse error<sup>p953</sup>](#).

If the character reference is being consumed [as part of an attribute<sup>p981</sup>](#), and the last character matched is not a U+003B SEMICOLON character (;), and the next character is either a U+003D EQUALS SIGN character (=) or an [alphanumeric ASCII character<sup>p59</sup>](#), then, for historical reasons, all the characters that were matched after the U+0026 AMPERSAND character (&) must be unconsumed, and nothing is returned. However, if this next character is in fact a U+003D EQUALS SIGN character (=), then this is a [parse error<sup>p953</sup>](#), because some legacy user agents will misinterpret the markup in those cases.

Otherwise, a character reference is parsed. If the last character matched is not a U+003B SEMICOLON character (;), there is a [parse error<sup>p953</sup>](#).

Return one or two character tokens for the character(s) corresponding to the character reference name (as given by the second column of the [named character references<sup>b1044</sup>](#) table).

**Example** If the markup contains (not in an attribute) the string I'm &notit; I tell you, the character reference is parsed as "not", as in, I'm -it; I tell you (and this is a parse error). But if the markup was I'm &notin; I tell you, the character reference would be parsed as "notin;", resulting in I'm € I tell you (and no parse error).

## 12.2.5 Tree construction

The input to the tree construction stage is a sequence of tokens from the [tokenization<sup>p965</sup>](#) stage. The tree construction stage is associated with a DOM [Document<sup>p102</sup>](#) object when a parser is created. The "output" of this stage consists of dynamically modifying or extending that document's DOM tree.

This specification does not define when an interactive user agent has to render the [Document<sup>p102</sup>](#) so that it is available to the user, or when it has to begin accepting user input.

As each token is emitted from the tokenizer, the user agent must follow the appropriate steps from the following list, known as the **tree construction dispatcher**:

- ↪ If the [stack of open elements](#)<sup>p962</sup> is empty
- ↪ If the [adjusted current node](#)<sup>p963</sup> is an element in the [HTML namespace](#)<sup>p101</sup>
- ↪ If the [adjusted current node](#)<sup>p963</sup> is a [MathML text integration point](#)<sup>p994</sup> and the token is a start tag whose tag name is neither "mglyph" nor "malignmark"
- ↪ If the [adjusted current node](#)<sup>p963</sup> is a [MathML text integration point](#)<sup>p994</sup> and the token is a character token
- ↪ If the [adjusted current node](#)<sup>p963</sup> is an [annotation-xml](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup> and the token is a start tag whose tag name is "svg"
- ↪ If the [adjusted current node](#)<sup>p963</sup> is an [HTML integration point](#)<sup>p994</sup> and the token is a start tag
- ↪ If the [adjusted current node](#)<sup>p963</sup> is an [HTML integration point](#)<sup>p994</sup> and the token is a character token
- ↪ If the token is an end-of-file token

Process the token according to the rules given in the section corresponding to the current [insertion mode](#)<sup>b961</sup> in HTML content.

- ↪ Otherwise

Process the token according to the rules given in the section for parsing tokens [in foreign content](#)<sup>p1030</sup>.

The **next token** is the token that is about to be processed by the [tree construction dispatcher](#)<sup>p993</sup> (even if the token is subsequently just ignored).

A node is a **MathML text integration point** if it is one of the following elements:

- An [mi](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup>
- An [mo](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup>
- An [mn](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup>
- An [ms](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup>
- An [mtext](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup>

A node is an **HTML integration point** if it is one of the following elements:

- An [annotation-xml](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup> whose start tag token had an attribute with the name "encoding" whose value was an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "text/html"
- An [annotation-xml](#)<sup>p395</sup> element in the [MathML namespace](#)<sup>p101</sup> whose start tag token had an attribute with the name "encoding" whose value was an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "application/xhtml+xml"
- A [foreignObject](#) element in the [SVG namespace](#)<sup>p101</sup>
- A [desc](#) element in the [SVG namespace](#)<sup>p101</sup>
- A [title](#) element in the [SVG namespace](#)<sup>p101</sup>

**Note** If the node in question is the [context](#)<sup>p1043</sup> element passed to the [HTML fragment parsing algorithm](#)<sup>p1043</sup>, then the start tag token for that element is the "fake" token created during by that [HTML fragment parsing algorithm](#)<sup>p1043</sup>.

**Note** Not all of the tag names mentioned below are conformant tag names in this specification; many are included to handle legacy content. They still form part of the algorithm that implementations are required to implement to claim conformance.

**Note** The algorithm described below places no limit on the depth of the DOM tree generated, or on the length of tag names, attribute names, attribute values, [Text](#)<sup>p51</sup> nodes, etc. While implementors are encouraged to avoid arbitrary limits, it is recognised that [practical concerns](#)<sup>p47</sup> will likely force user agents to impose nesting depth constraints.

### 12.2.5.1 Creating and inserting nodes

While the parser is processing a token, it can enable or disable **foster parenting**. This affects the following algorithm.

The **appropriate place for inserting a node**, optionally using a particular *override target*, is the position in an element returned by running the following steps:

1. If there was an *override target* specified, then let *target* be the *override target*.  
Otherwise, let *target* be the [current node](#)<sup>p963</sup>.
2. Determine the *adjusted insertion location* using the first matching steps from the following list:

- ↪ If [foster parenting](#)<sup>b994</sup> is enabled and *target* is a [table](#)<sup>p398</sup>, [tbody](#)<sup>p408</sup>, [tfoot](#)<sup>p410</sup>, [thead](#)<sup>p409</sup>, or [tr](#)<sup>p411</sup> element

**Note** Foster parenting happens when content is misnested in tables.

Run these substeps:

1. Let *last template* be the last template<sup>p604</sup> element in the stack of open elements<sup>p962</sup>, if any.
2. Let *last table* be the last table<sup>p398</sup> element in the stack of open elements<sup>p962</sup>, if any.
3. If there is a *last template* and either there is no *last table*, or there is one, but *last template* is lower (more recently added) than *last table* in the stack of open elements<sup>p962</sup>, then: let *adjusted insertion location* be inside *last template*'s template contents<sup>p605</sup>, after its last child (if any), and abort these substeps.
4. If there is no *last table*, then let *adjusted insertion location* be inside the first element in the stack of open elements<sup>p962</sup> (the html<sup>p137</sup> element), after its last child (if any), and abort these substeps. (fragment case<sup>p1043</sup>)
5. If *last table* has a parent node, then let *adjusted insertion location* be inside *last table*'s parent node, immediately before *last table*, and abort these substeps.
6. Let *previous element* be the element immediately above *last table* in the stack of open elements<sup>p962</sup>.
7. Let *adjusted insertion location* be inside *previous element*, after its last child (if any).

**Note**

*These steps are involved in part because it's possible for elements, the table<sup>p398</sup> element in this case in particular, to have been moved by a script around in the DOM, or indeed removed from the DOM entirely, after the element was inserted by the parser.*

↪ **Otherwise**

Let *adjusted insertion location* be inside *target*, after its last child (if any).

3. If the *adjusted insertion location* is inside a template<sup>p604</sup> element, let it instead be inside the template<sup>p604</sup> element's template contents<sup>p605</sup>, after its last child (if any).
4. Return the *adjusted insertion location*.

When the steps below require the UA to **create an element for a token** in a particular *given namespace* and with a particular *intended parent*, the UA must run the following steps:

1. Create a node implementing the interface appropriate for the element type corresponding to the tag name of the token in *given namespace* (as given in the specification that defines that element, e.g. for an a<sup>p208</sup> element in the HTML namespace<sup>p101</sup>, this specification defines it to be the HTMLAnchorElement<sup>p208</sup> interface), with the tag name being the name of that element, with the node being in the *given namespace*, and with the attributes on the node being those given in the *given token*.

The interface appropriate for an element in the HTML namespace<sup>p101</sup> that is not defined in this specification (or other applicable specifications<sup>p56</sup>) is HTMLUnknownElement<sup>p112</sup>. Elements in other namespaces whose interface is not defined by that namespace's specification must use the interface Element<sup>p51</sup>.

The node document of the newly created element must be the node document of the *intended parent*.

2. If the newly created element has an xmlns attribute in the XMLNS namespace<sup>p101</sup> whose value is not exactly the same as the element's namespace, that is a parse error<sup>p953</sup>. Similarly, if the newly created element has an xmlns:xlink attribute in the XMLNS namespace<sup>p101</sup> whose value is not the XLink Namespace<sup>p101</sup>, that is a parse error<sup>p953</sup>.
3. If the newly created element is a resettable element<sup>p447</sup>, invoke its reset algorithm<sup>p567</sup>. (This initialises the element's value<sup>p527</sup> and checkedness<sup>p527</sup> based on the element's attributes.)
4. If the element is a form-associated element<sup>p446</sup>, and the form element pointer<sup>p965</sup> is not null, and there is no template<sup>p604</sup> element on the stack of open elements<sup>p962</sup>, and the newly created element is either not reassociateable<sup>p447</sup> or doesn't have a form<sup>p527</sup> attribute, and the *intended parent* is in the same home subtree<sup>p42</sup> as the element pointed to by the form element pointer<sup>p965</sup>, associate<sup>p527</sup> the newly created element with the form<sup>p447</sup> element pointed to by the form element pointer<sup>p965</sup>, and suppress the running of the reset the form owner<sup>p528</sup> algorithm when the parser subsequently attempts to insert the element.
5. Return the newly created element.

When the steps below require the user agent to **insert a foreign element** for a token in a given namespace, the user agent must run these steps:

- Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p994</sup>.
  - Create an element for the token<sup>p995</sup> in the given namespace, with the intended parent being the element in which the *adjusted insertion location* finds itself.
  - If it is possible to insert an element at the *adjusted insertion location*, then insert the newly created element at the *adjusted insertion location*.
- Note** If the adjusted insertion location cannot accept more elements, e.g. because it's a [Document](#)<sup>p102</sup> that already has an element child, then the newly created element is dropped on the floor.
- Push the element onto the [stack of open elements](#)<sup>p962</sup> so that it is the new [current node](#)<sup>p963</sup>.
  - Return the newly created element.

When the steps below require the user agent to **insert an HTML element** for a token, the user agent must [insert a foreign element](#)<sup>p995</sup> for the token, in the [HTML namespace](#)<sup>p101</sup>.

When the steps below require the user agent to **adjust MathML attributes** for a token, then, if the token has an attribute named `definitionurl`, change its name to `definitionURL` (note the case difference).

When the steps below require the user agent to **adjust SVG attributes** for a token, then, for each attribute on the token whose attribute name is one of the ones in the first column of the following table, change the attribute's name to the name given in the corresponding cell in the second column. (This fixes the case of SVG attributes that are not all lowercase.)

Attribute name on token	Attribute name on element
<code>attributename</code>	<code>attributeName</code>
<code>attributetype</code>	<code>attributeType</code>
<code>basefrequency</code>	<code>baseFrequency</code>
<code>baseprofile</code>	<code>baseProfile</code>
<code>calcmode</code>	<code>calcMode</code>
<code>clippathunits</code>	<code>clipPathUnits</code>
<code>diffuseconstant</code>	<code>diffuseConstant</code>
<code>edgemode</code>	<code>edgeMode</code>
<code>filterunits</code>	<code>filterUnits</code>
<code>glyphref</code>	<code>glyphRef</code>
<code>gradienttransform</code>	<code>gradientTransform</code>
<code>gradientunits</code>	<code>gradientUnits</code>
<code>kernelmatrix</code>	<code>kernelMatrix</code>
<code>kernelunitlength</code>	<code>kernelUnitLength</code>
<code>keypoints</code>	<code>keyPoints</code>
<code>keysplines</code>	<code>keySplines</code>
<code>keytimes</code>	<code>keyTimes</code>
<code>lengthadjust</code>	<code>lengthAdjust</code>
<code>limitingconeangle</code>	<code>limitingConeAngle</code>
<code>markerheight</code>	<code>markerHeight</code>
<code>markerunits</code>	<code>markerUnits</code>
<code>markerwidth</code>	<code>markerWidth</code>
<code>maskcontentunits</code>	<code>maskContentUnits</code>
<code>maskunits</code>	<code>maskUnits</code>
<code>numoctaves</code>	<code>numOctaves</code>
<code>pathlength</code>	<code>pathLength</code>
<code>patterncontentunits</code>	<code>patternContentUnits</code>
<code>patterntransform</code>	<code>patternTransform</code>
<code>patternunits</code>	<code>patternUnits</code>
<code>pointsatx</code>	<code>pointsAtX</code>
<code>pointsaty</code>	<code>pointsAtY</code>

Attribute name on token	Attribute name on element
pointsatz	pointsAtZ
preservealpha	preserveAlpha
preserveaspectratio	preserveAspectRatio
primitiveunits	primitiveUnits
refx	refX
refy	refY
repeatcount	repeatCount
repeatdur	repeatDur
requiredextensions	requiredExtensions
requiredfeatures	requiredFeatures
specularconstant	specularConstant
specularexponent	specularExponent
spreadmethod	spreadMethod
startoffset	startOffset
stddeviation	stdDeviation
stitchtiles	stitchTiles
surfacescale	surfaceScale
systemlanguage	systemLanguage
tablevalues	tableValues
targetx	targetX
targety	targetY
textlength	textLength
viewbox	viewBox
viewtarget	viewTarget
xchannelselector	xChannelSelector
ychannelselector	yChannelSelector
zoomandpan	zoomAndPan

When the steps below require the user agent to **adjust foreign attributes** for a token, then, if any of the attributes on the token match the strings given in the first column of the following table, let the attribute be a namespaced attribute, with the prefix being the string given in the corresponding cell in the second column, the local name being the string given in the corresponding cell in the third column, and the namespace being the namespace given in the corresponding cell in the fourth column. (This fixes the use of namespaced attributes, in particular [lang attributes in the XML namespace<sup>b123</sup>](#).)

Attribute name	Prefix	Local name	Namespace
xlink:actuate	xlink	actuate	<a href="#">XLink namespace<sup>b101</sup></a>
xlink:arcrole	xlink	arcrole	<a href="#">XLink namespace<sup>b101</sup></a>
xlink:href	xlink	href	<a href="#">XLink namespace<sup>b101</sup></a>
xlink:role	xlink	role	<a href="#">XLink namespace<sup>b101</sup></a>
xlink:show	xlink	show	<a href="#">XLink namespace<sup>b101</sup></a>
xlink:title	xlink	title	<a href="#">XLink namespace<sup>b101</sup></a>
xlink:type	xlink	type	<a href="#">XLink namespace<sup>b101</sup></a>
xml:base	xml	base	<a href="#">XML namespace<sup>b101</sup></a>
xml:lang	xml	lang	<a href="#">XML namespace<sup>b101</sup></a>
xml:space	xml	space	<a href="#">XML namespace<sup>b101</sup></a>
xmlns	(none)	xmlns	<a href="#">XMLNS namespace<sup>b101</sup></a>
xmlns:xlink	xmlns	xlink	<a href="#">XMLNS namespace<sup>b101</sup></a>

When the steps below require the user agent to **insert a character** while processing a token, the user agent must run the following steps:

- Let *data* be the characters passed to the algorithm, or, if no characters were explicitly specified, the character of the character token being processed.

2. Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p994</sup>.
3. If the *adjusted insertion location* is in a [Document](#)<sup>p102</sup> node, then abort these steps.
4. If there is a [Text](#)<sup>p51</sup> node immediately before the *adjusted insertion location*, then append *data* to that [Text](#)<sup>p51</sup> node's data.

**Note** The DOM will not let [Document](#)<sup>p102</sup> nodes have [Text](#)<sup>p51</sup> node children, so they are dropped on the floor.

Otherwise, create a new [Text](#)<sup>p51</sup> node whose data is *data* and whose [node document](#) is the same as that of the element in which the *adjusted insertion location* finds itself, and insert the newly created node at the *adjusted insertion location*.

### Example

Here are some sample inputs to the parser and the corresponding number of [Text](#)<sup>p51</sup> nodes that they result in, assuming a user agent that executes scripts.

Input	Number of <a href="#">Text</a> <sup>p51</sup> nodes
<pre>A&lt;script&gt; var script = document.getElementsByName('script')[0]; document.body.removeChild(script); &lt;/script&gt;B</pre>	One <a href="#">Text</a> <sup>p51</sup> node in the document, containing "AB".
<pre>A&lt;script&gt; var text = document.createTextNode('B'); document.body.appendChild(text); &lt;/script&gt;C</pre>	Three <a href="#">Text</a> <sup>p51</sup> nodes; "A" before the script, the script's contents, and "BC" after the script (the parser appends to the <a href="#">Text</a> <sup>p51</sup> node created by the script).
<pre>A&lt;script&gt; var text = document.getElementsByName('script')[0].firstChild; text.data = 'B'; document.body.appendChild(text); &lt;/script&gt;C</pre>	Two adjacent <a href="#">Text</a> <sup>p51</sup> nodes in the document, containing "A" and "BC".
<pre>A&lt;table&gt;B&lt;tr&gt;C&lt;/tr&gt;D&lt;/table&gt;</pre>	One <a href="#">Text</a> <sup>p51</sup> node before the table, containing "ABCD". (This is caused by <a href="#">foster parenting</a> <sup>p994</sup> .)
<pre>A&lt;table&gt;&lt;tr&gt; B&lt;/tr&gt; C&lt;/table&gt;</pre>	One <a href="#">Text</a> <sup>p51</sup> node before the table, containing "A B C" (A-space-B-space-C). (This is caused by <a href="#">foster parenting</a> <sup>p994</sup> .)
<pre>A&lt;table&gt;&lt;tr&gt; B&lt;/tr&gt; &lt;/em&gt;C&lt;/table&gt;</pre>	One <a href="#">Text</a> <sup>p51</sup> node before the table, containing "A BC" (A-space-B-C), and one <a href="#">Text</a> <sup>p51</sup> node inside the table (as a child of a <a href="#">tbody</a> <sup>p408</sup> ) with a single space character. (Space characters separated from non-space characters by non-character tokens are not affected by <a href="#">foster parenting</a> <sup>p994</sup> , even if those other tokens then get ignored.)

When the steps below require the user agent to **insert a comment** while processing a comment token, optionally with an explicitly insertion position *position*, the user agent must run the following steps:

1. Let *data* be the data given in the comment token being processed.
2. If *position* was specified, then let the *adjusted insertion location* be *position*. Otherwise, let *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p994</sup>.
3. Create a [Comment](#)<sup>p51</sup> node whose *data* attribute is set to *data* and whose [node document](#) is the same as that of the node in which the *adjusted insertion location* finds itself.
4. Insert the newly created node at the *adjusted insertion location*.

DOM mutation events must not fire for changes caused by the UA parsing the document. This includes the parsing of any content inserted using [document.write\(\)](#)<sup>p851</sup> and [document.writeln\(\)](#)<sup>p851</sup> calls. [\[DOMEVENTS\]](#)<sup>p1149</sup>

However, [mutation observers](#) do fire, as required by the DOM specification.

### 12.2.5.2 Parsing elements that contain only text

The **generic raw text element parsing algorithm** and the **generic RCDATA element parsing algorithm** consist of the following steps. These algorithms are always invoked in response to a start tag token.

1. Insert an [HTML element](#)<sup>p996</sup> for the token.
2. If the algorithm that was invoked is the [generic raw text element parsing algorithm](#)<sup>p999</sup>, switch the tokenizer to the [RAWTEXT state](#)<sup>p967</sup>; otherwise the algorithm invoked was the [generic RCDATA element parsing algorithm](#)<sup>p999</sup>, switch the tokenizer to the [RCDATA state](#)<sup>p967</sup>.
3. Let the [original insertion mode](#)<sup>p961</sup> be the current [insertion mode](#)<sup>p961</sup>.
4. Then, switch the [insertion mode](#)<sup>p961</sup> to "text"<sup>p1017</sup>.

### 12.2.5.3 Closing elements that have implied end tags

When the steps below require the UA to **generate implied end tags**, then, while the [current node](#)<sup>p963</sup> is a [dd](#)<sup>p202</sup> element, a [dt](#)<sup>p201</sup> element, an [li](#)<sup>p198</sup> element, an [option](#)<sup>p505</sup> element, an [optgroup](#)<sup>p504</sup> element, a [p](#)<sup>p187</sup> element, an [rp](#)<sup>p225</sup> element, or an [rt](#)<sup>p225</sup> element, the UA must pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

If a step requires the UA to generate implied end tags but lists an element to exclude from the process, then the UA must perform the above steps as if that element was not in the above list.

When the steps below require the UA to **generate all implied end tags thoroughly**, then, while the [current node](#)<sup>p963</sup> is a [caption](#)<sup>p405</sup> element, a [colgroup](#)<sup>p406</sup> element, a [dd](#)<sup>p202</sup> element, a [dt](#)<sup>p201</sup> element, an [li](#)<sup>p198</sup> element, an [option](#)<sup>p505</sup> element, an [optgroup](#)<sup>p504</sup> element, a [p](#)<sup>p187</sup> element, an [rp](#)<sup>p225</sup> element, an [rt](#)<sup>p225</sup> element, a [tbody](#)<sup>p408</sup> element, a [td](#)<sup>p412</sup> element, a [tfoot](#)<sup>p410</sup> element, a [th](#)<sup>p414</sup> element, a [thead](#)<sup>p409</sup> element, or a [tr](#)<sup>p411</sup> element, the UA must pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

### 12.2.5.4 The rules for parsing tokens in HTML content

#### 12.2.5.4.1 The "initial" insertion mode

When the user agent is to apply the rules for the "[initial](#)<sup>p999</sup>" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

- ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

Ignore the token.

- ↪ A comment token

[Insert a comment](#)<sup>p998</sup> as the last child of the [Document](#)<sup>p102</sup> object.

- ↪ A DOCTYPE token

If the DOCTYPE token's name is not a [case-sensitive](#)<sup>p58</sup> match for the string "html", or the token's public identifier is not missing, or the token's system identifier is neither missing nor a [case-sensitive](#)<sup>p58</sup> match for the string "about:legacy-compat"<sup>p82</sup>, and none of the sets of conditions in the following list are matched, then there is a [parse error](#)<sup>p953</sup>.

- The DOCTYPE token's name is a [case-sensitive](#)<sup>p58</sup> match for the string "html", the token's public identifier is the [case-sensitive](#)<sup>p58</sup> string "-//W3C//DTD HTML 4.0//EN", and the token's system identifier is either missing or the [case-sensitive](#)<sup>p58</sup> string "http://www.w3.org/TR/REC-html40/strict.dtd".
- The DOCTYPE token's name is a [case-sensitive](#)<sup>p58</sup> match for the string "html", the token's public identifier is the [case-sensitive](#)<sup>p58</sup> string "-//W3C//DTD HTML 4.01//EN", and the token's system identifier is either missing or the [case-sensitive](#)<sup>p58</sup> string "http://www.w3.org/TR/html4/strict.dtd".
- The DOCTYPE token's name is a [case-sensitive](#)<sup>p58</sup> match for the string "html", the token's public identifier is the [case-sensitive](#)<sup>p58</sup> string "-//W3C//DTD XHTML 1.0 Strict//EN", and the token's system identifier is the [case-sensitive](#)<sup>p58</sup> string "http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd".

- The DOCTYPE token's name is a [case-sensitive<sup>p58</sup>](#) match for the string "html", the token's public identifier is the [case-sensitive<sup>p58</sup>](#) string "-//W3C//DTD XHTML 1.1//EN", and the token's system identifier is the [case-sensitive<sup>p58</sup>](#) string "http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd".

Conformance checkers may, based on the values (including presence or lack thereof) of the DOCTYPE token's name, public identifier, or system identifier, switch to a conformance checking mode for another language (e.g. based on the DOCTYPE token a conformance checker could recognise that the document is an HTML4-era document, and defer to an HTML4 conformance checker.)

Append a [DocumentType<sup>p51</sup>](#) node to the [Document<sup>p102</sup>](#) node, with the `name` attribute set to the name given in the DOCTYPE token, or the empty string if the name was missing; the `publicId` attribute set to the public identifier given in the DOCTYPE token, or the empty string if the public identifier was missing; the `systemId` attribute set to the system identifier given in the DOCTYPE token, or the empty string if the system identifier was missing; and the other attributes specific to [DocumentType<sup>p51</sup>](#) objects set to null and empty lists as appropriate. Associate the [DocumentType<sup>p51</sup>](#) node with the [Document<sup>p102</sup>](#) object so that it is returned as the value of the `doctype` attribute of the [Document<sup>p102</sup>](#) object.

Then, if the document is *not* [an iframe srcdoc document<sup>p300</sup>](#), and the DOCTYPE token matches one of the conditions in the following list, then set the [Document<sup>p102</sup>](#) to [quirks mode<sup>p51</sup>](#):

- The [force-quirks flag<sup>p966</sup>](#) is set to *on*.
- The name is set to anything other than "html" (compared [case-sensitively<sup>p58</sup>](#)).
- The public identifier is set to: "-//W3O//DTD W3 HTML Strict 3.0//EN//"
- The public identifier is set to: "-//W3C/DTD HTML 4.0 Transitional//EN"
- The public identifier is set to: "HTML"
- The system identifier is set to: "http://www.ibm.com/data/dtd/v11/ibmxhtml1-transitional.dtd"
- The public identifier starts with: "+//Silmaril//dtd html Pro v0r11 19970101//"
- The public identifier starts with: "-//AS//DTD HTML 3.0 asWedit + extensions//"
- The public identifier starts with: "-//AdvaSoft Ltd//DTD HTML 3.0 asWedit + extensions//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict//"
- The public identifier starts with: "-//IETF//DTD HTML 2.1E//"
- The public identifier starts with: "-//IETF//DTD HTML 3.0//"
- The public identifier starts with: "-//IETF//DTD HTML 3.2 Final//"
- The public identifier starts with: "-//IETF//DTD HTML 3.2//"
- The public identifier starts with: "-//IETF//DTD HTML 3//"
- The public identifier starts with: "-//IETF//DTD HTML Level 0//"
- The public identifier starts with: "-//IETF//DTD HTML Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML Level 3//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 0//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 3//"
- The public identifier starts with: "-//IETF//DTD HTML Strict//"
- The public identifier starts with: "-//IETF//DTD HTML//"
- The public identifier starts with: "-//Metrius//DTD Metrius Presentational//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 HTML Strict//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 HTML//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 Tables//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 HTML Strict//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 HTML//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 Tables//"
- The public identifier starts with: "-//Netscape Comm. Corp.//DTD HTML//"
- The public identifier starts with: "-//Netscape Comm. Corp.//DTD Strict HTML//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML 2.0//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML Extended 1.0//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML Extended Relaxed 1.0//"
- The public identifier starts with: "-//SQ//DTD HTML 2.0 HoTMetal + extensions//"
- The public identifier starts with: "-//SoftQuad Software//DTD HoTMetal PRO 6.0::19990601::extensions to HTML 4.0//"
- The public identifier starts with: "-//SoftQuad//DTD HoTMetal PRO 4.0::19971010::extensions to HTML 4.0//"
- The public identifier starts with: "-//Spyglass//DTD HTML 2.0 Extended//"
- The public identifier starts with: "-//Sun Microsystems Corp.//DTD HotJava HTML//"
- The public identifier starts with: "-//Sun Microsystems Corp.//DTD HotJava Strict HTML//"
- The public identifier starts with: "-//W3C//DTD HTML 3 1995-03-24//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2 Draft//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2 Final//"

- The public identifier starts with: "-//W3C//DTD HTML 3.2//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2S Draft//"
- The public identifier starts with: "-//W3C//DTD HTML 4.0 Frameset//"
- The public identifier starts with: "-//W3C//DTD HTML 4.0 Transitional//"
- The public identifier starts with: "-//W3C//DTD HTML Experimental 19960712//"
- The public identifier starts with: "-//W3C//DTD HTML Experimental 970421//"
- The public identifier starts with: "-//W3C//DTD W3 HTML//"
- The public identifier starts with: "-//W3O//DTD W3 HTML 3.0//"
- The public identifier starts with: "-//WebTechs//DTD Mozilla HTML 2.0//"
- The public identifier starts with: "-//WebTechs//DTD Mozilla HTML//"
- The system identifier is missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Frameset//"
- The system identifier is missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Transitional//"

Otherwise, if the document is *not* an [iframe srcdoc document](#)<sup>p300</sup>, and the DOCTYPE token matches one of the conditions in the following list, then set the [Document](#)<sup>p102</sup> to [limited-quirks mode](#)<sup>p51</sup>.

- The public identifier starts with: "-//W3C//DTD XHTML 1.0 Frameset//"
- The public identifier starts with: "-//W3C//DTD XHTML 1.0 Transitional//"
- The system identifier is not missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Frameset//"
- The system identifier is not missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Transitional//"

The system identifier and public identifier strings must be compared to the values given in the lists above in an [ASCII case-insensitive](#)<sup>p58</sup> manner. A system identifier whose value is the empty string is not considered missing for the purposes of the conditions above.

Then, switch the [insertion mode](#)<sup>p961</sup> to "[before html](#)"<sup>p1001</sup>.

#### ↪ Anything else

If the document is *not* an [iframe srcdoc document](#)<sup>p300</sup>, then this is a [parse error](#)<sup>p953</sup>; set the [Document](#)<sup>p102</sup> to [quirks mode](#)<sup>p51</sup>.

In any case, switch the [insertion mode](#)<sup>p961</sup> to "[before html](#)"<sup>p1001</sup>, then reprocess the token.

### 12.2.5.4.2 The "before html" insertion mode

When the user agent is to apply the rules for the "[before html](#)"<sup>p1001</sup> [insertion mode](#)<sup>b961</sup>, the user agent must handle the token as follows:

#### ↪ A DOCTYPE token

[Parse error](#)<sup>p953</sup>. Ignore the token.

#### ↪ A comment token

[Insert a comment](#)<sup>p998</sup> as the last child of the [Document](#)<sup>p102</sup> object.

#### ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

Ignore the token.

#### ↪ A start tag whose tag name is "html"

[Create an element for the token](#)<sup>p995</sup> in the [HTML namespace](#)<sup>p101</sup>, with the [Document](#)<sup>p102</sup> as the intended parent. Append it to the [Document](#)<sup>p102</sup> object. Put this element in the [stack of open elements](#)<sup>p962</sup>.

If the [Document](#)<sup>p102</sup> is being loaded as part of [navigation](#)<sup>b791</sup> of a [browsing context](#)<sup>b762</sup>, then: if the newly created element has a [manifest](#)<sup>b137</sup> attribute whose value is not the empty string, then [resolve](#)<sup>p82</sup> the value of that attribute to an [absolute URL](#)<sup>p48</sup>, relative to the newly created element, and if that is successful, run the [application cache selection algorithm](#)<sup>p822</sup> with the result of applying the [URL serialiser](#)<sup>p48</sup> algorithm to the resulting [parsed URL](#)<sup>p48</sup> with the [exclude fragment flag](#) set; otherwise, if there is no such attribute, or its value is the empty string, or resolving its value fails, run the [application cache selection algorithm](#)<sup>p822</sup> with no manifest. The algorithm must be passed the [Document](#)<sup>p102</sup> object.

Switch the [insertion mode](#)<sup>p961</sup> to "[before head](#)"<sup>p1002</sup>.

#### ↪ An end tag whose tag name is one of: "head", "body", "html", "br"

Act as described in the "anything else" entry below.

↪ **Any other end tag**

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ **Anything else**

Create an [html<sup>p137</sup>](#) element whose [node document](#) is the [Document<sup>p102</sup>](#) object. Append it to the [Document<sup>p102</sup>](#) object. Put this element in the [stack of open elements<sup>p962</sup>](#).

If the [Document<sup>p102</sup>](#) is being loaded as part of [navigation<sup>b791</sup>](#) of a [browsing context<sup>b762</sup>](#), then: run the [application cache selection algorithm<sup>p822</sup>](#) with no manifest, passing it the [Document<sup>p102</sup>](#) object.

Switch the [insertion mode<sup>p961</sup>](#) to "[before head<sup>p1002</sup>](#)", then reprocess the token.

The root element can end up being removed from the [Document<sup>p102</sup>](#) object, e.g. by scripts; nothing in particular happens in such cases, content continues being appended to the nodes as described in the next section.

#### 12.2.5.4.3 The "before head" insertion mode

When the user agent is to apply the rules for the "[before head<sup>p1002</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Ignore the token.

↪ **A comment token**

[Insert a comment<sup>p998</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).

↪ **A start tag whose tag name is "head"**

[Insert an HTML element<sup>p996</sup>](#) for the token.

Set the [head element pointer<sup>p965</sup>](#) to the newly created [head<sup>p138</sup>](#) element.

Switch the [insertion mode<sup>p961</sup>](#) to "[in head<sup>p1002</sup>](#)".

↪ **An end tag whose tag name is one of: "head", "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **Any other end tag**

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ **Anything else**

[Insert an HTML element<sup>p996</sup>](#) for a "head" start tag token with no attributes.

Set the [head element pointer<sup>p965</sup>](#) to the newly created [head<sup>p138</sup>](#) element.

Switch the [insertion mode<sup>p961</sup>](#) to "[in head<sup>p1002</sup>](#)".

Reprocess the current token.

#### 12.2.5.4.4 The "in head" insertion mode

When the user agent is to apply the rules for the "[in head<sup>p1002</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Insert the character<sup>p997</sup>.](#)

↪ A comment token

[Insert a comment<sup>p998</sup>.](#)

↪ A DOCTYPE token

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ A start tag whose tag name is "html"

Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).

↪ A start tag whose tag name is one of: "base", "basefont", "bgsound", "link"

[Insert an HTML element<sup>p996</sup>](#) for the token. Immediately pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#).

[Acknowledge the token's self-closing flag<sup>p966</sup>](#), if it is set.

↪ A start tag whose tag name is "meta"

[Insert an HTML element<sup>p986</sup>](#) for the token. Immediately pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#).

[Acknowledge the token's self-closing flag<sup>p966</sup>](#), if it is set.

If the element has a [charset<sup>p146</sup>](#) attribute, and [getting an encoding](#) from its value results in a supported [ASCII-compatible character encoding<sup>p44</sup>](#) or a [UTF-16 encoding<sup>p44</sup>](#), and the [confidence<sup>p955</sup>](#) is currently *tentative*, then [change the encoding<sup>p960</sup>](#) to the resulting encoding.

Otherwise, if the element has an [http-equiv<sup>p149</sup>](#) attribute whose value is an [ASCII case-insensitive<sup>p58</sup>](#) match for the string "Content-Type", and the element has a [content<sup>p146</sup>](#) attribute, and applying the [algorithm for extracting a character encoding from a meta element<sup>p86</sup>](#) to that attribute's value returns a supported [ASCII-compatible character encoding<sup>p44</sup>](#) or a [UTF-16 encoding<sup>p44</sup>](#), and the [confidence<sup>p955</sup>](#) is currently *tentative*, then [change the encoding<sup>p960</sup>](#) to the extracted encoding.

↪ A start tag whose tag name is "title"

Follow the [generic RCDATA element parsing algorithm<sup>p999</sup>](#).

↪ A start tag whose tag name is "noscript", if the [scripting flag<sup>p965</sup>](#) is enabled

↪ A start tag whose tag name is one of: "noframes", "style"

Follow the [generic raw text element parsing algorithm<sup>p999</sup>](#).

↪ A start tag whose tag name is "noscript", if the [scripting flag<sup>p965</sup>](#) is disabled

[Insert an HTML element<sup>p996</sup>](#) for the token.

Switch the [insertion mode<sup>p961</sup>](#) to "[in head noscript<sup>p1004</sup>](#)".

↪ A start tag whose tag name is "script"

Run these steps:

1. Let the *adjusted insertion location* be the [appropriate place for inserting a node<sup>p994</sup>](#).
2. [Create an element for the token<sup>p995</sup>](#) in the [HTML namespace<sup>p101</sup>](#), with the intended parent being the element in which the *adjusted insertion location* finds itself.
3. Mark the element as being "[parser-inserted<sup>p593</sup>](#)" and unset the element's "[non-blocking<sup>p593</sup>](#)" flag.

**Note** This ensures that, if the script is external, any [document.write\(\)<sup>p851</sup>](#) calls in the script will execute in-line, instead of blowing the document away, as would happen in most other cases. It also prevents the script from executing until the end tag is seen.

4. If the parser was originally created for the [HTML fragment parsing algorithm<sup>p1043</sup>](#), then mark the [script<sup>p591</sup>](#) element as "[already started<sup>p593</sup>](#)". ([fragment case<sup>p1043</sup>](#))
5. Insert the newly created element at the *adjusted insertion location*.

6. Push the element onto the [stack of open elements](#)<sup>p962</sup> so that it is the new [current node](#)<sup>p963</sup>.
7. Switch the tokenizer to the [script data state](#)<sup>p967</sup>.
8. Let the [original insertion mode](#)<sup>p961</sup> be the current [insertion mode](#)<sup>p961</sup>.
9. Switch the [insertion mode](#)<sup>p961</sup> to "[text](#)<sup>p1017</sup>".

↪ **An end tag whose tag name is "head"**

Pop the [current node](#)<sup>p963</sup> (which will be the [head](#)<sup>p138</sup> element) off the [stack of open elements](#)<sup>p962</sup>.

Switch the [insertion mode](#)<sup>p961</sup> to "[after head](#)<sup>p1005</sup>".

↪ **An end tag whose tag name is one of: "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **A start tag whose tag name is "template"**

[Insert an HTML element](#)<sup>p996</sup> for the token.

Insert a [marker](#)<sup>p964</sup> at the end of the [list of active formatting elements](#)<sup>p964</sup>.

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

Switch the [insertion mode](#)<sup>p961</sup> to "[in template](#)<sup>p1027</sup>".

Push "[in template](#)<sup>p1027</sup>" onto the [stack of template insertion modes](#)<sup>p961</sup> so that it is the new [current template insertion mode](#)<sup>p961</sup>.

↪ **An end tag whose tag name is "template"**

If there is no [template](#)<sup>p604</sup> element on the [stack of open elements](#)<sup>p962</sup>, then this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate all implied end tags thoroughly](#)<sup>p999</sup>.
2. If the [current node](#)<sup>p963</sup> is not a [template](#)<sup>p604</sup> element, then this is a [parse error](#)<sup>p953</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p962</sup> until a [template](#)<sup>p604</sup> element has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker](#)<sup>p965</sup>.
5. Pop the [current template insertion mode](#)<sup>p961</sup> off the [stack of template insertion modes](#)<sup>p961</sup>.
6. [Reset the insertion mode appropriately](#)<sup>p961</sup>.

↪ **A start tag whose tag name is "head"**

↪ **Any other end tag**

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ **Anything else**

Pop the [current node](#)<sup>p963</sup> (which will be the [head](#)<sup>p138</sup> element) off the [stack of open elements](#)<sup>p962</sup>.

Switch the [insertion mode](#)<sup>p961</sup> to "[after head](#)<sup>p1005</sup>".

Reprocess the token.

#### 12.2.5.4.5 The "in head noscript" insertion mode

When the user agent is to apply the rules for the "[in head noscript](#)<sup>p1004</sup>" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

↪ **A DOCTYPE token**

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ A start tag whose tag name is "html"

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)" [insertion mode](#)<sup>p961</sup>.

↪ An end tag whose tag name is "noscript"

Pop the [current node](#)<sup>p963</sup> (which will be a [noscript](#)<sup>p602</sup> element) from the [stack of open elements](#)<sup>p962</sup>; the new [current node](#)<sup>p963</sup> will be a [head](#)<sup>p138</sup> element.

Switch the [insertion mode](#)<sup>p961</sup> to "[in head](#)"<sup>p1002</sup>.

↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

↪ A comment token

↪ A start tag whose tag name is one of: "basefont", "bgsound", "link", "meta", "noframes", "style"

Process the token [using the rules for](#)<sup>p961</sup> the "[in head](#)"<sup>p1002</sup> [insertion mode](#)<sup>p961</sup>.

↪ An end tag whose tag name is "br"

Act as described in the "anything else" entry below.

↪ A start tag whose tag name is one of: "head", "noscript"

↪ Any other end tag

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ Anything else

[Parse error](#)<sup>p953</sup>.

Pop the [current node](#)<sup>p963</sup> (which will be a [noscript](#)<sup>p602</sup> element) from the [stack of open elements](#)<sup>p962</sup>; the new [current node](#)<sup>p963</sup> will be a [head](#)<sup>p138</sup> element.

Switch the [insertion mode](#)<sup>p961</sup> to "[in head](#)"<sup>p1002</sup>.

Reprocess the token.

#### 12.2.5.4.6 The "after head" insertion mode

When the user agent is to apply the rules for the "[after head](#)"<sup>p1005</sup> [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Insert the character](#)<sup>p997</sup>.

↪ A comment token

[Insert a comment](#)<sup>p998</sup>.

↪ A DOCTYPE token

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ A start tag whose tag name is "html"

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)"<sup>p1006</sup> [insertion mode](#)<sup>p961</sup>.

↪ A start tag whose tag name is "body"

[Insert an HTML element](#)<sup>p996</sup> for the token.

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

Switch the [insertion mode](#)<sup>p961</sup> to "[in body](#)"<sup>p1006</sup>.

↪ A start tag whose tag name is "frameset"

[Insert an HTML element](#)<sup>p996</sup> for the token.

Switch the [insertion mode](#)<sup>p961</sup> to "in frameset"<sup>p1028</sup>.

- ↪ A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"  
[Parse error](#)<sup>p953</sup>.

Push the node pointed to by the [head element pointer](#)<sup>p965</sup> onto the [stack of open elements](#)<sup>p962</sup>.

Process the token [using the rules for](#)<sup>p961</sup> the "in head"<sup>p1002</sup> [insertion mode](#)<sup>p961</sup>.

Remove the node pointed to by the [head element pointer](#)<sup>p965</sup> from the [stack of open elements](#)<sup>p962</sup>. (It might not be the [current node](#)<sup>p963</sup> at this point.)

**Note** *The [head element pointer](#)<sup>p965</sup> cannot be null at this point.*

- ↪ An end tag whose tag name is "template"

Process the token [using the rules for](#)<sup>p961</sup> the "in head"<sup>p1002</sup> [insertion mode](#)<sup>p961</sup>.

- ↪ An end tag whose tag name is one of: "body", "html", "br"

Act as described in the "anything else" entry below.

- ↪ A start tag whose tag name is "head"

- ↪ Any other end tag

[Parse error](#)<sup>p953</sup>. Ignore the token.

- ↪ Anything else

[Insert an HTML element](#)<sup>p996</sup> for a "body" start tag token with no attributes.

Switch the [insertion mode](#)<sup>p961</sup> to "in body"<sup>p1006</sup>.

Reprocess the current token.

#### 12.2.5.4.7 The "in body" insertion mode

When the user agent is to apply the rules for the "in body"<sup>p1006</sup> [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

- ↪ A character token that is U+0000 NULL

[Parse error](#)<sup>p953</sup>. Ignore the token.

- ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.

[Insert the token's character](#)<sup>p997</sup>.

- ↪ Any other character token

[Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.

[Insert the token's character](#)<sup>p997</sup>.

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

- ↪ A comment token

[Insert a comment](#)<sup>p998</sup>.

- ↪ A DOCTYPE token

[Parse error](#)<sup>p953</sup>. Ignore the token.

- ↪ A start tag whose tag name is "html"

[Parse error](#)<sup>p953</sup>.

If there is a template<sup>b604</sup> element on the stack of open elements<sup>p962</sup>, then ignore the token.

Otherwise, for each attribute on the token, check to see if the attribute is already present on the top element of the stack of open elements<sup>p962</sup>. If it is not, add the attribute and its corresponding value to that element.

↪ A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"

↪ An end tag whose tag name is "template"

Process the token using the rules for<sup>p961</sup> the "in head<sup>p1002</sup>" insertion mode<sup>p961</sup>.

↪ A start tag whose tag name is "body"

Parse error<sup>p953</sup>.

If the second element on the stack of open elements<sup>p962</sup> is not a body<sup>p157</sup> element, if the stack of open elements<sup>p962</sup> has only one node on it, or if there is a template<sup>b604</sup> element on the stack of open elements<sup>p962</sup>, then ignore the token. (fragment case<sup>p1043</sup>)

Otherwise, set the frameset-ok flag<sup>p965</sup> to "not ok"; then, for each attribute on the token, check to see if the attribute is already present on the body<sup>b157</sup> element (the second element) on the stack of open elements<sup>p962</sup>, and if it is not, add the attribute and its corresponding value to that element.

↪ A start tag whose tag name is "frameset"

Parse error<sup>p953</sup>.

If the stack of open elements<sup>p962</sup> has only one node on it, or if the second element on the stack of open elements<sup>p962</sup> is not a body<sup>p157</sup> element, then ignore the token. (fragment case<sup>p1043</sup>)

If the frameset-ok flag<sup>p965</sup> is set to "not ok", ignore the token.

Otherwise, run the following steps:

1. Remove the second element on the stack of open elements<sup>p962</sup> from its parent node, if it has one.
2. Pop all the nodes from the bottom of the stack of open elements<sup>p962</sup>, from the current node<sup>p963</sup> up to, but not including, the root html<sup>p137</sup> element.
3. Insert an HTML element<sup>p996</sup> for the token.
4. Switch the insertion mode<sup>p961</sup> to "in frameset<sup>p1028</sup>".

↪ An end-of-file token

If the stack of template insertion modes<sup>p961</sup> is not empty, then process the token using the rules for<sup>p961</sup> the "in template<sup>p1027</sup>" insertion mode<sup>p961</sup>.

Otherwise, follow these steps:

1. If there is a node in the stack of open elements<sup>p962</sup> that is not either a dd<sup>p202</sup> element, a dt<sup>p201</sup> element, an li<sup>p198</sup> element, an optgroup<sup>p504</sup> element, an option<sup>p505</sup> element, a p<sup>p187</sup> element, an rp<sup>p225</sup> element, an rt<sup>p225</sup> element, a tbody<sup>p408</sup> element, a td<sup>p412</sup> element, a tfoot<sup>p410</sup> element, a th<sup>p414</sup> element, a thead<sup>p409</sup> element, a tr<sup>p411</sup> element, the body<sup>p157</sup> element, or the html<sup>p137</sup> element, then this is a parse error<sup>p953</sup>.
2. Stop parsing<sup>p1033</sup>.

↪ An end tag whose tag name is "body"

If the stack of open elements<sup>p962</sup> does not have a body element in scope<sup>p963</sup>, this is a parse error<sup>p953</sup>; ignore the token.

Otherwise, if there is a node in the stack of open elements<sup>p962</sup> that is not either a dd<sup>p202</sup> element, a dt<sup>p201</sup> element, an li<sup>p198</sup> element, an optgroup<sup>p504</sup> element, an option<sup>p505</sup> element, a p<sup>p187</sup> element, an rp<sup>p225</sup> element, an rt<sup>p225</sup> element, a tbody<sup>p408</sup> element, a td<sup>p412</sup> element, a tfoot<sup>p410</sup> element, a th<sup>p414</sup> element, a thead<sup>p409</sup> element, a tr<sup>p411</sup> element, the body<sup>p157</sup> element, or the html<sup>p137</sup> element, then this is a parse error<sup>p953</sup>.

Switch the insertion mode<sup>p961</sup> to "after body<sup>p1028</sup>".

↪ An end tag whose tag name is "html"

If the [stack of open elements](#)<sup>p962</sup> does not [have a body element in scope](#)<sup>p963</sup>, this is a [parse error](#)<sup>p953</sup>, ignore the token.

Otherwise, if there is a node in the [stack of open elements](#)<sup>p962</sup> that is not either a [dd](#)<sup>p202</sup> element, a [dt](#)<sup>p201</sup> element, an [li](#)<sup>p198</sup> element, an [optgroup](#)<sup>p504</sup> element, an [option](#)<sup>p505</sup> element, a [p](#)<sup>p187</sup> element, an [rp](#)<sup>p225</sup> element, an [rt](#)<sup>p225</sup> element, a [tbody](#)<sup>p408</sup> element, a [td](#)<sup>p412</sup> element, a [tfoot](#)<sup>p410</sup> element, a [th](#)<sup>p144</sup> element, a [thead](#)<sup>p409</sup> element, a [tr](#)<sup>p411</sup> element, the [body](#)<sup>p157</sup> element, or the [html](#)<sup>p137</sup> element, then this is a [parse error](#)<sup>p953</sup>.

Switch the [insertion mode](#)<sup>p961</sup> to "[after body](#)<sup>p1028</sup>".

Reprocess the token.

↪ A start tag whose tag name is one of: "address", "article", "aside", "blockquote", "center", "details", "dialog", "dir", "div", "dl", "fieldset", "figcaption", "figure", "footer", "header", "hgroup", "main", "menu", "nav", "ol", "p", "section", "summary", "ul"

If the [stack of open elements](#)<sup>p962</sup> has a [p](#) element in button scope<sup>p964</sup>, then [close a p element](#)<sup>p1015</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token.

↪ A start tag whose tag name is one of: "h1", "h2", "h3", "h4", "h5", "h6"

If the [stack of open elements](#)<sup>p962</sup> has a [p](#) element in button scope<sup>p964</sup>, then [close a p element](#)<sup>p1015</sup>.

If the [current node](#)<sup>p963</sup> is an [HTML element](#)<sup>p42</sup> whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6", then this is a [parse error](#)<sup>p953</sup>; pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token.

↪ A start tag whose tag name is one of: "pre", "listing"

If the [stack of open elements](#)<sup>p962</sup> has a [p](#) element in button scope<sup>p964</sup>, then [close a p element](#)<sup>p1015</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token.

If the [next token](#)<sup>p994</sup> is a U+000A LINE FEED (LF) character token, then ignore that token and move on to the next one. (Newlines at the start of [pre](#)<sup>p191</sup> blocks are ignored as an authoring convenience.)

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

↪ A start tag whose tag name is "form"

If the [form element pointer](#)<sup>p965</sup> is not null, and there is no [template](#)<sup>p604</sup> element on the [stack of open elements](#)<sup>p962</sup>, then this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise:

If the [stack of open elements](#)<sup>p962</sup> has a [p](#) element in button scope<sup>p964</sup>, then [close a p element](#)<sup>p1015</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token, and, if there is no [template](#)<sup>p604</sup> element on the [stack of open elements](#)<sup>p962</sup>, set the [form element pointer](#)<sup>p965</sup> to point to the element created.

↪ A start tag whose tag name is "li"

Run these steps:

1. Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".
2. Initialise *node* to be the [current node](#)<sup>p963</sup> (the bottommost node of the stack).
3. *Loop*: If *node* is an [li](#)<sup>p198</sup> element, then run these substeps:
  1. [Generate implied end tags](#)<sup>p999</sup>, except for [li](#)<sup>p198</sup> elements.
  2. If the [current node](#)<sup>p963</sup> is not an [li](#)<sup>p198</sup> element, then this is a [parse error](#)<sup>p953</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p962</sup> until an [li](#)<sup>p198</sup> element has been popped from the stack.
  4. Jump to the step labeled *done* below.

4. If *node* is in the [special<sup>p963</sup>](#) category, but is not an [address<sup>p175</sup>](#), [div<sup>p207</sup>](#), or [p<sup>p187</sup>](#) element, then jump to the step labeled *done* below.
5. Otherwise, set *node* to the previous entry in the [stack of open elements<sup>p962</sup>](#) and return to the step labeled *loop*.
6. *Done*: If the [stack of open elements<sup>p962</sup>](#) has a [p element in button scope<sup>p964</sup>](#), then [close a p element<sup>p1015</sup>](#).
7. Finally, [insert an HTML element<sup>p996</sup>](#) for the token.

↪ A start tag whose tag name is one of: "dd", "dt"

Run these steps:

1. Set the [frameset-ok flag<sup>p965</sup>](#) to "not ok".
2. Initialise *node* to be the [current node<sup>p963</sup>](#) (the bottommost node of the stack).
3. *Loop*: If *node* is a [dd<sup>p202</sup>](#) element, then run these substeps:
  1. [Generate implied end tags<sup>p999</sup>](#), except for [dd<sup>p202</sup>](#) elements.
  2. If the [current node<sup>p963</sup>](#) is not a [dd<sup>p202</sup>](#) element, then this is a [parse error<sup>p953</sup>](#).
  3. Pop elements from the [stack of open elements<sup>p962</sup>](#) until a [dd<sup>p202</sup>](#) element has been popped from the stack.
  4. Jump to the step labeled *done* below.
4. If *node* is a [dt<sup>p201</sup>](#) element, then run these substeps:
  1. [Generate implied end tags<sup>p999</sup>](#), except for [dt<sup>p201</sup>](#) elements.
  2. If the [current node<sup>p963</sup>](#) is not a [dt<sup>p201</sup>](#) element, then this is a [parse error<sup>p953</sup>](#).
  3. Pop elements from the [stack of open elements<sup>p962</sup>](#) until a [dt<sup>p201</sup>](#) element has been popped from the stack.
  4. Jump to the step labeled *done* below.
5. If *node* is in the [special<sup>p963</sup>](#) category, but is not an [address<sup>p175</sup>](#), [div<sup>p207</sup>](#), or [p<sup>p187</sup>](#) element, then jump to the step labeled *done* below.
6. Otherwise, set *node* to the previous entry in the [stack of open elements<sup>p962</sup>](#) and return to the step labeled *loop*.
7. *Done*: If the [stack of open elements<sup>p962</sup>](#) has a [p element in button scope<sup>p964</sup>](#), then [close a p element<sup>p1015</sup>](#).
8. Finally, [insert an HTML element<sup>p996</sup>](#) for the token.

↪ A start tag whose tag name is "plaintext"

If the [stack of open elements<sup>p962</sup>](#) has a [p element in button scope<sup>p964</sup>](#), then [close a p element<sup>p1015</sup>](#).

[Insert an HTML element<sup>p996</sup>](#) for the token.

Switch the tokenizer to the [PLAINTEXT state<sup>p968</sup>](#).

**Note** Once a start tag with the tag name "plaintext" has been seen, that will be the last token ever seen other than character tokens (and the end-of-file token), because there is no way to switch out of the [PLAINTEXT state<sup>p968</sup>](#).

↪ A start tag whose tag name is "button"

1. If the [stack of open elements<sup>p962</sup>](#) has a [button element in scope<sup>p963</sup>](#), then run these substeps:
  1. [Parse error<sup>p953</sup>](#).
  2. [Generate implied end tags<sup>p999</sup>](#).
  3. Pop elements from the [stack of open elements<sup>p962</sup>](#) until a [button<sup>p495</sup>](#) element has been popped from the stack.
2. [Reconstruct the active formatting elements<sup>p964</sup>](#), if any.
3. [Insert an HTML element<sup>p996</sup>](#) for the token.

4. Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

↪ An end tag whose tag name is one of: "address", "article", "aside", "blockquote", "button", "center", "details", "dialog", "dir", "div", "dl", "fieldset", "figcaption", "figure", "footer", "header", "hgroup", "listing", "main", "menu", "nav", "ol", "pre", "section", "summary", "ul"

If the [stack of open elements](#)<sup>p962</sup> does not [have an element in scope](#)<sup>p963</sup> that is an [HTML element](#)<sup>p42</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p999</sup>.

2. If the [current node](#)<sup>p963</sup> is not an [HTML element](#)<sup>p42</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p953</sup>.

3. Pop elements from the [stack of open elements](#)<sup>p962</sup> until an [HTML element](#)<sup>p42</sup> with the same tag name as the token has been popped from the stack.

↪ An end tag whose tag name is "form"

If there is no [template](#)<sup>b604</sup> element on the [stack of open elements](#)<sup>p962</sup>, then run these substeps:

1. Let *node* be the element that the [form element pointer](#)<sup>p965</sup> is set to, or null if it is not set to an element.

2. Set the [form element pointer](#)<sup>p965</sup> to null.

3. If *node* is null or if the [stack of open elements](#)<sup>p962</sup> does not [have node in scope](#)<sup>p963</sup>, then this is a [parse error](#)<sup>p953</sup>; abort these steps and ignore the token.

4. [Generate implied end tags](#)<sup>p999</sup>.

5. If the [current node](#)<sup>p963</sup> is not *node*, then this is a [parse error](#)<sup>p953</sup>.

6. Remove *node* from the [stack of open elements](#)<sup>p962</sup>.

If there is a [template](#)<sup>b604</sup> element on the [stack of open elements](#)<sup>p962</sup>, then run these substeps instead:

1. If the [stack of open elements](#)<sup>p962</sup> does not [have a form element in scope](#)<sup>p963</sup>, then this is a [parse error](#)<sup>p953</sup>, abort these steps and ignore the token.

2. [Generate implied end tags](#)<sup>p999</sup>.

3. If the [current node](#)<sup>p963</sup> is not a [form](#)<sup>p447</sup> element, then this is a [parse error](#)<sup>p953</sup>.

4. Pop elements from the [stack of open elements](#)<sup>p962</sup> until a [form](#)<sup>p447</sup> element has been popped from the stack.

↪ An end tag whose tag name is "p"

If the [stack of open elements](#)<sup>p962</sup> does not [have a p element in button scope](#)<sup>p964</sup>, then this is a [parse error](#)<sup>p953</sup>; [insert an HTML element](#)<sup>p996</sup> for a "p" start tag token with no attributes.

[Close a p element](#)<sup>p1015</sup>.

↪ An end tag whose tag name is "li"

If the [stack of open elements](#)<sup>p962</sup> does not [have an li element in list item scope](#)<sup>p964</sup>, then this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p999</sup>, except for [li](#)<sup>p198</sup> elements.

2. If the [current node](#)<sup>p963</sup> is not an [li](#)<sup>p198</sup> element, then this is a [parse error](#)<sup>p953</sup>.

3. Pop elements from the [stack of open elements](#)<sup>p962</sup> until an [li](#)<sup>p198</sup> element has been popped from the stack.

↪ An end tag whose tag name is one of: "dd", "dt"

If the [stack of open elements](#)<sup>p962</sup> does not [have an element in scope](#)<sup>p963</sup> that is an [HTML element](#)<sup>p42</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise, run these steps:

1. Generate implied end tags<sup>p999</sup>, except for HTML elements<sup>p42</sup> with the same tag name as the token.
2. If the current node<sup>p963</sup> is not an HTML element<sup>p42</sup> with the same tag name as that of the token, then this is a parse error<sup>p953</sup>.
3. Pop elements from the stack of open elements<sup>p962</sup> until an HTML element<sup>p42</sup> with the same tag name as the token has been popped from the stack.

↪ An end tag whose tag name is one of: "h1", "h2", "h3", "h4", "h5", "h6"

If the stack of open elements<sup>p962</sup> does not have an element in scope<sup>p963</sup> that is an HTML element<sup>p42</sup> and whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6", then this is a parse error<sup>p953</sup>; ignore the token.

Otherwise, run these steps:

1. Generate implied end tags<sup>p999</sup>.
2. If the current node<sup>p963</sup> is not an HTML element<sup>p42</sup> with the same tag name as that of the token, then this is a parse error<sup>p953</sup>.
3. Pop elements from the stack of open elements<sup>p962</sup> until an HTML element<sup>p42</sup> whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6" has been popped from the stack.

↪ An end tag whose tag name is "sarcasm"

Take a deep breath, then act as described in the "any other end tag" entry below.

↪ A start tag whose tag name is "a"

If the list of active formatting elements<sup>p964</sup> contains an a<sup>p208</sup> element between the end of the list and the last marker<sup>p964</sup> on the list (or the start of the list if there is no marker<sup>p964</sup> on the list), then this is a parse error<sup>p953</sup>; run the adoption agency algorithm<sup>p1015</sup> for the tag name "a", then remove that element from the list of active formatting elements<sup>p964</sup> and the stack of open elements<sup>p962</sup> if the adoption agency algorithm<sup>p1015</sup> didn't already remove it (it might not have if the element is not in table scope<sup>p964</sup>).

**Example** In the non-conforming stream `<a href="a">a<table><a href="b">b</table>x`, the first a<sup>p208</sup> element would be closed upon seeing the second one, and the "x" character would be inside a link to "b", not to "a". This is despite the fact that the outer a<sup>p208</sup> element is not in table scope (meaning that a regular `</a>` end tag at the start of the table wouldn't close the outer a<sup>p208</sup> element). The result is that the two a<sup>p208</sup> elements are indirectly nested inside each other — non-conforming markup will often result in non-conforming DOMs when parsed.

Reconstruct the active formatting elements<sup>p964</sup>, if any.

Insert an HTML element<sup>p996</sup> for the token. Push onto the list of active formatting elements<sup>p964</sup> that element.

↪ A start tag whose tag name is one of: "b", "big", "code", "em", "font", "i", "s", "small", "strike", "strong", "tt", "u"

Reconstruct the active formatting elements<sup>p964</sup>, if any.

Insert an HTML element<sup>p996</sup> for the token. Push onto the list of active formatting elements<sup>p964</sup> that element.

↪ A start tag whose tag name is "nobr"

Reconstruct the active formatting elements<sup>p964</sup>, if any.

If the stack of open elements<sup>p962</sup> has a nobr element in scope<sup>p963</sup>, then this is a parse error<sup>p953</sup>; run the adoption agency algorithm<sup>p1015</sup> for the tag name "nobr", then once again reconstruct the active formatting elements<sup>p964</sup>, if any.

Insert an HTML element<sup>p996</sup> for the token. Push onto the list of active formatting elements<sup>p964</sup> that element.

↪ An end tag whose tag name is one of: "a", "b", "big", "code", "em", "font", "i", "nobr", "s", "small", "strike", "strong", "tt", "u"

Run the adoption agency algorithm<sup>p1015</sup> for the token's tag name.

↪ A start tag whose tag name is one of: "applet", "marquee", "object"

Reconstruct the active formatting elements<sup>p964</sup>, if any.

Insert an HTML element<sup>p996</sup> for the token.

Insert a marker<sup>p964</sup> at the end of the list of active formatting elements<sup>p964</sup>.

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

↪ A end tag token whose tag name is one of: "applet", "marquee", "object"

If the [stack of open elements](#)<sup>p962</sup> does not [have an element in scope](#)<sup>p963</sup> that is an [HTML element](#)<sup>p42</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p999</sup>.
2. If the [current node](#)<sup>p963</sup> is not an [HTML element](#)<sup>p42</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p953</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p962</sup> until an [HTML element](#)<sup>p42</sup> with the same tag name as the token has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker](#)<sup>p965</sup>.

↪ A start tag whose tag name is "table"

If the [Document](#)<sup>p102</sup> is *not* set to [quirks mode](#)<sup>p51</sup>, and the [stack of open elements](#)<sup>p962</sup> [has a p element in button scope](#)<sup>p964</sup>, then [close a p element](#)<sup>p1015</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token.

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

Switch the [insertion mode](#)<sup>p961</sup> to "[in table](#)<sup>p1018</sup>".

↪ An end tag whose tag name is "br"

[Parse error](#)<sup>p953</sup>. Drop the attributes from the token, and act as described in the next entry; i.e. act as if this was a "br" start tag token with no attributes, rather than the end tag token that it actually is.

↪ A start tag whose tag name is one of: "area", "br", "embed", "img", "keygen", "wbr"

[Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.

[Insert an HTML element](#)<sup>p996</sup> for the token. Immediately pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p966</sup>, if it is set.

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

↪ A start tag whose tag name is "input"

[Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.

[Insert an HTML element](#)<sup>p996</sup> for the token. Immediately pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p966</sup>, if it is set.

If the token does not have an attribute with the name "type", or if it does, but that attribute's value is not an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "hidden", then: set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

↪ A start tag whose tag name is one of: "menuitem", "param", "source", "track"

[Insert an HTML element](#)<sup>p996</sup> for the token. Immediately pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p966</sup>, if it is set.

↪ A start tag whose tag name is "hr"

If the [stack of open elements](#)<sup>p962</sup> [has a p element in button scope](#)<sup>p964</sup>, then [close a p element](#)<sup>p1015</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token. Immediately pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p966</sup>, if it is set.

Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".

↪ A start tag whose tag name is "image"

[Parse error](#). Change the token's tag name to "img" and reprocess it. (Don't ask.)

↪ A start tag whose tag name is "isindex"

[Parse error](#).

If there is no [template](#) element on the [stack of open elements](#) and the [form element pointer](#) is not null, then ignore the token.

Otherwise:

[Acknowledge the token's self-closing flag](#), if it is set.

Set the [frameset-ok flag](#) to "not ok".

If the [stack of open elements](#) has a [p element in button scope](#), then [close a p element](#).

[Insert an HTML element](#) for a "form" start tag token with no attributes, and, if there is no [template](#) element on the [stack of open elements](#), set the [form element pointer](#) to point to the element created.

If the token has an attribute called "action", set the [action](#) attribute on the resulting [form](#) element to the value of the "action" attribute of the token.

[Insert an HTML element](#) for an "hr" start tag token with no attributes. Immediately pop the [current node](#) off the [stack of open elements](#).

[Reconstruct the active formatting elements](#), if any.

[Insert an HTML element](#) for a "label" start tag token with no attributes.

[Insert characters](#) (see below for [what they should say](#)).

[Insert an HTML element](#) for an "input" start tag token with all the attributes from the "isindex" token except "name", "action", and "prompt", and with an attribute named "name" with the value "isindex". (This creates an [input](#) element with the [name](#) attribute set to the magic value "[isindex](#)").) Immediately pop the [current node](#) off the [stack of open elements](#).

[Insert more characters](#) (see below for [what they should say](#)).

Pop the [current node](#) (which will be the [label](#) element created earlier) off the [stack of open elements](#).

[Insert an HTML element](#) for an "hr" start tag token with no attributes. Immediately pop the [current node](#) off the [stack of open elements](#).

Pop the [current node](#) (which will be the [form](#) element created earlier) off the [stack of open elements](#), and, if there is no [template](#) element on the [stack of open elements](#), set the [form element pointer](#) back to null.

**Prompt:** If the token has an attribute with the name "prompt", then the first stream of characters must be the same string as given in that attribute, and the second stream of characters must be empty. Otherwise, the two streams of character tokens together should, together with the [input](#) element, express the equivalent of "This is a searchable index. Enter search keywords: (input field)" in the user's preferred language.

↪ A start tag whose tag name is "textarea"

Run these steps:

1. [Insert an HTML element](#) for the token.
2. If the [next token](#) is a U+000A LINE FEED (LF) character token, then ignore that token and move on to the next one. (Newlines at the start of [textarea](#) elements are ignored as an authoring convenience.)
3. Switch the tokenizer to the [RCDATA state](#).
4. Let the [original insertion mode](#) be the current [insertion mode](#).

5. Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".
  6. Switch the [insertion mode](#)<sup>p961</sup> to "[text](#)"<sup>p1017</sup>.
- ↪ A start tag whose tag name is "xmp"
- If the [stack of open elements](#)<sup>p962</sup> has a [p element in button scope](#)<sup>p964</sup>, then [close a p element](#)<sup>p1015</sup>.
- [Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.
- Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".
- Follow the [generic raw text element parsing algorithm](#)<sup>p999</sup>.
- ↪ A start tag whose tag name is "iframe"
- Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".
- Follow the [generic raw text element parsing algorithm](#)<sup>p999</sup>.
- ↪ A start tag whose tag name is "noembed"
- ↪ A start tag whose tag name is "noscript", if the [scripting flag](#)<sup>p965</sup> is enabled
- Follow the [generic raw text element parsing algorithm](#)<sup>p999</sup>.
- ↪ A start tag whose tag name is "select"
- [Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.
- [Insert an HTML element](#)<sup>p996</sup> for the token.
- Set the [frameset-ok flag](#)<sup>p965</sup> to "not ok".
- If the [insertion mode](#)<sup>p961</sup> is one of "[in table](#)"<sup>p1018</sup>, "[in caption](#)"<sup>p1020</sup>, "[in table body](#)"<sup>p1022</sup>, "[in row](#)"<sup>p1023</sup>, or "[in cell](#)"<sup>p1024</sup>, then switch the [insertion mode](#)<sup>p961</sup> to "[in select in table](#)". Otherwise, switch the [insertion mode](#)<sup>p961</sup> to "[in select](#)".
- ↪ A start tag whose tag name is one of: "optgroup", "option"
- If the [current node](#)<sup>p963</sup> is an [option](#)<sup>p505</sup> element, then pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.
- [Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.
- [Insert an HTML element](#)<sup>p996</sup> for the token.
- ↪ A start tag whose tag name is one of: "rp", "rt"
- If the [stack of open elements](#)<sup>p962</sup> has a [ruby element in scope](#)<sup>p963</sup>, then [generate implied end tags](#)<sup>p999</sup>. If the [current node](#)<sup>p963</sup> is not then a [ruby](#)<sup>p219</sup> element, this is a [parse error](#)<sup>p953</sup>.
- [Insert an HTML element](#)<sup>p996</sup> for the token.
- ↪ A start tag whose tag name is "math"
- [Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.
- [Adjust MathML attributes](#)<sup>p996</sup> for the token. (This fixes the case of MathML attributes that are not all lowercase.)
- [Adjust foreign attributes](#)<sup>p997</sup> for the token. (This fixes the use of namespaced attributes, in particular XLink.)
- [Insert a foreign element](#)<sup>p995</sup> for the token, in the [MathML namespace](#)<sup>p101</sup>.
- If the token has its [self-closing flag](#)<sup>p966</sup> set, pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup> and [acknowledge the token's self-closing flag](#)<sup>p966</sup>.
- ↪ A start tag whose tag name is "svg"
- [Reconstruct the active formatting elements](#)<sup>p964</sup>, if any.
- [Adjust SVG attributes](#)<sup>p996</sup> for the token. (This fixes the case of SVG attributes that are not all lowercase.)

[Adjust foreign attributes<sup>p997</sup>](#) for the token. (This fixes the use of namespaced attributes, in particular XLink in SVG.)

[Insert a foreign element<sup>p995</sup>](#) for the token, in the [SVG namespace<sup>p101</sup>](#).

If the token has its [self-closing flag<sup>p966</sup>](#) set, pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#) and [acknowledge the token's self-closing flag<sup>p966</sup>](#).

- ↪ A start tag whose tag name is one of: "caption", "col", "colgroup", "frame", "head", "tbody", "td", "tfoot", "th", "thead", "tr"  
[Parse error<sup>p953</sup>](#). Ignore the token.

- ↪ Any other start tag

[Reconstruct the active formatting elements<sup>p964</sup>](#), if any.

[Insert an HTML element<sup>p996</sup>](#) for the token.

**Note** This element will be an [ordinary<sup>p963</sup>](#) element.

- ↪ Any other end tag

Run these steps:

1. Initialise *node* to be the [current node<sup>p963</sup>](#) (the bottommost node of the stack).
2. *Loop*: If *node* is an [HTML element<sup>p42</sup>](#) with the same tag name as the token, then:
  1. [Generate implied end tags<sup>p999</sup>](#), except for [HTML elements<sup>p42</sup>](#) with the same tag name as the token.
  2. If *node* is not the [current node<sup>p963</sup>](#), then this is a [parse error<sup>p953</sup>](#).
  3. Pop all the nodes from the [current node<sup>p963</sup>](#) up to *node*, including *node*, then stop these steps.
3. Otherwise, if *node* is in the [special<sup>p963</sup>](#) category, then this is a [parse error<sup>p953</sup>](#); ignore the token, and abort these steps.
4. Set *node* to the previous entry in the [stack of open elements<sup>p962</sup>](#).
5. Return to the step labeled *loop*.

When the steps above say the user agent is to **close a p element**, it means that the user agent must run the following steps:

1. [Generate implied end tags<sup>p999</sup>](#), except for [p<sup>187</sup>](#) elements.
2. If the [current node<sup>p963</sup>](#) is not a [p<sup>187</sup>](#) element, then this is a [parse error<sup>p953</sup>](#).
3. Pop elements from the [stack of open elements<sup>p962</sup>](#) until a [p<sup>187</sup>](#) element has been popped from the stack.

The **adoption agency algorithm**, which takes as its only argument a tag name *subject* for which the algorithm is being run, consists of the following steps:

1. If the [current node<sup>p963</sup>](#) is an [HTML element<sup>p42</sup>](#) whose tag name is *subject*, and the [current node<sup>p963</sup>](#) is not in the [list of active formatting elements<sup>p964</sup>](#), then pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#), and abort these steps.
2. Let *outer loop counter* be zero.
3. *Outer loop*: If *outer loop counter* is greater than or equal to eight, then abort these steps.
4. Increment *outer loop counter* by one.
5. Let *formatting element* be the last element in the [list of active formatting elements<sup>p964</sup>](#) that:
  - is between the end of the list and the last [marker<sup>p964</sup>](#) in the list, if any, or the start of the list otherwise, and
  - has the tag name *subject*.

If there is no such element, then abort these steps and instead act as described in the "any other end tag" entry above.

6. If *formatting element* is not in the [stack of open elements<sup>p962</sup>](#), then this is a [parse error<sup>p953</sup>](#); remove the element from the list, and abort these steps.

7. If *formatting element* is in the [stack of open elements](#)<sup>p962</sup>, but the element is not [in scope](#)<sup>p963</sup>, then this is a [parse error](#)<sup>p953</sup>; abort these steps.
8. If *formatting element* is not the [current node](#)<sup>p963</sup>, this is a [parse error](#)<sup>p953</sup>. (But do not abort these steps.)
9. Let *furthest block* be the topmost node in the [stack of open elements](#)<sup>p962</sup> that is lower in the stack than *formatting element*, and is an element in the [special](#)<sup>p963</sup> category. There might not be one.
10. If there is no *furthest block*, then the UA must first pop all the nodes from the bottom of the [stack of open elements](#)<sup>p962</sup>, from the [current node](#)<sup>p963</sup> up to and including *formatting element*, then remove *formatting element* from the [list of active formatting elements](#)<sup>p964</sup>, and finally abort these steps.
11. Let *common ancestor* be the element immediately above *formatting element* in the [stack of open elements](#)<sup>p962</sup>.
12. Let a bookmark note the position of *formatting element* in the [list of active formatting elements](#)<sup>p964</sup> relative to the elements on either side of it in the list.
13. Let *node* and *last node* be *furthest block*. Follow these steps:
  1. Let *inner loop counter* be zero.
  2. *Inner loop*: Increment *inner loop counter* by one.
  3. Let *node* be the element immediately above *node* in the [stack of open elements](#)<sup>p962</sup>, or if *node* is no longer in the [stack of open elements](#)<sup>p962</sup> (e.g. because it got removed by this algorithm), the element that was immediately above *node* in the [stack of open elements](#)<sup>p962</sup> before *node* was removed.
  4. If *node* is *formatting element*, then go to the next step in the overall algorithm.
  5. If *inner loop counter* is greater than three and *node* is in the [list of active formatting elements](#)<sup>p964</sup>, then remove *node* from the [list of active formatting elements](#)<sup>p964</sup>.
  6. If *node* is not in the [list of active formatting elements](#)<sup>p964</sup>, then remove *node* from the [stack of open elements](#)<sup>p962</sup> and then go back to the step labeled *inner loop*.
  7. [Create an element for the token](#)<sup>p995</sup> for which the element *node* was created, in the [HTML namespace](#)<sup>p101</sup>, with *common ancestor* as the intended parent; replace the entry for *node* in the [list of active formatting elements](#)<sup>p964</sup> with an entry for the new element, replace the entry for *node* in the [stack of open elements](#)<sup>p962</sup> with an entry for the new element, and let *node* be the new element.
  8. If *last node* is *furthest block*, then move the aforementioned bookmark to be immediately after the new *node* in the [list of active formatting elements](#)<sup>p964</sup>.
  9. Insert *last node* into *node*, first removing it from its previous parent node if any.
  10. Let *last node* be *node*.
  11. Return to the step labeled *inner loop*.
14. Insert whatever *last node* ended up being in the previous step at the [appropriate place for inserting a node](#)<sup>p994</sup>, but using *common ancestor* as the *override target*.
15. [Create an element for the token](#)<sup>p995</sup> for which *formatting element* was created, in the [HTML namespace](#)<sup>p101</sup>, with *furthest block* as the intended parent.
16. Take all of the child nodes of *furthest block* and append them to the element created in the last step.
17. Append that new element to *furthest block*.
18. Remove *formatting element* from the [list of active formatting elements](#)<sup>p964</sup>, and insert the new element into the [list of active formatting elements](#)<sup>p964</sup> at the position of the aforementioned bookmark.
19. Remove *formatting element* from the [stack of open elements](#)<sup>p962</sup>, and insert the new element into the [stack of open elements](#)<sup>p962</sup> immediately below the position of *furthest block* in that stack.
20. Jump back to the step labeled *outer loop*.

**Note** This algorithm's name, the "adoption agency algorithm", comes from the way it causes elements to change parents, and is in contrast with other possible algorithms for dealing with misnested content, which included the "incest algorithm", the "secret affair algorithm", and the "Heisenberg algorithm".

#### 12.2.5.4.8 The "text" insertion mode

When the user agent is to apply the rules for the "[text<sup>p1017</sup>](#) [insertion mode<sup>p961</sup>](#)", the user agent must handle the token as follows:

↪ A character token

[Insert the token's character<sup>p997</sup>](#).

**Note** This can never be a U+0000 NULL character; the tokenizer converts those to U+FFFD REPLACEMENT CHARACTER characters.

↪ An end-of-file token

[Parse error<sup>p953</sup>](#).

If the [current node<sup>p963</sup>](#) is a [script<sup>p591</sup>](#) element, mark the [script<sup>p591</sup>](#) element as ["already started"<sup>p593</sup>](#).

Pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#).

Switch the [insertion mode<sup>p961</sup>](#) to the [original insertion mode<sup>p961</sup>](#) and reprocess the token.

↪ An end tag whose tag name is "script"

If the [stack of script settings objects<sup>p830</sup>](#) is empty, [perform a microtask checkpoint<sup>p837</sup>](#).

Let *script* be the [current node<sup>p963</sup>](#) (which will be a [script<sup>p591</sup>](#) element).

Pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#).

Switch the [insertion mode<sup>p961</sup>](#) to the [original insertion mode<sup>p961</sup>](#).

Let the *old insertion point* have the same value as the current [insertion point<sup>p961</sup>](#). Let the [insertion point<sup>p961</sup>](#) be just before the [next input character<sup>p961</sup>](#).

Increment the parser's [script nesting level<sup>p954</sup>](#) by one.

[Prepare<sup>p593</sup>](#) the *script*. This might cause some script to execute, which might cause [new characters to be inserted into the tokenizer<sup>p851</sup>](#), and might cause the tokenizer to output more tokens, resulting in a [reentrant invocation of the parser<sup>p954</sup>](#).

Decrement the parser's [script nesting level<sup>p954</sup>](#) by one. If the parser's [script nesting level<sup>p954</sup>](#) is zero, then set the [parser pause flag<sup>p954</sup>](#) to false.

Let the [insertion point<sup>p961</sup>](#) have the value of the *old insertion point*. (In other words, restore the [insertion point<sup>p961</sup>](#) to its previous value. This value might be the "undefined" value.)

At this stage, if there is a [pending parsing-blocking script<sup>p596</sup>](#), then:

↪ If the [script nesting level<sup>p954</sup>](#) is not zero:

Set the [parser pause flag<sup>p954</sup>](#) to true, and abort the processing of any nested invocations of the tokenizer, yielding control back to the caller. (Tokenization will resume when the caller returns to the "outer" tree construction stage.)

**Note** The tree construction stage of this particular parser is [being called reentrantly<sup>p954</sup>](#), say from a call to [document.write\(\)<sup>p851</sup>](#).

↪ Otherwise:

Run these steps:

1. Let *script* be the [pending parsing-blocking script<sup>p596</sup>](#). There is no longer a [pending parsing-blocking script<sup>p596</sup>](#).

2. Block the [tokenizer](#)<sup>p965</sup> for this instance of the [HTML parser](#)<sup>p952</sup>, such that the [event loop](#)<sup>p834</sup> will not run [tasks](#)<sup>p834</sup> that invoke the [tokenizer](#)<sup>p965</sup>.
  3. If the parser's [Document](#)<sup>p102</sup> [has a style sheet that is blocking scripts](#)<sup>p157</sup> or [the script's "ready to be parser-executed"](#)<sup>p593</sup> flag is not set: [spin the event loop](#)<sup>p838</sup> until the parser's [Document](#)<sup>p102</sup> [has no style sheet that is blocking scripts](#)<sup>p157</sup> and [the script's "ready to be parser-executed"](#)<sup>p593</sup> flag is set.
  4. If this [parser has been aborted](#)<sup>p1033</sup> in the meantime, abort these steps.
- Note** *This could happen if, e.g., while the [spin the event loop](#)<sup>p838</sup> algorithm is running, the [browsing context](#)<sup>p762</sup> gets closed, or the [document.open\(\)](#)<sup>p848</sup> method gets invoked on the [Document](#)<sup>p102</sup>.*
5. Unblock the [tokenizer](#)<sup>p965</sup> for this instance of the [HTML parser](#)<sup>p952</sup>, such that [tasks](#)<sup>p834</sup> that invoke the [tokenizer](#)<sup>p965</sup> can again be run.
  6. Let the [insertion point](#)<sup>p961</sup> be just before the [next input character](#)<sup>p961</sup>.
  7. Increment the parser's [script nesting level](#)<sup>p954</sup> by one (it should be zero before this step, so this sets it to one).
  8. [Execute](#)<sup>p596</sup> [the script](#).
  9. Decrement the parser's [script nesting level](#)<sup>p954</sup> by one. If the parser's [script nesting level](#)<sup>p954</sup> is zero (which it always should be at this point), then set the [parser pause flag](#)<sup>p954</sup> to false.
  10. Let the [insertion point](#)<sup>p961</sup> be undefined again.
  11. If there is once again a [pending parsing-blocking script](#)<sup>p596</sup>, then repeat these steps from step 1.

#### ↪ Any other end tag

Pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

Switch the [insertion mode](#)<sup>p961</sup> to the [original insertion mode](#)<sup>p961</sup>.

#### 12.2.5.4.9 The "in table" insertion mode

When the user agent is to apply the rules for the "[in table](#)<sup>p1018</sup>" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

#### ↪ A character token, if the [current node](#)<sup>p963</sup> is [table](#)<sup>p398</sup>, [tbody](#)<sup>p408</sup>, [tfoot](#)<sup>p410</sup>, [thead](#)<sup>p409</sup>, or [tr](#)<sup>p411</sup> element

Let the [pending table character tokens](#) be an empty list of tokens.

Let the [original insertion mode](#)<sup>p961</sup> be the current [insertion mode](#)<sup>p961</sup>.

Switch the [insertion mode](#)<sup>p961</sup> to "[in table text](#)<sup>p1020</sup>" and reprocess the token.

#### ↪ A comment token

[Insert a comment](#)<sup>p998</sup>.

#### ↪ A DOCTYPE token

[Parse error](#)<sup>p953</sup>. Ignore the token.

#### ↪ A start tag whose tag name is "caption"

[Clear the stack back to a table context](#)<sup>p1020</sup>. (See below.)

Insert a [marker](#)<sup>p964</sup> at the end of the [list of active formatting elements](#)<sup>p964</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token, then switch the [insertion mode](#)<sup>p961</sup> to "[in caption](#)<sup>p1020</sup>".

#### ↪ A start tag whose tag name is "colgroup"

[Clear the stack back to a table context](#)<sup>p1020</sup>. (See below.)

[Insert an HTML element](#)<sup>p996</sup> for the token, then switch the [insertion mode](#)<sup>p961</sup> to "[in column group](#)<sup>p1021</sup>".

↪ A start tag whose tag name is "col"

[Clear the stack back to a table context](#)<sup>p1020</sup>. (See below.)

[Insert an HTML element](#)<sup>p996</sup> for a "colgroup" start tag token with no attributes, then switch the [insertion mode](#)<sup>p961</sup> to "in column group".

Reprocess the current token.

↪ A start tag whose tag name is one of: "tbody", "tfoot", "thead"

[Clear the stack back to a table context](#)<sup>p1020</sup>. (See below.)

[Insert an HTML element](#)<sup>p996</sup> for the token, then switch the [insertion mode](#)<sup>p961</sup> to "in table body".

↪ A start tag whose tag name is one of: "td", "th", "tr"

[Clear the stack back to a table context](#)<sup>p1020</sup>. (See below.)

[Insert an HTML element](#)<sup>p996</sup> for a "tbody" start tag token with no attributes, then switch the [insertion mode](#)<sup>p961</sup> to "in table body".

Reprocess the current token.

↪ A start tag whose tag name is "table"

[Parse error](#)<sup>p953</sup>.

If the [stack of open elements](#)<sup>p962</sup> does not [have a table element in table scope](#)<sup>p964</sup>, ignore the token.

Otherwise:

Pop elements from this stack until a [table](#)<sup>p398</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

Reprocess the token.

↪ An end tag whose tag name is "table"

If the [stack of open elements](#)<sup>p962</sup> does not [have a table element in table scope](#)<sup>p964</sup>, this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise:

Pop elements from this stack until a [table](#)<sup>p398</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

↪ An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "tbody", "td", "tfoot", "th", "thead", "tr"

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ A start tag whose tag name is one of: "style", "script", "template"

↪ An end tag whose tag name is "template"

Process the token [using the rules for](#)<sup>p961</sup> the "in head"<sup>p1002</sup> [insertion mode](#)<sup>p961</sup>.

↪ A start tag whose tag name is "input"

If the token does not have an attribute with the name "type", or if it does, but that attribute's value is not an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "hidden", then: act as described in the "anything else" entry below.

Otherwise:

[Parse error](#)<sup>p953</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token.

Pop that [input](#)<sup>p452</sup> element off the [stack of open elements](#)<sup>p962</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p966</sup>, if it is set.

↪ A start tag whose tag name is "form"

[Parse error<sup>p953</sup>.](#)

If there is a [template<sup>p604</sup>](#) element on the [stack of open elements<sup>p962</sup>](#), or if the [form element pointer<sup>p965</sup>](#) is not null, ignore the token.

Otherwise:

[Insert an HTML element<sup>p996</sup>](#) for the token, and set the [form element pointer<sup>p965</sup>](#) to point to the element created.

Pop that [form<sup>p447</sup>](#) element off the [stack of open elements<sup>p962</sup>](#).

↪ An end-of-file token

Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).

↪ Anything else

[Parse error<sup>p953</sup>](#). Enable [foster parenting<sup>p994</sup>](#), process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#), and then disable [foster parenting<sup>p994</sup>](#).

When the steps above require the UA to **clear the stack back to a table context**, it means that the UA must, while the [current node<sup>p963</sup>](#) is not a [table<sup>p398</sup>](#), [template<sup>p604</sup>](#), or [html<sup>p137</sup>](#) element, pop elements from the [stack of open elements<sup>p962</sup>](#).

**Note** *This is the same list of elements as used in the [has an element in table scope<sup>p964</sup>](#) steps.*

**Note** *The [current node<sup>p963</sup>](#) being an [html<sup>p137</sup>](#) element after this process is a [fragment case<sup>p1043</sup>](#).*

#### 12.2.5.4.10 The "in table text" insertion mode

When the user agent is to apply the rules for the "[in table text<sup>p1020</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

↪ A character token that is U+0000 NULL

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ Any other character token

Append the character token to the [pending table character tokens<sup>p1018</sup>](#) list.

↪ Anything else

If any of the tokens in the [pending table character tokens<sup>p1018</sup>](#) list are character tokens that are not [space characters<sup>p58</sup>](#), then this is a [parse error<sup>p953</sup>](#): reprocess the character tokens in the [pending table character tokens<sup>p1018</sup>](#) list using the rules given in the "anything else" entry in the "[in table<sup>p1018</sup>](#)" insertion mode.

Otherwise, [insert the characters<sup>p997</sup>](#) given by the [pending table character tokens<sup>p1018</sup>](#) list.

Switch the [insertion mode<sup>p961</sup>](#) to the [original insertion mode<sup>p961</sup>](#) and reprocess the token.

#### 12.2.5.4.11 The "in caption" insertion mode

When the user agent is to apply the rules for the "[in caption<sup>p1020</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

↪ An end tag whose tag name is "caption"

If the [stack of open elements<sup>p962</sup>](#) does not [have a caption element in table scope<sup>p964</sup>](#), this is a [parse error<sup>p953</sup>](#); ignore the token.  
([fragment case<sup>p1043</sup>](#))

Otherwise:

[Generate implied end tags<sup>p999</sup>](#).

Now, if the [current node<sup>p963</sup>](#) is not a [caption<sup>p405</sup>](#) element, then this is a [parse error<sup>p953</sup>](#).

Pop elements from this stack until a [caption<sup>p405</sup>](#) element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker<sup>p965</sup>](#).

Switch the [insertion mode<sup>p961</sup>](#) to "[in table<sup>p1018</sup>](#)".

↪ A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "td", "tfoot", "th", "thead", "tr"

↪ An end tag whose tag name is "table"

If the [stack of open elements<sup>p962</sup>](#) does not [have a caption element in table scope<sup>p964</sup>](#), this is a [parse error<sup>p953</sup>](#); ignore the token.  
([fragment case<sup>p1043</sup>](#))

Otherwise:

[Generate implied end tags<sup>p999</sup>](#).

Now, if the [current node<sup>p963</sup>](#) is not a [caption<sup>p405</sup>](#) element, then this is a [parse error<sup>p953</sup>](#).

Pop elements from this stack until a [caption<sup>p405</sup>](#) element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker<sup>p965</sup>](#).

Switch the [insertion mode<sup>p961</sup>](#) to "[in table<sup>p1018</sup>](#)".

Reprocess the token.

↪ An end tag whose tag name is one of: "body", "col", "colgroup", "html", "tbody", "td", "tfoot", "th", "thead", "tr"

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ Anything else

Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).

#### 12.2.5.4.12 The "in column group" insertion mode

When the user agent is to apply the rules for the "[in column group<sup>p1021</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Insert the character<sup>p997</sup>](#).

↪ A comment token

[Insert a comment<sup>p998</sup>](#).

↪ A DOCTYPE token

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ A start tag whose tag name is "html"

Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).

↪ A start tag whose tag name is "col"

[Insert an HTML element<sup>p996</sup>](#) for the token. Immediately pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#).

[Acknowledge the token's self-closing flag<sup>p966</sup>](#), if it is set.

↪ An end tag whose tag name is "colgroup"

If the [current node<sup>p963</sup>](#) is not a [colgroup<sup>p406</sup>](#) element, then this is a [parse error<sup>p953</sup>](#); ignore the token.

Otherwise, pop the [current node<sup>p963</sup>](#) from the [stack of open elements<sup>p962</sup>](#). Switch the [insertion mode<sup>p961</sup>](#) to "[in table<sup>p1018</sup>](#)".

↪ An end tag whose tag name is "col"

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ A start tag whose tag name is "template"

↪ An end tag whose tag name is "template"

Process the token [using the rules for](#)<sup>p961</sup> the "[in head](#)<sup>p1002</sup>" [insertion mode](#)<sup>p961</sup>.

↪ An end-of-file token

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)<sup>p1006</sup>" [insertion mode](#)<sup>p961</sup>.

↪ Anything else

If the [current node](#)<sup>p963</sup> is not a [colgroup](#)<sup>p406</sup> element, then this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise, pop the [current node](#)<sup>p963</sup> from the [stack of open elements](#)<sup>p962</sup>.

Switch the [insertion mode](#)<sup>p961</sup> to "[in table](#)<sup>p1018</sup>".

Reprocess the token.

#### 12.2.5.4.13 The "in table body" insertion mode

When the user agent is to apply the rules for the "[in table body](#)<sup>p1022</sup>" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

↪ A start tag whose tag name is "tr"

[Clear the stack back to a table body context](#)<sup>p1023</sup>. (See below.)

[Insert an HTML element](#)<sup>p996</sup> for the token, then switch the [insertion mode](#)<sup>p961</sup> to "[in row](#)<sup>p1023</sup>".

↪ A start tag whose tag name is one of: "th", "td"

[Parse error](#)<sup>p953</sup>.

[Clear the stack back to a table body context](#)<sup>p1023</sup>. (See below.)

[Insert an HTML element](#)<sup>p996</sup> for a "tr" start tag token with no attributes, then switch the [insertion mode](#)<sup>p961</sup> to "[in row](#)<sup>p1023</sup>".

Reprocess the current token.

↪ An end tag whose tag name is one of: "tbody", "tfoot", "thead"

If the [stack of open elements](#)<sup>p962</sup> does not [have an element in table scope](#)<sup>p964</sup> that is an [HTML element](#)<sup>p42</sup> with the same tag name as the token, this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table body context](#)<sup>p1023</sup>. (See below.)

Pop the [current node](#)<sup>p963</sup> from the [stack of open elements](#)<sup>p962</sup>. Switch the [insertion mode](#)<sup>p961</sup> to "[in table](#)<sup>p1018</sup>".

↪ A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "tfoot", "thead"

↪ An end tag whose tag name is "table"

If the [stack of open elements](#)<sup>p962</sup> does not [have a tbody, thead, or tfoot element in table scope](#)<sup>p964</sup>, this is a [parse error](#)<sup>p953</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table body context](#)<sup>p1023</sup>. (See below.)

Pop the [current node](#)<sup>p963</sup> from the [stack of open elements](#)<sup>p962</sup>. Switch the [insertion mode](#)<sup>p961</sup> to "[in table](#)<sup>p1018</sup>".

Reprocess the token.

↪ An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "td", "th", "tr"

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ Anything else

Process the token [using the rules for<sup>p961</sup>](#) the "[in table<sup>p1018</sup>](#)" [insertion mode<sup>p961</sup>](#).

When the steps above require the UA to **clear the stack back to a table body context**, it means that the UA must, while the [current node<sup>p963</sup>](#) is not a [tbody<sup>p408</sup>](#), [tfoot<sup>p410</sup>](#), [thead<sup>p409</sup>](#), [template<sup>p604</sup>](#), or [html<sup>p137</sup>](#) element, pop elements from the [stack of open elements<sup>p962</sup>](#).

**Note** *The current node<sup>p963</sup> being an [html<sup>p137</sup>](#) element after this process is a [fragment case<sup>p1043</sup>](#).*

#### 12.2.5.4.14 The "in row" insertion mode

When the user agent is to apply the rules for the "[in row<sup>p1023</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

↪ A start tag whose tag name is one of: "th", "td"

[Clear the stack back to a table row context<sup>p1024</sup>](#). (See below.)

[Insert an HTML element<sup>p996</sup>](#) for the token, then switch the [insertion mode<sup>p961</sup>](#) to "[in cell<sup>p1024</sup>](#)".

Insert a [marker<sup>p964</sup>](#) at the end of the [list of active formatting elements<sup>p964</sup>](#).

↪ An end tag whose tag name is "tr"

If the [stack of open elements<sup>p962</sup>](#) does not [have a \[tr\]\(#\) element in table scope<sup>p964</sup>](#), this is a [parse error<sup>p953</sup>](#), ignore the token.

Otherwise:

[Clear the stack back to a table row context<sup>p1024</sup>](#). (See below.)

Pop the [current node<sup>p963</sup>](#) (which will be a [tr<sup>p411</sup>](#) element) from the [stack of open elements<sup>p962</sup>](#). Switch the [insertion mode<sup>p961</sup>](#) to "[in table body<sup>p1022</sup>](#)".

↪ A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "tfoot", "thead", "tr"

↪ An end tag whose tag name is "table"

If the [stack of open elements<sup>p962</sup>](#) does not [have a \[tr\]\(#\) element in table scope<sup>p964</sup>](#), this is a [parse error<sup>p953</sup>](#), ignore the token.

Otherwise:

[Clear the stack back to a table row context<sup>p1024</sup>](#). (See below.)

Pop the [current node<sup>p963</sup>](#) (which will be a [tr<sup>p411</sup>](#) element) from the [stack of open elements<sup>p962</sup>](#). Switch the [insertion mode<sup>p961</sup>](#) to "[in table body<sup>p1022</sup>](#)".

Reprocess the token.

↪ An end tag whose tag name is one of: "tbody", "tfoot", "thead"

If the [stack of open elements<sup>p962</sup>](#) does not [have an element in table scope<sup>p964</sup>](#) that is an [HTML element<sup>p42</sup>](#) with the same tag name as the token, this is a [parse error<sup>p953</sup>](#); ignore the token.

If the [stack of open elements<sup>p962</sup>](#) does not [have a \[tr\]\(#\) element in table scope<sup>p964</sup>](#), ignore the token.

Otherwise:

[Clear the stack back to a table row context<sup>p1024</sup>](#). (See below.)

Pop the [current node<sup>p963</sup>](#) (which will be a [tr<sup>p411</sup>](#) element) from the [stack of open elements<sup>p962</sup>](#). Switch the [insertion mode<sup>p961</sup>](#) to "[in table body<sup>p1022</sup>](#)".

Reprocess the token.

↪ An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "td", "th"

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ Anything else

Process the token [using the rules for<sup>p961</sup>](#) the "[in table<sup>p1018</sup>](#)" [insertion mode<sup>p961</sup>](#).

When the steps above require the UA to **clear the stack back to a table row context**, it means that the UA must, while the [current node<sup>p963</sup>](#) is not a [tr<sup>p411</sup>](#), [template<sup>p604</sup>](#), or [html<sup>p137</sup>](#) element, pop elements from the [stack of open elements<sup>p962</sup>](#).

**Note** *The current node<sup>p963</sup> being an [html<sup>p137</sup>](#) element after this process is a [fragment case<sup>p1043</sup>](#).*

#### 12.2.5.4.15 The "in cell" insertion mode

When the user agent is to apply the rules for the "[in cell<sup>p1024</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

↪ An end tag whose tag name is one of: "td", "th"

If the [stack of open elements<sup>p962</sup>](#) does not [have an element in table scope<sup>p964</sup>](#) that is an [HTML element<sup>p42</sup>](#) with the same tag name as that of the token, then this is a [parse error<sup>p953</sup>](#); ignore the token.

Otherwise:

[Generate implied end tags<sup>p999</sup>](#).

Now, if the [current node<sup>p963</sup>](#) is not an [HTML element<sup>p42</sup>](#) with the same tag name as the token, then this is a [parse error<sup>p953</sup>](#).

Pop elements from the [stack of open elements<sup>p962</sup>](#) stack until an [HTML element<sup>p42</sup>](#) with the same tag name as the token has been popped from the stack.

[Clear the list of active formatting elements up to the last marker<sup>p965</sup>](#).

Switch the [insertion mode<sup>p961</sup>](#) to "[in row<sup>p1023</sup>](#)".

↪ A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "td", "tfoot", "th", "thead", "tr"

If the [stack of open elements<sup>p962</sup>](#) does not [have a td or th element in table scope<sup>p964</sup>](#), then this is a [parse error<sup>p953</sup>](#); ignore the token. ([fragment case<sup>p1043</sup>](#))

Otherwise, [close the cell<sup>p1024</sup>](#) (see below) and reprocess the token.

↪ An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html"

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ An end tag whose tag name is one of: "table", "tbody", "tfoot", "thead", "tr"

If the [stack of open elements<sup>p962</sup>](#) does not [have an element in table scope<sup>p964</sup>](#) that is an [HTML element<sup>p42</sup>](#) with the same tag name as that of the token, then this is a [parse error<sup>p953</sup>](#); ignore the token.

Otherwise, [close the cell<sup>p1024</sup>](#) (see below) and reprocess the token.

↪ Anything else

Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).

Where the steps above say to **close the cell**, they mean to run the following algorithm:

1. [Generate implied end tags<sup>p999</sup>](#).
2. If the [current node<sup>p963</sup>](#) is not now a [td<sup>p412</sup>](#) element or a [th<sup>p414</sup>](#) element, then this is a [parse error<sup>p953</sup>](#).
3. Pop elements from the [stack of open elements<sup>p962</sup>](#) stack until a [td<sup>p412</sup>](#) element or a [th<sup>p414</sup>](#) element has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker<sup>p965</sup>](#).
5. Switch the [insertion mode<sup>p961</sup>](#) to "[in row<sup>p1023</sup>](#)".

**Note** The [stack of open elements](#)<sup>p962</sup> cannot have both a [td](#)<sup>p412</sup> and a [th](#)<sup>p414</sup> element [in table scope](#)<sup>p964</sup> at the same time, nor can it have neither when the [close the cell](#)<sup>p1024</sup> algorithm is invoked.

#### 12.2.5.4.16 The "in select" insertion mode

When the user agent is to apply the rules for the "[in select](#)" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

↪ A character token that is U+0000 NULL

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ Any other character token

[Insert the token's character](#)<sup>p997</sup>.

↪ A comment token

[Insert a comment](#)<sup>p998</sup>.

↪ A DOCTYPE token

[Parse error](#)<sup>p953</sup>. Ignore the token.

↪ A start tag whose tag name is "html"

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)" [insertion mode](#)<sup>p961</sup>.

↪ A start tag whose tag name is "option"

If the [current node](#)<sup>p963</sup> is an [option](#)<sup>p505</sup> element, pop that node from the [stack of open elements](#)<sup>p962</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token.

↪ A start tag whose tag name is "optgroup"

If the [current node](#)<sup>p963</sup> is an [option](#)<sup>p505</sup> element, pop that node from the [stack of open elements](#)<sup>p962</sup>.

If the [current node](#)<sup>p963</sup> is an [optgroup](#)<sup>p504</sup> element, pop that node from the [stack of open elements](#)<sup>p962</sup>.

[Insert an HTML element](#)<sup>p996</sup> for the token.

↪ An end tag whose tag name is "optgroup"

First, if the [current node](#)<sup>p963</sup> is an [option](#)<sup>p505</sup> element, and the node immediately before it in the [stack of open elements](#)<sup>p962</sup> is an [optgroup](#)<sup>p504</sup> element, then pop the [current node](#)<sup>p963</sup> from the [stack of open elements](#)<sup>p962</sup>.

If the [current node](#)<sup>p963</sup> is an [optgroup](#)<sup>p504</sup> element, then pop that node from the [stack of open elements](#)<sup>p962</sup>. Otherwise, this is a [parse error](#)<sup>p953</sup>; ignore the token.

↪ An end tag whose tag name is "option"

If the [current node](#)<sup>p963</sup> is an [option](#)<sup>p505</sup> element, then pop that node from the [stack of open elements](#)<sup>p962</sup>. Otherwise, this is a [parse error](#)<sup>p953</sup>; ignore the token.

↪ An end tag whose tag name is "select"

If the [stack of open elements](#)<sup>p962</sup> does not [have a select element in select scope](#)<sup>p964</sup>, this is a [parse error](#)<sup>p953</sup>; ignore the token. ([fragment case](#)<sup>p1043</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p962</sup> until a [select](#)<sup>p498</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

↪ A start tag whose tag name is "select"

[Parse error](#)<sup>p953</sup>.

If the [stack of open elements](#)<sup>p962</sup> does not [have a select element in select scope](#)<sup>p964</sup>, ignore the token. ([fragment case](#)<sup>p1043</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>b962</sup> until a [select](#)<sup>p498</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

**Note** *It just gets treated like an end tag.*

↪ A start tag whose tag name is one of: "input", "keygen", "textarea"

[Parse error](#)<sup>p953</sup>.

If the [stack of open elements](#)<sup>b962</sup> does not [have a select element in select scope](#)<sup>b964</sup>, ignore the token. ([fragment case](#)<sup>p1043</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>b962</sup> until a [select](#)<sup>p498</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

Reprocess the token.

↪ A start tag whose tag name is one of: "script", "template"

↪ An end tag whose tag name is "template"

Process the token [using the rules for](#)<sup>p961</sup> the "[in head](#)<sup>p1002</sup>" [insertion mode](#)<sup>p961</sup>.

↪ An end-of-file token

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)<sup>p1006</sup>" [insertion mode](#)<sup>p961</sup>.

↪ Anything else

[Parse error](#)<sup>p953</sup>. Ignore the token.

#### 12.2.5.4.17 The "in select in table" insertion mode

When the user agent is to apply the rules for the "[in select in table](#)<sup>p1026</sup>" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

↪ A start tag whose tag name is one of: "caption", "table", "tbody", "tfoot", "thead", "tr", "td", "th"

[Parse error](#)<sup>p953</sup>.

Pop elements from the [stack of open elements](#)<sup>b962</sup> until a [select](#)<sup>p498</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

Reprocess the token.

↪ An end tag whose tag name is one of: "caption", "table", "tbody", "tfoot", "thead", "tr", "td", "th"

[Parse error](#)<sup>p953</sup>.

If the [stack of open elements](#)<sup>b962</sup> does not [have an element in table scope](#)<sup>b964</sup> that is an [HTML element](#)<sup>p42</sup> with the same tag name as that of the token, then ignore the token.

Otherwise:

Pop elements from the [stack of open elements](#)<sup>b962</sup> until a [select](#)<sup>p498</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

Reprocess the token.

↪ Anything else

Process the token [using the rules for](#)<sup>p961</sup> the "[in select](#)<sup>p1025</sup>" [insertion mode](#)<sup>p961</sup>.

#### 12.2.5.4.18 The "in template" insertion mode

When the user agent is to apply the rules for the "[in template](#)" [insertion mode](#), the user agent must handle the token as follows:

↪ A character token

↪ A comment token

↪ A DOCTYPE token

Process the token [using the rules for](#) the "[in body](#)" [insertion mode](#).

↪ A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"

↪ An end tag whose tag name is "template"

Process the token [using the rules for](#) the "[in head](#)" [insertion mode](#).

↪ A start tag whose tag name is one of: "caption", "colgroup", "tbody", "tfoot", "thead"

Pop the [current template insertion mode](#) off the [stack of template insertion modes](#).

Push "[in table](#)" onto the [stack of template insertion modes](#) so that it is the new [current template insertion mode](#).

Switch the [insertion mode](#) to "[in table](#)", and reprocess the token.

↪ A start tag whose tag name is "col"

Pop the [current template insertion mode](#) off the [stack of template insertion modes](#).

Push "[in column group](#)" onto the [stack of template insertion modes](#) so that it is the new [current template insertion mode](#).

Switch the [insertion mode](#) to "[in column group](#)", and reprocess the token.

↪ A start tag whose tag name is "tr"

Pop the [current template insertion mode](#) off the [stack of template insertion modes](#).

Push "[in table body](#)" onto the [stack of template insertion modes](#) so that it is the new [current template insertion mode](#).

Switch the [insertion mode](#) to "[in table body](#)", and reprocess the token.

↪ A start tag whose tag name is one of: "td", "th"

Pop the [current template insertion mode](#) off the [stack of template insertion modes](#).

Push "[in row](#)" onto the [stack of template insertion modes](#) so that it is the new [current template insertion mode](#).

Switch the [insertion mode](#) to "[in row](#)", and reprocess the token.

↪ Any other start tag

Pop the [current template insertion mode](#) off the [stack of template insertion modes](#).

Push "[in body](#)" onto the [stack of template insertion modes](#) so that it is the new [current template insertion mode](#).

Switch the [insertion mode](#) to "[in body](#)", and reprocess the token.

↪ Any other end tag

[Parse error](#). Ignore the token.

↪ An end-of-file token

If there is no [template](#) element on the [stack of open elements](#), then [stop parsing](#). ([fragment case](#))

Otherwise, this is a [parse error](#).

Pop elements from the [stack of open elements](#) until a [template](#) element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker](#).

Pop the [current template insertion mode](#) off the [stack of template insertion modes](#).

[Reset the insertion mode appropriately](#)<sup>p961</sup>.

Reprocess the token.

#### 12.2.5.4.19 The "after body" insertion mode

When the user agent is to apply the rules for the "[after body](#)<sup>p1028</sup>" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

- ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)<sup>p1006</sup>" [insertion mode](#)<sup>p961</sup>.

- ↪ A comment token

[Insert a comment](#)<sup>p998</sup> as the last child of the first element in the [stack of open elements](#)<sup>p962</sup> (the [html](#)<sup>p137</sup> element).

- ↪ A DOCTYPE token

[Parse error](#)<sup>p953</sup>. Ignore the token.

- ↪ A start tag whose tag name is "html"

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)<sup>p1006</sup>" [insertion mode](#)<sup>p961</sup>.

- ↪ An end tag whose tag name is "html"

If the parser was originally created as part of the [HTML fragment parsing algorithm](#)<sup>p1043</sup>, this is a [parse error](#)<sup>p953</sup>; ignore the token. ([fragment case](#)<sup>p1043</sup>)

Otherwise, switch the [insertion mode](#)<sup>p961</sup> to "[after after body](#)<sup>p1029</sup>".

- ↪ An end-of-file token

[Stop parsing](#)<sup>p1033</sup>.

- ↪ Anything else

[Parse error](#)<sup>p953</sup>. Switch the [insertion mode](#)<sup>p961</sup> to "[in body](#)<sup>p1006</sup>" and reprocess the token.

#### 12.2.5.4.20 The "in frameset" insertion mode

When the user agent is to apply the rules for the "[in frameset](#)<sup>p1028</sup>" [insertion mode](#)<sup>p961</sup>, the user agent must handle the token as follows:

- ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Insert the character](#)<sup>p997</sup>.

- ↪ A comment token

[Insert a comment](#)<sup>p998</sup>.

- ↪ A DOCTYPE token

[Parse error](#)<sup>p953</sup>. Ignore the token.

- ↪ A start tag whose tag name is "html"

Process the token [using the rules for](#)<sup>p961</sup> the "[in body](#)<sup>p1006</sup>" [insertion mode](#)<sup>p961</sup>.

- ↪ A start tag whose tag name is "frameset"

[Insert an HTML element](#)<sup>p996</sup> for the token.

- ↪ An end tag whose tag name is "frameset"

If the [current node](#)<sup>p963</sup> is the root [html](#)<sup>p137</sup> element, then this is a [parse error](#)<sup>p953</sup>; ignore the token. ([fragment case](#)<sup>p1043</sup>)

Otherwise, pop the [current node](#)<sup>p963</sup> from the [stack of open elements](#)<sup>p962</sup>.

If the parser was *not* originally created as part of the [HTML fragment parsing algorithm<sup>p1043</sup>](#) ([fragment case<sup>p1043</sup>](#)), and the [current node<sup>p963</sup>](#) is no longer a [frameset<sup>p1104</sup>](#) element, then switch the [insertion mode<sup>p961</sup>](#) to "[after frameset<sup>p1029</sup>](#)".

↪ A start tag whose tag name is "frame"

[Insert an HTML element<sup>p996</sup>](#) for the token. Immediately pop the [current node<sup>p963</sup>](#) off the [stack of open elements<sup>p962</sup>](#).

[Acknowledge the token's self-closing flag<sup>p966</sup>](#), if it is set.

↪ A start tag whose tag name is "noframes"

Process the token [using the rules for<sup>p961</sup>](#) the "[in head<sup>p1002</sup>" insertion mode<sup>p961</sup>.](#)

↪ An end-of-file token

If the [current node<sup>p963</sup>](#) is not the root [html<sup>p137</sup>](#) element, then this is a [parse error<sup>p953</sup>](#).

**Note** *The current node<sup>p963</sup> can only be the root [html<sup>p137</sup>](#) element in the fragment case<sup>p1043</sup>.*

[Stop parsing<sup>p1033</sup>](#).

↪ Anything else

[Parse error<sup>p953</sup>](#). Ignore the token.

#### 12.2.5.4.21 The "after frameset" insertion mode

When the user agent is to apply the rules for the "[after frameset<sup>p1029</sup>" insertion mode<sup>p961</sup>](#)", the user agent must handle the token as follows:

↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Insert the character<sup>p997</sup>](#).

↪ A comment token

[Insert a comment<sup>p998</sup>](#).

↪ A DOCTYPE token

[Parse error<sup>p953</sup>](#). Ignore the token.

↪ A start tag whose tag name is "html"

Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>" insertion mode<sup>p961</sup>.](#)

↪ An end tag whose tag name is "html"

Switch the [insertion mode<sup>p961</sup>](#) to "[after after frameset<sup>p1030</sup>](#)".

↪ A start tag whose tag name is "noframes"

Process the token [using the rules for<sup>p961</sup>](#) the "[in head<sup>p1002</sup>" insertion mode<sup>p961</sup>.](#)

↪ An end-of-file token

[Stop parsing<sup>p1033</sup>](#).

↪ Anything else

[Parse error<sup>p953</sup>](#). Ignore the token.

#### 12.2.5.4.22 The "after after body" insertion mode

When the user agent is to apply the rules for the "[after after body<sup>p1029</sup>" insertion mode<sup>p961</sup>](#)", the user agent must handle the token as follows:

↪ A comment token

[Insert a comment<sup>p998</sup>](#) as the last child of the [Document<sup>p102</sup>](#) object.

- ↪ A DOCTYPE token
- ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE
- ↪ A start tag whose tag name is "html"
  - Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).
- ↪ An end-of-file token
  - [Stop parsing<sup>p1033</sup>](#).
- ↪ Anything else
  - [Parse error<sup>p953</sup>](#). Switch the [insertion mode<sup>p961</sup>](#) to "[in body<sup>p1006</sup>](#)" and reprocess the token.

#### 12.2.5.4.23 The "after after frameset" insertion mode

When the user agent is to apply the rules for the "[after after frameset<sup>p1030</sup>](#)" [insertion mode<sup>p961</sup>](#), the user agent must handle the token as follows:

- ↪ A comment token
  - [Insert a comment<sup>p998</sup>](#) as the last child of the [Document<sup>p102</sup>](#) object.
- ↪ A DOCTYPE token
- ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE
- ↪ A start tag whose tag name is "html"
  - Process the token [using the rules for<sup>p961</sup>](#) the "[in body<sup>p1006</sup>](#)" [insertion mode<sup>p961</sup>](#).
- ↪ An end-of-file token
  - [Stop parsing<sup>p1033</sup>](#).
- ↪ A start tag whose tag name is "noframes"
  - Process the token [using the rules for<sup>p961</sup>](#) the "[in head<sup>p1002</sup>](#)" [insertion mode<sup>p961</sup>](#).
- ↪ Anything else
  - [Parse error<sup>p953</sup>](#). Ignore the token.

#### 12.2.5.5 The rules for parsing tokens in foreign content

When the user agent is to apply the rules for parsing tokens in foreign content, the user agent must handle the token as follows:

- ↪ A character token that is U+0000 NULL
  - [Parse error<sup>p953</sup>](#). [Insert a U+FFFD REPLACEMENT CHARACTER character<sup>p997</sup>](#).
- ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE
  - [Insert the token's character<sup>p997</sup>](#).
- ↪ Any other character token
  - [Insert the token's character<sup>p997</sup>](#).
- Set the [frameset-ok flag<sup>p965</sup>](#) to "not ok".
- ↪ A comment token
  - [Insert a comment<sup>p998</sup>](#).
- ↪ A DOCTYPE token
  - [Parse error<sup>p953</sup>](#). Ignore the token.

- ↪ A start tag whose tag name is one of: "b", "big", "blockquote", "body", "br", "center", "code", "dd", "div", "dl", "dt", "em", "embed", "h1", "h2", "h3", "h4", "h5", "h6", "head", "hr", "i", "img", "li", "listing", "menu", "meta", "nobr", "ol", "p", "pre", "ruby", "s", "small", "span", "strong", "strike", "sub", "sup", "table", "tt", "u", "ul", "var"

- ↪ A start tag whose tag name is "font", if the token has any attributes named "color", "face", or "size"

[Parse error<sup>p953</sup>](#).

If the parser was originally created for the [HTML fragment parsing algorithm<sup>p1043</sup>](#), then act as described in the "any other start tag" entry below. ([fragment case<sup>p1043</sup>](#))

Otherwise:

Pop an element from the [stack of open elements<sup>p962</sup>](#), and then keep popping more elements from the [stack of open elements<sup>p962</sup>](#) until the [current node<sup>p963</sup>](#) is a [MathML text integration point<sup>p994</sup>](#), an [HTML integration point<sup>p994</sup>](#), or an element in the [HTML namespace<sup>p101</sup>](#).

Then, reprocess the token.

#### ↪ Any other start tag

If the [adjusted current node<sup>p963</sup>](#) is an element in the [MathML namespace<sup>p101</sup>](#), [adjust MathML attributes<sup>p996</sup>](#) for the token. (This fixes the case of MathML attributes that are not all lowercase.)

If the [adjusted current node<sup>p963</sup>](#) is an element in the [SVG namespace<sup>p101</sup>](#), and the token's tag name is one of the ones in the first column of the following table, change the tag name to the name given in the corresponding cell in the second column. (This fixes the case of SVG elements that are not all lowercase.)

Tag name	Element name
altglyph	altGlyph
altglyphdef	altGlyphDef
altglyphitem	altGlyphItem
animatecolor	animateColor
animatemotion	animateMotion
animatetransform	animateTransform
clippath	clipPath
feblend	feBlend
fecolormatrix	feColorMatrix
fecomponenttransfer	feComponentTransfer
fecomposite	feComposite
feconvolvematrix	feConvolveMatrix
fediffuselighting	feDiffuseLighting
fedisplacementmap	feDisplacementMap
fedistantlight	feDistantLight
fedropshadow	feDropShadow
feflood	feFlood
fefunca	feFuncA
fefuncb	feFuncB
fefuncg	feFuncG
fefuncr	feFuncR
fegaussianblur	feGaussianBlur
feimage	feImage
femerge	feMerge
femergenode	feMergeNode
femorphology	feMorphology
feoffset	feOffset
fepointlight	fePointLight
fespecularlighting	feSpecularLighting
fespotlight	feSpotLight
fetile	feTile
feturbulence	feTurbulence

Tag name	Element name
foreignobject	foreignObject
glyphref	glyphRef
lineargradient	linearGradient
radialgradient	radialGradient
textpath	textPath

If the [adjusted current node](#)<sup>p963</sup> is an element in the [SVG namespace](#)<sup>p101</sup>, [adjust SVG attributes](#)<sup>p996</sup> for the token. (This fixes the case of SVG attributes that are not all lowercase.)

[Adjust foreign attributes](#)<sup>p997</sup> for the token. (This fixes the use of namespaced attributes, in particular XLink in SVG.)

[Insert a foreign element](#)<sup>p995</sup> for the token, in the same namespace as the [adjusted current node](#)<sup>p963</sup>.

If the token has its [self-closing flag](#)<sup>p966</sup> set, then run the appropriate steps from the following list:

- ↪ If the token's tag name is "script", and the new [current node](#)<sup>p963</sup> is in the [SVG namespace](#)<sup>p101</sup> [Acknowledge the token's self-closing flag](#)<sup>p966</sup>, and then act as described in the steps for a "script" end tag below.

#### ↪ Otherwise

Pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup> and [acknowledge the token's self-closing flag](#)<sup>p966</sup>.

- ↪ An end tag whose tag name is "script", if the [current node](#)<sup>p963</sup> is a `script` element in the [SVG namespace](#)<sup>p101</sup> Pop the [current node](#)<sup>p963</sup> off the [stack of open elements](#)<sup>p962</sup>.

Let the *old insertion point* have the same value as the current [insertion point](#)<sup>p961</sup>. Let the [insertion point](#)<sup>p961</sup> be just before the [next input character](#)<sup>p961</sup>.

Increment the parser's [script nesting level](#)<sup>p954</sup> by one. Set the [parser pause flag](#)<sup>p954</sup> to true.

[Process the `script` element](#) according to the SVG rules, if the user agent supports SVG. [\[SVG\]](#)<sup>p1153</sup>

**Note** Even if this causes [new characters to be inserted into the tokenizer](#)<sup>p851</sup>, the parser will not be executed reentrantly, since the [parser pause flag](#)<sup>p954</sup> is true.

Decrement the parser's [script nesting level](#)<sup>p954</sup> by one. If the parser's [script nesting level](#)<sup>p954</sup> is zero, then set the [parser pause flag](#)<sup>p954</sup> to false.

Let the [insertion point](#)<sup>p961</sup> have the value of the *old insertion point*. (In other words, restore the [insertion point](#)<sup>p961</sup> to its previous value. This value might be the "undefined" value.)

- ↪ Any other end tag

Run these steps:

1. Initialise *node* to be the [current node](#)<sup>p963</sup> (the bottommost node of the stack).
2. If *node*'s tag name, [converted to ASCII lowercase](#)<sup>p58</sup>, is not the same as the tag name of the token, then this is a [parse error](#)<sup>p953</sup>.
3. *Loop*: If *node* is the topmost element in the [stack of open elements](#)<sup>p962</sup>, abort these steps. ([fragment case](#)<sup>p1043</sup>)
4. If *node*'s tag name, [converted to ASCII lowercase](#)<sup>p58</sup>, is the same as the tag name of the token, pop elements from the [stack of open elements](#)<sup>p962</sup> until *node* has been popped from the stack, and then abort these steps.
5. Set *node* to the previous entry in the [stack of open elements](#)<sup>p962</sup>.
6. If *node* is not an element in the [HTML namespace](#)<sup>p101</sup>, return to the step labeled *loop*.
7. Otherwise, process the token according to the rules given in the section corresponding to the current [insertion mode](#)<sup>p961</sup> in HTML content.

## 12.2.6 The end

Once the user agent **stops parsing** the document, the user agent must run the following steps:

1. Set the [current document readiness](#) to "interactive" and the [insertion point](#) to undefined.
2. Pop *all* the nodes off the [stack of open elements](#).
3. If the [list of scripts that will execute when the document has finished parsing](#) is not empty, run these substeps:
  1. [Spin the event loop](#) until the first [script](#) in the [list of scripts that will execute when the document has finished parsing](#) has its "[ready to be parser-executed](#)" flag set *and* the parser's [Document](#) [has no styles blocking scripts](#).
  2. [Execute](#) the first [script](#) in the [list of scripts that will execute when the document has finished parsing](#).
  3. Remove the first [script](#) element from the [list of scripts that will execute when the document has finished parsing](#) (i.e. shift out the first entry in the list).
  4. If the [list of scripts that will execute when the document has finished parsing](#) is still not empty, repeat these substeps again from substep 1.
4. [Queue a task](#) to [fire a simple event](#) that bubbles named [DOMContentLoaded](#) at the [Document](#).
5. [Spin the event loop](#) until the [set of scripts that will execute as soon as possible](#) and the [list of scripts that will execute in order as soon as possible](#) are empty.
6. [Spin the event loop](#) until there is nothing that [delays the load event](#) in the [Document](#).
7. [Queue a task](#) to run the following substeps:
  1. Set the [current document readiness](#) to "complete".
  2. *Load event:* If the [Document](#) is in a [browsing context](#), [fire a simple event](#) named [load](#) at the [Document](#)'s [Window](#) object, with [target override](#) set to the [Document](#) object.
8. If the [Document](#) is in a [browsing context](#), then [queue a task](#) to run the following substeps:
  1. If the [Document](#)'s [page showing](#) flag is true, then abort this task (i.e. don't fire the event below).
  2. Set the [Document](#)'s [page showing](#) flag to true.
  3. [Fire](#) a [trusted](#) event with the name [pageshow](#) at the [Window](#) object of the [Document](#), with [target override](#) set to the [Document](#) object, using the [PageTransitionEvent](#) interface, with the [persisted](#) attribute initialised to false. This event must not bubble, must not be cancelable, and has no default action.
9. If the [Document](#) has any [pending application cache download process tasks](#), then [queue](#) each such [task](#) in the order they were added to the list of [pending application cache download process tasks](#), and then empty the list of [pending application cache download process tasks](#). The [task source](#) for these [tasks](#) is the [networking task source](#).
10. If the [Document](#)'s [print when loaded](#) flag is set, then run the [printing steps](#).
11. The [Document](#) is now **ready for post-load tasks**.
12. [Queue a task](#) to mark the [Document](#) as **completely loaded**.

Source: caniuse.com

When the user agent is to **abort a parser**, it must run the following steps:

1. Throw away any pending content in the [input stream](#), and discard any future content that would have been added to it.
2. Set the [current document readiness](#) to "interactive".
3. Pop *all* the nodes off the [stack of open elements](#).
4. Set the [current document readiness](#) to "complete".

Except where otherwise specified, the [task source](#) for the [tasks](#) mentioned in this section is the [DOM manipulation task source](#).

## 12.2.7 Coercing an HTML DOM into an inferset

When an application uses an [HTML parser<sup>p952</sup>](#) in conjunction with an XML pipeline, it is possible that the constructed DOM is not compatible with the XML tool chain in certain subtle ways. For example, an XML toolchain might not be able to represent attributes with the name `xmlns`, since they conflict with the Namespaces in XML syntax. There is also some data that the [HTML parser<sup>p952</sup>](#) generates that isn't included in the DOM itself. This section specifies some rules for handling these issues.

If the XML API being used doesn't support DOCTYPEs, the tool may drop DOCTYPEs altogether.

If the XML API doesn't support attributes in no namespace that are named "`xmlns`", attributes whose names start with "`xmlns:`", or attributes in the [XMLNS namespace<sup>b101</sup>](#), then the tool may drop such attributes.

The tool may annotate the output with any namespace declarations required for proper operation.

If the XML API being used restricts the allowable characters in the local names of elements and attributes, then the tool may map all element and attribute local names that the API wouldn't support to a set of names that *are* allowed, by replacing any character that isn't supported with the uppercase letter U and the six digits of the character's Unicode code point when expressed in hexadecimal, using digits 0-9 and capital letters A-F as the symbols, in increasing numeric order.

**Example** For example, the element name `foo<bar`, which can be output by the [HTML parser<sup>p952</sup>](#), though it is neither a legal HTML element name nor a well-formed XML element name, would be converted into `fooU00003Cbar`, which *is* a well-formed XML element name (though it's still not legal in HTML by any means).

**Example** As another example, consider the attribute `xlink:href`. Used on a MathML element, it becomes, after being [adjusted<sup>p997</sup>](#), an attribute with a prefix "`xlink`" and a local name "`href`". However, used on an HTML element, it becomes an attribute with no prefix and the local name "`xlink:href`", which is not a valid NCName, and thus might not be accepted by an XML API. It could thus get converted, becoming "`xlinkU00003Ahref`".

**Note** *The resulting names from this conversion conveniently can't clash with any attribute generated by the [HTML parser<sup>p952</sup>](#), since those are all either lowercase or those listed in the [adjust foreign attributes<sup>p997</sup>](#) algorithm's table.*

If the XML API restricts comments from having two consecutive U+002D HYPHEN-MINUS characters (--), the tool may insert a single U+0020 SPACE character between any such offending characters.

If the XML API restricts comments from ending in a U+002D HYPHEN-MINUS character (-), the tool may insert a single U+0020 SPACE character at the end of such comments.

If the XML API restricts allowed characters in character data, attribute values, or comments, the tool may replace any U+000C FORM FEED (FF) character with a U+0020 SPACE character, and any other literal non-XML character with a U+FFFD REPLACEMENT CHARACTER.

If the tool has no way to convey out-of-band information, then the tool may drop the following information:

- Whether the document is set to [no-quirks mode<sup>b51</sup>](#), [limited-quirks mode<sup>b51</sup>](#), or [quirks mode<sup>p51</sup>](#)
- The association between form controls and forms that aren't their nearest [form<sup>p447</sup>](#) element ancestor (use of the [form element pointer<sup>p965</sup>](#) in the parser)
- The [template contents<sup>b605</sup>](#) of any [template<sup>p604</sup>](#) elements.

**Note** *The mutations allowed by this section apply after the [HTML parser<sup>p952</sup>](#)'s rules have been applied. For example, a `<a::>` start tag will be closed by a `</a::>` end tag, and never by a `</aU00003AU00003A>` end tag, even if the user agent is using the rules above to then generate an actual element in the DOM with the name `aU00003AU00003A` for that start tag.*

## 12.2.8 An introduction to error handling and strange cases in the parser

*This section is non-normative.*

This section examines some erroneous markup and discusses how the [HTML parser<sup>p952</sup>](#) handles these cases.

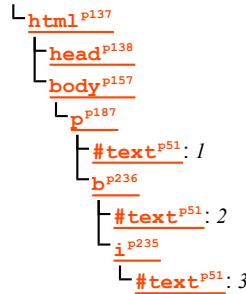

### 12.2.8.1 Misnested tags: <b><i></b></i>

*This section is non-normative.*

The most-often discussed example of erroneous markup is as follows:

```
<p>12<i>34</i>5</p>
```

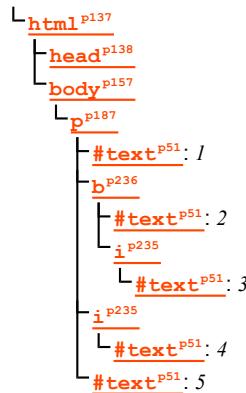

The parsing of this markup is straightforward up to the "3". At this point, the DOM looks like this:

Here, the [stack of open elements](#) has five elements on it: [html](#), [body](#), [p](#), [b](#), and [i](#). The [list of active formatting elements](#) just has two: [b](#) and [i](#). The [insertion mode](#) is "[in body](#)".

Upon receiving the end tag token with the tag name "b", the "[adoption agency algorithm](#)" is invoked. This is a simple case, in that the [formatting element](#) is the [b](#) element, and there is no [furthest block](#). Thus, the [stack of open elements](#) ends up with just three elements: [html](#), [body](#), and [p](#), while the [list of active formatting elements](#) has just one: [i](#). The DOM tree is unmodified at this point.

The next token is a character ("4"), triggers the [reconstruction of the active formatting elements](#), in this case just the [i](#) element. A new [i](#) element is thus created for the "4" [Text](#) node. After the end tag token for the "i" is also received, and the "5" [Text](#) node is inserted, the DOM looks as follows:

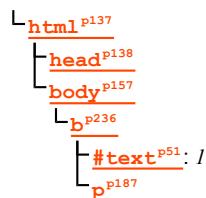

### 12.2.8.2 Misnested tags: <b><p></b></p>

*This section is non-normative.*

A case similar to the previous one is the following:

```
1<p>23</p>
```

Up to the "2" the parsing here is straightforward:

└ #text<sup>p51</sup>: 2

The interesting part is when the end tag token with the tag name "b" is parsed.

Before that token is seen, the stack of open elements<sup>p962</sup> has four elements on it: html<sup>p137</sup>, body<sup>p157</sup>, b<sup>p236</sup>, and p<sup>p187</sup>. The list of active formatting elements<sup>p964</sup> just has the one: b<sup>p236</sup>. The insertion mode<sup>p961</sup> is "in body<sup>p1006</sup>".

Upon receiving the end tag token with the tag name "b", the "adoption agency algorithm<sup>p1015</sup>" is invoked, as in the previous example. However, in this case, there *is* a *furthest block*, namely the p<sup>p187</sup> element. Thus, this time the adoption agency algorithm isn't skipped over.

The common ancestor is the body<sup>p157</sup> element. A conceptual "bookmark" marks the position of the b<sup>p236</sup> in the list of active formatting elements<sup>p964</sup>, but since that list has only one element in it, the bookmark won't have much effect.

As the algorithm progresses, node ends up set to the formatting element (b<sup>p236</sup>), and last node ends up set to the *furthest block* (p<sup>p187</sup>).

The last node gets appended (moved) to the common ancestor, so that the DOM looks like:

```
└ htmlp137
 └ headp138
 └ bodyp157
 └ bp236
 └ #textp51: 1
 └ pp187
 └ #textp51: 2
```

A new b<sup>p236</sup> element is created, and the children of the p<sup>p187</sup> element are moved to it:

```
└ htmlp137
 └ headp138
 └ bodyp157
 └ bp236
 └ #textp51: 1
 └ pp187
 └ bp236
 └ #textp51: 2
```

Finally, the new b<sup>p236</sup> element is appended to the p<sup>p187</sup> element, so that the DOM looks like:

```
└ htmlp137
 └ headp138
 └ bodyp157
 └ bp236
 └ #textp51: 1
 └ pp187
 └ bp236
 └ #textp51: 2
```

The b<sup>p236</sup> element is removed from the list of active formatting elements<sup>p964</sup> and the stack of open elements<sup>p962</sup>, so that when the "3" is parsed, it is appended to the p<sup>p187</sup> element:

```
└ htmlp137
 └ headp138
 └ bodyp157
 └ bp236
 └ #textp51: 1
 └ pp187
 └ bp236
 └ #textp51: 2
 └ #textp51: 3
```

### 12.2.8.3 Unexpected markup in tables

This section is non-normative.

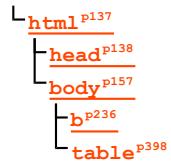

Error handling in tables is, for historical reasons, especially strange. For example, consider the following markup:

```
<table><tr><td>aaa</td></tr></table>ccc
```

The highlighted `bp236` element start tag is not allowed directly inside a table like that, and the parser handles this case by placing the element *before* the table. (This is called [foster parenting<sup>p994</sup>](#).) This can be seen by examining the DOM tree as it stands just after the `tablep398` element's start tag has been seen:

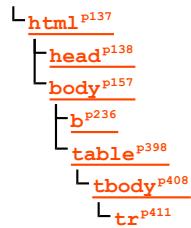

...and then immediately after the `bp236` element start tag has been seen:

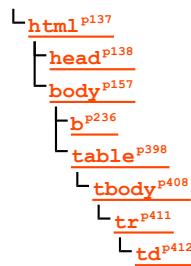

At this point, the [stack of open elements<sup>p962</sup>](#) has on it the elements `htmlp137`, `bodyp157`, `tablep398`, and `bp236` (in that order, despite the resulting DOM tree); the [list of active formatting elements<sup>p964</sup>](#) just has the `bp236` element in it; and the [insertion mode<sup>p961</sup>](#) is "[in table<sup>p1018</sup>](#)".

The `trp411` start tag causes the `bp236` element to be popped off the stack and a `tbodyp408` start tag to be implied; the `tbodyp408` and `trp411` elements are then handled in a rather straight-forward manner, taking the parser through the "[in table body<sup>p1022</sup>](#)" and "[in row<sup>p1023</sup>](#)" insertion modes, after which the DOM looks as follows:

Here, the [stack of open elements<sup>p962</sup>](#) has on it the elements `htmlp137`, `bodyp157`, `tablep398`, `tbodyp408`, and `trp411`; the [list of active formatting elements<sup>p964</sup>](#) still has the `bp236` element in it; and the [insertion mode<sup>p961</sup>](#) is "[in row<sup>p1023</sup>](#)".

The `tdp412` element start tag token, after putting a `tdp412` element on the tree, puts a [marker<sup>p964</sup>](#) on the [list of active formatting elements<sup>p964</sup>](#) (it also switches to the "[in cell<sup>p1024</sup>](#)" [insertion mode<sup>p961</sup>](#)).

The [marker<sup>p964</sup>](#) means that when the "aaa" character tokens are seen, no `bp236` element is created to hold the resulting `Textp51` node:

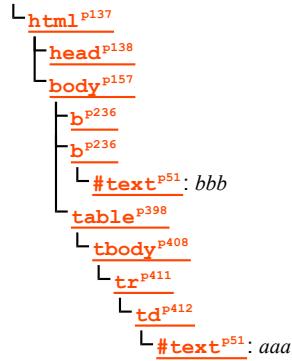

The end tags are handled in a straight-forward manner; after handling them, the [stack of open elements](#) has on it the elements [html](#), [body](#), [table](#), and [tbody](#); the [list of active formatting elements](#) still has the [b](#) element in it (the [marker](#) having been removed by the "td" end tag token); and the [insertion mode](#) is "[in table body](#)".

Thus it is that the "bbb" character tokens are found. These trigger the "[in table text](#)" insertion mode to be used (with the [original insertion mode](#) set to "[in table body](#)"). The character tokens are collected, and when the next token (the [table](#) element end tag) is seen, they are processed as a group. Since they are not all spaces, they are handled as per the "anything else" rules in the "[in table](#)" insertion mode, which defer to the "[in body](#)" insertion mode but with [foster parenting](#).

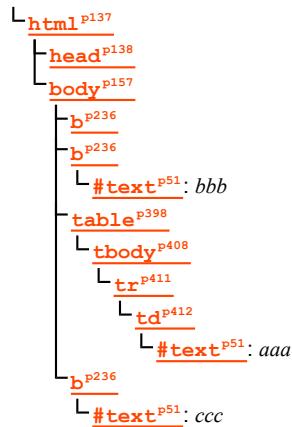

When [the active formatting elements are reconstructed](#), a [b](#) element is created and [foster parented](#), and then the "bbb" [Text](#) node is appended to it:

The [stack of open elements](#) has on it the elements [html](#), [body](#), [table](#), [tbody](#), and the new [b](#) (again, note that this doesn't match the resulting tree!); the [list of active formatting elements](#) has the new [b](#) element in it; and the [insertion mode](#) is still "[in table body](#)".

Had the character tokens been only [space characters](#) instead of "bbb", then those [space characters](#) would just be appended to the [tbody](#) element.

Finally, the [table](#) is closed by a "table" end tag. This pops all the nodes from the [stack of open elements](#) up to and including the [table](#) element, but it doesn't affect the [list of active formatting elements](#), so the "ccc" character tokens after the table result in yet another [b](#) element being created, this time after the table:

#### 12.2.8.4 Scripts that modify the page as it is being parsed

*This section is non-normative.*

Consider the following markup, which for this example we will assume is the document with [URL<sup>p48</sup>](http://example.com/inner) `http://example.com/inner`, being rendered as the content of an [iframe<sup>p299</sup>](#) in another document with the [URL<sup>p48</sup>](http://example.com/outer) `http://example.com/outer`:

```
<div id=a>
<script>
 var div = document.getElementById('a');
 parent.document.body.appendChild(div);
</script>
<script>
 alert(document.URL);
</script>
</div>
<script>
 alert (document.URL);
</script>
```

Up to the first "script" end tag, before the script is parsed, the result is relatively straightforward:

The diagram shows a hierarchical structure of elements. At the top level is `htmlp137`. Below it is `headp138`. Below `head` is `bodyp157`. Inside `body` is a `divp207` element with `idp122= "a"`. Inside `div` is a `#textp51` node containing the text "#". Below `div` is a `scriptp591` element. A final `#textp51` node below the script contains the JavaScript code: `var div = document.getElementById('a'); parent.document.body.appendChild(div);`.

After the script is parsed, though, the `divp207` element and its child `scriptp591` element are gone:

The diagram shows the same hierarchical structure as before, but the `divp207` element and its child `scriptp591` element have been removed from the tree.

They are, at this point, in the [Document<sup>p102</sup>](#) of the aforementioned outer [browsing context<sup>p762</sup>](#). However, the [stack of open elements<sup>p962</sup>](#) still contains the `divp207` element.

Thus, when the second `scriptp591` element is parsed, it is inserted *into the outer Document<sup>p102</sup> object*.

Those parsed into different [Document<sup>p102</sup>](#)'s than the one the parser was created for do not execute, so the first alert does not show.

Once the `divp207` element's end tag is parsed, the `divp207` element is popped off the stack, and so the next `scriptp591` element is in the inner [Document<sup>p102</sup>](#):

The diagram shows the same hierarchical structure as before, but the `divp207` element has been closed. The second `scriptp591` element is now the child of the `bodyp157` element. It contains the text "alert(document.URL);".

This script does execute, resulting in an alert that says "http://example.com/inner".

### 12.2.8.5 The execution of scripts that are moving across multiple documents

*This section is non-normative.*

Elaborating on the example in the previous section, consider the case where the second `scriptp591` element is an external script (i.e. one with a `srcp592` attribute). Since the element was not in the parser's [Document<sup>p102</sup>](#) when it was created, that external script is not even downloaded.

In a case where a `scriptp591` element with a `srcp592` attribute is parsed normally into its parser's [Document<sup>p102</sup>](#), but while the external script is being downloaded, the element is moved to another document, the script continues to download, but does not execute.

**Note** In general, moving `script`<sup>p591</sup> elements between `Document`<sup>p102</sup>s is considered a bad practice.

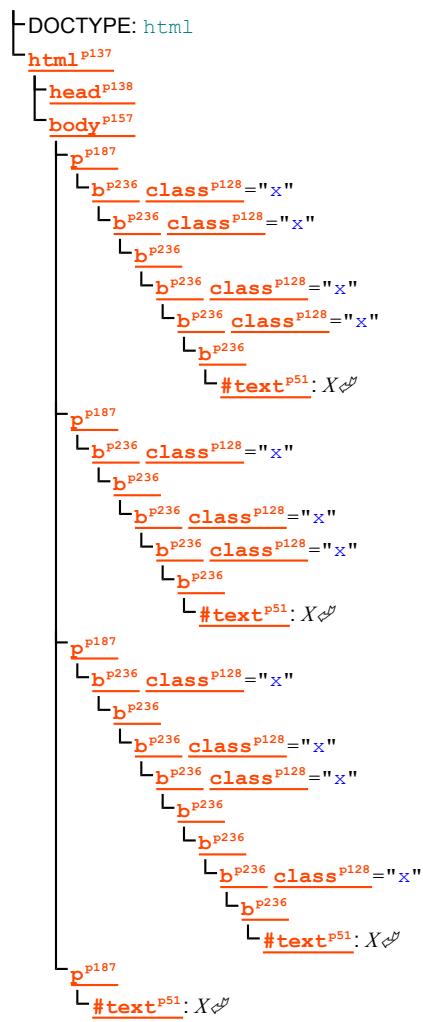

#### 12.2.8.6 Unclosed formatting elements

This section is non-normative.

The following markup shows how nested formatting elements (such as `b`<sup>p236</sup>) get collected and continue to be applied even as the elements they are contained in are closed, but that excessive duplicates are thrown away.

```
<!DOCTYPE html>
<p><b class=x><b class=x><b class=x><b class=x>X
<p>X
<p><b class=x>X
<p>
```

The resulting DOM tree is as follows:

Note how the second `p`<sup>p187</sup> element in the markup has no explicit `b`<sup>p236</sup> elements, but in the resulting DOM, up to three of each kind of formatting element (in this case three `b`<sup>p236</sup> elements with the class attribute, and two unadorned `b`<sup>p236</sup> elements) get reconstructed before the element's "X".

Also note how this means that in the final paragraph only six `b`<sup>p236</sup> end tags are needed to completely clear the [list of active formatting elements](#)<sup>p964</sup>, even though nine `b`<sup>p236</sup> start tags have been seen up to this point.

## 12.3 Serialising HTML fragments

Spec bugs: [28113](#)

The following steps form the **HTML fragment serialisation algorithm**. The algorithm takes as input a DOM [Element<sup>p51</sup>](#), [Document<sup>p102</sup>](#), or [DocumentFragment<sup>p51</sup>](#) referred to as *the node*, and either returns a string or throws an exception.

**Note** This algorithm serialises the children of the node being serialised, not the node itself.

1. Let *s* be a string, and initialise it to the empty string.
2. If *the node* is a [template<sup>p604</sup>](#) element, then let *the node* instead be the [template<sup>p604</sup>](#) element's [template contents<sup>p605</sup>](#) (a [DocumentFragment<sup>p51</sup>](#) node).
3. For each child node of *the node*, in [tree order<sup>p42</sup>](#), run the following steps:
  1. Let *current node* be the child node being processed.
  2. Append the appropriate string from the following list to *s*:
    - ↪ If *current node* is an [Element](#)  
If *current node* is an element in the [HTML namespace<sup>p101</sup>](#), the [MathML namespace<sup>p101</sup>](#), or the [SVG namespace<sup>p101</sup>](#), then let *tagname* be *current node*'s local name. Otherwise, let *tagname* be *current node*'s qualified name.  
Append a U+003C LESS-THAN SIGN character (<), followed by *tagname*.

**Note** For [HTML elements<sup>p42</sup>](#) created by the [HTML parser<sup>p952</sup>](#) or `Document.createElement()`, *tagname* will be lowercase.

For each attribute that the element has, append a U+0020 SPACE character, the [attribute's serialised name as described below<sup>p1041</sup>](#), a U+003D EQUALS SIGN character (=), a U+0022 QUOTATION MARK character ("'), the attribute's value, [escaped as described below<sup>p1042</sup>](#) in *attribute mode*, and a second U+0022 QUOTATION MARK character ("').

An **attribute's serialised name** for the purposes of the previous paragraph must be determined as follows:

↪ If the attribute has no namespace

The attribute's serialised name is the attribute's local name.

**Note** For attributes on [HTML elements<sup>p42</sup>](#) set by the [HTML parser<sup>p952</sup>](#) or by `Element.setAttribute()`, the local name will be lowercase.

↪ If the attribute is in the [XML namespace<sup>p101</sup>](#)

The attribute's serialised name is the string "xml:" followed by the attribute's local name.

↪ If the attribute is in the [XMLNS namespace<sup>p101</sup>](#) and the attribute's local name is `xmldns`

The attribute's serialised name is the string "xmldns:".

↪ If the attribute is in the [XMLNS namespace<sup>p101</sup>](#) and the attribute's local name is not `xmldns`

The attribute's serialised name is the string "xmldns:" followed by the attribute's local name.

↪ If the attribute is in the [XLink namespace<sup>p101</sup>](#)

The attribute's serialised name is the string "xlink:" followed by the attribute's local name.

↪ If the attribute is in some other namespace

The attribute's serialised name is the attribute's qualified name.

While the exact order of attributes is UA-defined, and may depend on factors such as the order that the attributes were given in the original markup, the sort order must be stable, such that consecutive invocations of this algorithm serialise an element's attributes in the same order.

Append a U+003E GREATER-THAN SIGN character (>).

If *current node* is an `area`<sup>p390</sup>, `base`<sup>p140</sup>, `basefont`<sup>p1096</sup>, `bgsound`<sup>p1096</sup>, `br`<sup>p242</sup>, `col`<sup>p407</sup>, `embed`<sup>p307</sup>, `frame`<sup>p1105</sup>, `hr`<sup>p190</sup>, `img`<sup>p272</sup>, `input`<sup>p452</sup>, `keygen`<sup>p513</sup>, `link`<sup>p141</sup>, `menuitem`<sup>p574</sup>, `meta`<sup>p145</sup>, `param`<sup>p316</sup>, `source`<sup>p322</sup>, `track`<sup>p324</sup> or `wbr`<sup>p243</sup> element, then continue on to the next child node at this point.

If *current node* is a `pre`<sup>p191</sup>, `textarea`<sup>p508</sup>, or `listing`<sup>p1096</sup> element, and the first child node of the element, if any, is a `Text`<sup>p51</sup> node whose character data has as its first character a U+000A LINE FEED (LF) character, then append a U+000A LINE FEED (LF) character.

Append the value of running the [HTML fragment serialisation algorithm](#)<sup>p1041</sup> on the *current node* element (thus recursing into this algorithm for that element), followed by a U+003C LESS-THAN SIGN character (<), a U+002F SOLIDUS character (/), *tagname* again, and finally a U+003E GREATER-THAN SIGN character (>).

↪ If *current node* is a `Text` node

If the parent of *current node* is a `style`<sup>p154</sup>, `script`<sup>p591</sup>, `xmp`<sup>p1096</sup>, `iframe`<sup>p299</sup>, `noembed`<sup>p1096</sup>, `noframes`<sup>p1096</sup>, or `plaintext`<sup>p1096</sup> element, or if the parent of *current node* is a `noscript`<sup>p602</sup> element and `scripting is enabled`<sup>p828</sup> for the node, then append the value of *current node*'s `data IDL` attribute literally.

Otherwise, append the value of *current node*'s `data IDL` attribute, [escaped as described below](#)<sup>p1042</sup>.

↪ If *current node* is a `Comment`

Append the literal string "<! --" (U+003C LESS-THAN SIGN, U+0021 EXCLAMATION MARK, U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS), followed by the value of *current node*'s `data IDL` attribute, followed by the literal string "-->" (U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS, U+003E GREATER-THAN SIGN).

↪ If *current node* is a `ProcessingInstruction`

Append the literal string "<?" (U+003C LESS-THAN SIGN, U+003F QUESTION MARK), followed by the value of *current node*'s `target IDL` attribute, followed by a single U+0020 SPACE character, followed by the value of *current node*'s `data IDL` attribute, followed by a single U+003E GREATER-THAN SIGN character (>).

↪ If *current node* is a `DocumentType`

Append the literal string "<!DOCTYPE" (U+003C LESS-THAN SIGN, U+0021 EXCLAMATION MARK, U+0044 LATIN CAPITAL LETTER D, U+004F LATIN CAPITAL LETTER O, U+0043 LATIN CAPITAL LETTER C, U+0054 LATIN CAPITAL LETTER T, U+0059 LATIN CAPITAL LETTER Y, U+0050 LATIN CAPITAL LETTER P, U+0045 LATIN CAPITAL LETTER E), followed by a space (U+0020 SPACE), followed by the value of *current node*'s `name IDL` attribute, followed by the literal string ">" (U+003E GREATER-THAN SIGN).

4. The result of the algorithm is the string *s*.

*It is possible that the output of this algorithm, if parsed with an [HTML parser](#)<sup>p952</sup>, will not return the original tree structure.*

**Example**

For instance, if a `textarea`<sup>p508</sup> element to which a `Comment` node has been appended is serialised and the output is then reparsed, the comment will end up being displayed in the text field. Similarly, if, as a result of DOM manipulation, an element contains a comment that contains the literal string "-->", then when the result of serialising the element is parsed, the comment will be truncated at that point and the rest of the comment will be interpreted as markup. More examples would be making a `script`<sup>p591</sup> element contain a `Text`<sup>p51</sup> node with the text string "</script>", or having a `p`<sup>p187</sup> element that contains a `ul`<sup>p197</sup> element (as the `ul`<sup>p197</sup> element's `start tag`<sup>p944</sup> would imply the end tag for the `p`<sup>p187</sup>).

This can enable cross-site scripting attacks. An example of this would be a page that lets the user enter some font family names that are then inserted into a CSS `style`<sup>p154</sup> block via the DOM and which then uses the `innerHTML`<sup>p52</sup> IDL attribute to get the HTML serialisation of that `style`<sup>p154</sup> element: if the user enters "</style><script>attack</script>" as a font family name, `innerHTML`<sup>p52</sup> will return markup that, if parsed in a different context, would contain a `script`<sup>p591</sup> node, even though no `script`<sup>p591</sup> node existed in the original DOM.

**Escaping a string** (for the purposes of the algorithm above) consists of running the following steps:

1. Replace any occurrence of the "&" character by the string "&".
2. Replace any occurrences of the U+00A0 NO-BREAK SPACE character by the string " ".

3. If the algorithm was invoked in the *attribute mode*, replace any occurrences of the "" character by the string """.
4. If the algorithm was *not* invoked in the *attribute mode*, replace any occurrences of the "<" character by the string "&lt;", and any occurrences of the ">" character by the string "&gt;".

## 12.4 Parsing HTML fragments

The following steps form the **HTML fragment parsing algorithm**. The algorithm takes as input an [Element<sup>p51</sup>](#) node, referred to as the **context** element, which gives the context for the parser, as well as *input*, a string to parse, and returns a list of zero or more nodes.

**Note** *Parts marked fragment case in algorithms in the parser section are parts that only occur if the parser was created for the purposes of this algorithm. The algorithms have been annotated with such markings for informational purposes only; such markings have no normative weight. If it is possible for a condition described as a [fragment case<sup>p1043</sup>](#) to occur even when the parser wasn't created for the purposes of handling this algorithm, then that is an error in the specification.*

1. Create a new [Document<sup>p102</sup>](#) node, and mark it as being an [HTML document<sup>p51</sup>](#).
2. If the [node document](#) of the [context<sup>p1043</sup>](#) element is in [quirks mode<sup>p51</sup>](#), then let the [Document<sup>p102</sup>](#) be in [quirks mode<sup>p51</sup>](#). Otherwise, the [node document](#) of the [context<sup>p1043</sup>](#) element is in [limited-quirks mode<sup>p51</sup>](#), then let the [Document<sup>p102</sup>](#) be in [limited-quirks mode<sup>p51</sup>](#). Otherwise, leave the [Document<sup>p102</sup>](#) in [no-quirks mode<sup>p51</sup>](#).
3. Create a new [HTML parser<sup>p952</sup>](#), and associate it with the just created [Document<sup>p102</sup>](#) node.
4. Set the state of the [HTML parser<sup>p952</sup>](#)'s [tokenization<sup>p965</sup>](#) stage as follows:
  - ↪ **If it is a [title<sup>p139</sup>](#) or [textarea<sup>p508</sup>](#) element**  
Switch the tokenizer to the [RCDATA state<sup>p967</sup>](#).
  - ↪ **If it is a [style<sup>p154</sup>](#), [xmp<sup>p1096</sup>](#), [iframe<sup>p299</sup>](#), [noembed<sup>p1096</sup>](#), or [noframes<sup>p1096</sup>](#) element**  
Switch the tokenizer to the [RAWTEXT state<sup>p967</sup>](#).
  - ↪ **If it is a [script<sup>p591</sup>](#) element**  
Switch the tokenizer to the [script data state<sup>p967</sup>](#).
  - ↪ **If it is a [noscript<sup>p602</sup>](#) element**  
If the [scripting flag<sup>p965</sup>](#) is enabled, switch the tokenizer to the [RAWTEXT state<sup>p967</sup>](#). Otherwise, leave the tokenizer in the [data state<sup>p966</sup>](#).
  - ↪ **If it is a [plaintext<sup>p1096</sup>](#) element**  
Switch the tokenizer to the [PLAINTEXT state<sup>p968</sup>](#).
  - ↪ **Otherwise**  
Leave the tokenizer in the [data state<sup>p966</sup>](#).

**Note** *For performance reasons, an implementation that does not report errors and that uses the actual state machine described in this specification directly could use the PLAINTEXT state instead of the RAWTEXT and script data states where those are mentioned in the list above. Except for rules regarding parse errors, they are equivalent, since there is no [appropriate end tag token<sup>p966</sup>](#) in the fragment case, yet they involve far fewer state transitions.*

5. Let *root* be a new [htm1<sup>p137</sup>](#) element with no attributes.
6. Append the element *root* to the [Document<sup>p102</sup>](#) node created above.
7. Set up the parser's [stack of open elements<sup>p962</sup>](#) so that it contains just the single element *root*.
8. If the [context<sup>p1043</sup>](#) element is a [template<sup>p604</sup>](#) element, push "in template<sup>p1027</sup>" onto the [stack of template insertion modes<sup>p961</sup>](#) so that it is the new [current template insertion mode<sup>p961</sup>](#).
9. Create a start tag token whose name is the local name of [context<sup>p1043</sup>](#) and whose attributes are the attributes of [context<sup>p1043</sup>](#).

Let this start tag token be the start tag token of the [context<sup>p1043</sup>](#) node, e.g. for the purposes of determining if it is an [HTML integration point<sup>p994</sup>](#).

10. Reset the parser's insertion mode appropriately<sup>p961</sup>.

**Note** The parser will reference the `context`<sup>p1043</sup> element as part of that algorithm.

11. Set the parser's `form element pointer`<sup>p965</sup> to the nearest node to the `context`<sup>p1043</sup> element that is a `form`<sup>p447</sup> element (going straight up the ancestor chain, and including the element itself, if it is a `form`<sup>p447</sup> element), if any. (If there is no such `form`<sup>p447</sup> element, the `form element pointer`<sup>p965</sup> keeps its initial value, null.)
12. Place the `input` into the `input stream`<sup>p960</sup> for the `HTML parser`<sup>p952</sup> just created. The encoding `confidence`<sup>p955</sup> is *irrelevant*.
13. Start the parser and let it run until it has consumed all the characters just inserted into the input stream.
14. Return the child nodes of `root`, in `tree order`<sup>p42</sup>.

## 12.5 Named character references

This table lists the character reference names that are supported by HTML, and the code points to which they refer. It is referenced by the previous sections.

## 13 The XHTML syntax

**Note** This section only describes the rules for XML resources. Rules for [text/html<sup>p1116</sup>](#) resources are discussed in the section above entitled "The HTML syntax<sup>p941</sup>".

### 13.1 Writing XHTML documents

Spec bugs: [20993](#)

The syntax for using HTML with XML, whether in XHTML documents or embedded in other XML documents, is defined in the XML and Namespaces in XML specifications. [\[XML\]<sup>p1154</sup>](#) [\[XMLNS\]<sup>p1154</sup>](#)

This specification does not define any syntax-level requirements beyond those defined for XML proper.

XML documents may contain a `DOCTYPE` if desired, but this is not required to conform to this specification. This specification does not define a public or system identifier, nor provide a formal DTD.

**Note** According to the XML specification, XML processors are not guaranteed to process the external DTD subset referenced in the `DOCTYPE`. This means, for example, that using [entity references](#) for characters in XHTML documents is unsafe if they are defined in an external file (except for `&lt;`, `&gt;`, `&amp;`, `&quot;` and `&apos;`).

### 13.2 Parsing XHTML documents

Spec bugs: [23739](#)

Support:

	Chrome	4+
	IE	9+
	Chrome for Android	40+
	Firefox	2+
	iOS Safari	3.2+
	Android Browser	2.1+
	UC Browser for Android	9.9+
	Opera Mini	5.0-8.0+
	Safari	3.1+
	Opera	9+
	IE Mobile	10+
	Firefox for Android	33+

Source: [caniuse.com](#)

This section describes the relationship between XML and the DOM, with a particular emphasis on how this interacts with HTML.

An **XML parser**, for the purposes of this specification, is a construct that follows the rules given in the XML specification to map a characters into a [Document<sup>p102</sup>](#) object.

**Note** At the time of writing, no such rules actually exist.

An [XML parser<sup>p1054</sup>](#) is either associated with a [Document<sup>p102</sup>](#) object when it is created, or creates one implicitly.

This [Document<sup>p102</sup>](#) must then be populated with DOM nodes that represent the tree structure of the input passed to the parser, as defined by the XML specification, the Namespaces in XML specification, and the DOM specification. DOM mutation events must not fire for the operations that the [XML parser<sup>p1054</sup>](#) performs on the [Document<sup>p102</sup>](#)'s tree, but the user agent must act as if elements and attributes were individually appended and set respectively so as to trigger rules in this specification regarding what happens when an element is inserted into a document or has its attributes set, and the DOM specification's requirements regarding [mutation observers](#) mean that mutation observers are fired (unlike mutation events). [\[XML\]<sup>p1154</sup>](#) [\[XMLNS\]<sup>p1154</sup>](#) [\[DOM\]<sup>p1149</sup>](#) [\[DOMEVENTS\]<sup>p1149</sup>](#)

Between the time an element's start tag is parsed and the time either the element's end tag is parsed or the parser detects a well-formedness error, the user agent must act as if the element was in a [stack of open elements<sup>p962</sup>](#).

**Note** This is used, e.g. by the [object<sup>p310</sup>](#) element to avoid instantiating plugins before the [param<sup>p316</sup>](#) element children have been parsed.

This specification provides the following additional information that user agents should use when retrieving an external entity: the public identifiers given in the following list all correspond to [the URL given by this link](#). (This URL is a DTD containing the [entity declarations](#) for the names listed in the [named character references<sup>p1044</sup>](#) section.) [\[XML\]<sup>p1154</sup>](#)

- -//W3C//DTD XHTML 1.0 Transitional//EN
- -//W3C//DTD XHTML 1.1//EN
- -//W3C//DTD XHTML 1.0 Strict//EN
- -//W3C//DTD XHTML 1.0 Frameset//EN
- -//W3C//DTD XHTML Basic 1.0//EN
- -//W3C//DTD XHTML 1.1 plus MathML 2.0//EN
- -//W3C//DTD XHTML 1.1 plus MathML 2.0 plus SVG 1.1//EN
- -//W3C//DTD MathML 2.0//EN

Furthermore, user agents should attempt to retrieve the above external entity's content when one of the above public identifiers is used, and should not attempt to retrieve any other external entity's content.

**Note** This is not strictly a [violation<sup>p26</sup>](#) of the XML specification, but it does contradict the spirit of the XML specification's requirements. This is motivated by a desire for user agents to all handle entities in an interoperable fashion without requiring any network access for handling external subsets. [XML]<sup>p1154</sup>

XML parsers can be invoked with **XML scripting support enabled** or **disabled**. Except where otherwise specified, XML parsers are invoked with [XML scripting support enabled](#)<sup>p1055</sup>.

When an [XML parser](#)<sup>p1054</sup> with [XML scripting support enabled](#)<sup>p1055</sup> creates a [script](#)<sup>p591</sup> element, it must be marked as being "[parser-inserted](#)"<sup>p593</sup> and its "[non-blocking](#)"<sup>p593</sup> flag must be unset. If the parser was originally created for the [XML fragment parsing algorithm](#)<sup>p1056</sup>, then the element must be marked as "[already started](#)"<sup>p593</sup> also. When the element's end tag is subsequently parsed, the user agent must [perform a microtask checkpoint](#)<sup>p837</sup>, and then [prepare](#)<sup>p593</sup> the [script](#)<sup>p591</sup> element. If this causes there to be a [pending parsing-blocking script](#)<sup>p596</sup>, then the user agent must run the following steps:

1. Block this instance of the [XML parser](#)<sup>p1054</sup>, such that the [event loop](#)<sup>p834</sup> will not run [tasks](#)<sup>p834</sup> that invoke it.
2. [Spin the event loop](#)<sup>p838</sup> until the parser's [Document](#)<sup>p102</sup> [has no style sheet that is blocking scripts](#)<sup>p157</sup> and the [pending parsing-blocking script](#)<sup>p596</sup>'s "[ready to be parser-executed](#)"<sup>p593</sup> flag is set.
3. Unblock this instance of the [XML parser](#)<sup>p1054</sup>, such that [tasks](#)<sup>p834</sup> that invoke it can again be run.
4. [Execute](#)<sup>p596</sup> the [pending parsing-blocking script](#)<sup>p596</sup>.
5. There is no longer a [pending parsing-blocking script](#)<sup>p596</sup>.

**Note** Since the [document.write\(\)](#)<sup>p851</sup> API is not available for [XML documents](#)<sup>p51</sup>, much of the complexity in the [HTML parser](#)<sup>p952</sup> is not needed in the [XML parser](#)<sup>p1054</sup>.

**Note** When the [XML parser](#)<sup>p1054</sup> has [XML scripting support disabled](#)<sup>p1055</sup>, none of this happens.

When an [XML parser](#)<sup>p1054</sup> would append a node to a [template](#)<sup>p604</sup> element, it must instead append it to the [template](#)<sup>p604</sup> element's [template contents](#)<sup>p605</sup> (a [DocumentFragment](#)<sup>p51</sup> node).

**Note** This is a [willful violation](#)<sup>p26</sup> of the XML specification; unfortunately, XML is not formally extensible in the manner that is needed for [template](#)<sup>p604</sup> processing. [XML]<sup>p1154</sup>

When an [XML parser](#)<sup>p1054</sup> creates a [Node](#)<sup>p51</sup> object, its [node document](#) must be set to the [node document](#) of the node into which the newly created node is to be inserted.

Certain algorithms in this specification **spoon-feed the parser** characters one string at a time. In such cases, the [XML parser](#)<sup>p1054</sup> must act as it would have if faced with a single string consisting of the concatenation of all those characters.

When an [XML parser](#)<sup>p1054</sup> reaches the end of its input, it must [stop parsing](#)<sup>p1033</sup>, following the same rules as the [HTML parser](#)<sup>p952</sup>. An [XML parser](#)<sup>p1054</sup> can also be [aborted](#)<sup>p1033</sup>, which must again be done in the same way as for an [HTML parser](#)<sup>p952</sup>.

For the purposes of conformance checkers, if a resource is determined to be in [the XHTML syntax](#)<sup>p1054</sup>, then it is an [XML document](#)<sup>p51</sup>.

### 13.3 Serialising XHTML fragments

The **XML fragment serialisation algorithm** for a [Document](#)<sup>p102</sup> or [Element](#)<sup>p51</sup> node either returns a fragment of XML that represents that node or throws an exception.

For [Document](#)<sup>p102</sup>s, the algorithm must return a string in the form of a [document entity](#), if none of the error cases below apply.

For [Element](#)<sup>p51</sup>s, the algorithm must return a string in the form of an [internal general parsed entity](#), if none of the error cases below apply.

In both cases, the string returned must be XML namespace-well-formed and must be an isomorphic serialisation of all of that node's [relevant child nodes](#)<sup>p1056</sup>, in [tree order](#)<sup>p42</sup>. User agents may adjust prefixes and namespace declarations in the serialisation (and indeed might be forced to do so in some cases to obtain namespace-well-formed XML). User agents may use a combination of regular text and character references to represent [Text](#)<sup>p51</sup> nodes in the DOM.

A node's **relevant child nodes** are those that apply given the following rules:

**For [template](#)<sup>p604</sup> elements**

The [relevant child nodes](#)<sup>p1056</sup> are the child nodes of the [template](#)<sup>p604</sup> element's [template contents](#)<sup>p605</sup>, if any.

**For all other nodes**

The [relevant child nodes](#)<sup>p1056</sup> are the child nodes of node itself, if any.

For [Element](#)<sup>p51</sup>s, if any of the elements in the serialisation are in no namespace, the default namespace in scope for those elements must be explicitly declared as the empty string. (This doesn't apply in the [Document](#)<sup>p102</sup> case.) [\[XML\]](#)<sup>p1154</sup> [\[XMLNS\]](#)<sup>p1154</sup>

For the purposes of this section, an internal general parsed entity is considered XML namespace-well-formed if a document consisting of an element with no namespace declarations whose contents are the internal general parsed entity would itself be XML namespace-well-formed.

If any of the following error cases are found in the DOM subtree being serialised, then the algorithm must throw an [InvalidStateError](#)<sup>p50</sup> exception instead of returning a string:

- A [Document](#)<sup>p102</sup> node with no child element nodes.
- A [DocumentType](#)<sup>p51</sup> node that has an external subset public identifier that contains characters that are not matched by the XML PubidChar production. [\[XML\]](#)<sup>p1154</sup>
- A [DocumentType](#)<sup>p51</sup> node that has an external subset system identifier that contains both a U+0022 QUOTATION MARK ("") and a U+0027 APOSTROPHE ('') or that contains characters that are not matched by the XML Char production. [\[XML\]](#)<sup>p1154</sup>
- A node with a local name containing a U+003A COLON (:).
- A node with a local name that does not match the XML Name production. [\[XML\]](#)<sup>p1154</sup>
- An [Attr](#)<sup>p51</sup> node with no namespace whose local name is the lowercase string "xmlns". [\[XMLNS\]](#)<sup>p1154</sup>
- An [Element](#)<sup>p51</sup> node with two or more attributes with the same local name and namespace.
- An [Attr](#)<sup>p51</sup> node, [Text](#)<sup>p51</sup> node, [Comment](#)<sup>p51</sup> node, or [ProcessingInstruction](#)<sup>p51</sup> node whose data contains characters that are not matched by the XML Char production. [\[XML\]](#)<sup>p1154</sup>
- A [Comment](#)<sup>p51</sup> node whose data contains two adjacent U+002D HYPHEN-MINUS characters (-) or ends with such a character.
- A [ProcessingInstruction](#)<sup>p51</sup> node whose target name is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "xml".
- A [ProcessingInstruction](#)<sup>p51</sup> node whose target name contains a U+003A COLON (:).
- A [ProcessingInstruction](#)<sup>p51</sup> node whose data contains the string "?>".

**Note** These are the only ways to make a DOM unserialisable. The DOM enforces all the other XML constraints; for example, trying to append two elements to a [Document](#)<sup>p102</sup> node will throw a [HierarchyRequestError](#)<sup>p50</sup> exception.

## 13.4 Parsing XHTML fragments

The **XML fragment parsing algorithm** either returns a [Document](#)<sup>p102</sup> or throws a [SyntaxError](#)<sup>p50</sup> exception. Given a string *input* and a context element [context](#)<sup>p1043</sup>, the algorithm is as follows:

1. Create a new [XML parser](#)<sup>p1054</sup>.
2. Feed the parser<sup>p1055</sup> just created the string corresponding to the start tag of the [context](#)<sup>p1043</sup> element, declaring all the namespace prefixes that are in scope on that element in the DOM, as well as declaring the default namespace (if any) that is in scope on that element in the DOM.

A namespace prefix is in scope if the DOM `lookupNamespaceURI()` method on the element would return a non-null value for that prefix.

The default namespace is the namespace for which the DOM `isDefaultNamespace()` method on the element would return true.

**Note** *No DOCTYPE is passed to the parser, and therefore no external subset is referenced, and therefore no entities will be recognized.*

3. [Feed the parser](#)<sup>p1055</sup> just created the string *input*.
4. [Feed the parser](#)<sup>p1055</sup> just created the string corresponding to the end tag of the [context](#)<sup>p1043</sup> element.
5. If there is an XML well-formedness or XML namespace well-formedness error, then throw a [SyntaxError](#)<sup>p50</sup> exception and abort these steps.
6. If the root element of the resulting [Document](#)<sup>p102</sup> has any sibling nodes, then throw a [SyntaxError](#)<sup>p50</sup> exception and abort these steps.
7. Return the child nodes of the root element of the resulting [Document](#)<sup>p102</sup>, in [tree order](#)<sup>p42</sup>.

## 14 Rendering

User agents are not required to present HTML documents in any particular way. However, this section provides a set of suggestions for rendering HTML documents that, if followed, are likely to lead to a user experience that closely resembles the experience intended by the documents' authors. So as to avoid confusion regarding the normativity of this section, RFC2119 terms have not been used. Instead, the term "expected" is used to indicate behaviour that will lead to this experience. For the purposes of conformance for user agents designated as [supporting the suggested default rendering<sup>p46</sup>](#), the term "expected" in this section has the same conformance implications as the RFC2119-defined term "must".

### 14.1 Introduction

In general, user agents are expected to support CSS, and many of the suggestions in this section are expressed in CSS terms. User agents that use other presentation mechanisms can derive their expected behaviour by translating from the CSS rules given in this section.

In the absence of style-layer rules to the contrary (e.g. author style sheets), user agents are expected to render an element so that it conveys to the user the meaning that the element [represents<sup>b111</sup>](#), as described by this specification.

The suggestions in this section generally assume a visual output medium with a resolution of 96dpi or greater, but HTML is intended to apply to multiple media (it is a *media-independent* language). User agent implementors are encouraged to adapt the suggestions in this section to their target media.

An element is **being rendered** if it has any associated CSS layout boxes, SVG layout boxes, or some equivalent in other styling languages.

**Note** Just being off-screen does not mean the element is not [being rendered<sup>p1058</sup>](#). The presence of the [hidden<sup>p723</sup>](#) attribute normally means the element is not [being rendered<sup>p1058</sup>](#), though this might be overridden by the style sheets.

User agents that do not honor author-level CSS style sheets are nonetheless expected to act as if they applied the CSS rules given in these sections in a manner consistent with this specification and the relevant CSS and Unicode specifications. [\[CSS\]<sup>p1149</sup>](#) [\[UNICODE\]<sup>p1153</sup>](#) [\[BIDI\]<sup>p1148</sup>](#)

**Note** This is especially important for issues relating to the 'display', 'unicode-bidi', and 'direction' properties.

### 14.2 The CSS user agent style sheet and presentational hints

Spec bugs: [22124](#)

The CSS rules given in these subsections are, except where otherwise specified, expected to be used as part of the user-agent level style sheet defaults for all documents that contain [HTML elements<sup>p42</sup>](#).

Some rules are intended for the author-level zero-specificity presentational hints part of the CSS cascade; these are explicitly called out as **presentational hints**.

Some of the rules regarding left and right margins are given here as appropriate for elements whose 'direction' property is 'ltr', and are expected to be flipped around on elements whose 'direction' property is 'rtl'. These are marked "**LTR-specific**".

**Note** These markings only affect the handling of attribute values, not attribute names or element names.

When the text below says that an attribute **attribute** on an element **element** **maps to the pixel length property** (or properties) **properties**, it means that if **element** has an attribute **attribute** set, and parsing that attribute's value using the [rules for parsing non-negative integers<sup>p61</sup>](#) doesn't generate an error, then the user agent is expected to use the parsed value as a pixel length for a [presentational hint<sup>p1058</sup>](#) for **properties**.

When the text below says that an attribute **attribute** on an element **element** **maps to the dimension property** (or properties) **properties**, it means that if **element** has an attribute **attribute** set, and parsing that attribute's value using the [rules for parsing dimension values<sup>p63</sup>](#) doesn't generate an

error, then the user agent is expected to use the parsed dimension as the value for a [presentational hint<sup>p1058</sup>](#) for *properties*, with the value given as a pixel length if the dimension was an integer, and with the value given as a percentage if the dimension was a percentage.

When a user agent is to **align descendants** of a node, the user agent is expected to align only those descendants that have both their 'margin-left' and 'margin-right' properties computing to a value other than 'auto', that are over-constrained and that have one of those two margins with a used value forced to a greater value, and that do not themselves have an applicable `align` attribute. When multiple elements are to [align<sup>p1059</sup>](#) a particular descendant, the most deeply nested such element is expected to override the others. Aligned elements are expected to be aligned by having the used values of their left and right margins be set accordingly.

## 14.3 Non-replaced elements

### 14.3.1 Hidden elements

CSS

```
@namespace url (http://www.w3.org/1999/xhtml);

[hidden], area, base, basefont, datalist, head, link, menu[type=popup i], meta,
noembed, noframes, param, rp, script, source, style, template, track, title {
 display: none;
}

embed[hidden] { display: inline; height: 0; width: 0; }

input[type=hidden i] { display: none ! important; }
```

The user agent is expected to force the 'display' property of [noscript<sup>p602</sup>](#) elements for whom [scripting is enabled<sup>p828</sup>](#) to compute to 'none', irrespective of CSS rules.

### 14.3.2 The page

CSS

```
@namespace url (http://www.w3.org/1999/xhtml);

html, body { display: block; }
```

For each property in the table below, given a [body<sup>p157</sup>](#) element, the first attribute that exists [maps to the pixel length property<sup>p1058</sup>](#) on the [body<sup>p157</sup>](#) element. If none of the attributes for a property are found, or if the value of the attribute that was found cannot be parsed successfully, then, if the [body<sup>p157</sup>](#) element's [node document's browsing context<sup>p762</sup>](#) does not have its [seamless browsing context flag<sup>p305</sup>](#) set, a default value of 8px is expected to be used for that property instead.

Property	Source
'margin-top'	<a href="#">body<sup>p157</sup></a> element's <a href="#">marginheight<sup>p1100</sup></a> attribute
	The <a href="#">body<sup>p157</sup></a> element's <a href="#">container frame element<sup>p1060</sup></a> 's <a href="#">marginheight<sup>p1100</sup></a> attribute
	<a href="#">body<sup>p157</sup></a> element's <a href="#">topmargin<sup>p1100</sup></a> attribute
'margin-right'	<a href="#">body<sup>p157</sup></a> element's <a href="#">marginwidth<sup>p1100</sup></a> attribute
	The <a href="#">body<sup>p157</sup></a> element's <a href="#">container frame element<sup>p1060</sup></a> 's <a href="#">marginwidth<sup>p1100</sup></a> attribute
	<a href="#">body<sup>p157</sup></a> element's <a href="#">rightmargin<sup>p1100</sup></a> attribute
'margin-bottom'	<a href="#">body<sup>p157</sup></a> element's <a href="#">marginheight<sup>p1100</sup></a> attribute
	The <a href="#">body<sup>p157</sup></a> element's <a href="#">container frame element<sup>p1060</sup></a> 's <a href="#">marginheight<sup>p1100</sup></a> attribute
	<a href="#">body<sup>p157</sup></a> element's <a href="#">bottommargin<sup>p1100</sup></a> attribute
'margin-left'	<a href="#">body<sup>p157</sup></a> element's <a href="#">marginwidth<sup>p1100</sup></a> attribute
	The <a href="#">body<sup>p157</sup></a> element's <a href="#">container frame element<sup>p1060</sup></a> 's <a href="#">marginwidth<sup>p1100</sup></a> attribute
	<a href="#">body<sup>p157</sup></a> element's <a href="#">leftmargin<sup>p1100</sup></a> attribute

If the `body`<sup>p157</sup> element's `node document`'s `browsing context`<sup>p762</sup> is a `nested browsing context`<sup>p763</sup>, and the `browsing context container`<sup>p763</sup> of that `nested browsing context`<sup>p763</sup> is a `frame`<sup>p1105</sup> or `iframe`<sup>p299</sup> element, then the `container frame element` of the `body`<sup>p157</sup> element is that `frame`<sup>p1105</sup> or `iframe`<sup>p299</sup> element. Otherwise, there is no `container frame element`<sup>p1060</sup>.

**⚠️ Warning!** *The above requirements imply that a page can change the margins of another page (including one from another origin<sup>p776</sup>) using, for example, an `iframe`<sup>p299</sup>. This is potentially a security risk, as it might in some cases allow an attack to contrive a situation in which a page is rendered not as the author intended, possibly for the purposes of phishing or otherwise misleading the user.*

If a `Document`<sup>p102</sup> is in a `nested browsing context`<sup>p763</sup>, it is expected to be positioned and sized to fit inside the content box of its `browsing context container`<sup>p763</sup>. If a `browsing context`<sup>p762</sup> is not `being rendered`<sup>p1058</sup>, it is expected to have a viewport with zero width and zero height.

If the `Document`<sup>p102</sup> is in a `nested browsing context`<sup>p763</sup>, and the `browsing context container`<sup>p763</sup> of that `nested browsing context`<sup>p763</sup> is a `frame`<sup>p1105</sup> or `iframe`<sup>p299</sup> element, and that element has a `scrolling` attribute, and that attribute's value is an `ASCII case-insensitive`<sup>p58</sup> match for the string "off", "noscroll", or "no", then the user agent is expected to prevent any scroll bars from being shown for the viewport of the `nested browsing context`<sup>p763</sup>, regardless of the 'overflow' property that applies to that viewport.

When a `body`<sup>p157</sup> element has a `background`<sup>p1101</sup> attribute set to a non-empty value, the new value is expected to be `resolved`<sup>p82</sup> relative to the element, and if this is successful, the user agent is expected to treat the attribute as a `presentational hint`<sup>p1058</sup> setting the element's 'background-image' property to the resulting `absolute URL`<sup>p48</sup>.

When a `body`<sup>p157</sup> element has a `bgcolor`<sup>p1100</sup> attribute set, the new value is expected to be parsed using the `rules for parsing a legacy colour value`<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a `presentational hint`<sup>p1058</sup> setting the element's 'background-color' property to the resulting colour.

When a `body`<sup>p157</sup> element has a `text`<sup>p1100</sup> attribute, its value is expected to be parsed using the `rules for parsing a legacy colour value`<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a `presentational hint`<sup>p1058</sup> setting the element's 'color' property to the resulting colour.

When a `body`<sup>p157</sup> element has a `link`<sup>p1100</sup> attribute, its value is expected to be parsed using the `rules for parsing a legacy colour value`<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a `presentational hint`<sup>p1058</sup> setting the 'color' property of any element in the `Document`<sup>p102</sup> matching the ':link' pseudo-class to the resulting colour.

When a `body`<sup>p157</sup> element has a `ylink`<sup>p1100</sup> attribute, its value is expected to be parsed using the `rules for parsing a legacy colour value`<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a `presentational hint`<sup>p1058</sup> setting the 'color' property of any element in the `Document`<sup>p102</sup> matching the ':visited' pseudo-class to the resulting colour.

When a `body`<sup>p157</sup> element has an `alink`<sup>p1100</sup> attribute, its value is expected to be parsed using the `rules for parsing a legacy colour value`<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a `presentational hint`<sup>p1058</sup> setting the 'color' property of any element in the `Document`<sup>p102</sup> matching the ':active' pseudo-class and either the ':link' pseudo-class or the ':visited' pseudo-class to the resulting colour.

### 14.3.3 Flow content

Spec bugs: [27673](#)

CSS

```
@namespace url (http://www.w3.org/1999/xhtml);

address, blockquote, center, div, figure, figcaption, footer, form, header, hr,
legend, listing, main, p, plaintext, pre, summary, xmp {
 display: block;
}

blockquote, figure, listing, p, plaintext, pre, xmp {
 margin-top: 1em; margin-bottom: 1em;
}

blockquote, figure { margin-left: 40px; margin-right: 40px; }
```

```

address { font-style: italic; }

listing, plaintext, pre, xmp {
 font-family: monospace; white-space: pre;
}

dialog:not([open]) { display: none; }
dialog {
 position: absolute;
 left: 0; right: 0;
 width: fit-content;
 height: fit-content;
 margin: auto;
 border: solid;
 padding: 1em;
 background: white;
 color: black;
}
dialog::backdrop {
 position: fixed;
 top: 0; right: 0; bottom: 0; left: 0;
 background: rgba(0,0,0,0.1);
}

/* for small devices, modal dialogs go full-screen */
@media screen and (max-width: 540px) {
 dialog:modal {
 top: 0;
 width: auto;
 margin: 1em;
 }
}

```

The following rules are also expected to apply, as [presentational hints<sup>p1058</sup>](#):

**CSS**

```

@namespace url(http://www.w3.org/1999/xhtml);

pre[wrap] { white-space: pre-wrap; }

```

In [quirks mode<sup>p51</sup>](#), the following rules are also expected to apply:

**CSS**

```

@namespace url(http://www.w3.org/1999/xhtml);

form { margin-bottom: 1em; }

```

The [center<sup>p1096</sup>](#) element, and the [div<sup>p207</sup>](#) element when it has an [align<sup>p1100</sup>](#) attribute whose value is an [ASCII case-insensitive<sup>p58</sup>](#) match for either the string "center" or the string "middle", are expected to center text within themselves, as if they had their 'text-align' property set to 'center' in a [presentational hint<sup>p1058</sup>](#), and to [align descendants<sup>p1059</sup>](#) to the center.

The [div<sup>p207</sup>](#) element, when it has an [align<sup>p1100</sup>](#) attribute whose value is an [ASCII case-insensitive<sup>p58</sup>](#) match for the string "left", is expected to left-align text within itself, as if it had its 'text-align' property set to 'left' in a [presentational hint<sup>p1058</sup>](#), and to [align descendants<sup>p1059</sup>](#) to the left.

The [div<sup>p207</sup>](#) element, when it has an [align<sup>p1100</sup>](#) attribute whose value is an [ASCII case-insensitive<sup>p58</sup>](#) match for the string "right", is expected to right-align text within itself, as if it had its 'text-align' property set to 'right' in a [presentational hint<sup>p1058</sup>](#), and to [align descendants<sup>p1059</sup>](#) to the right.

The [div<sup>p207</sup>](#) element, when it has an [align<sup>p1100</sup>](#) attribute whose value is an [ASCII case-insensitive<sup>p58</sup>](#) match for the string "justify", is expected to full-justify text within itself, as if it had its 'text-align' property set to 'justify' in a [presentational hint<sup>p1058</sup>](#), and to [align descendants<sup>p1059</sup>](#) to the left.

#### 14.3.4 Phrasing content

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

cite, dfn, em, i, var { font-style: italic; }
b, strong { font-weight: bolder; }
code, kbd, samp, tt { font-family: monospace; }
big { font-size: larger; }
small { font-size: smaller; }

sub { vertical-align: sub; }
sup { vertical-align: super; }
sub, sup { line-height: normal; font-size: smaller; }

ruby { display: ruby; }
rt { display: ruby-text; }

:link { color: #0000EE; }
:visited { color: #551A8B; }
:link:active, :visited:active { color: #FF0000; }
:link, :visited { text-decoration: underline; cursor: pointer; }
a:link[rel~=help], a:visited[rel~=help],
area:link[rel~=help], area:visited[rel~=help] { cursor: help; }

:focus { outline: auto; }

mark { background: yellow; color: black; } /* this colour is just a suggestion and can be changed
based on implementation feedback */

abbr[title], acronym[title] { text-decoration: dotted underline; }
ins, u { text-decoration: underline; }
del, s, strike { text-decoration: line-through; }
blink { text-decoration: blink; }

q::before { content: open-quote; }
q::after { content: close-quote; }

br { display-outside: newline; } /* this also has bidi implications */
nobr { white-space: nowrap; }
wbr { display-outside: break-opportunity; } /* this also has bidi implications */
nobr wbr { white-space: normal; }

Spec bugs: 28080, 26264
```

The following rules are also expected to apply, as [presentational hints](#)<sup>p1058</sup>:

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

br[clear=left i] { clear: left; }
br[clear=right i] { clear: right; }
br[clear=all i], br[clear=both i] { clear: both; }
```

For the purposes of the CSS ruby model, runs of children of ruby<sup>p219</sup> elements that are not rt<sup>p225</sup> or rp<sup>p225</sup> elements are expected to be wrapped in anonymous boxes whose 'display' property has the value 'ruby-base'. [\[CSSRUBY\]](#)<sup>p1149</sup>

When a particular part of a ruby has more than one annotation, the annotations should be distributed on both sides of the base text so as to minimise the stacking of ruby annotations on one side.

**Note** When it becomes possible to do so, the preceding requirement will be updated to be expressed in terms of CSS ruby. (Currently, CSS ruby does not handle nested ruby<sup>p219</sup> elements or multiple sequential rt<sup>p225</sup> elements, which is how this semantic is expressed.)

User agents that do not support correct ruby rendering are expected to render parentheses around the text of [rt<sup>p225</sup>](#) elements in the absence of [rp<sup>p225</sup>](#) elements.

User agents are expected to support the 'clear' property on inline elements (in order to render [br<sup>p242</sup>](#) elements with [clear<sup>p1100</sup>](#) attributes) in the manner described in the non-normative note to this effect in CSS2.1.

The initial value for the 'color' property is expected to be black. The initial value for the 'background-color' property is expected to be 'transparent'. The canvas' background is expected to be white.

When a [font<sup>p1096</sup>](#) element has a `color` attribute, its value is expected to be parsed using the [rules for parsing a legacy colour value<sup>p79</sup>](#), and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint<sup>p1058</sup>](#) setting the element's 'color' property to the resulting colour.

When a [font<sup>p1096</sup>](#) element has a `face` attribute, the user agent is expected to treat the attribute as a [presentational hint<sup>p1058</sup>](#) setting the element's 'font-family' property to the attribute's value.

When a [font<sup>p1096</sup>](#) element has a `size` attribute, the user agent is expected to use the following steps, known as the [rules for parsing a legacy font size](#), to treat the attribute as a [presentational hint<sup>p1058</sup>](#) setting the element's 'font-size' property:

1. Let *input* be the attribute's value.
2. Let *position* be a pointer into *input*, initially pointing at the start of the string.
3. [Skip whitespace<sup>b59</sup>](#).
4. If *position* is past the end of *input*, there is no [presentational hint<sup>p1058</sup>](#). Abort these steps.
5. If the character at *position* is a U+002B PLUS SIGN character (+), then let *mode* be *relative-plus*, and advance *position* to the next character. Otherwise, if the character at *position* is a U+002D HYPHEN-MINUS character (-), then let *mode* be *relative-minus*, and advance *position* to the next character. Otherwise, let *mode* be *absolute*.
6. [Collect a sequence of characters<sup>p59</sup>](#) that are [ASCII digits<sup>p58</sup>](#), and let the resulting sequence be *digits*.
7. If *digits* is the empty string, there is no [presentational hint<sup>p1058</sup>](#). Abort these steps.
8. Interpret *digits* as a base-ten integer. Let *value* be the resulting number.
9. If *mode* is *relative-plus*, then increment *value* by 3. If *mode* is *relative-minus*, then let *value* be the result of subtracting *value* from 3.
10. If *value* is greater than 7, let it be 7.
11. If *value* is less than 1, let it be 1.
12. Set 'font-size' to the keyword corresponding to the value of *value* according to the following table:

<code>value</code>	'font-size' keyword	Notes
1	x-small	
2	small	
3	medium	
4	large	
5	x-large	
6	xx-large	
7	xxx-large	<i>see below</i>

The 'xxx-large' value is a non-CSS value used here to indicate a font size 50% larger than 'xx-large'.

### 14.3.5 Bidirectional text

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

[dir]:dir(ltr), bdi:dir(ltr), input[type=tel]:dir(ltr) { direction: ltr; }
[dir]:dir(rtl), bdi:dir(rtl) { direction: rtl; }

address, blockquote, center, div, figure, figcaption, footer, form, header, hr,
legend, listing, main, p, plaintext, pre, summary, xmp, article, aside, h1, h2,
h3, h4, h5, h6, hgroup, nav, section, table, caption, colgroup, col, thead,
tbody, tfoot, tr, td, th, dir, dd, dl, dt, menu, ol, ul, li, bdi, output,
[dir=ltr i], [dir=rtl i], [dir=auto i] {
 unicode-bidi: isolate;
}

bdo, bdo[dir] { unicode-bidi: isolate-override; }

textarea[dir=auto i], pre[dir=auto i] { unicode-bidi: plaintext; }

/* the rules setting the 'content' property on br and wbr elements also has bidi implications */
```

Input fields (i.e. [textarea](#)<sup>p508</sup> elements, and [input](#)<sup>p452</sup> elements when their [type](#)<sup>p454</sup> attribute is in the [Text](#)<sup>p458</sup>, [Search](#)<sup>p458</sup>, [Telephone](#)<sup>p459</sup>, [URL](#)<sup>p460</sup>, or [E-mail](#)<sup>p461</sup> state) are expected to present an editing user interface with a directionality that matches the element's 'direction' property.

When the document's character encoding is ISO-8859-8, the following rules are additionally expected to apply, following those above:  
[\[ENCODING\]](#)<sup>p1150</sup>

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

address, blockquote, center, div, figure, figcaption, footer, form, header, hr,
legend, listing, main, p, plaintext, pre, summary, xmp, article, aside, h1, h2,
h3, h4, h5, h6, hgroup, nav, section, table, caption, colgroup, col, thead,
tbody, tfoot, tr, td, th, dir, dd, dl, dt, menu, ol, ul, li, [dir=ltr i],
[dir=rtl i], [dir=auto i], *|* {
 unicode-bidi: bidi-override;
}
input:not([type=submit i]):not([type=reset i]):not([type=button i]),
textarea, keygen {
 unicode-bidi: normal;
}
```

### 14.3.6 Quotes

This block is automatically generated from the Unicode Common Locale Data Repository. [\[CLDR\]](#)<sup>p1148</sup>

User agents are expected to use either the block below (which will be regularly updated) or to automatically generate their own copy directly from the source material. The language codes are derived from the CLDR file names. The quotes are derived from the `delimiter` blocks, with fallback handled as specified in the CLDR documentation.

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

:root { quotes: '\201c' '\201d' '\2018'
\2019' } /* " ' ' */
:root:lang(af), :not(:lang(af)) > :lang(af) { quotes: '\201c' '\201d' '\2018'
\2019' } /* " ' ' */
:root:lang(agq), :not(:lang(agq)) > :lang(agq) { quotes: '\201e' '\201d' '\201a'
\2019' } /* " , ' */
```

```

:root:lang(ak), :not(:lang(ak)) > :lang(ak) { quotes: '\201c' '\201d' '\2018'
'\2019' } /* " " ' */
:root:lang(am), :not(:lang(am)) > :lang(am) { quotes: '\00ab' '\00bb' '\2039'
'\203a' } /* <> < > */
:root:lang(ar), :not(:lang(ar)) > :lang(ar) { quotes: '\201d' '\201c' '\2019'
'\2018' } /* " " ' */

#### 14.3.7 Sections and headings

##### CSS

```

@namespace url(http://www.w3.org/1999/xhtml);

article, aside, h1, h2, h3, h4, h5, h6, hgroup, nav, section {
 display: block;
}

h1 { margin-top: 0.67em; margin-bottom: 0.67em; font-size: 2.00em; font-weight: bold; }
h2 { margin-top: 0.83em; margin-bottom: 0.83em; font-size: 1.50em; font-weight: bold; }
h3 { margin-top: 1.00em; margin-bottom: 1.00em; font-size: 1.17em; font-weight: bold; }
h4 { margin-top: 1.33em; margin-bottom: 1.33em; font-size: 1.00em; font-weight: bold; }
h5 { margin-top: 1.67em; margin-bottom: 1.67em; font-size: 0.83em; font-weight: bold; }
h6 { margin-top: 2.33em; margin-bottom: 2.33em; font-size: 0.67em; font-weight: bold; }

```

In the following CSS block, x is shorthand for the following selector: `:matches(article, aside, nav, section)`

##### CSS

```

@namespace url(http://www.w3.org/1999/xhtml);

x h1 { margin-top: 0.83em; margin-bottom: 0.83em; font-size: 1.50em; }
x x h1 { margin-top: 1.00em; margin-bottom: 1.00em; font-size: 1.17em; }
x x x h1 { margin-top: 1.33em; margin-bottom: 1.33em; font-size: 1.00em; }
x x x x h1 { margin-top: 1.67em; margin-bottom: 1.67em; font-size: 0.83em; }
x x x x x h1 { margin-top: 2.33em; margin-bottom: 2.33em; font-size: 0.67em; }

```

```

x hgroup > h1 ~ h2 { margin-top: 1.00em; margin-bottom: 1.00em; font-size: 1.17em; }
x x hgroup > h1 ~ h2 { margin-top: 1.33em; margin-bottom: 1.33em; font-size: 1.00em; }
x x x hgroup > h1 ~ h2 { margin-top: 1.67em; margin-bottom: 1.67em; font-size: 0.83em; }
x x x x hgroup > h1 ~ h2 { margin-top: 2.33em; margin-bottom: 2.33em; font-size: 0.67em; }

x hgroup > h1 ~ h3 { margin-top: 1.33em; margin-bottom: 1.33em; font-size: 1.00em; }
x x hgroup > h1 ~ h3 { margin-top: 1.67em; margin-bottom: 1.67em; font-size: 0.83em; }
x x x hgroup > h1 ~ h3 { margin-top: 2.33em; margin-bottom: 2.33em; font-size: 0.67em; }

x hgroup > h1 ~ h4 { margin-top: 1.67em; margin-bottom: 1.67em; font-size: 0.83em; }
x x hgroup > h1 ~ h4 { margin-top: 2.33em; margin-bottom: 2.33em; font-size: 0.67em; }

x hgroup > h1 ~ h5 { margin-top: 2.33em; margin-bottom: 2.33em; font-size: 0.67em; }

```

**Note** *The shorthand is used to keep this block at least mildly readable.*

### 14.3.8 Lists

Spec bugs: 17770

CSS

```

@namespace url(http://www.w3.org/1999/xhtml);

dir, dd, dl, dt, menu, ol, ul { display: block; }
li { display: list-item; }

dir, dl, menu, ol, ul { margin-top: 1em; margin-bottom: 1em; }

:matches(dir, dl, menu, ol, ul) :matches(dir, dl, menu, ol, ul) {
 margin-top: 0; margin-bottom: 0;
}

dd { margin-left: 40px; /* LTR-specific: use 'margin-right' for rtl elements */
dir, menu, ol, ul { padding-left: 40px; /* LTR-specific: use 'padding-right' for rtl elements */

ol { list-style-type: decimal; }

dir, menu, ul {
 list-style-type: disc;
}
:matches(dir, menu, ol, ul) :matches(dir, menu, ul) {
 list-style-type: circle;
}
:matches(dir, menu, ol, ul) :matches(dir, menu, ol, ul) :matches(dir, menu, ul) {
 list-style-type: square;
}

```

The following rules are also expected to apply, as [presentational hints](#)<sup>p1058</sup>.

CSS

```

@namespace url(http://www.w3.org/1999/xhtml);

ol[type=1], li[type=1] { list-style-type: decimal; }
ol[type=a], li[type=a] { list-style-type: lower-alpha; }
ol[type=A], li[type=A] { list-style-type: upper-alpha; }
ol[type=i], li[type=i] { list-style-type: lower-roman; }
ol[type=I], li[type=I] { list-style-type: upper-roman; }
ul[type=none i], li[type=none i] { list-style-type: none; }
ul[type=disc i], li[type=disc i] { list-style-type: disc; }
ul[type=circle i], li[type=circle i] { list-style-type: circle; }
ul[type=square i], li[type=square i] { list-style-type: square; }

```

When rendering [`li`](#)<sup>p198</sup> elements, non-CSS user agents are expected to use the [ordinal value](#)<sup>p198</sup> of the [`li`](#)<sup>p198</sup> element to render the counter in the list item marker.

This specification does not yet define the CSS-specific rules for rendering [`li`](#)<sup>p198</sup> elements, because CSS doesn't yet provide sufficient hooks for this purpose.

Spec bugs: [17632](#)

#### 14.3.9 Tables

Spec bugs: [27886](#)

CSS

```
@namespace url (http://www.w3.org/1999/xhtml);

table { display: table; }
caption { display: table-caption; }
colgroup, colgroup[hidden] { display: table-column-group; }
col, col[hidden] { display: table-column; }
thead, thead[hidden] { display: table-header-group; }
tbody, tbody[hidden] { display: table-row-group; }
tfoot, tfoot[hidden] { display: table-footer-group; }
tr, tr[hidden] { display: table-row; }
td, th, td[hidden], th[hidden] { display: table-cell; }

colgroup[hidden], col[hidden], thead[hidden], tbody[hidden],
tfoot[hidden], tr[hidden], td[hidden], th[hidden] {
 visibility: collapse;
}

table {
 box-sizing: border-box;
 border-spacing: 2px;
 border-collapse: separate;
 text-indent: initial;
}
td, th { padding: 1px; }
th { font-weight: bold; }

thead, tbody, tfoot, table > tr { vertical-align: middle; }
tr, td, th { vertical-align: inherit; }

table, td, th { border-color: gray; }

table[rules=rows i] > thead > tr > td, table[rules=rows i] > thead > tr > th,
table[rules=rows i] > tbody > tr > td, table[rules=rows i] > tbody > tr > th,
table[rules=rows i] > tfoot > tr > td, table[rules=rows i] > tfoot > tr > th {
 border-width: 1px;
 border-style: none;
}
table[rules=cols i] > tr > td, table[rules=cols i] > tr > th,
table[rules=cols i] > thead > tr > td, table[rules=cols i] > thead > tr > th,
table[rules=cols i] > tbody > tr > td, table[rules=cols i] > tbody > tr > th,
table[rules=cols i] > tfoot > tr > td, table[rules=cols i] > tfoot > tr > th {
 border-width: 1px;
 border-style: none solid;
}
table[rules=all i] > tr > td, table[rules=all i] > tr > th,
table[rules=all i] > thead > tr > td, table[rules=all i] > thead > tr > th,
table[rules=all i] > tbody > tr > td, table[rules=all i] > tbody > tr > th,
table[rules=all i] > tfoot > tr > td, table[rules=all i] > tfoot > tr > th {
 border-width: 1px;
 border-style: solid;
}

table[rules=groups i] > colgroup {
 border-left-width: 1px;
 border-left-style: solid;
 border-right-width: 1px;
 border-right-style: solid;
}
table[rules=groups i] > thead,

```

```

table[rules=groups i] > tbody,
table[rules=groups i] > tfoot {
 border-top-width: 1px;
 border-top-style: solid;
 border-bottom-width: 1px;
 border-bottom-style: solid;
}

table[rules=rows i] > tr, table[rules=rows i] > thead > tr,
table[rules=rows i] > tbody > tr, table[rules=rows i] > tfoot > tr {
 border-top-width: 1px;
 border-top-style: solid;
 border-bottom-width: 1px;
 border-bottom-style: solid;
}

```

In [quirks mode](#)<sup>p51</sup>, the following rules are also expected to apply:

CSS

```

@namespace url (http://www.w3.org/1999/xhtml);

table {
 font-weight: initial;
 font-style: initial;
 font-variant: initial;
 font-size: initial;
 line-height: initial;
 white-space: initial;
 text-align: initial;
}

```

For the purposes of the CSS table model, the [col](#)<sup>p407</sup> element is expected to be treated as if it was present as many times as its [span](#)<sup>p408</sup> attribute [specifies](#)<sup>p61</sup>.

For the purposes of the CSS table model, the [colgroup](#)<sup>p406</sup> element, if it contains no [col](#)<sup>p407</sup> element, is expected to be treated as if it had as many such children as its [span](#)<sup>p407</sup> attribute [specifies](#)<sup>p61</sup>.

For the purposes of the CSS table model, the [colspan](#)<sup>p416</sup> and [rowspan](#)<sup>p416</sup> attributes on [td](#)<sup>p412</sup> and [th](#)<sup>p414</sup> elements are expected to [provide](#)<sup>p61</sup> the *special knowledge* regarding cells spanning rows and columns.

In [HTML documents](#)<sup>p51</sup>, the following rules are also expected to apply:

CSS

```

@namespace url (http://www.w3.org/1999/xhtml);

:matches(table, thead, tbody, tfoot, tr) > form { display: none !important; }

```

The [table](#)<sup>p398</sup> element's [cellspacing](#)<sup>p1101</sup> attribute [maps to the pixel length property](#)<sup>p1058</sup> 'border-spacing' on the element.

The [table](#)<sup>p398</sup> element's [cellpadding](#)<sup>p1101</sup> attribute [maps to the pixel length properties](#)<sup>p1058</sup> 'padding-top', 'padding-right', 'padding-bottom', and 'padding-left' of any [td](#)<sup>p412</sup> and [th](#)<sup>p414</sup> elements that have corresponding [cells](#)<sup>p417</sup> in the [table](#)<sup>p417</sup> corresponding to the [table](#)<sup>p398</sup> element.

The [table](#)<sup>p398</sup> element's [hspace](#)<sup>p1101</sup> attribute [maps to the dimension properties](#)<sup>p1058</sup> 'margin-left' and 'margin-right' on the [table](#)<sup>p398</sup> element.

The [table](#)<sup>p398</sup> element's [vspace](#)<sup>p1101</sup> attribute [maps to the dimension properties](#)<sup>p1058</sup> 'margin-top' and 'margin-bottom' on the [table](#)<sup>p398</sup> element.

The [table](#)<sup>p398</sup> element's [height](#)<sup>p1101</sup> attribute [maps to the dimension property](#)<sup>p1058</sup> 'height' on the [table](#)<sup>p398</sup> element.

The [table](#)<sup>p398</sup> element's [width](#)<sup>p1101</sup> attribute [maps to the dimension property](#)<sup>p1058</sup> 'width' on the [table](#)<sup>p398</sup> element.

The `col`<sup>p407</sup> element's `width`<sup>p1100</sup> attribute [maps to the dimension property](#)<sup>p1058</sup> 'width' on the `col`<sup>p407</sup> element.

The `tr`<sup>p411</sup> element's `height`<sup>p1101</sup> attribute [maps to the dimension property](#)<sup>p1058</sup> 'height' on the `tr`<sup>p411</sup> element.

The `td`<sup>p412</sup> and `th`<sup>p414</sup> elements' `height`<sup>p1101</sup> attributes [map to the dimension property](#)<sup>p1058</sup> 'height' on the element.

The `td`<sup>p412</sup> and `th`<sup>p414</sup> elements' `width`<sup>p1101</sup> attributes [map to the dimension property](#)<sup>p1058</sup> 'width' on the element.

The `caption`<sup>p405</sup> element unless specified otherwise below, and the `thead`<sup>p409</sup>, `tbody`<sup>p408</sup>, `tfoot`<sup>p410</sup>, `tr`<sup>p411</sup>, `td`<sup>p412</sup>, and `th`<sup>p414</sup> elements when they have an `align` attribute whose value is an [ASCII case-insensitive](#)<sup>p58</sup> match for either the string "center" or the string "middle", are expected to center text within themselves, as if they had their 'text-align' property set to 'center' in a [presentational hint](#)<sup>p1058</sup>, and to [align descendants](#)<sup>p1059</sup> to the center.

The `caption`<sup>p405</sup>, `thead`<sup>p409</sup>, `tbody`<sup>p408</sup>, `tfoot`<sup>p410</sup>, `tr`<sup>p411</sup>, `td`<sup>p412</sup>, and `th`<sup>p414</sup> elements, when they have an `align` attribute whose value is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "left", are expected to left-align text within themselves, as if they had their 'text-align' property set to 'left' in a [presentational hint](#)<sup>p1058</sup>, and to [align descendants](#)<sup>p1059</sup> to the left.

The `caption`<sup>p405</sup>, `thead`<sup>p409</sup>, `tbody`<sup>p408</sup>, `tfoot`<sup>p410</sup>, `tr`<sup>p411</sup>, `td`<sup>p412</sup>, and `th`<sup>p414</sup> elements, when they have an `align` attribute whose value is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "right", are expected to right-align text within themselves, as if they had their 'text-align' property set to 'right' in a [presentational hint](#)<sup>p1058</sup>, and to [align descendants](#)<sup>p1059</sup> to the right.

The `caption`<sup>p405</sup>, `thead`<sup>p409</sup>, `tbody`<sup>p408</sup>, `tfoot`<sup>p410</sup>, `tr`<sup>p411</sup>, `td`<sup>p412</sup>, and `th`<sup>p414</sup> elements, when they have an `align` attribute whose value is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "justify", are expected to full-justify text within themselves, as if they had their 'text-align' property set to 'justify' in a [presentational hint](#)<sup>p1058</sup>, and to [align descendants](#)<sup>p1059</sup> to the left.

User agents are expected to have a rule in their user agent stylesheet that matches `th`<sup>p414</sup> elements that have a parent node whose computed value for the 'text-align' property is its initial value, whose declaration block consists of just a single declaration that sets the 'text-align' property to the value 'center'.

When a `table`<sup>p398</sup>, `thead`<sup>p409</sup>, `tbody`<sup>p408</sup>, `tfoot`<sup>p410</sup>, `tr`<sup>p411</sup>, `td`<sup>p412</sup>, or `th`<sup>p414</sup> element has a `background`<sup>p1101</sup> attribute set to a non-empty value, the new value is expected to be [resolved](#)<sup>p82</sup> relative to the element, and if this is successful, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1058</sup> setting the element's 'background-image' property to the resulting [absolute URL](#)<sup>p48</sup>.

When a `table`<sup>p398</sup>, `thead`<sup>p409</sup>, `tbody`<sup>p408</sup>, `tfoot`<sup>p410</sup>, `tr`<sup>p411</sup>, `td`<sup>p412</sup>, or `th`<sup>p414</sup> element has a `bgcolor` attribute set, the new value is expected to be parsed using the [rules for parsing a legacy colour value](#)<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1058</sup> setting the element's 'background-color' property to the resulting colour.

When a `table`<sup>p398</sup> element has a `bordercolor`<sup>p1101</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy colour value](#)<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1058</sup> setting the element's 'border-top-color', 'border-right-color', 'border-bottom-color', and 'border-right-color' properties to the resulting colour.

The `table`<sup>p398</sup> element's `border`<sup>p1101</sup> attribute [maps to the pixel length properties](#)<sup>p1058</sup> 'border-top-width', 'border-right-width', 'border-bottom-width', 'border-left-width' on the element. If the attribute is present but parsing the attribute's value using the [rules for parsing non-negative integers](#)<sup>p61</sup> generates an error, a default value of 1px is expected to be used for that property instead.

Rules marked "**only if border is not equivalent to zero**" in the CSS block above is expected to only be applied if the `border`<sup>p1101</sup> attribute mentioned in the selectors for the rule is not only present but, when parsed using the [rules for parsing non-negative integers](#)<sup>p61</sup>, is also found to have a value other than zero or to generate an error.

In [quirks mode](#)<sup>p51</sup>, a `td`<sup>p412</sup> element or a `th`<sup>p414</sup> element that has a `nowrap`<sup>p1101</sup> attribute but also has a `width`<sup>p1101</sup> attribute whose value, when parsed using the [rules for parsing dimension values](#)<sup>p63</sup>, is found to be a length (not an error or a number classified as a percentage), is expected to have a [presentational hint](#)<sup>p1058</sup> setting the element's 'white-space' property to 'normal', overriding the rule in the CSS block above that sets it to 'nowrap'.

User agents are expected to render [sorting interface `th` elements<sup>p423</sup>](#) in such a manner as to indicate that activating the elements will cause the table to be sorted.

#### 14.3.10 Margin collapsing quirks

A node is **substantial** if it is a text node that is not [inter-element whitespace<sup>p113</sup>](#), or if it is an element node.

A node is **blank** if it is an element that contains no [substantial<sup>p1077</sup>](#) nodes.

The **elements with default margins** are the following elements: [blockquote<sup>p193</sup>](#), [dir<sup>p1096</sup>](#), [dl<sup>p199</sup>](#), [h1<sup>p168</sup>](#), [h2<sup>p168</sup>](#), [h3<sup>p168</sup>](#), [h4<sup>p168</sup>](#), [h5<sup>p168</sup>](#), [h6<sup>p168</sup>](#). [listing<sup>p1096</sup>](#), [menu<sup>p571</sup>](#), [multicol<sup>p1096</sup>](#), [ol<sup>p195</sup>](#), [p<sup>p187</sup>](#), [plaintext<sup>p1096</sup>](#), [pre<sup>p191</sup>](#), [ul<sup>p197</sup>](#), [xmp<sup>p1096</sup>](#). Spec bugs: [2762](#) :

In [quirks mode<sup>p51</sup>](#), any [element with default margins<sup>p1077</sup>](#) that is the child of a [body<sup>p157</sup>](#), [td<sup>p412</sup>](#), or [th<sup>p414</sup>](#) element and has no [substantial<sup>p1077</sup>](#) previous siblings is expected to have a user-agent level style sheet rule that sets its 'margin-top' property to zero.

In [quirks mode<sup>p51</sup>](#), any [element with default margins<sup>p1077</sup>](#) that is the child of a [body<sup>p157</sup>](#), [td<sup>p412</sup>](#), or [th<sup>p414</sup>](#) element, has no [substantial<sup>p1077</sup>](#) previous siblings, and is [blank<sup>p1077</sup>](#), is expected to have a user-agent level style sheet rule that sets its 'margin-bottom' property to zero also.

In [quirks mode<sup>p51</sup>](#), any [element with default margins<sup>p1077</sup>](#) that is the child of a [td<sup>p412</sup>](#) or [th<sup>p414</sup>](#) element, has no [substantial<sup>p1077</sup>](#) following siblings, and is [blank<sup>p1077</sup>](#), is expected to have a user-agent level style sheet rule that sets its 'margin-top' property to zero.

In [quirks mode<sup>p51</sup>](#), any [p<sup>p187</sup>](#) element that is the child of a [td<sup>p412</sup>](#) or [th<sup>p414</sup>](#) element and has no [substantial<sup>p1077</sup>](#) following siblings, is expected to have a user-agent level style sheet rule that sets its 'margin-bottom' property to zero.

#### 14.3.11 Form controls

Spec bugs: [27652](#) :

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

input, select, option, optgroup, button, textarea, keygen {
 text-indent: initial;
}

textarea { white-space: pre-wrap; }

input[type="radio"], input[type="checkbox"], input[type="reset"], input[type="button"],
input[type="submit"], select, button {
 box-sizing: border-box;
}
```

In [quirks mode<sup>p51</sup>](#), the following rules are also expected to apply:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

input:not([type=image]), textarea { box-sizing: border-box; }
```

Each kind of form control is also given a specific default binding, as described in subsequent sections, which implements the look and feel of the control.

#### 14.3.12 The [hr<sup>p190</sup>](#) element

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

hr { color: gray; border-style: inset; border-width: 1px; margin: 0.5em auto; }
```

The following rules are also expected to apply, as [presentational hints](#)<sup>p1058</sup>:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

hr[align=left] { margin-left: 0; margin-right: auto; }
hr[align=right] { margin-left: auto; margin-right: 0; }
hr[align=center] { margin-left: auto; margin-right: auto; }
hr[color], hr[noshade] { border-style: solid; }
```

If an [hr](#)<sup>p190</sup> element has either a [color](#)<sup>p1100</sup> attribute or a [noshade](#)<sup>p1100</sup> attribute, and furthermore also has a [size](#)<sup>p1100</sup> attribute, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>b61</sup> doesn't generate an error, then the user agent is expected to use the parsed value divided by two as a pixel length for [presentational hints](#)<sup>p1058</sup> for the properties 'border-top-width', 'border-right-width', 'border-bottom-width', and 'border-left-width' on the element.

Otherwise, if an [hr](#)<sup>p190</sup> element has neither a [color](#)<sup>p1100</sup> attribute nor a [noshade](#)<sup>p1100</sup> attribute, but does have a [size](#)<sup>p1100</sup> attribute, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>b61</sup> doesn't generate an error, then: if the parsed value is one, then the user agent is expected to use the attribute as a [presentational hint](#)<sup>p1058</sup> setting the element's 'border-bottom-width' to 0; otherwise, if the parsed value is greater than one, then the user agent is expected to use the parsed value minus two as a pixel length for [presentational hints](#)<sup>p1058</sup> for the 'height' property on the element.

The [width](#)<sup>p1100</sup> attribute on an [hr](#)<sup>p190</sup> element [maps to the dimension property](#)<sup>p1058</sup> 'width' on the element.

When an [hr](#)<sup>p190</sup> element has a [color](#)<sup>p1100</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy colour value](#)<sup>b79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1058</sup> setting the element's 'color' property to the resulting colour.

#### 14.3.13 The [fieldset](#)<sup>b524</sup> and [legend](#)<sup>p526</sup> elements

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

fieldset {
 display: block;
 margin-left: 2px; margin-right: 2px;
 border: groove 2px ThreedFace;
 padding: 0.35em 0.625em 0.75em;
 min-width: min-content;
}

legend {
 padding-left: 2px; padding-right: 2px;
}
```

The [fieldset](#)<sup>b524</sup> element is expected to establish a new block formatting context.

If the [fieldset](#)<sup>b524</sup> element has a child that matches the conditions in the list below, then the first such child is the [fieldset](#)<sup>b524</sup> element's [rendered legend](#):

- The child is a [legend](#)<sup>b526</sup> element.
- The child is not out-of-flow (e.g. not absolutely positioned or floated).
- The child is generating a box (e.g. it is not 'display:none').

A [fieldset](#)<sup>b524</sup> element's [rendered legend](#)<sup>b1078</sup>, if any, is expected to be rendered over the top border edge of the [fieldset](#)<sup>b524</sup> element as a 'block' box (overriding any explicit 'display' value). In the absence of an explicit width, the box should shrink-wrap. If the [legend](#)<sup>b526</sup> element in question has an [align](#)<sup>p1100</sup> attribute, and its value is an [ASCII case-insensitive](#)<sup>p58</sup> match for one of the strings in the first column of the following table, then the [legend](#)<sup>b526</sup> is expected to be rendered horizontally aligned over the border edge in the position given in the corresponding cell on the same row in the second column. If the attribute is absent or has a value that doesn't match any of the cases in the table, then the position is expected to be on the right if the 'direction' property on this element has a computed value of 'rtl', and on the left otherwise.

Attribute value	Alignment position
left	On the left
right	On the right
center	In the middle

## 14.4 Replaced elements

### 14.4.1 Embedded content

The `embed`<sup>p307</sup>, `iframe`<sup>p299</sup>, and `video`<sup>p317</sup> elements are expected to be treated as replaced elements.

A `canvas`<sup>p607</sup> element that represents<sup>p111</sup> embedded content<sup>p116</sup> is expected to be treated as a replaced element; the contents of such elements are the element's bitmap, if any, or else a transparent black bitmap with the same intrinsic dimensions as the element. Other `canvas`<sup>p607</sup> elements are expected to be treated as ordinary elements in the rendering model.

An `object`<sup>p310</sup> element that represents<sup>p111</sup> an image, plugin, or nested browsing context<sup>p763</sup> is expected to be treated as a replaced element. Other `object`<sup>p310</sup> elements are expected to be treated as ordinary elements in the rendering model.

An `applet`<sup>p1101</sup> element that represents<sup>p111</sup> a `plugin`<sup>p43</sup> is expected to be treated as a replaced element. Other `applet`<sup>p1101</sup> elements are expected to be treated as ordinary elements in the rendering model.

The `audio`<sup>p321</sup> element, when it is exposing a user interface<sup>p382</sup>, is expected to be treated as a replaced element about one line high, as wide as is necessary to expose the user agent's user interface features. When an `audio`<sup>p321</sup> element is not exposing a user interface<sup>p382</sup>, the user agent is expected to force its 'display' property to compute to 'none', irrespective of CSS rules.

Whether a `video`<sup>p317</sup> element is exposing a user interface<sup>p382</sup> is not expected to affect the size of the rendering; controls are expected to be overlaid above the page content without causing any layout changes, and are expected to disappear when the user does not need them.

When a `video`<sup>p317</sup> element represents a poster frame or frame of video, the poster frame or frame of video is expected to be rendered at the largest size that maintains the aspect ratio of that poster frame or frame of video without being taller or wider than the `video`<sup>p317</sup> element itself, and is expected to be centered in the `video`<sup>p317</sup> element.

Any subtitles or captions are expected to be overlayed directly on top of their `video`<sup>p317</sup> element, as defined by the relevant rendering rules; for WebVTT, those are the rules for updating the display of WebVTT text tracks<sup>p54</sup>. [WEBVTT]<sup>p1154</sup>

When the user agent starts exposing a user interface<sup>p382</sup> for a `video`<sup>p317</sup> element, the user agent should run the rules for updating the text track rendering<sup>p367</sup> of each of the `text tracks`<sup>p365</sup> in the `video`<sup>p317</sup> element's list of text tracks<sup>p365</sup> that are showing<sup>p367</sup> and whose text track kind<sup>p366</sup> is one of subtitles<sup>p366</sup> or captions<sup>p366</sup> (e.g., for `text tracks`<sup>p365</sup> based on WebVTT, the rules for updating the display of WebVTT text tracks<sup>p54</sup>). [WEBVTT]<sup>p1154</sup>

**Note** Resizing `video`<sup>p317</sup> and `canvas`<sup>p607</sup> elements does not interrupt video playback or clear the canvas.

The following CSS rules are expected to apply:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);

```

```
iframe:not([seamless]) { border: 2px inset; }
iframe[seamless] { display: block; }
video { object-fit: contain; }
```

## 14.4.2 Images

User agents are expected to render `img`<sup>p272</sup> elements and `input`<sup>p452</sup> elements whose `type`<sup>p454</sup> attributes are in the `Image Button`<sup>p479</sup> state, according to the first applicable rules from the following list:

↪ If the element `represents`<sup>p111</sup> an image

The user agent is expected to treat the element as a replaced element and render the image according to the rules for doing so defined in CSS.

↪ If the element does not `represent`<sup>p111</sup> an image, but the element already has intrinsic dimensions (e.g. from the `dimension attributes`<sup>p397</sup> or CSS rules), and either:

- the user agent has reason to believe that the image will become `available`<sup>p274</sup> and be rendered in due course, or
- the element has no `alt` attribute, or
- the `Document`<sup>p102</sup> is in `quirks mode`<sup>p51</sup>

The user agent is expected to treat the element as a replaced element whose content is the text that the element represents, if any, optionally alongside an icon indicating that the image is being obtained (if applicable). For `input`<sup>p452</sup> elements, the element is expected to appear button-like to indicate that the element is a `button`<sup>p447</sup>.

↪ If the element is an `img`<sup>p272</sup> element that `represents`<sup>p111</sup> some text and the user agent does not expect this to change

The user agent is expected to treat the element as a non-replaced phrasing element whose content is the text, optionally with an icon indicating that an image is missing, so that the user can request the image be displayed or investigate why it is not rendering. In non-graphical contexts, such an icon should be omitted.

↪ If the element is an `img`<sup>p272</sup> element that `represents`<sup>p111</sup> nothing and the user agent does not expect this to change

The user agent is expected to treat the element as an empty inline element. (In the absence of further styles, this will cause the element to essentially not be rendered.)

↪ If the element is an `input`<sup>p452</sup> element that does not `represent`<sup>p111</sup> an image and the user agent does not expect this to change

The user agent is expected to treat the element as a replaced element consisting of a button whose content is the element's alternative text. The intrinsic dimensions of the button are expected to be about one line in height and whatever width is necessary to render the text on one line.

The icons mentioned above are expected to be relatively small so as not to disrupt most text but be easily clickable. In a visual environment, for instance, icons could be 16 pixels by 16 pixels square, or 1em by 1em if the images are scalable. In an audio environment, the icon could be a short bleep. The icons are intended to indicate to the user that they can be used to get to whatever options the UA provides for images, and, where appropriate, are expected to provide access to the context menu that would have come up if the user interacted with the actual image.

All animated images with the same `absolute URL`<sup>p48</sup> and the same image data are expected to be rendered synchronised to the same timeline as a group, with the timeline starting at the time of the least recent addition to the group.

**Note** *In other words, when a second image with the same `absolute URL`<sup>p48</sup> and animated image data is inserted into a document, it jumps to the point in the animation cycle that is currently being displayed by the first image.*

When a user agent is to **restart the animation** for an `img`<sup>p272</sup> element showing an animated image, all animated images with the same `absolute URL`<sup>p48</sup> and the same image data in that `img`<sup>p272</sup> element's `node document` are expected to restart their animation from the beginning.

The following CSS rules are expected to apply when the `Document`<sup>p102</sup> is in `quirks mode`<sup>p51</sup>:

```
CSS @namespace url(http://www.w3.org/1999/xhtml);
 img[align=left i] { margin-right: 3px; }
 img[align=right i] { margin-left: 3px; }
```

## 14.4.3 Attributes for embedded content and images

The following CSS rules are expected to apply as `presentational hints`<sup>p1058</sup>.

## CSS

```

@namespace url("http://www.w3.org/1999/xhtml");

iframe[frameborder=0], iframe[frameborder=no i] { border: none; }

applet[align=left i], embed[align=left i], iframe[align=left i],
img[align=left i], input[type=image i][align=left i], object[align=left i] {
 float: left;
}

applet[align=right i], embed[align=right i], iframe[align=right i],
img[align=right i], input[type=image i][align=right i], object[align=right i] {
 float: right;
}

applet[align=top i], embed[align=top i], iframe[align=top i],
img[align=top i], input[type=image i][align=top i], object[align=top i] {
 vertical-align: top;
}

applet[align=baseline i], embed[align=baseline i], iframe[align=baseline i],
img[align=baseline i], input[type=image i][align=baseline i], object[align=baseline i] {
 vertical-align: baseline;
}

applet[align=texttop i], embed[align=texttop i], iframe[align=texttop i],
img[align=texttop i], input[type=image i][align=texttop i], object[align=texttop i] {
 vertical-align: text-top;
}

applet[align=absmiddle i], embed[align=absmiddle i], iframe[align=absmiddle i],
img[align=absmiddle i], input[type=image i][align=absmiddle i], object[align=absmiddle i],
applet[align=abscenter i], embed[align=abscenter i], iframe[align=abscenter i],
img[align=abscenter i], input[type=image i][align=abscenter i], object[align=abscenter i] {
 vertical-align: middle;
}

applet[align=bottom i], embed[align=bottom i], iframe[align=bottom i],
img[align=bottom i], input[type=image i][align=bottom i],
object[align=bottom i] {
 vertical-align: bottom;
}

```

When an [applet](#)<sup>p1101</sup>, [embed](#)<sup>p307</sup>, [iframe](#)<sup>p299</sup>, [img](#)<sup>p272</sup>, or [object](#)<sup>p310</sup> element, or an [input](#)<sup>p452</sup> element whose [type](#)<sup>p454</sup> attribute is in the [Image Button](#)<sup>p479</sup> state, has an [align](#) attribute whose value is an [ASCII case-insensitive](#)<sup>p58</sup> match for the string "center" or the string "middle", the user agent is expected to act as if the element's 'vertical-align' property was set to a value that aligns the vertical middle of the element with the parent element's baseline.

The [hspace](#) attribute of [applet](#)<sup>p1101</sup>, [embed](#)<sup>p307</sup>, [iframe](#)<sup>p299</sup>, [img](#)<sup>p272</sup>, or [object](#)<sup>p310</sup> elements, and [input](#)<sup>p452</sup> elements with a [type](#)<sup>p454</sup> attribute in the [Image Button](#)<sup>p479</sup> state, [maps to the dimension properties](#)<sup>p1058</sup> 'margin-left' and 'margin-right' on the element.

The [vspace](#) attribute of [applet](#)<sup>p1101</sup>, [embed](#)<sup>p307</sup>, [iframe](#)<sup>p299</sup>, [img](#)<sup>p272</sup>, or [object](#)<sup>p310</sup> elements, and [input](#)<sup>p452</sup> elements with a [type](#)<sup>p454</sup> attribute in the [Image Button](#)<sup>p479</sup> state, [maps to the dimension properties](#)<sup>p1058</sup> 'margin-top' and 'margin-bottom' on the element.

When an [img](#)<sup>p272</sup> element, [object](#)<sup>p310</sup> element, or [input](#)<sup>p452</sup> element with a [type](#)<sup>p454</sup> attribute in the [Image Button](#)<sup>p479</sup> state has a [border](#) attribute whose value, when parsed using the [rules for parsing non-negative integers](#)<sup>p61</sup>, is found to be a number greater than zero, the user agent is expected to use the parsed value for eight [presentational hints](#)<sup>p1058</sup>: four setting the parsed value as a pixel length for the element's 'border-top-width', 'border-right-width', 'border-bottom-width', and 'border-left-width' properties, and four setting the element's 'border-top-style', 'border-right-style', 'border-bottom-style', and 'border-left-style' properties to the value 'solid'.

The `width`<sup>p397</sup> and `height`<sup>p397</sup> attributes on `applet`<sup>p1101</sup>, `embed`<sup>p307</sup>, `iframe`<sup>p299</sup>, `img`<sup>p272</sup>, `object`<sup>p310</sup> or `video`<sup>p317</sup> elements, and `input`<sup>b452</sup> elements with a `type`<sup>p454</sup> attribute in the `Image Button`<sup>p479</sup> state and that either represents an image or that the user expects will eventually represent an image, [map to the dimension properties](#)<sup>p1058</sup> 'width' and 'height' on the element respectively.

#### 14.4.4 Image maps

Shapes on an `image map`<sup>p393</sup> are expected to act, for the purpose of the CSS cascade, as elements independent of the original `area`<sup>p390</sup> element that happen to match the same style rules but inherit from the `img`<sup>p272</sup> or `object`<sup>b310</sup> element.

For the purposes of the rendering, only the 'cursor' property is expected to have any effect on the shape.

**Example** Thus, for example, if an `area`<sup>p390</sup> element has a `style`<sup>p128</sup> attribute that sets the 'cursor' property to 'help', then when the user designates that shape, the cursor would change to a Help cursor.

**Example** Similarly, if an `area`<sup>p390</sup> element had a CSS rule that set its 'cursor' property to 'inherit' (or if no rule setting the 'cursor' property matched the element at all), the shape's cursor would be inherited from the `img`<sup>p272</sup> or `object`<sup>p310</sup> element of the `image map`<sup>p393</sup>, not from the parent of the `area`<sup>p390</sup> element.

### 14.5 Bindings

#### 14.5.1 Introduction

A number of elements have their rendering defined in terms of the 'binding' property. [\[BECSS\]](#)<sup>p1148</sup>

The CSS snippets below set the 'binding' property to a user-agent-defined value, represented below by keywords like `button`. The rules then described for these bindings are only expected to apply if the element's 'binding' property has not been overridden (e.g. by the author) to have another value.

Exactly how the bindings are implemented is not specified by this specification. User agents are encouraged to make their bindings set the 'appearance' CSS property appropriately to achieve platform-native appearances for widgets, and are expected to implement any relevant animations, etc, that are appropriate for the platform. [\[CSSUI\]](#)<sup>p1149</sup>

#### 14.5.2 The `button`<sup>p495</sup> element

```
CSS @namespace url(http://www.w3.org/1999/xhtml);
 button { binding: button; }
```

When the `button` binding applies to a `button`<sup>p495</sup> element, the element is expected to render as an 'inline-block' box rendered as a button whose contents are the contents of the element.

When the `button`<sup>p495</sup> element's `type`<sup>p496</sup> attribute is in the `Menu`<sup>p497</sup> state, the user agent is expected to indicate that activating the element will display a menu, e.g. by displaying a down-pointing triangle after the button's label.

#### 14.5.3 The `details`<sup>p567</sup> element

```
CSS @namespace url(http://www.w3.org/1999/xhtml);
 details { binding: details; }
```

When the `details` binding applies to a [details<sup>p567</sup>](#) element, the element is expected to render as a 'block' box with its 'padding-left' property set to '40px' for left-to-right elements ([LTR-specific<sup>p108</sup>](#)) and with its 'padding-right' property set to '40px' for right-to-left elements. The element's shadow tree is expected to take the element's first child [summary<sup>p571</sup>](#) element, if any, and place it in a first 'block' box container, and then take the element's remaining descendants, if any, and place them in a second 'block' box container.

The first container is expected to contain at least one line box, and that line box is expected to contain a disclosure widget (typically a triangle), horizontally positioned within the left padding of the [details<sup>p567</sup>](#) element. That widget is expected to allow the user to request that the details be shown or hidden.

The second container is expected to have its 'overflow' property set to 'hidden'. When the [details<sup>p567</sup>](#) element does not have an [open<sup>p567</sup>](#) attribute, this second container is expected to be removed from the rendering.

#### 14.5.4 The [input<sup>p452</sup>](#) element as a text entry widget

Spec bugs: [24296](#)

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

input { binding: input-textfield; }
input[type=password] { binding: input-password; }
/* later rules override this for other values of type="" */
```

When the `input-textfield` binding applies to an [input<sup>p452</sup>](#) element whose `typep454` attribute is in the [Text<sup>p458</sup>](#), [Search<sup>p458</sup>](#), [Telephone<sup>p459</sup>](#), [URL<sup>p460</sup>](#), or [E-mail<sup>p461</sup>](#) state, the element is expected to render as an 'inline-block' box rendered as a text field.

When the `input-password` binding applies to an [input<sup>p452</sup>](#) element whose `typep454` attribute is in the [Password<sup>p462</sup>](#) state, the element is expected to render as an 'inline-block' box rendered as a text field whose contents are obscured.

If these text fields provide a text selection, then, when the user changes the current selection in such a binding, the user agent is expected to [queue a task<sup>p835</sup>](#) to [fire a simple event<sup>p846</sup>](#) that bubbles named [select<sup>p1145</sup>](#) at the element, using the [user interaction task source<sup>p838</sup>](#) as the task source.

If an [input<sup>p452</sup>](#) element whose `typep454` attribute is in one of the above states has a `sizep483` attribute, and parsing that attribute's value using the [rules for parsing non-negative integers<sup>p61</sup>](#) doesn't generate an error, then the user agent is expected to use the attribute as a [presentational hint<sup>p1058</sup>](#) for the 'width' property on the element, with the value obtained from applying the [converting a character width to pixels<sup>p1083</sup>](#) algorithm to the value of the attribute.

If an [input<sup>p452</sup>](#) element whose `typep454` attribute is in one of the above states does *not* have a `sizep483` attribute, then the user agent is expected to act as if it had a user-agent-level style sheet rule setting the 'width' property on the element to the value obtained from applying the [converting a character width to pixels<sup>p1083</sup>](#) algorithm to the number 20.

The **converting a character width to pixels** algorithm returns  $(size-1) \times avg + max$ , where `size` is the character width to convert, `avg` is the average character width of the primary font for the element for which the algorithm is being run, in pixels, and `max` is the maximum character width of that same font, also in pixels. (The element's 'letter-spacing' property does not affect the result.)

When the `input-textfield` binding applies to an element, the 'line-height' property, if it has a computed value equivalent to a value that is less than 1.0, must have a used value of 1.0.

#### 14.5.5 The [input<sup>p452</sup>](#) element as domain-specific widgets

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

input[type=datetime] { binding: input-datetime; }
input[type=date] { binding: input-date; }
input[type=month] { binding: input-month; }
input[type=week] { binding: input-week; }
input[type=time] { binding: input-time; }
```

```
input[type=datetime-local i] { binding: input-datetime-local; }
input[type=number i] { binding: input-number; }
```

When the *input-datetime* binding applies to an `inputp452` element whose `typep454` attribute is in the `Date and Timep463` state, the element is expected to render as an 'inline-block' box depicting a Date and Time control.

When the *input-date* binding applies to an `inputp452` element whose `typep454` attribute is in the `Datep464` state, the element is expected to render as an 'inline-block' box depicting a Date control.

When the *input-month* binding applies to an `inputp452` element whose `typep454` attribute is in the `Monthp465` state, the element is expected to render as an 'inline-block' box depicting a Month control.

When the *input-week* binding applies to an `inputp452` element whose `typep454` attribute is in the `Weekp466` state, the element is expected to render as an 'inline-block' box depicting a Week control.

When the *input-time* binding applies to an `inputp452` element whose `typep454` attribute is in the `Timep467` state, the element is expected to render as an 'inline-block' box depicting a Time control.

When the *input-datetime-local* binding applies to an `inputp452` element whose `typep454` attribute is in the `Local Date and Timep468` state, the element is expected to render as an 'inline-block' box depicting a Local Date and Time control.

When the *input-number* binding applies to an `inputp452` element whose `typep454` attribute is in the `Numberp469` state, the element is expected to render as an 'inline-block' box depicting a Number control.

These controls are all expected to be about one line high, and about as wide as necessary to show the widest possible value.

#### 14.5.6 The `inputp452` element as a range control

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);
input[type=range i] { binding: input-range; }
```

When the *input-range* binding applies to an `inputp452` element whose `typep454` attribute is in the `Rangep470` state, the element is expected to render as an 'inline-block' box depicting a slider control.

When the control is wider than it is tall (or square), the control is expected to be a horizontal slider, with the lowest value on the right if the 'direction' property on this element has a computed value of 'rtl', and on the left otherwise. When the control is taller than it is wide, it is expected to be a vertical slider, with the lowest value on the bottom.

Predefined suggested values (provided by the `listp489` attribute) are expected to be shown as tick marks on the slider, which the slider can snap to.

User agents are expected to use the used value of the 'direction' property on the element to determine the direction in which the slider operates. Typically, a left-to-right ('ltr') horizontal control would have the lowest value on the left and the highest value on the right, and vice versa.

#### 14.5.7 The `inputp452` element as a colour well

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);
input[type=color i] { binding: input-color; }
```

When the *input-color* binding applies to an `inputp452` element whose `typep454` attribute is in the `Colourp474` state, the element is expected to render as an 'inline-block' box depicting a colour well, which, when activated, provides the user with a colour picker (e.g. a colour wheel or colour palette) from which the colour can be changed.

Predefined suggested values (provided by the `list`<sup>p489</sup> attribute) are expected to be shown in the colour picker interface, not on the colour well itself.

#### 14.5.8 The `input`<sup>p452</sup> element as a checkbox and radio button widgets

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

input[type=checkbox i] { binding: input-checkbox; }
input[type=radio i] { binding: input-radio; }
```

When the `input-checkbox` binding applies to an `input`<sup>p452</sup> element whose `type`<sup>p454</sup> attribute is in the [Checkbox](#)<sup>p475</sup> state, the element is expected to render as an 'inline-block' box containing a single checkbox control, with no label.

When the `input-radio` binding applies to an `input`<sup>p452</sup> element whose `type`<sup>p454</sup> attribute is in the [Radio Button](#)<sup>p475</sup> state, the element is expected to render as an 'inline-block' box containing a single radio button control, with no label.

#### 14.5.9 The `input`<sup>p452</sup> element as a file upload control

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

input[type=file i] { binding: input-file; }
```

When the `input-file` binding applies to an `input`<sup>p452</sup> element whose `type`<sup>p454</sup> attribute is in the [File Upload](#)<sup>p476</sup> state, the element is expected to render as an 'inline-block' box containing a span of text giving the file name(s) of the [selected files](#)<sup>p476</sup>, if any, followed by a button that, when activated, provides the user with a file picker from which the selection can be changed.

#### 14.5.10 The `input`<sup>p452</sup> element as a button

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

input[type=submit i], input[type=reset i], input[type=button i] {
 binding: input-button;
}
```

When the `input-button` binding applies to an `input`<sup>p452</sup> element whose `type`<sup>p454</sup> attribute is in the [Submit Button](#)<sup>p478</sup>, [Reset Button](#)<sup>p481</sup>, or [Button](#)<sup>p482</sup> state, the element is expected to render as an 'inline-block' box rendered as a button, about one line high, containing the contents of the element's `value`<sup>p457</sup> attribute, if any, or text derived from the element's `type`<sup>p454</sup> attribute in a user-agent-defined (and probably locale-specific) fashion, if not.

#### 14.5.11 The `marquee`<sup>p1102</sup> element

CSS

```
@namespace url(http://www.w3.org/1999/xhtml);

marquee { binding: marquee; }
```

When the `marquee` binding applies to a `marquee`<sup>p1102</sup> element, while the element is [turned on](#)<sup>p1103</sup>, the element is expected to render in an animated fashion according to its attributes as follows:

### If the element's `behavior`<sup>p1103</sup> attribute is in the `scroll`<sup>p1103</sup> state

Slide the contents of the element in the direction described by the `direction`<sup>p1103</sup> attribute as defined below, such that it begins off the start side of the `marquee`<sup>p1102</sup>, and ends flush with the inner end side.

**Example** For example, if the `direction`<sup>p1103</sup> attribute is `left`<sup>p1103</sup> (the default), then the contents would start such that their left edge are off the side of the right edge of the `marquee`<sup>p1102</sup>'s content area, and the contents would then slide up to the point where the left edge of the contents are flush with the left inner edge of the `marquee`<sup>p1102</sup>'s content area.

Once the animation has ended, the user agent is expected to [increment the marquee current loop index](#)<sup>p1104</sup>. If the element is still [turned on](#)<sup>p1103</sup> after this, then the user agent is expected to restart the animation.

### If the element's `behavior`<sup>p1103</sup> attribute is in the `slide`<sup>p1103</sup> state

Slide the contents of the element in the direction described by the `direction`<sup>p1103</sup> attribute as defined below, such that it begins off the start side of the `marquee`<sup>p1102</sup>, and ends off the end side of the `marquee`<sup>p1102</sup>.

**Example** For example, if the `direction`<sup>p1103</sup> attribute is `left`<sup>p1103</sup> (the default), then the contents would start such that their left edge are off the side of the right edge of the `marquee`<sup>p1102</sup>'s content area, and the contents would then slide up to the point where the `right` edge of the contents are flush with the left inner edge of the `marquee`<sup>p1102</sup>'s content area.

Once the animation has ended, the user agent is expected to [increment the marquee current loop index](#)<sup>p1104</sup>. If the element is still [turned on](#)<sup>p1103</sup> after this, then the user agent is expected to restart the animation.

### If the element's `behavior`<sup>p1103</sup> attribute is in the `alternate`<sup>p1103</sup> state

When the `marquee current loop index`<sup>p1104</sup> is even (or zero), slide the contents of the element in the direction described by the `direction`<sup>p1103</sup> attribute as defined below, such that it begins flush with the start side of the `marquee`<sup>p1102</sup>, and ends flush with the end side of the `marquee`<sup>p1102</sup>.

When the `marquee current loop index`<sup>p1104</sup> is odd, slide the contents of the element in the opposite direction than that described by the `direction`<sup>p1103</sup> attribute as defined below, such that it begins flush with the end side of the `marquee`<sup>p1102</sup>, and ends flush with the start side of the `marquee`<sup>p1102</sup>.

**Example** For example, if the `direction`<sup>p1103</sup> attribute is `left`<sup>p1103</sup> (the default), then the contents would with their right edge flush with the right inner edge of the `marquee`<sup>p1102</sup>'s content area, and the contents would then slide up to the point where the `left` edge of the contents are flush with the left inner edge of the `marquee`<sup>p1102</sup>'s content area.

Once the animation has ended, the user agent is expected to [increment the marquee current loop index](#)<sup>p1104</sup>. If the element is still [turned on](#)<sup>p1103</sup> after this, then the user agent is expected to continue the animation.

The `direction`<sup>p1103</sup> attribute has the meanings described in the following table:

<code>direction</code> <sup>p1103</sup> attribute state	Direction of animation	Start edge	End edge	Opposite direction
<code>left</code> <sup>p1103</sup>	← Right to left	Right	Left	→ Left to Right
<code>right</code> <sup>p1103</sup>	→ Left to Right	Left	Right	← Right to left
<code>up</code> <sup>p1103</sup>	↑ Up (Bottom to Top)	Bottom	Top	↓ Down (Top to Bottom)
<code>down</code> <sup>p1103</sup>	↓ Down (Top to Bottom)	Top	Bottom	↑ Up (Bottom to Top)

In any case, the animation should proceed such that there is a delay given by the `marquee scroll interval`<sup>p1103</sup> between each frame, and such that the content moves at most the distance given by the `marquee scroll distance`<sup>p1053</sup> with each frame.

When a `marquee`<sup>p1102</sup> element has a `bgcolor` attribute set, the value is expected to be parsed using the [rules for parsing a legacy colour value](#)<sup>p79</sup>, and if that does not return an error, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1058</sup> setting the element's 'background-color' property to the resulting colour.

The `width` and `height` attributes on a `marquee`<sup>p1102</sup> element [map to the dimension properties](#)<sup>p1058</sup> 'width' and 'height' on the element respectively.

The intrinsic height of a `marquee`<sup>p1102</sup> element with its `direction`<sup>p1103</sup> attribute in the `up`<sup>p1103</sup> or `down`<sup>p1103</sup> states is 200 CSS pixels.

The `vspace` attribute of a `marquee`<sup>p1102</sup> element [maps to the dimension properties](#)<sup>p1058</sup> 'margin-top' and 'margin-bottom' on the element. The `hspace` attribute of a `marquee`<sup>p1102</sup> element [maps to the dimension properties](#)<sup>p1058</sup> 'margin-left' and 'margin-right' on the element.

The 'overflow' property on the `marquee`<sup>p1102</sup> element is expected to be ignored; overflow is expected to always be hidden.

#### 14.5.12 The `meter`<sup>p519</sup> element

CSS

```
@namespace url (http://www.w3.org/1999/xhtml);

meter { binding: meter; }
```

When the `meter` binding applies to a `meter`<sup>p519</sup> element, the element is expected to render as an 'inline-block' box with a 'height' of '1em' and a 'width' of '5em', a 'vertical-align' of '-0.2em', and with its contents depicting a gauge.

When the element is wider than it is tall (or square), the depiction is expected to be of a horizontal gauge, with the minimum value on the right if the 'direction' property on this element has a computed value of 'rtl', and on the left otherwise. When the element is taller than it is wide, it is expected to depict a vertical gauge, with the minimum value on the bottom.

User agents are expected to use a presentation consistent with platform conventions for gauges, if any.

**Note** Requirements for what must be depicted in the gauge are included in the definition of the `meter`<sup>p519</sup> element.

#### 14.5.13 The `progress`<sup>p518</sup> element

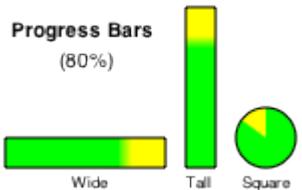

CSS

```
@namespace url (http://www.w3.org/1999/xhtml);

progress { binding: progress; }
```

When the `progress` binding applies to a `progress`<sup>p518</sup> element, the element is expected to render as an 'inline-block' box with a 'height' of '1em' and a 'width' of '10em', and a 'vertical-align' of '-0.2em'.

When the element is wider than it is tall, the element is expected to be depicted as a horizontal progress bar, with the start on the right and the end on the left if the 'direction' property on this element has a computed value of 'rtl', and with the start on the left and the end on the right otherwise. When the element is taller than it is wide, it is expected to be depicted as a vertical progress bar, with the lowest value on the bottom. When the element is square, it is expected to be depicted as a direction-independent progress widget (e.g. a circular progress ring).

User agents are expected to use a presentation consistent with platform conventions for progress bars. In particular, user agents are expected to use different presentations for determinate and indeterminate progress bars. User agents are also expected to vary the presentation based on the dimensions of the element.

**Example** For example, on some platforms for showing indeterminate progress there is a "spinner" progress indicator with square dimensions, which could be used when the element is square, and an indeterminate progress bar, which could be used when the element is wide.

**Note** Requirements for how to determine if the progress bar is determinate or indeterminate, and what progress a determinate progress bar is to show, are included in the definition of the `progress`<sup>p518</sup> element.

#### 14.5.14 The `select`<sup>p498</sup> element

CSS

```
@namespace url (http://www.w3.org/1999/xhtml);

select { binding: select; }
```

When the `select` binding applies to a `select`<sup>p498</sup> element whose `multiple`<sup>p499</sup> attribute is present, the element is expected to render as a multi-select list box.

When the `select` binding applies to a `select`<sup>p498</sup> element whose `multiple`<sup>p499</sup> attribute is absent, and the element's `display size`<sup>p499</sup> is greater than 1, the element is expected to render as a single-select list box.

When the element renders as a list box, it is expected to render as an 'inline-block' box whose 'height' is the height necessary to contain as many rows for items as given by the element's `display size`<sup>p499</sup>, or four rows if the attribute is absent, and whose 'width' is the `width of the select's labels`<sup>p1088</sup> plus the width of a scrollbar.

When the `select` binding applies to a `select`<sup>p498</sup> element whose `multiple`<sup>p499</sup> attribute is absent, and the element's `display size`<sup>p499</sup> is 1, the element is expected to render as a one-line drop down box whose width is the `width of the select's labels`<sup>p1088</sup>.

In either case (list box or drop-down box), the element's items are expected to be the element's `list of options`<sup>p499</sup>, with the element's `optgroup`<sup>p504</sup> element children providing headers for groups of options where applicable.

An `optgroup`<sup>p504</sup> element is expected to be rendered by displaying the element's `label`<sup>p505</sup> attribute.

An `option`<sup>p505</sup> element is expected to be rendered by displaying the element's `label`<sup>p506</sup>, indented under its `optgroup`<sup>b504</sup> element if it has one.

The `width of the select's labels` is the wider of the width necessary to render the widest `optgroup`<sup>p504</sup>, and the width necessary to render the widest `option`<sup>p505</sup> element in the element's `list of options`<sup>p499</sup> (including its indent, if any).

If a `select`<sup>p498</sup> element contains a `placeholder label option`<sup>p499</sup>, the user agent is expected to render that `option`<sup>p505</sup> in a manner that conveys that it is a label, rather than a valid option of the control. This can include preventing the `placeholder label option`<sup>p499</sup> from being explicitly selected by the user. When the `placeholder label option`<sup>p499</sup>'s `selectedness`<sup>p507</sup> is true, the control is expected to be displayed in a fashion that indicates that no valid option is currently selected.

User agents are expected to render the labels in a `select`<sup>p498</sup> in such a manner that any alignment remains consistent whether the label is being displayed as part of the page or in a menu control.

#### 14.5.15 The `textarea`<sup>b508</sup> element

```
CSS @namespace url(http://www.w3.org/1999/xhtml);
 textarea { binding: textarea; white-space: pre-wrap; }
```

When the `textarea` binding applies to a `textarea`<sup>b508</sup> element, the element is expected to render as an 'inline-block' box rendered as a multiline text field. If this text field provides a selection, then, when the user changes the current selection in such a binding, the user agent is expected to queue a task<sup>p835</sup> to fire a simple event<sup>p846</sup> that bubbles named `select`<sup>p1145</sup> at the element, using the `user interaction task source`<sup>p838</sup> as the task source.

If the element has a `cols`<sup>b510</sup> attribute, and parsing that attribute's value using the `rules for parsing non-negative integers`<sup>p61</sup> doesn't generate an error, then the user agent is expected to use the attribute as a `presentational hint`<sup>p1058</sup> for the 'width' property on the element, with the value being the `textarea effective width`<sup>p1088</sup> (as defined below). Otherwise, the user agent is expected to act as if it had a user-agent-level style sheet rule setting the 'width' property on the element to the `textarea effective width`<sup>p1088</sup>.

The **textarea effective width** of a `textarea`<sup>b508</sup> element is  $size \times avg + sbw$ , where `size` is the element's `character width`<sup>p510</sup>, `avg` is the average character width of the primary font of the element, in CSS pixels, and `sbw` is the width of a scroll bar, in CSS pixels. (The element's 'letter-spacing' property does not affect the result.)

If the element has a `rows`<sup>b510</sup> attribute, and parsing that attribute's value using the `rules for parsing non-negative integers`<sup>p61</sup> doesn't generate an error, then the user agent is expected to use the attribute as a `presentational hint`<sup>p1058</sup> for the 'height' property on the element, with the value being the `textarea effective height`<sup>p1088</sup> (as defined below). Otherwise, the user agent is expected to act as if it had a user-agent-level style sheet rule setting the 'height' property on the element to the `textarea effective height`<sup>p1088</sup>.

The **textarea effective height** of a `textarea`<sup>b508</sup> element is the height in CSS pixels of the number of lines specified the element's `character height`<sup>p510</sup>, plus the height of a scrollbar in CSS pixels.

User agents are expected to apply the 'white-space' CSS property to `textarea`<sup>p508</sup> elements. For historical reasons, if the element has a `wrap`<sup>p510</sup> attribute whose value is an [ASCII case-insensitive](#)<sup>b58</sup> match for the string "off", then the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1058</sup> setting the element's 'white-space' property to 'pre'.

#### 14.5.16 The `keygen`<sup>p513</sup> element

```
CSS @namespace url (http://www.w3.org/1999/xhtml);

keygen { binding: keygen; }
```

When the `keygen` binding applies to a `keygen`<sup>p513</sup> element, the element is expected to render as an 'inline-block' box containing a user interface to configure the key pair to be generated.

### 14.6 Frames and framesets

User agents are expected to render `frameset`<sup>p1104</sup> elements as a box with the height and width of the viewport, with a surface rendered according to the following layout algorithm:

1. The `cols` and `rows` variables are lists of zero or more pairs consisting of a number and a unit, the unit being one of *percentage*, *relative*, and *absolute*.

Use the [rules for parsing a list of dimensions](#)<sup>p65</sup> to parse the value of the element's `cols` attribute, if there is one. Let `sized cols` be the result, or an empty list if there is no such attribute.

Use the [rules for parsing a list of dimensions](#)<sup>p65</sup> to parse the value of the element's `rows` attribute, if there is one. Let `sized rows` be the result, or an empty list if there is no such attribute.

2. For any of the entries in `sized cols` or `sized rows` that have the number zero and the unit *relative*, change the entry's number to one.
3. If `sized cols` has no entries, then add a single entry consisting of the value 1 and the unit *relative* to `sized cols`.  
If `sized rows` has no entries, then add a single entry consisting of the value 1 and the unit *relative* to `sized rows`.
4. Invoke the algorithm defined below to [convert a list of dimensions to a list of pixel values](#)<sup>p1090</sup> using `sized cols` as the input list, and the width of the surface that the `frameset`<sup>p1104</sup> is being rendered into, in CSS pixels, as the input dimension. Let `sized cols` be the resulting list.  
Invoke the algorithm defined below to [convert a list of dimensions to a list of pixel values](#)<sup>p1090</sup> using `sized rows` as the input list, and the height of the surface that the `frameset`<sup>p1104</sup> is being rendered into, in CSS pixels, as the input dimension. Let `sized rows` be the resulting list.
5. Split the surface into a grid of  $w \times h$  rectangles, where  $w$  is the number of entries in `sized cols` and  $h$  is the number of entries in `sized rows`.  
Size the columns so that each column in the grid is as many CSS pixels wide as the corresponding entry in the `sized cols` list.  
Size the rows so that each row in the grid is as many CSS pixels high as the corresponding entry in the `sized rows` list.
6. Let `children` be the list of `frame`<sup>p1105</sup> and `frameset`<sup>p1104</sup> elements that are children of the `frameset`<sup>p1104</sup> element for which the algorithm was invoked.
7. For each row of the grid of rectangles created in the previous step, from top to bottom, run these substeps:
  1. For each rectangle in the row, from left to right, run these substeps:
    1. If there are any elements left in `children`, take the first element in the list, and assign it to the rectangle.  
If this is a `frameset`<sup>p1104</sup> element, then recurse the entire `frameset`<sup>p1104</sup> layout algorithm for that `frameset`<sup>p1104</sup> element, with the rectangle as the surface.  
Otherwise, it is a `frame`<sup>p1105</sup> element; render its [nested browsing context](#)<sup>p763</sup>, positioned and sized to fit the rectangle.

2. If there are any elements left in *children*, remove the first element from *children*.
8. If the *frameset*<sup>p1104</sup> element *has a border*<sup>p1090</sup>, draw an outer set of borders around the rectangles, using the element's *frame border colour*<sup>p1090</sup>.

For each rectangle, if there is an element assigned to that rectangle, and that element *has a border*<sup>p1090</sup>, draw an inner set of borders around that rectangle, using the element's *frame border colour*<sup>p1090</sup>.

For each (visible) border that does not abut a rectangle that is assigned a *frame*<sup>p1105</sup> element with a *noresize* attribute (including rectangles in further nested *frameset*<sup>p1104</sup> elements), the user agent is expected to allow the user to move the border, resizing the rectangles within, keeping the proportions of any nested *frameset*<sup>p1104</sup> grids.

A *frameset*<sup>p1104</sup> or *frame*<sup>p1105</sup> element **has a border** if the following algorithm returns true:

1. If the element has a *frameborder* attribute whose value is not the empty string and whose first character is either a U+0031 DIGIT ONE (1) character, a U+0079 LATIN SMALL LETTER Y character (y), or a U+0059 LATIN CAPITAL LETTER Y character (Y), then return true.
2. Otherwise, if the element has a *frameborder* attribute, return false.
3. Otherwise, if the element has a parent element that is a *frameset*<sup>p1104</sup> element, then return true if *that* element *has a border*<sup>p1090</sup>, and false if it does not.
4. Otherwise, return true.

The **frame border colour** of a *frameset*<sup>p1104</sup> or *frame*<sup>p1105</sup> element is the colour obtained from the following algorithm:

1. If the element has a *bordercolor* attribute, and applying the *rules for parsing a legacy colour value*<sup>p79</sup> to that attribute's value does not result in an error, then return the colour so obtained.
2. Otherwise, if the element has a parent element that is a *frameset*<sup>p1104</sup> element, then return the *frame border colour*<sup>p1090</sup> of that element.
3. Otherwise, return gray.

The algorithm to **convert a list of dimensions to a list of pixel values** consists of the following steps:

1. Let *input list* be the list of numbers and units passed to the algorithm.  
Let *output list* be a list of numbers the same length as *input list*, all zero.  
Entries in *output list* correspond to the entries in *input list* that have the same position.
  2. Let *input dimension* be the size passed to the algorithm.  
3. Let *count percentage* be the number of entries in *input list* whose unit is *percentage*.  
Let *total percentage* be the sum of all the numbers in *input list* whose unit is *percentage*.  
Let *count relative* be the number of entries in *input list* whose unit is *relative*.  
Let *total relative* be the sum of all the numbers in *input list* whose unit is *relative*.  
Let *count absolute* be the number of entries in *input list* whose unit is *absolute*.  
Let *total absolute* be the sum of all the numbers in *input list* whose unit is *absolute*.  
Let *remaining space* be the value of *input dimension*.
  4. If *total absolute* is greater than *remaining space*, then for each entry in *input list* whose unit is *absolute*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total absolute*. Then, set *remaining space* to zero.
- Otherwise, for each entry in *input list* whose unit is *absolute*, set the corresponding value in *output list* to the number of the entry in *input list*. Then, decrement *remaining space* by *total absolute*.

- If *total percentage* multiplied by the *input dimension* and divided by 100 is greater than *remaining space*, then for each entry in *input list* whose unit is *percentage*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total percentage*. Then, set *remaining space* to zero.

Otherwise, for each entry in *input list* whose unit is *percentage*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by the *input dimension* and divided by 100. Then, decrement *remaining space* by *total percentage* multiplied by the *input dimension* and divided by 100.

- For each entry in *input list* whose unit is *relative*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total relative*.
- Return *output list*.

User agents working with integer values for frame widths (as opposed to user agents that can lay frames out with subpixel accuracy) are expected to distribute the remainder first to the last entry whose unit is *relative*, then equally (not proportionally) to each entry whose unit is *percentage*, then equally (not proportionally) to each entry whose unit is *absolute*, and finally, failing all else, to the last entry.

The contents of a [frame<sup>p1105</sup>](#) element that does not have a [frameset<sup>p1104</sup>](#) parent are expected to be rendered as transparent black; the user agent is expected to not render the [nested browsing context<sup>p763</sup>](#) in this case, and that [nested browsing context<sup>p763</sup>](#) is expected to have a viewport with zero width and zero height.

## 14.7 Interactive media

### 14.7.1 Links, forms, and navigation

User agents are expected to allow the user to control aspects of [hyperlink<sup>p245</sup>](#) activation and [form submission<sup>p557</sup>](#), such as which [browsing context<sup>p762</sup>](#) is to be used for the subsequent [navigation<sup>p791</sup>](#).

User agents are expected to allow users to discover the destination of [hyperlinks<sup>p245</sup>](#) and of [forms<sup>p447</sup>](#) before triggering their [navigation<sup>p791</sup>](#).

User agents are expected to inform the user of whether a [hyperlink<sup>p245</sup>](#) includes [hyperlink auditing<sup>p249</sup>](#), and to let them know at a minimum which domains will be contacted as part of such auditing.

User agents may allow users to [navigate<sup>p791</sup>](#) [browsing contexts<sup>p762</sup>](#) to the resources [indicated<sup>p82</sup>](#) by the `cite` attributes on [q<sup>p215</sup>](#), [blockquote<sup>p193</sup>](#), [ins<sup>p260</sup>](#), and [del<sup>p262</sup>](#) elements.

User agents may surface [hyperlinks<sup>p245</sup>](#) created by [link<sup>p141</sup>](#) elements in their user interface.

**Note** While [link<sup>p141</sup>](#) elements that create [hyperlinks<sup>p245</sup>](#) will match the ':link' or ':visited' pseudo-classes, will react to clicks if visible, and so forth, this does not extend to any browser interface constructs that expose those same links. Activating a link through the browser's interface, rather than in the page itself, does not trigger [click<sup>p52</sup>](#) events and the like.

### 14.7.2 The [title<sup>p122</sup>](#) attribute

User agents are expected to expose the [advisory information<sup>p123</sup>](#) of elements upon user request, and to make the user aware of the presence of such information.

On interactive graphical systems where the user can use a pointing device, this could take the form of a tooltip. When the user is unable to use a pointing device, then the user agent is expected to make the content available in some other fashion, e.g. by making the element a *focusable area* and always displaying the [advisory information<sup>p123</sup>](#) of the currently [focused<sup>p728</sup>](#) element, or by showing the [advisory information<sup>p123</sup>](#) of the elements under the user's finger on a touch device as the user pans around the screen.

U+000A LINE FEED (LF) characters are expected to cause line breaks in the tooltip; U+0009 CHARACTER TABULATION (tab) characters are expected to render as a non-zero horizontal shift that lines up the next glyph with the next tab stop, with tab stops occurring at points that are multiples of 8 times the width of a U+0020 SPACE character.

**Example**

For example, a visual user agent could make elements with a [title](#)<sup>p122</sup> attribute [focusable](#)<sup>p726</sup>, and could make any [focused](#)<sup>p728</sup> element with a [title](#)<sup>p122</sup> attribute show its tooltip under the element while the element has focus. This would allow a user to tab around the document to find all the advisory text.

### Example

As another example, a screen reader could provide an audio cue when reading an element with a tooltip, with an associated key to read the last tooltip for which a cue was played.

## 14.7.3 Editing hosts

The current text editing caret (i.e. the [active range](#)<sup>p741</sup>, if it is empty and in an [editing host](#)<sup>p741</sup>), if any, is expected to act like an inline replaced element with the vertical dimensions of the caret and with zero width for the purposes of the CSS rendering model.

**Note** *This means that even an empty block can have the caret inside it, and that when the caret is in such an element, it prevents margins from collapsing through the element.*

## 14.7.4 Text rendered in native user interfaces

User agents are expected to honor the Unicode semantics of text that is exposed in user interfaces, for example supporting the bidirectional algorithm in text shown in dialogs, title bars, pop-up menus, and tooltips. Text from the contents of elements is expected to be rendered in a manner that honors [the directionality](#)<sup>p125</sup> of the element from which the text was obtained. Text from attributes is expected to be rendered in a manner that honours the [directionality of the attribute](#)<sup>p126</sup>.

### Example

Consider the following markup, which has Hebrew text asking for a programming language, the languages being text for which a left-to-right direction is important given the punctuation in some of their names:

```
<p dir="rtl" lang="he">
 <label>
 בחר שפת תכנות
 > <select>
 <option dir="ltr">C++</option>
 <option dir="ltr">C#</option>
 <option dir="ltr">FreePascal</option>
 <option dir="ltr">F#</option>
 </select>
</label>
</p>
```

If the [select](#)<sup>p498</sup> element was rendered as a drop down box, a correct rendering would ensure that the punctuation was the same both in the drop down, and in the box showing the current selection.

### Example

The directionality of attributes depends on the attribute and on the element's [dir](#)<sup>p125</sup> attribute, as the following example demonstrates. Consider this markup:

```
<table>
 <tr>
 <th abbr="A" dir="ltr">A
 <th abbr="A" dir="rtl">A
```

```
<th abbr="()" dir="auto">A
</table>
```

If the [abbr](#)<sup>p415</sup> attributes are rendered, e.g. in a tooltip or other user interface, the first will have a left parenthesis (because the direction is 'ltr'), the second will have a right parenthesis (because the direction is 'rtl'), and the third will have a right parenthesis (because the direction is determined *from the attribute value* to be 'rtl').

However, if instead the attribute was not a [directionality-capable attribute](#)<sup>p127</sup>, the results would be different:

```
<table>
<tr>
<th data-abbr="()" dir="ltr">A
<th data-abbr="()" dir="rtl">A
<th data-abbr="()" dir="auto">A
</table>
```

In this case, if the user agent were to expose the `data-abbr` attribute in the user interface (e.g. in a debugging environment), the last case would be rendered with a *left* parenthesis, because the direction would be determined from the element's contents.

A string provided by a script (e.g. the argument to [window.alert\(\)](#)<sup>p855</sup>) is expected to be treated as an independent set of one or more bidirectional algorithm paragraphs when displayed, as defined by the bidirectional algorithm, including, for instance, supporting the paragraph-breaking behaviour of U+000A LINE FEED (LF) characters. For the purposes of determining the paragraph level of such text in the bidirectional algorithm, this specification does *not* provide a higher-level override of rules P2 and P3. [\[BIDI\]](#)<sup>p1148</sup>

When necessary, authors can enforce a particular direction for a given paragraph by starting it with the Unicode U+200E LEFT-TO-RIGHT MARK or U+200F RIGHT-TO-LEFT MARK characters.

#### Example

Thus, the following script:

```
alert ('\u05DC\u05DE\u05D3 HTML \u05D4\u05D9\u05D5\u05DD!')
```

...would always result in a message reading "היום HTML למד" (not "למד HTML היום!"), regardless of the language of the user agent interface or the direction of the page or any of its elements.

#### Example

For a more complex example, consider the following script:

```
/* Warning: this script does not handle right-to-left scripts correctly */
var s;
if (s = prompt('What is your name?')) {
 alert(s + '! Ok, Fred, ' + s + ', and Wilma will get the car.');
}
```

When the user enters "Kitty", the user agent would alert "Kitty! Ok, Fred, Kitty, and Wilma will get the car.". However, if the user enters "Fred! Ok", then the bidirectional algorithm will determine that the direction of the paragraph is right-to-left, and so the output will be the following unintended mess: ".and Wilma will get the car ,Fred! Ok, Fred !Fred!"

To force an alert that starts with user-provided text (or other text of unknown directionality) to render left-to-right, the string can be prefixed with a U+200E LEFT-TO-RIGHT MARK character:

```
var s;
if (s = prompt('What is your name?')) {
 alert('\u200E' + s + '! Ok, Fred, ' + s + ', and Wilma will get the car.');
}
```

## 14.8 Print media

User agents are expected to allow the user to request the opportunity to [obtain a physical form](#) (or a representation of a physical form) of a [Document](#)<sup>p102</sup>. For example, selecting the option to print a page or convert it to PDF format. [\[PDF\]](#)<sup>p1151</sup>

When the user actually [obtains a physical form<sup>p1093</sup>](#) (or a representation of a physical form) of a [Document<sup>p102</sup>](#), the user agent is expected to create a new rendering of the [Document<sup>p102</sup>](#) for the print media.

## 14.9 Unstyled XML documents

HTML user agents may, in certain circumstances, find themselves rendering non-HTML documents that use vocabularies for which they lack any built-in knowledge. This section provides for a way for user agents to handle such documents in a somewhat useful manner.

While a [Document<sup>p102</sup>](#) is an [unstyled document<sup>p1094</sup>](#), the user agent is expected to render [an unstyled document view<sup>p1094</sup>](#).

A [Document<sup>p102</sup>](#) is an **unstyled document** while it matches the following conditions:

- The [Document<sup>p102</sup>](#) has no author style sheets (whether referenced by HTTP headers, processing instructions, elements like [link<sup>p141</sup>](#), inline elements like [style<sup>p154</sup>](#), or any other mechanism).
- None of the elements in the [Document<sup>p102</sup>](#) have any [presentational hints<sup>p1058</sup>](#).
- None of the elements in the [Document<sup>p102</sup>](#) have any [CSS styling attributes<sup>p53</sup>](#).
- None of the elements in the [Document<sup>p102</sup>](#) are in any of the following namespaces: [HTML namespace<sup>p101</sup>](#), [SVG namespace<sup>p101</sup>](#), [MathML namespace<sup>p101</sup>](#)
- The [Document<sup>p102</sup>](#) has no *focusable area* (e.g. from XLink) other than the viewport.
- The [Document<sup>p102</sup>](#) has no [hyperlinks<sup>p245</sup>](#) (e.g. from XLink).
- There exists no [script<sup>p828</sup>](#) whose [settings object<sup>p829</sup>](#) specifies this [Document<sup>p102</sup>](#) as the [responsible document<sup>p829</sup>](#).
- None of the elements in the [Document<sup>p102</sup>](#) have any registered event listeners.

An **unstyled document view** is one where the DOM is not rendered according to CSS (which would, since there are no applicable styles in this context, just result in a wall of text), but is instead rendered in a manner that is useful for a developer. This could consist of just showing the [Document<sup>p102</sup>](#) object's source, maybe with syntax highlighting, or it could consist of displaying just the DOM tree, or simply a message saying that the page is not a styled document.

**Note** If a [Document<sup>p102</sup>](#) stops being an [unstyled document<sup>p1094</sup>](#), then the conditions above stop applying, and thus a user agent following these requirements will switch to using the regular CSS rendering.

## 15 Obsolete features

### 15.1 Obsolete but conforming features

Features listed in this section will trigger warnings in conformance checkers.

Authors should not specify a `border`<sup>p1100</sup> attribute on an `img`<sup>p272</sup> element. If the attribute is present, its value must be the string "0". CSS should be used instead.

Authors should not specify a `language`<sup>p1098</sup> attribute on a `script`<sup>p591</sup> element. If the attribute is present, its value must be an `ASCII case-insensitive`<sup>p58</sup> match for the string "JavaScript" and either the `type`<sup>p592</sup> attribute must be omitted or its value must be an `ASCII case-insensitive`<sup>p58</sup> match for the string "text/javascript". The attribute should be entirely omitted instead (with the value "JavaScript", it has no effect), or replaced with use of the `type`<sup>p592</sup> attribute.

Authors should not specify the `name`<sup>p1097</sup> attribute on `a`<sup>p208</sup> elements. If the attribute is present, its value must not be the empty string and must neither be equal to the value of any of the `ID`s<sup>p51</sup> in the element's `home subtree`<sup>p42</sup> other than the element's own `ID`<sup>p51</sup>, if any, nor be equal to the value of any of the other `name`<sup>p1097</sup> attributes on `a`<sup>p208</sup> elements in the element's `home subtree`<sup>p42</sup>. If this attribute is present and the element has an `ID`<sup>p51</sup>, then the attribute's value must be equal to the element's `ID`<sup>p51</sup>. In earlier versions of the language, this attribute was intended as a way to specify possible targets for fragment identifiers in `URLs`<sup>p48</sup>. The `id`<sup>p122</sup> attribute should be used instead.

Authors should not, but may despite requirements to the contrary elsewhere in this specification, specify the `maxlength`<sup>p483</sup> and `size`<sup>p483</sup> attributes on `input`<sup>p452</sup> elements whose `type`<sup>p454</sup> attributes are in the `Number`<sup>p469</sup> state. One valid reason for using these attributes regardless is to help legacy user agents that do not support `input`<sup>p452</sup> elements with `type="number"` to still render the text field with a useful width.

**Note** In the [HTML syntax](#)<sup>p941</sup>, specifying a `DOCTYPE`<sup>p941</sup> that is an [obsolete permitted DOCTYPE](#)<sup>p942</sup> will also trigger a warning.

#### 15.1.1 Warnings for obsolete but conforming features

To ease the transition from HTML4 Transitional documents to the language defined in *this* specification, and to discourage certain features that are only allowed in very few circumstances, conformance checkers must warn the user when the following features are used in a document. These are generally old obsolete features that have no effect, and are allowed only to distinguish between likely mistakes (regular conformance errors) and mere vestigial markup or unusual and discouraged practices (these warnings).

The following features must be categorised as described above:

- The presence of an `obsolete permitted DOCTYPE`<sup>p942</sup> in an `HTML document`<sup>p51</sup>.
- The presence of a `border`<sup>p1100</sup> attribute on an `img`<sup>p272</sup> element if its value is the string "0".
- The presence of a `language`<sup>b1098</sup> attribute on a `script`<sup>p591</sup> element if its value is an `ASCII case-insensitive`<sup>p58</sup> match for the string "JavaScript" and if there is no `type`<sup>p592</sup> attribute or there is and its value is an `ASCII case-insensitive`<sup>p58</sup> match for the string "text/javascript".
- The presence of a `name`<sup>p1097</sup> attribute on an `a`<sup>p208</sup> element, if its value is not the empty string.
- The presence of a `maxlength`<sup>p483</sup> attribute on an `input`<sup>p452</sup> element whose `type`<sup>p454</sup> attribute is in the `Number`<sup>p469</sup> state.
- The presence of a `size`<sup>p483</sup> attribute on an `input`<sup>p452</sup> element whose `type`<sup>p454</sup> attribute is in the `Number`<sup>p469</sup> state.

Conformance checkers must distinguish between pages that have no conformance errors and have none of these obsolete features, and pages that have no conformance errors but do have some of these obsolete features.

**Example** For example, a validator could report some pages as "Valid HTML" and others as "Valid HTML with warnings".

## 15.2 Non-conforming features

Spec bugs: [26189](#)

Elements in the following list are entirely obsolete, and must not be used by authors:

### applet<sup>b1101</sup>

Use embed<sup>p307</sup> or object<sup>p310</sup> instead.

### acronym

Use abbr<sup>p218</sup> instead.

### bgsound

Use audio<sup>p321</sup> instead.

### dir

Use ul<sup>p197</sup> instead.

### frame<sup>p1105</sup>

### frameset<sup>p1104</sup>

### noframes

Either use iframe<sup>p299</sup> and CSS instead, or use server-side includes to generate complete pages with the various invariant parts merged in.

### isindex

Use an explicit form<sup>p447</sup> and text field<sup>p458</sup> combination instead.

### listing

Use pre<sup>p191</sup> and code<sup>p231</sup> instead.

### nextid

Use GUIDs instead.

### noembed

Use object<sup>p310</sup> instead of embed<sup>p307</sup> when fallback is necessary.

### plaintext

Use the "text/plain" MIME type<sup>p42</sup> instead.

### rb

Providing the ruby base directly inside the ruby<sup>b219</sup> element is sufficient; the rb<sup>p1096</sup> element is unnecessary. Omit it altogether.

### strike

Use del<sup>p262</sup> instead if the element is marking an edit, otherwise use s<sup>p214</sup> instead.

### xmp

Use pre<sup>p191</sup> and code<sup>p231</sup> instead, and escape "<" and "&" characters as "&lt;" and "&amp;" respectively.

### basefont

### big

### blink

### center

### font

### marquee<sup>b1102</sup>

### multicol

### nobr

### spacer

### tt

Use appropriate elements or CSS instead.

Where the [tt<sup>p1096</sup>](#) element would have been used for marking up keyboard input, consider the [kbd<sup>p234</sup>](#) element; for variables, consider the [var<sup>p232</sup>](#) element; for computer code, consider the [code<sup>b231</sup>](#) element; and for computer output, consider the [samp<sup>p233</sup>](#) element.

Similarly, if the [big<sup>p1096</sup>](#) element is being used to denote a heading, consider using the [h1<sup>p168</sup>](#) element; if it is being used for marking up important passages, consider the [strong<sup>p211</sup>](#) element; and if it is being used for highlighting text for reference purposes, consider the [mark<sup>p238</sup>](#) element.

See also the [text-level semantics usage summary<sup>p244</sup>](#) for more suggestions with examples.

The following attributes are obsolete (though the elements are still part of the language), and must not be used by authors:

**charset on [a<sup>p208</sup>](#) elements**

**charset on [link<sup>p141</sup>](#) elements**

Use an HTTP Content-Type header on the linked resource instead.

**coords on [a<sup>p208</sup>](#) elements**

**shape on [a<sup>p208</sup>](#) elements**

Use [area<sup>p390</sup>](#) instead of [a<sup>p208</sup>](#) for image maps.

**methods on [a<sup>p208</sup>](#) elements**

**methods on [link<sup>p141</sup>](#) elements**

Use the HTTP OPTIONS feature instead.

**name on [a<sup>p208</sup>](#) elements (except as noted in the previous section)**

**name on [embed<sup>p307</sup>](#) elements**

**name on [img<sup>p272</sup>](#) elements**

**name on [option<sup>p505</sup>](#) elements**

Use the [id<sup>p122</sup>](#) attribute instead.

**rev on [a<sup>p208</sup>](#) elements**

**rev on [link<sup>p141</sup>](#) elements**

Use the [rel<sup>p246</sup>](#) attribute instead, with an opposite term. (For example, instead of `rev="made"`, use `rel="author"`.)

**urn on [a<sup>p208</sup>](#) elements**

**urn on [link<sup>p141</sup>](#) elements**

Specify the preferred persistent identifier using the [href<sup>p245</sup>](#) attribute instead.

**accept on [form<sup>p447</sup>](#) elements**

Use the [accept<sup>p477</sup>](#) attribute directly on the [input<sup>p452</sup>](#) elements instead.

**nohref on [area<sup>p390</sup>](#) elements**

Omitting the [href<sup>p245</sup>](#) attribute is sufficient; the [nohref<sup>p1097</sup>](#) attribute is unnecessary. Omit it altogether.

**profile on [head<sup>p138</sup>](#) elements**

When used for declaring which [meta<sup>p145</sup>](#) terms are used in the document, unnecessary; omit it altogether, and [register the names<sup>p148</sup>](#).

When used for triggering specific user agent behaviours: use a [link<sup>p141</sup>](#) element instead.

**version on [html<sup>p137</sup>](#) elements**

Unnecessary. Omit it altogether.

**ismap on [input<sup>p452</sup>](#) elements**

Unnecessary. Omit it altogether. All [input<sup>p452</sup>](#) elements with a [type<sup>p454</sup>](#) attribute in the [Image Button<sup>p479</sup>](#) state are processed as server-side image maps.

## **usemap** on input<sup>p452</sup> elements

Use img<sup>p272</sup> instead of input<sup>p452</sup> for image maps.

## **longdesc** on iframe<sup>p299</sup> elements

### **longdesc** on img<sup>p272</sup> elements

Use a regular a<sup>p208</sup> element to link to the description, or (in the case of images) use an image map<sup>p393</sup> to provide a link from the image to the image's description.

## **lowsrc** on img<sup>p272</sup> elements

Use a progressive JPEG image (given in the src<sup>p273</sup> attribute), instead of using two separate images.

## **target** on link<sup>p141</sup> elements

Unnecessary. Omit it altogether.

## **scheme** on meta<sup>p145</sup> elements

Use only one scheme per field, or make the scheme declaration part of the value.

## **archive** on object<sup>b310</sup> elements

## **classid** on object<sup>b310</sup> elements

## **code** on object<sup>b310</sup> elements

## **codebase** on object<sup>b310</sup> elements

## **codetype** on object<sup>b310</sup> elements

Use the data<sup>p311</sup> and type<sup>p311</sup> attributes to invoke plugins<sup>p43</sup>. To set parameters with these names in particular, the param<sup>p316</sup> element can be used.

## **declare** on object<sup>b310</sup> elements

Repeat the object<sup>b310</sup> element completely each time the resource is to be reused.

## **standby** on object<sup>b310</sup> elements

Optimise the linked resource so that it loads quickly or, at least, incrementally.

## **type** on param<sup>p316</sup> elements

## **valuetype** on param<sup>p316</sup> elements

Use the name<sup>b316</sup> and value<sup>p316</sup> attributes without declaring value types.

## **language** on script<sup>b591</sup> elements (except as noted in the previous section)

Use the type<sup>b592</sup> attribute instead.

## **event** on script<sup>b591</sup> elements

## **for** on script<sup>b591</sup> elements

Use DOM Events mechanisms to register event listeners. [DOM]<sup>p1149</sup>

## **media** on source<sup>p322</sup> elements

Use script to select the media resource(s) to use.

## **datapagesize** on table<sup>p398</sup> elements

Unnecessary. Omit it altogether.

## **summary** on table<sup>p398</sup> elements

Use one of the techniques for describing tables<sup>p402</sup> given in the table<sup>p398</sup> section instead.

## **abbr** on td<sup>p412</sup> elements

Use text that begins in an unambiguous and terse manner, and include any more elaborate text after that. The title<sup>p122</sup> attribute can also be useful in including more detailed text, so that the cell's contents can be made terse. If it's a heading, use th<sup>p414</sup> (which has an abbr<sup>b415</sup> attribute).

**axis** on [td](#)<sup>p412</sup> and [th](#)<sup>p414</sup> elements

Use the [scope](#)<sup>p414</sup> attribute on the relevant [th](#)<sup>p414</sup>.

**scope** on [td](#)<sup>p412</sup> elements

Use [th](#)<sup>p414</sup> elements for heading cells.

**datasrc** on [a](#)<sup>p208</sup>, [applet](#)<sup>p1101</sup>, [button](#)<sup>p495</sup>, [div](#)<sup>p207</sup>, [frame](#)<sup>p1105</sup>, [iframe](#)<sup>p299</sup>, [img](#)<sup>p272</sup>, [input](#)<sup>p452</sup>, [label](#)<sup>p451</sup>, [legend](#)<sup>p526</sup>, [marquee](#)<sup>p1102</sup>, [object](#)<sup>p310</sup>, [option](#)<sup>p505</sup>, [select](#)<sup>p498</sup>, [span](#)<sup>p242</sup>, [table](#)<sup>p398</sup>, and [textarea](#)<sup>p508</sup> elements

**datafld** on [a](#)<sup>p208</sup>, [applet](#)<sup>p1101</sup>, [button](#)<sup>p495</sup>, [div](#)<sup>p207</sup>, [fieldset](#)<sup>p524</sup>, [frame](#)<sup>p1105</sup>, [iframe](#)<sup>p299</sup>, [img](#)<sup>p272</sup>, [input](#)<sup>p452</sup>, [label](#)<sup>p451</sup>, [legend](#)<sup>p526</sup>, [marquee](#)<sup>p1102</sup>, [object](#)<sup>p310</sup>, [param](#)<sup>p316</sup>, [select](#)<sup>p498</sup>, [span](#)<sup>p242</sup>, and [textarea](#)<sup>p508</sup> elements

**dataformatas** on [button](#)<sup>p495</sup>, [div](#)<sup>p207</sup>, [input](#)<sup>p452</sup>, [label](#)<sup>p451</sup>, [legend](#)<sup>p526</sup>, [marquee](#)<sup>p1102</sup>, [object](#)<sup>p310</sup>, [option](#)<sup>p505</sup>, [select](#)<sup>p498</sup>, [span](#)<sup>p242</sup>, and [table](#)<sup>p398</sup> elements

Use script and a mechanism such as [XMLHttpRequest](#)<sup>p52</sup> to populate the page dynamically. [XHR]<sup>p1154</sup>

**[alink](#)** on [body](#)<sup>p157</sup> elements  
**[bgcolor](#)** on [body](#)<sup>p157</sup> elements  
**[bottommargin](#)** on [body](#)<sup>p157</sup> elements  
**[leftmargin](#)** on [body](#)<sup>p157</sup> elements  
**[link](#)** on [body](#)<sup>p157</sup> elements  
**[marginheight](#)** on [body](#)<sup>p157</sup> elements  
**[marginwidth](#)** on [body](#)<sup>p157</sup> elements  
**[rightmargin](#)** on [body](#)<sup>p157</sup> elements  
**[text](#)** on [body](#)<sup>p157</sup> elements  
**[margintop](#)** on [body](#)<sup>b157</sup> elements  
**[vlink](#)** on [body](#)<sup>p157</sup> elements  
**[clear](#)** on [br](#)<sup>p242</sup> elements  
**[align](#)** on [caption](#)<sup>p405</sup> elements  
**[align](#)** on [col](#)<sup>p407</sup> elements  
**[char](#)** on [col](#)<sup>p407</sup> elements  
**[charoff](#)** on [col](#)<sup>p407</sup> elements  
**[valign](#)** on [col](#)<sup>p407</sup> elements  
**[width](#)** on [col](#)<sup>p407</sup> elements  
**[align](#)** on [div](#)<sup>p207</sup> elements  
**[compact](#)** on [dl](#)<sup>p199</sup> elements  
**[align](#)** on [embed](#)<sup>p307</sup> elements  
**[hspace](#)** on [embed](#)<sup>p307</sup> elements  
**[vspace](#)** on [embed](#)<sup>p307</sup> elements  
**[align](#)** on [hr](#)<sup>p190</sup> elements  
**[color](#)** on [hr](#)<sup>p190</sup> elements  
**[noshade](#)** on [hr](#)<sup>p190</sup> elements  
**[size](#)** on [hr](#)<sup>p190</sup> elements  
**[width](#)** on [hr](#)<sup>p190</sup> elements  
**[align](#)** on [h1](#)<sup>p168</sup>—[h6](#)<sup>p168</sup> elements  
**[align](#)** on [iframe](#)<sup>p299</sup> elements  
**[allowtransparency](#)** on [iframe](#)<sup>p299</sup> elements  
**[frameborder](#)** on [iframe](#)<sup>p299</sup> elements  
**[hspace](#)** on [iframe](#)<sup>p299</sup> elements  
**[marginheight](#)** on [iframe](#)<sup>p299</sup> elements  
**[marginwidth](#)** on [iframe](#)<sup>p299</sup> elements  
**[scrolling](#)** on [iframe](#)<sup>p299</sup> elements  
**[vspace](#)** on [iframe](#)<sup>p299</sup> elements  
**[align](#)** on [input](#)<sup>p452</sup> elements  
**[border](#)** on [input](#)<sup>p452</sup> elements  
**[hspace](#)** on [input](#)<sup>p452</sup> elements  
**[vspace](#)** on [input](#)<sup>p452</sup> elements  
**[align](#)** on [img](#)<sup>p272</sup> elements  
**[border](#)** on [img](#)<sup>p272</sup> elements (except as noted in the previous section)  
**[hspace](#)** on [img](#)<sup>p272</sup> elements  
**[vspace](#)** on [img](#)<sup>p272</sup> elements  
**[align](#)** on [legend](#)<sup>p526</sup> elements  
**[type](#)** on [li](#)<sup>p198</sup> elements  
**[compact](#)** on [menu](#)<sup>p571</sup> elements  
**[align](#)** on [object](#)<sup>p310</sup> elements  
**[border](#)** on [object](#)<sup>p310</sup> elements

**hspace** on object<sup>p310</sup> elements  
**vspace** on object<sup>p310</sup> elements  
**compact** on ol<sup>p195</sup> elements  
**align** on p<sup>p187</sup> elements  
**width** on pre<sup>p191</sup> elements  
**align** on table<sup>p398</sup> elements  
**bgcolor** on table<sup>p398</sup> elements  
**border** on table<sup>p398</sup> elements  
**bordercolor** on table<sup>p398</sup> elements  
**cellpadding** on table<sup>p398</sup> elements  
**cellspacing** on table<sup>p398</sup> elements  
**frame** on table<sup>p398</sup> elements  
**height** on table<sup>p398</sup> elements  
**hspace** on table<sup>p398</sup> elements  
**rules** on table<sup>p398</sup> elements  
**vspace** on table<sup>p398</sup> elements  
**width** on table<sup>p398</sup> elements  
**align** on tbody<sup>p408</sup>, thead<sup>p409</sup>, and tfoot<sup>p410</sup> elements  
**char** on tbody<sup>p408</sup>, thead<sup>p409</sup>, and tfoot<sup>p410</sup> elements  
**charoff** on tbody<sup>p408</sup>, thead<sup>p409</sup>, and tfoot<sup>p410</sup> elements  
**valign** on tbody<sup>p408</sup>, thead<sup>p409</sup>, and tfoot<sup>p410</sup> elements  
**align** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**bgcolor** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**char** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**charoff** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**height** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**nowrap** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**valign** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**width** on td<sup>p412</sup> and th<sup>p414</sup> elements  
**align** on tr<sup>p411</sup> elements  
**bgcolor** on tr<sup>p411</sup> elements  
**char** on tr<sup>p411</sup> elements  
**charoff** on tr<sup>p411</sup> elements  
**height** on tr<sup>p411</sup> elements  
**valign** on tr<sup>p411</sup> elements  
**compact** on ul<sup>p197</sup> elements  
**type** on ul<sup>p197</sup> elements  
**background** on body<sup>p157</sup>, table<sup>p398</sup>, thead<sup>p409</sup>, tbody<sup>p408</sup>, tfoot<sup>p410</sup>, tr<sup>p411</sup>, td<sup>p412</sup>, and th<sup>p414</sup> elements

Use CSS instead.

Spec bugs: [24654](#), [24679](#)

## 15.3 Requirements for implementations

### 15.3.1 The applet element

The applet<sup>p1101</sup> element is a Java-specific variant of the embed<sup>p307</sup> element. The applet<sup>p1101</sup> element is now obsolete so that all extension frameworks (Java, .NET, Flash, etc) are handled in a consistent manner.

When the element matches any of the following conditions, it represents<sup>p111</sup> its contents:

- The element is still in the stack of open elements<sup>p962</sup> of an HTML parser<sup>p952</sup> or XML parser<sup>p1054</sup>.

- The element is not [in a Document](#)<sup>p42</sup>.
- The element's [node document](#) is not [fully active](#)<sup>p763</sup>.
- The element's [node document's active sandboxing flag set](#)<sup>p782</sup> has its [sandboxed plugins browsing context flag](#)<sup>p780</sup> set.
- The element has an ancestor [media element](#)<sup>p326</sup>.
- The element has an ancestor [object](#)<sup>p310</sup> element that is *not* showing its [fallback content](#)<sup>p116</sup>.
- No Java Language runtime [plugin](#)<sup>p43</sup> is available.
- A Java runtime [plugin](#)<sup>p43</sup> is available but it is disabled.

Otherwise, the user agent should instantiate a Java Language runtime [plugin](#)<sup>p43</sup>, and should pass the names and values of all the attributes on the element, in the order they were added to the element, with the attributes added by the parser being ordered in source order, and then a parameter named "PARAM" whose value is null, and then all the names and values of [parameters](#)<sup>p316</sup> given by [param](#)<sup>p316</sup> elements that are children of the [applet](#)<sup>p1101</sup> element, in [tree order](#)<sup>p42</sup>, to the [plugin](#)<sup>p43</sup> used. If the [plugin](#)<sup>p43</sup> supports a scriptable interface, the [HTMLAppletElement](#)<sup>p1102</sup> object representing the element should expose that interface. The [applet](#)<sup>p1101</sup> element [represents](#)<sup>p111</sup> the [plugin](#)<sup>p43</sup>.

**Note** The [applet](#)<sup>p1101</sup> element is unaffected by the CSS 'display' property. The Java Language runtime is instantiated even if the element is hidden with a 'display:none' CSS style.

The [applet](#)<sup>p1101</sup> element must implement the [HTMLAppletElement](#)<sup>p1102</sup> interface.

#### IDL

```
interface HTMLAppletElement : HTMLElement {
 attribute DOMString align;
 attribute DOMString alt;
 attribute DOMString archive;
 attribute DOMString code;
 attribute DOMString codeBase;
 attribute DOMString height;
 attribute unsigned long hspace;
 attribute DOMString name;
 attribute DOMString _object; // the underscore is not part of the identifier
 attribute unsigned long vspace;
 attribute DOMString width;
};
```

The [align](#), [alt](#), [archive](#), [code](#), [height](#), [hspace](#), [name](#), [object](#), [vspace](#), and [width](#) IDL attributes must [reflect](#)<sup>p88</sup> the respective content attributes of the same name. For the purposes of reflection, the [applet](#)<sup>p1101</sup> element's [object](#) content attribute is defined as containing a [URL](#)<sup>p48</sup>.

The [codeBase](#) IDL attribute must [reflect](#)<sup>p88</sup> the [codebase](#) content attribute, which for the purposes of reflection is defined as containing a [URL](#)<sup>p48</sup>.

### 15.3.2 The [marquee](#) element

The [marquee](#)<sup>p1102</sup> element is a presentational element that animates content. CSS transitions and animations are a more appropriate mechanism. [\[CSSANIMATIONS\]](#)<sup>p1149</sup> [\[CSSTRANSITIONS\]](#)<sup>p1149</sup>

The [task source](#)<sup>p835</sup> for tasks mentioned in this section is the [DOM manipulation task source](#)<sup>p838</sup>.

The [marquee](#)<sup>p1102</sup> element must implement the [HTMLMarqueeElement](#)<sup>p1102</sup> interface.

#### IDL

```
interface HTMLMarqueeElement : HTMLElement {
 attribute DOMString behavior;
 attribute DOMString bgColor;
 attribute DOMString direction;
 attribute DOMString height;
 attribute unsigned long hspace;
 attribute long loop;
 attribute unsigned long scrollAmount;
 attribute unsigned long scrollDelay;
 attribute boolean trueSpeed;
 attribute unsigned long vspace;
};
```

```

attribute DOMString width;

attribute EventHandler onbounce;
attribute EventHandler onfinish;
attribute EventHandler onstart;

void start();
void stop();
};

```

A marquee<sup>p1102</sup> element can be **turned on** or **turned off**. When it is created, it is turned on<sup>p1103</sup>.

When the start() method is called, the marquee<sup>p1102</sup> element must be turned on<sup>p1103</sup>.

When the stop() method is called, the marquee<sup>p1102</sup> element must be turned off<sup>p1103</sup>.

When a marquee<sup>p1102</sup> element is created, the user agent must queue a task<sup>p835</sup> to fire a simple event<sup>p846</sup> named start at the element.

The **behavior** content attribute on marquee<sup>b1102</sup> elements is an enumerated attribute<sup>p60</sup> with the following keywords (all non-conforming):

Keyword	State
scroll	scroll
slide	slide
alternate	alternate

The missing value default<sup>p60</sup> is the scroll<sup>p1103</sup> state.

The **direction** content attribute on marquee<sup>p1102</sup> elements is an enumerated attribute<sup>p60</sup> with the following keywords (all non-conforming):

Keyword	State
left	left
right	right
up	up
down	down

The missing value default<sup>p60</sup> is the left<sup>p1103</sup> state.

The **truespeed** content attribute on marquee<sup>p1102</sup> elements is a boolean attribute<sup>p59</sup>.

A marquee<sup>p1102</sup> element has a **marquee scroll interval**, which is obtained as follows:

1. If the element has a scrolldelay attribute, and parsing its value using the rules for parsing non-negative integers<sup>p61</sup> does not return an error, then let delay be the parsed value. Otherwise, let delay be 85.
2. If the element does not have a truespeed<sup>p1103</sup> attribute, and the delay value is less than 60, then let delay be 60 instead.
3. The marquee scroll interval<sup>p1103</sup> is delay, interpreted in milliseconds.

A marquee<sup>p1102</sup> element has a **marquee scroll distance**, which, if the element has a scrollamount attribute, and parsing its value using the rules for parsing non-negative integers<sup>p61</sup> does not return an error, is the parsed value interpreted in CSS pixels, and otherwise is 6 CSS pixels.

A marquee<sup>p1102</sup> element has a **marquee loop count**, which, if the element has a loop attribute, and parsing its value using the rules for parsing integers<sup>p60</sup> does not return an error or a number less than 1, is the parsed value, and otherwise is -1.

The `loop` IDL attribute, on getting, must return the element's [marquee loop count](#); and on setting, if the new value is different than the element's [marquee loop count](#) and either greater than zero or equal to -1, must set the element's [loop](#) content attribute (adding it if necessary) to the [valid integer](#) that represents the new value. (Other values are ignored.)

A [marquee](#) element also has a [marquee current loop index](#), which is zero when the element is created.

The rendering layer will occasionally [increment the marquee current loop index](#), which must cause the following steps to be run:

1. If the [marquee loop count](#) is -1, then abort these steps.
2. Increment the [marquee current loop index](#) by one.
3. If the [marquee current loop index](#) is now equal to or greater than the element's [marquee loop count](#), [turn off](#) the [marquee](#) element and [queue a task](#) to [fire a simple event](#) named `finish` at the [marquee](#) element.  
Otherwise, if the [behavior](#) attribute is in the [alternate](#) state, then [queue a task](#) to [fire a simple event](#) named `bounce` at the [marquee](#) element.  
Otherwise, [queue a task](#) to [fire a simple event](#) named `start` at the [marquee](#) element.

The following are the [event handlers](#) (and their corresponding [event handler event types](#)) that must be supported, as [event handler content attributes](#) and [event handler IDL attributes](#), by [marquee](#) elements:

<a href="#">Event handler</a>	<a href="#">Event handler event type</a>
<code>onbounce</code>	<code>bounce</code>
<code>onfinish</code>	<code>finish</code>
<code>onstart</code>	<code>start</code>

The [behavior](#), [direction](#), [height](#), [hspace](#), [vspace](#), and [width](#) IDL attributes must [reflect](#) the respective content attributes of the same name.

The [bgColor](#) IDL attribute must [reflect](#) the `bgcolor` content attribute.

The [scrollAmount](#) IDL attribute must [reflect](#) the `scrollamount` content attribute. The default value is 6.

The [scrollDelay](#) IDL attribute must [reflect](#) the `scrolldelay` content attribute. The default value is 85.

The [trueSpeed](#) IDL attribute must [reflect](#) the [truespeed](#) content attribute.

### 15.3.3 Frames

The [frameset](#) element acts as [the body element](#) in documents that use frames.

The [frameset](#) element must implement the [HTMLFrameSetElement](#) interface.

IDL	<pre>interface HTMLFrameSetElement : HTMLElement {     attribute DOMString cols;     attribute DOMString rows; }; HTMLFrameSetElement implements WindowEventHandlers;</pre>
-----	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The [cols](#) and [rows](#) IDL attributes of the [frameset](#) element must [reflect](#) the respective content attributes of the same name.

The [frameset](#) element exposes as [event handler content attributes](#) a number of the [event handlers](#) of the [Window](#) object. It also mirrors their [event handler IDL attributes](#).

The `onblur`<sup>p844</sup>, `onerror`<sup>p844</sup>, `onfocus`<sup>p844</sup>, `onload`<sup>p844</sup>, `onresize`<sup>p844</sup>, and `onscroll`<sup>p844</sup> [event handlers](#)<sup>p839</sup> of the `Window`<sup>p768</sup> object, exposed on the `frameset`<sup>p1104</sup> element, replace the generic [event handlers](#)<sup>p839</sup> with the same names normally supported by [HTML elements](#)<sup>p842</sup>.

The `frame` element defines a [nested browsing context](#)<sup>p763</sup> similar to the `iframe`<sup>p299</sup> element, but rendered within a `frameset`<sup>p1104</sup> element.

A `frame`<sup>p1105</sup> element is said to be an **active frame element** when it is [in a Document](#)<sup>p42</sup>.

When a `frame`<sup>p1105</sup> element is created as an **active frame element**<sup>p1105</sup>, or becomes an **active frame element**<sup>p1105</sup> after not having been one, the user agent must [create](#)<sup>p762</sup> a [nested browsing context](#)<sup>p763</sup>, and then [process the frame attributes](#)<sup>p1105</sup> for the first time.

When a `frame`<sup>p1105</sup> element stops being an **active frame element**<sup>p1105</sup>, the user agent must [discard](#)<sup>p774</sup> the [nested browsing context](#)<sup>p763</sup>.

Whenever a `frame`<sup>p1105</sup> element with a [nested browsing context](#)<sup>p763</sup> has its `src` attribute set, changed, or removed, the user agent must [process the frame attributes](#)<sup>p1105</sup>.

When the user agent is to [process the frame attributes](#), it must run the first appropriate steps from the following list:

Spec bugs: [27867](#)

- ↪ If the element has no `src` attribute specified, and the user agent is processing the `frame`<sup>p1105</sup>'s attributes for the first time
  - Queue a task<sup>p835</sup> to [fire a simple event](#)<sup>p846</sup> named `load`<sup>p1144</sup> at the `frame`<sup>p1105</sup> element.

#### ↪ Otherwise

1. If the value of the `src` attribute is the empty string, let `url` be the string "`about:blank`<sup>p84</sup>".  
Otherwise, [resolve](#)<sup>p82</sup> the value of the `src` attribute, relative to the `frame`<sup>p1105</sup> element.  
If that is not successful, then let `url` be the string "`about:blank`<sup>p84</sup>". Otherwise, let `url` be the resulting [absolute URL](#)<sup>p48</sup>.
2. [Navigate](#)<sup>p791</sup> the element's [child browsing context](#)<sup>p763</sup> to `url`.

Any [navigation](#)<sup>p791</sup> required of the user agent in the [process the frame attributes](#)<sup>p1105</sup> algorithm must be completed as an [explicit self-navigation override](#)<sup>b791</sup> and with the `frame`<sup>p1105</sup> element's [node document](#)'s [browsing context](#)<sup>p762</sup> as the [source browsing context](#)<sup>b791</sup>.

Furthermore, if the [active document](#)<sup>p762</sup> of the element's [child browsing context](#)<sup>p763</sup> before such a [navigation](#)<sup>p791</sup> was not [completely loaded](#)<sup>p1033</sup> at the time of the new [navigation](#)<sup>p791</sup>, then the [navigation](#)<sup>p791</sup> must be completed with [replacement enabled](#)<sup>p802</sup>.

Similarly, if the [child browsing context](#)<sup>p763</sup>'s [session history](#)<sup>p782</sup> contained only one [Document](#)<sup>p102</sup> when the [process the frame attributes](#)<sup>p1105</sup> algorithm was invoked, and that was the `about:blank`<sup>p84</sup> [Document](#)<sup>p102</sup> created when the [child browsing context](#)<sup>p763</sup> was created, then any [navigation](#)<sup>p791</sup> required of the user agent in that algorithm must be completed with [replacement enabled](#)<sup>p802</sup>.

When a [Document](#)<sup>p102</sup> in a `frame`<sup>p1105</sup> is marked as [completely loaded](#)<sup>p1033</sup>, the user agent must [queue a task](#)<sup>p835</sup> to [fire a simple event](#)<sup>p846</sup> named `load`<sup>p1144</sup> at the `frame`<sup>p1105</sup> element.

The [task source](#)<sup>p835</sup> for the [tasks](#)<sup>p834</sup> above is the [DOM manipulation task source](#)<sup>p838</sup>.

When a `frame`<sup>p1105</sup> element's [nested browsing context](#)<sup>p763</sup>'s [active document](#)<sup>p762</sup> is not [ready for post-load tasks](#)<sup>p1033</sup>, and when anything is [delaying the load event](#)<sup>p1033</sup> of the `frame`<sup>p1105</sup> element's [browsing context](#)<sup>p762</sup>'s [active document](#)<sup>p762</sup>, and when the `frame`<sup>p1105</sup> element's [browsing context](#)<sup>p762</sup> is in the [delaying load events mode](#)<sup>b763</sup>, the `frame`<sup>p1105</sup> must [delay the load event](#)<sup>p1033</sup> of its document.

When the browsing context is created, if a `name` attribute is present, the [browsing context name](#)<sup>p765</sup> must be set to the value of this attribute; otherwise, the [browsing context name](#)<sup>p765</sup> must be set to the empty string.

Whenever the `name` attribute is set, the nested [browsing context](#)<sup>p762</sup>'s [name](#)<sup>p765</sup> must be changed to the new value. If the attribute is removed, the [browsing context name](#)<sup>p765</sup> must be set to the empty string.

The `frame`<sup>p1105</sup> element must implement the `HTMLFrameElement`<sup>p1105</sup> interface.

IDL

```
interface HTMLFrameElement : HTMLElement {
 attribute DOMString name;
 attribute DOMString scrolling;
```

```

attribute DOMString src;
attribute DOMString frameBorder;
attribute DOMString longDesc;
attribute boolean noResize;
readonly attribute Document? contentDocument;
readonly attribute WindowProxy? contentWindow;

[TreatNullAs=EmptyString] attribute DOMString marginHeight;
[TreatNullAs=EmptyString] attribute DOMString marginWidth;
};

```

The **name**, **scrolling**, and **src** IDL attributes of the frame<sup>p1105</sup> element must reflect<sup>p88</sup> the respective content attributes of the same name. For the purposes of reflection, the frame<sup>p1105</sup> element's **src** content attribute is defined as containing a URL<sup>p48</sup>.

The **frameBorder** IDL attribute of the frame<sup>p1105</sup> element must reflect<sup>p88</sup> the element's **frameborder** content attribute.

The **longDesc** IDL attribute of the frame<sup>p1105</sup> element must reflect<sup>p88</sup> the element's **longdesc** content attribute, which for the purposes of reflection is defined as containing a URL<sup>p48</sup>.

The **noResize** IDL attribute of the frame<sup>p1105</sup> element must reflect<sup>p88</sup> the element's **noresize** content attribute.

The **contentDocument** IDL attribute of the frame<sup>p1105</sup> element must return the Document<sup>p102</sup> object of the active document<sup>p762</sup> of the frame<sup>p1105</sup> element's nested browsing context<sup>p763</sup>, if any and if its effective script origin<sup>p776</sup> is the same origin<sup>p778</sup> as the effective script origin<sup>p776</sup> specified by the incumbent settings object<sup>p831</sup>, or null otherwise.

The **contentWindow** IDL attribute must return the WindowProxy<sup>p775</sup> object of the frame<sup>p1105</sup> element's nested browsing context<sup>p763</sup>.

The **marginHeight** IDL attribute of the frame<sup>p1105</sup> element must reflect<sup>p88</sup> the element's **marginheight** content attribute.

The **marginWidth** IDL attribute of the frame<sup>p1105</sup> element must reflect<sup>p88</sup> the element's **marginwidth** content attribute.

Spec bugs: [22253](#), [26540](#), [27987](#)

#### 15.3.4 Other elements, attributes and APIs

User agents must treat acronym<sup>p1096</sup> elements in a manner equivalent to abbr<sup>p218</sup> elements in terms of semantics and for purposes of rendering.

**IDL**

```

partial interface HTMLAnchorElement {
 attribute DOMString coords;
 attribute DOMString charset;
 attribute DOMString name;
 attribute DOMString rev;
 attribute DOMString shape;
};

```

The **coords**, **charset**, **name**, **rev**, and **shape** IDL attributes of the a<sup>p208</sup> element must reflect<sup>p88</sup> the respective content attributes of the same name.

**IDL**

```

partial interface HTMLAreaElement {
 attribute boolean noHref;
};

```

The **noHref** IDL attribute of the area<sup>p390</sup> element must reflect<sup>p88</sup> the element's nohref<sup>p1097</sup> content attribute.

## IDL

```
partial interface HTMLBodyElement {
 [TreatNullAs=EmptyString] attribute DOMString text;
 [TreatNullAs=EmptyString] attribute DOMString link;
 [TreatNullAs=EmptyString] attribute DOMString vLink;
 [TreatNullAs=EmptyString] attribute DOMString aLink;
 [TreatNullAs=EmptyString] attribute DOMString bgColor;
 attribute DOMString background;
};
```

The **text** IDL attribute of the body<sup>p157</sup> element must reflect<sup>p88</sup> the element's text<sup>p1100</sup> content attribute.

The **link** IDL attribute of the body<sup>p157</sup> element must reflect<sup>p88</sup> the element's link<sup>p1100</sup> content attribute.

The **aLink** IDL attribute of the body<sup>p157</sup> element must reflect<sup>p88</sup> the element's aLink<sup>p1100</sup> content attribute.

The **vLink** IDL attribute of the body<sup>p157</sup> element must reflect<sup>p88</sup> the element's vLink<sup>p1100</sup> content attribute.

The **bgColor** IDL attribute of the body<sup>p157</sup> element must reflect<sup>p88</sup> the element's bgcolor<sup>p1100</sup> content attribute.

The **background** IDL attribute of the body<sup>p157</sup> element must reflect<sup>p88</sup> the element's background<sup>p1101</sup> content attribute. (The background<sup>p1101</sup> content is *not* defined to contain a URL<sup>p48</sup>, despite rules regarding its handling in the rendering section above.)

## IDL

```
partial interface HTMLBRElement {
 attribute DOMString clear;
};
```

The **clear** IDL attribute of the br<sup>p242</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

## IDL

```
partial interface HTMLTableCaptionElement {
 attribute DOMString align;
};
```

The **align** IDL attribute of the caption<sup>p405</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

## IDL

```
partial interface HTMLTableColElement {
 attribute DOMString align;
 attribute DOMString ch;
 attribute DOMString chOff;
 attribute DOMString vAlign;
 attribute DOMString width;
};
```

The **align** and **width** IDL attributes of the col<sup>p407</sup> element must reflect<sup>p88</sup> the respective content attributes of the same name.

The **ch** IDL attribute of the col<sup>p407</sup> element must reflect<sup>p88</sup> the element's char<sup>p1100</sup> content attribute.

The **chOff** IDL attribute of the col<sup>p407</sup> element must reflect<sup>p88</sup> the element's charOff<sup>p1100</sup> content attribute.

The **vAlign** IDL attribute of the col<sup>p407</sup> element must reflect<sup>p88</sup> the element's valign<sup>p1100</sup> content attribute.

User agents must treat dir<sup>p1096</sup> elements in a manner equivalent to ul<sup>p197</sup> elements in terms of semantics and for purposes of rendering.

The dir<sup>p1096</sup> element must implement the HTMLDirectoryElement<sup>p1108</sup> interface.

**IDL**

```
interface HTMLDirectoryElement : HTMLElement {
 attribute boolean compact;
};
```

The **compact** IDL attribute of the dir<sup>b1096</sup> element must reflect<sup>b88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLDivElement {
 attribute DOMString align;
};
```

The **align** IDL attribute of the div<sup>p207</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLListElement {
 attribute boolean compact;
};
```

The **compact** IDL attribute of the dl<sup>p199</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLEmbedElement {
 attribute DOMString align;
 attribute DOMString name;
};
```

The **name** and **align** IDL attributes of the embed<sup>p307</sup> element must reflect<sup>p88</sup> the respective content attributes of the same name.

The font<sup>p1096</sup> element must implement the HTMLFontElement<sup>p1108</sup> interface.

**IDL**

```
interface HTMLFontElement : HTMLElement {
 [TreatNullAs=EmptyString] attribute DOMString color;
 attribute DOMString face;
 attribute DOMString size;
};
```

The **color**, **face**, and **size** IDL attributes of the font<sup>p1096</sup> element must reflect<sup>p88</sup> the respective content attributes of the same name.

**IDL**

```
partial interface HTMLHeadingElement {
 attribute DOMString align;
};
```

The **align** IDL attribute of the h1<sup>p168</sup>–h6<sup>p168</sup> elements must reflect<sup>p88</sup> the content attribute of the same name.

**Note** The **profile** IDL attribute on head<sup>p138</sup> elements (with the HTMLHeadElement<sup>p138</sup> interface) is intentionally omitted. Unless so required by another applicable specification<sup>p56</sup>, implementations would therefore not support this attribute. (It is mentioned here as it was defined in a previous version of the DOM specifications.)

**IDL**

```
partial interface HTMLHRElement {
 attribute DOMString align;
 attribute DOMString color;
};
```

```

 attribute boolean noShade;
 attribute DOMString size;
 attribute DOMString width;
 };

```

The **align**, **color**, **size**, and **width** IDL attributes of the [hr](#) element must [reflect<sup>p88</sup>](#) the respective content attributes of the same name.

The **noShade** IDL attribute of the [hr](#) element must [reflect<sup>p88</sup>](#) the element's [noshade](#)<sup>p1100</sup> content attribute.

**IDL**

```

partial interface HTMLHtmlElement {
 attribute DOMString version;
};

```

The **version** IDL attribute of the [html](#)<sup>p137</sup> element must [reflect<sup>p88</sup>](#) the content attribute of the same name.

**IDL**

```

partial interface HTMLIFrameElement {
 attribute DOMString align;
 attribute DOMString scrolling;
 attribute DOMString frameBorder;
 attribute DOMString longDesc;

 [TreatNullAs=EmptyString] attribute DOMString marginHeight;
 [TreatNullAs=EmptyString] attribute DOMString marginWidth;
};

```

The **align** and **scrolling** IDL attributes of the [iframe](#)<sup>p299</sup> element must [reflect<sup>p88</sup>](#) the respective content attributes of the same name.

The **frameBorder** IDL attribute of the [iframe](#)<sup>p299</sup> element must [reflect<sup>p88</sup>](#) the element's [frameborder](#)<sup>p1100</sup> content attribute.

The **longDesc** IDL attribute of the [iframe](#)<sup>p299</sup> element must [reflect<sup>p88</sup>](#) the element's [longdesc](#)<sup>p1098</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#)<sup>p48</sup>.

The **marginHeight** IDL attribute of the [iframe](#)<sup>p299</sup> element must [reflect<sup>p88</sup>](#) the element's [marginheight](#)<sup>p1100</sup> content attribute.

The **marginWidth** IDL attribute of the [iframe](#)<sup>p299</sup> element must [reflect<sup>p88</sup>](#) the element's [marginwidth](#)<sup>p1100</sup> content attribute.

**IDL**

```

partial interface HTMLImageElement {
 attribute DOMString name;
 attribute DOMString lowsrc;
 attribute DOMString align;
 attribute unsigned long hspace;
 attribute unsigned long vspace;
 attribute DOMString longDesc;

 [TreatNullAs=EmptyString] attribute DOMString border;
};

```

The **name**, **align**, **border**, **hspace**, and **vspace** IDL attributes of the [img](#)<sup>p272</sup> element must [reflect<sup>p88</sup>](#) the respective content attributes of the same name.

The **longDesc** IDL attribute of the [img](#)<sup>p272</sup> element must [reflect<sup>p88</sup>](#) the element's [longdesc](#)<sup>p1098</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#)<sup>p48</sup>.

The **lowsrc** IDL attribute of the [img](#)<sup>p272</sup> element must [reflect<sup>p88</sup>](#) the element's [lowsrc](#)<sup>p1098</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#)<sup>p48</sup>.

**IDL**

```
partial interface HTMLInputElement {
 attribute DOMString align;
 attribute DOMString useMap;
};
```

The **align** IDL attribute of the input<sup>p452</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

The **useMap** IDL attribute of the input<sup>p452</sup> element must reflect<sup>p88</sup> the element's usemap<sup>p1098</sup> content attribute.

**IDL**

```
partial interface HTMLLegendElement {
 attribute DOMString align;
};
```

The **align** IDL attribute of the legend<sup>p526</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLLIElement {
 attribute DOMString type;
};
```

The **type** IDL attribute of the li<sup>p198</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLLinkElement {
 attribute DOMString charset;
 attribute DOMString rev;
 attribute DOMString target;
};
```

The **charset**, **rev**, and **target** IDL attributes of the link<sup>p141</sup> element must reflect<sup>p88</sup> the respective content attributes of the same name.

User agents must treat listing<sup>p1096</sup> elements in a manner equivalent to pre<sup>p191</sup> elements in terms of semantics and for purposes of rendering.

**IDL**

```
partial interface HTMLMenuElement {
 attribute boolean compact;
};
```

The **compact** IDL attribute of the menu<sup>p571</sup> element must reflect<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLMetaElement {
 attribute DOMString scheme;
};
```

User agents may treat the scheme<sup>p1098</sup> content attribute on the meta<sup>p145</sup> element as an extension of the element's name<sup>p146</sup> content attribute when processing a meta<sup>p145</sup> element with a name<sup>p146</sup> attribute whose value is one that the user agent recognizes as supporting the scheme<sup>p1098</sup> attribute.

User agents are encouraged to ignore the scheme<sup>p1098</sup> attribute and instead process the value given to the metadata name as if it had been specified for each expected value of the scheme<sup>p1098</sup> attribute.

### Example

For example, if the user agent acts on meta<sup>p145</sup> elements with name<sup>p146</sup> attributes having the value "eGMS.subject.keyword", and knows that the scheme<sup>p1098</sup> attribute is used with this metadata name, then it could take the scheme<sup>p1098</sup> attribute into account, acting as if it

was an extension of the `name`<sup>p146</sup> attribute. Thus the following two `meta`<sup>p145</sup> elements could be treated as two elements giving values for two different metadata names, one consisting of a combination of "eGMS.subject.keyword" and "LGCL", and the other consisting of a combination of "eGMS.subject.keyword" and "ORLY":

```
<!-- this markup is invalid -->
<meta name="eGMS.subject.keyword" scheme="LGCL" content="Abandoned vehicles">
<meta name="eGMS.subject.keyword" scheme="ORLY" content="Mah car: kthxbye">
```

The suggested processing of this markup, however, would be equivalent to the following:

```
<meta name="eGMS.subject.keyword" content="Abandoned vehicles">
<meta name="eGMS.subject.keyword" content="Mah car: kthxbye">
```

The `scheme` IDL attribute of the `meta`<sup>p145</sup> element must `reflect`<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLObjectElement {
 attribute DOMString align;
 attribute DOMString archive;
 attribute DOMString code;
 attribute boolean declare;
 attribute unsigned long hspace;
 attribute DOMString standby;
 attribute unsigned long vspace;
 attribute DOMString codeBase;
 attribute DOMString codeType;

 [TreatNullAs=EmptyString] attribute DOMString border;
};
```

The `align`, `archive`, `border`, `code`, `declare`, `hspace`, `standby`, and `vspace` IDL attributes of the `object`<sup>p310</sup> element must `reflect`<sup>p88</sup> the respective content attributes of the same name.

The `codeBase` IDL attribute of the `object`<sup>p310</sup> element must `reflect`<sup>p88</sup> the element's `codebase`<sup>b1098</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#)<sup>p48</sup>.

The `codeType` IDL attribute of the `object`<sup>p310</sup> element must `reflect`<sup>p88</sup> the element's `codetype`<sup>p1098</sup> content attribute.

**IDL**

```
partial interface HTMLListElement {
 attribute boolean compact;
};
```

The `compact` IDL attribute of the `ol`<sup>p195</sup> element must `reflect`<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLParagraphElement {
 attribute DOMString align;
};
```

The `align` IDL attribute of the `p`<sup>p187</sup> element must `reflect`<sup>p88</sup> the content attribute of the same name.

**IDL**

```
partial interface HTMLParamElement {
 attribute DOMString type;
 attribute DOMString valueType;
};
```

The **type** IDL attribute of the [param<sup>p316</sup>](#) element must [reflect<sup>p88</sup>](#) the content attribute of the same name.

The **valueType** IDL attribute of the [param<sup>p316</sup>](#) element must [reflect<sup>p88</sup>](#) the element's [valuetype<sup>p1098</sup>](#) content attribute.

User agents must treat [plaintext<sup>p1096</sup>](#) elements in a manner equivalent to [pre<sup>p191</sup>](#) elements in terms of semantics and for purposes of rendering. (The parser has special behaviour for this element, though.)

**IDL**

```
partial interface HTMLPreElement {
 attribute long width;
};
```

The **width** IDL attribute of the [pre<sup>p191</sup>](#) element must [reflect<sup>p88</sup>](#) the content attribute of the same name.

**IDL**

```
partial interface HTMLScriptElement {
 attribute DOMString event;
 attribute DOMString htmlFor;
};
```

The **event** and **htmlFor** IDL attributes of the [script<sup>p591</sup>](#) element must return the empty string on getting, and do nothing on setting.

**IDL**

```
partial interface HTMLTableElement {
 attribute DOMString align;
 attribute DOMString border;
 attribute DOMString frame;
 attribute DOMString rules;
 attribute DOMString summary;
 attribute DOMString width;

 [TreatNullAs=EmptyString] attribute DOMString bgColor;
 [TreatNullAs=EmptyString] attribute DOMString cellPadding;
 [TreatNullAs=EmptyString] attribute DOMString cellSpacing;
};
```

The **align**, **border**, **frame**, **summary**, **rules**, and **width**, IDL attributes of the [table<sup>p398</sup>](#) element must [reflect<sup>p88</sup>](#) the respective content attributes of the same name.

The **bgColor** IDL attribute of the [table<sup>p398</sup>](#) element must [reflect<sup>p88</sup>](#) the element's [bgcolor<sup>p1101</sup>](#) content attribute.

The **cellPadding** IDL attribute of the [table<sup>p398</sup>](#) element must [reflect<sup>p88</sup>](#) the element's [cellpadding<sup>p1101</sup>](#) content attribute.

The **cellSpacing** IDL attribute of the [table<sup>p398</sup>](#) element must [reflect<sup>p88</sup>](#) the element's [cellspacing<sup>p1101</sup>](#) content attribute.

**IDL**

```
partial interface HTMLTableSectionElement {
 attribute DOMString align;
 attribute DOMString ch;
 attribute DOMString chOff;
 attribute DOMString vAlign;
};
```

The **align** IDL attribute of the [tbody<sup>p408</sup>](#), [thead<sup>p409</sup>](#), and [tfoot<sup>p410</sup>](#) elements must [reflect<sup>p88</sup>](#) the content attribute of the same name.

The **ch** IDL attribute of the [tbody<sup>p408</sup>](#), [thead<sup>p409</sup>](#), and [tfoot<sup>p410</sup>](#) elements must [reflect<sup>p88</sup>](#) the elements' [char<sup>p1101</sup>](#) content attributes.

The **chOff** IDL attribute of the `tbody`<sup>p408</sup>, `thead`<sup>p409</sup>, and `tfoot`<sup>p410</sup> elements must `reflectp88` the elements' `charoffp1101` content attributes.

The **vAlign** IDL attribute of the `tbody`<sup>p408</sup>, `thead`<sup>p409</sup>, and `tfoot`<sup>p410</sup> element must `reflectp88` the elements' `valignp1101` content attributes.

IDL

```
partial interface HTMLTableCellElement {
 attribute DOMString align;
 attribute DOMString axis;
 attribute DOMString height;
 attribute DOMString width;

 attribute DOMString ch;
 attribute DOMString chOff;
 attribute boolean noWrap;
 attribute DOMString vAlign;

 [TreatNullAs=EmptyString] attribute DOMString bgColor;
};
```

The **align**, **axis**, **height**, and **width** IDL attributes of the `td`<sup>p412</sup> and `th`<sup>p414</sup> elements must `reflectp88` the respective content attributes of the same name.

The **ch** IDL attribute of the `td`<sup>p412</sup> and `th`<sup>p414</sup> elements must `reflectp88` the elements' `charp1101` content attributes.

The **chOff** IDL attribute of the `td`<sup>p412</sup> and `th`<sup>p414</sup> elements must `reflectp88` the elements' `charoffp1101` content attributes.

The **noWrap** IDL attribute of the `td`<sup>p412</sup> and `th`<sup>p414</sup> elements must `reflectp88` the elements' `nowrapp1101` content attributes.

The **vAlign** IDL attribute of the `td`<sup>p412</sup> and `th`<sup>p414</sup> element must `reflectp88` the elements' `valignp1101` content attributes.

The **bgColor** IDL attribute of the `td`<sup>p412</sup> and `th`<sup>p414</sup> elements must `reflectp88` the elements' `bgcolorp1101` content attributes.

IDL

```
partial interface HTMLTableDataCellElement {
 attribute DOMString abbr;
};
```

The **abbr** IDL attribute of the `td`<sup>p412</sup> element must `reflectp88` the respective content attributes of the same name.

IDL

```
partial interface HTMLTableRowElement {
 attribute DOMString align;
 attribute DOMString ch;
 attribute DOMString chOff;
 attribute DOMString vAlign;

 [TreatNullAs=EmptyString] attribute DOMString bgColor;
};
```

The **align** IDL attribute of the `tr`<sup>p411</sup> element must `reflectp88` the content attribute of the same name.

The **ch** IDL attribute of the `tr`<sup>p411</sup> element must `reflectp88` the element's `charp1101` content attribute.

The **chOff** IDL attribute of the `tr`<sup>p411</sup> element must `reflectp88` the element's `charoffp1101` content attribute.

The **vAlign** IDL attribute of the `tr`<sup>p411</sup> element must `reflectp88` the element's `valignp1101` content attribute.

The **bgColor** IDL attribute of the `tr`<sup>p411</sup> element must `reflectp88` the element's `bgcolorp1101` content attribute.

## IDL

```
partial interface HTMLUListElement {
 attribute boolean compact;
 attribute DOMString type;
};
```

The [compact](#) and [type](#) IDL attributes of the [ul](#)<sup>p197</sup> element must [reflect](#)<sup>p88</sup> the respective content attributes of the same name.

User agents must treat [xmp](#)<sup>p1096</sup> elements in a manner equivalent to [pre](#)<sup>p191</sup> elements in terms of semantics and for purposes of rendering. (The parser has special behaviour for this element though.)

The [blink](#)<sup>p1096</sup>, [bgsound](#)<sup>p1096</sup>, [isindex](#)<sup>p1096</sup>, [multicol](#)<sup>p1096</sup>, [nextid](#)<sup>p1096</sup>, [rb](#)<sup>p1096</sup>, and [spacer](#)<sup>p1096</sup> elements must use the [HTMLUnknownElement](#)<sup>p112</sup> interface.

## IDL

```
partial interface Document {
 [TreatNullAs=EmptyString] attribute DOMString fgColor;
 [TreatNullAs=EmptyString] attribute DOMString linkColor;
 [TreatNullAs=EmptyString] attribute DOMString vlinkColor;
 [TreatNullAs=EmptyString] attribute DOMString alinkColor;
 [TreatNullAs=EmptyString] attribute DOMString bgColor;

 readonly attribute HTMLCollection anchors;
 readonly attribute HTMLCollection applets;

 void clear\(\);
 void captureEvents\(\);
 void releaseEvents\(\);

 readonly attribute HTMLAllCollection all;
};
```

The attributes of the [Document](#)<sup>p102</sup> object listed in the first column of the following table must [reflect](#)<sup>p88</sup> the content attribute on [the body element](#)<sup>p106</sup> with the name given in the corresponding cell in the second column on the same row, if [the body element](#)<sup>p106</sup> is a [body](#)<sup>p157</sup> element (as opposed to a [frameset](#)<sup>p1104</sup> element). When there is no [body element](#)<sup>p106</sup> or if it is a [frameset](#)<sup>p1104</sup> element, the attributes must instead return the empty string on getting and do nothing on setting.

IDL attribute	Content attribute
<a href="#">fgColor</a>	<a href="#">text</a> <sup>p1100</sup>
<a href="#">linkColor</a>	<a href="#">link</a> <sup>p1100</sup>
<a href="#">vlinkColor</a>	<a href="#">vlink</a> <sup>p1100</sup>
<a href="#">alinkColor</a>	<a href="#">alink</a> <sup>p1100</sup>
<a href="#">bgColor</a>	<a href="#">bgcolor</a> <sup>p1100</sup>

The [anchors](#) attribute must return an [HTMLCollection](#)<sup>p51</sup> rooted at the [Document](#)<sup>p102</sup> node, whose filter matches only [a](#)<sup>p208</sup> elements with [name](#)<sup>p1097</sup> attributes.

The [applets](#) attribute must return an [HTMLCollection](#)<sup>p51</sup> rooted at the [Document](#)<sup>p102</sup> node, whose filter matches only [applet](#)<sup>p1101</sup> elements.

The [clear\(\)](#), [captureEvents\(\)](#), and [releaseEvents\(\)](#) methods must do nothing.

The [all](#) attribute must return an [HTMLAllCollection](#)<sup>p90</sup> rooted at the [Document](#)<sup>p102</sup> node, whose filter matches all elements.

The object returned for [all](#)<sup>p1114</sup> has several unusual behaviours:

- The user agent must act as if the `ToBoolean()` operator in JavaScript converts the object returned for `all`<sup>p1114</sup> to the false value.
- The user agent must act as if, for the purposes of the `==` and `!=` operators in JavaScript, the object returned for `all`<sup>p1114</sup> compares as equal to the `undefined` and `null` values. (Comparisons using the `==` operator, and comparisons to other values such as strings or objects, are unaffected.)
- The user agent must act such that the `typeof` operator in JavaScript returns the string `undefined` when applied to the object returned for `all`<sup>p1114</sup>.

**Note** These requirements are a [willful violation<sup>p26</sup>](#) of the JavaScript specification current at the time of writing (ECMAScript edition 5). The JavaScript specification requires that the `ToBoolean()` operator convert all objects to the true value, and does not have provisions for objects acting as if they were `undefined` for the purposes of certain operators. This violation is motivated by a desire for compatibility with two classes of legacy content: one that uses the presence of `document.all`<sup>p1114</sup> as a way to detect legacy user agents, and one that only supports those legacy user agents and uses the `document.all`<sup>p1114</sup> object without testing for its presence first. [\[ECMA262\]<sup>p1150</sup>](#)

**IDL**

```
partial interface Window {
 void captureEvents();
 void releaseEvents();
};
```

The `captureEvents()` and `releaseEvents()` methods must do nothing.

## 16 IANA considerations

### 16.1 `text/html`

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

text

**Subtype name:**

html

**Required parameters:**

No required parameters

**Optional parameters:**

`charset`

The `charset` parameter may be provided to specify the [document's character encoding<sup>p51</sup>](#), overriding any [character encoding declarations<sup>p153</sup>](#) in the document other than a Byte Order Mark (BOM). The parameter's value must be one of the [labels<sup>p44</sup>](#) of the [character encoding<sup>p44</sup>](#) used to serialise the file. [\[ENCODING\]<sup>p150</sup>](#)

**Encoding considerations:**

8bit (see the section on [character encoding declarations<sup>p153</sup>](#))

**Security considerations:**

Entire novels have been written about the security considerations that apply to HTML documents. Many are listed in this document, to which the reader is referred for more details. Some general concerns bear mentioning here, however:

HTML is a scripted language, and has a large number of APIs (some of which are described in this document). Script can expose the user to potential risks of information leakage, credential leakage, cross-site scripting attacks, cross-site request forgeries, and a host of other problems. While the designs in this specification are intended to be safe if implemented correctly, a full implementation is a massive undertaking and, as with any software, user agents are likely to have security bugs.

Even without scripting, there are specific features in HTML which, for historical reasons, are required for broad compatibility with legacy content but that expose the user to unfortunate security problems. In particular, the [img<sup>p272</sup>](#) element can be used in conjunction with some other features as a way to effect a port scan from the user's location on the Internet. This can expose local network topologies that the attacker would otherwise not be able to determine.

HTML relies on a compartmentalization scheme sometimes known as the *same-origin policy*. An [origin<sup>p776</sup>](#) in most cases consists of all the pages served from the same host, on the same port, using the same protocol.

It is critical, therefore, to ensure that any untrusted content that forms part of a site be hosted on a different [origin<sup>p776</sup>](#) than any sensitive content on that site. Untrusted content can easily spoof any other page on the same origin, read data from that origin, cause scripts in that origin to execute, submit forms to and from that origin even if they are protected from cross-site request forgery attacks by unique tokens, and make use of any third-party resources exposed to or rights granted to that origin.

**Interoperability considerations:**

Rules for processing both conforming and non-conforming content are defined in this specification.

**Published specification:**

This document is the relevant specification. Labeling a resource with the [text/html<sup>p1116</sup>](#) type asserts that the resource is an [HTML document<sup>p51</sup>](#) using [the HTML syntax<sup>p941</sup>](#).

**Applications that use this media type:**

Web browsers, tools for processing Web content, HTML authoring tools, search engines, validators.

**Additional information:****Magic number(s):**

No sequence of bytes can uniquely identify an HTML document. More information on detecting HTML documents is available in the MIME Sniffing specification. [\[MIMESNIFF\]<sup>p151</sup>](#)

**File extension(s):**

"html" and "htm" are commonly, but certainly not exclusively, used as the extension for HTML documents.

**Macintosh file type code(s):**

TEXT

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

Fragment identifiers used with [text/html](#)<sup>p1116</sup> resources either refer to [the indicated part of the document](#)<sup>p800</sup> or provide state information for in-page scripts.

## 16.2 multipart/x-mixed-replace

Spec bugs: [25320](#)

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

multipart

**Subtype name:**

x-mixed-replace

**Required parameters:**

- boundary (defined in RFC2046) [\[RFC2046\]](#)<sup>p1152</sup>

**Optional parameters:**

No optional parameters.

**Encoding considerations:**

binary

**Security considerations:**

Subresources of a [multipart/x-mixed-replace](#)<sup>p1117</sup> resource can be of any type, including types with non-trivial security implications such as [text/html](#)<sup>p1116</sup>.

**Interoperability considerations:**

None.

**Published specification:**

This specification describes processing rules for Web browsers. Conformance requirements for generating resources with this type are the same as for [multipart/mixed](#)<sup>p1146</sup>. [\[RFC2046\]](#)<sup>p1152</sup>

**Applications that use this media type:**

This type is intended to be used in resources generated by Web servers, for consumption by Web browsers.

**Additional information:****Magic number(s):**

No sequence of bytes can uniquely identify a [multipart/x-mixed-replace](#)<sup>p1117</sup> resource.

**File extension(s):**

No specific file extensions are recommended for this type.

⋮

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <[ian@hixie.ch](mailto:ian@hixie.ch)>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <[ian@hixie.ch](mailto:ian@hixie.ch)>

**Change controller:**

W3C

Fragment identifiers used with [multipart/x-mixed-replace<sup>p1117</sup>](#) resources apply to each body part as defined by the type used by that body part.

## 16.3 application/xhtml+xml

Spec bugs: [13787](#)

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

application

**Subtype name:**

xhtml+xml

**Required parameters:**

Same as for [application/xml<sup>p1145</sup>](#) [[RFC7303<sup>p1153</sup>](#)]

**Optional parameters:**

Same as for [application/xml<sup>p1145</sup>](#) [[RFC7303<sup>p1153</sup>](#)]

**Encoding considerations:**

Same as for [application/xml<sup>p1145</sup>](#) [[RFC7303<sup>p1153</sup>](#)]

**Security considerations:**

Same as for [application/xml<sup>p1145</sup>](#) [[RFC7303<sup>p1153</sup>](#)]

**Interoperability considerations:**

Same as for [application/xml<sup>p1145</sup>](#) [[RFC7303<sup>p1153</sup>](#)]

**Published specification:**

Labeling a resource with the [application/xhtml+xml<sup>p1118</sup>](#) type asserts that the resource is an XML document that likely has a root element from the [HTML namespace<sup>p101</sup>](#). Thus, the relevant specifications are the XML specification, the Namespaces in XML specification, and this specification. [[XML<sup>p1154</sup>](#)] [[XMLNS<sup>p1155</sup>](#)]

**Applications that use this media type:**

Same as for [application/xml<sup>p1145</sup>](#) [[RFC7303<sup>p1153</sup>](#)]

**Additional information:****Magic number(s):**

Same as for [application/xml<sup>p1145</sup>](#) [[RFC7303<sup>p1153</sup>](#)]

**File extension(s):**

"xhtml" and "xht" are sometimes used as extensions for XML resources that have a root element from the [HTML namespace<sup>p101</sup>](#).

**Macintosh file type code(s):**

TEXT

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

Fragment identifiers used with [application/xhtml+xml<sup>p1118</sup>](#) resources have the same semantics as with any [XML MIME type<sup>p42</sup>](#).  
[\[RFC7303\]<sup>p1153</sup>](#)

## 16.4 application/x-www-form-urlencoded

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

application

**Subtype name:**

x-www-form-urlencoded

**Required parameters:**

No parameters

**Optional parameters:**

No parameters

**Encoding considerations:**

7bit (US-ASCII encoding of octets that themselves can be encoding text using any [ASCII-compatible character encoding<sup>p44</sup>](#))

**Security considerations:**

In isolation, an [application/x-www-form-urlencoded<sup>p1119</sup>](#) payload poses no security risks. However, as this type is usually used as part of a form submission, all the risks that apply to HTML forms need to be considered in the context of this type.

**Interoperability considerations:**

Rules for generating and processing [application/x-www-form-urlencoded<sup>p1119</sup>](#) payloads are defined in this specification.

**Published specification:**

This document is the relevant specification. Algorithms for [encoding<sup>p563</sup>](#) and [decoding<sup>p564</sup>](#) are defined.

**Applications that use this media type:**

Web browsers and servers.

**Additional information:****Magic number(s):**

There is no reliable mechanism for recognising [application/x-www-form-urlencoded<sup>p1119</sup>](#) payloads.

**File extension(s):**

Not applicable.

**Macintosh file type code(s):**

Not applicable.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

This type is only intended to be used to describe HTML form submission payloads.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

Fragment identifiers have no meaning with the [application/x-www-form-urlencoded<sup>p1119</sup>](#) type.

## 16.5 text/cache-manifest

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

text

**Subtype name:**

cache-manifest

**Required parameters:**

No parameters

**Optional parameters:**

charset

The `charset` parameter may be provided. The parameter's value must be "`utf-8`". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

**Encoding considerations:**

8bit (always UTF-8)

**Security considerations:**

Cache manifests themselves pose no immediate risk unless sensitive information is included within the manifest. Implementations, however, are required to follow specific rules when populating a cache based on a cache manifest, to ensure that certain origin-based restrictions are honored. Failure to correctly implement these rules can result in information leakage, cross-site scripting attacks, and the like.

**Interoperability considerations:**

Rules for processing both conforming and non-conforming content are defined in this specification.

**Published specification:**

This document is the relevant specification.

**Applications that use this media type:**

Web browsers.

**Additional information:****Magic number(s):**

Cache manifests begin with the string "CACHE MANIFEST", followed by either a U+0020 SPACE character, a U+0009 CHARACTER TABULATION (tab) character, a U+000A LINE FEED (LF) character, or a U+000D CARRIAGE RETURN (CR) character.

**File extension(s):**

"appcache"

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

Fragment identifiers have no meaning with [text/cache-manifest<sup>p1120</sup>](#) resources.

## 16.6 text/ping

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

text

**Subtype name:**

ping

**Required parameters:**

No parameters

**Optional parameters:**

charset

The `charset` parameter may be provided. The parameter's value must be "`utf-8`". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

**Encoding considerations:**

Not applicable.

**Security considerations:**

If used exclusively in the fashion described in the context of [hyperlink auditing<sup>p249</sup>](#), this type introduces no new security concerns.

**Interoperability considerations:**

Rules applicable to this type are defined in this specification.

**Published specification:**

This document is the relevant specification.

**Applications that use this media type:**

Web browsers.

**Additional information:****Magic number(s):**

[text/ping<sup>p1121</sup>](#) resources always consist of the four bytes 0x50 0x49 0x4E 0x47 (ASCII 'PING').

**File extension(s):**

No specific file extension is recommended for this type.

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

Only intended for use with HTTP POST requests generated as part of a Web browser's processing of the [ping<sup>p246</sup>](#) attribute.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

Fragment identifiers have no meaning with [text/ping<sup>p1121</sup>](#) resources.

## 16.7 application/microdata+json

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

application

**Subtype name:**

microdata+json

**Required parameters:**

Same as for [application/json<sup>p1145</sup>](#) [\[JSON\]<sup>p1150</sup>](#)

**Optional parameters:**

Same as for [application/json<sup>p1145</sup>](#) [\[JSON\]<sup>p1150</sup>](#)

**Encoding considerations:**

8bit (always UTF-8)

**Security considerations:**

Same as for [application/json<sup>p1145</sup>](#) [\[JSON\]<sup>p1150</sup>](#)

**Interoperability considerations:**

Same as for [application/json<sup>p1145</sup>](#) [\[JSON\]<sup>p1150</sup>](#)

**Published specification:**

Labeling a resource with the [application/microdata+json<sup>p1122</sup>](#) type asserts that the resource is a JSON text that consists of an object with a single entry called "items" consisting of an array of entries, each of which consists of an object with an entry called "id" whose value is a string, an entry called "type" whose value is another string, and an entry called "properties" whose value is an object whose entries each have a value consisting of an array of either objects or strings, the objects being of the same form as the objects in the aforementioned "items" entry. Thus, the relevant specifications are the JSON specification and this specification. [\[JSON\]<sup>p1150</sup>](#)

**Applications that use this media type:**

Applications that transfer data intended for use with HTML's microdata feature, especially in the context of drag-and-drop, are the primary application class for this type.

**Additional information:****Magic number(s):**

Same as for [application/json<sup>p1145</sup>](#) [\[JSON\]<sup>p1150</sup>](#)

**File extension(s):**

Same as for [application/json<sup>p1145</sup>](#) [\[JSON\]<sup>p1150</sup>](#)

**Macintosh file type code(s):**

Same as for [application/json<sup>p1145</sup>](#) [\[JSON\]<sup>p1150</sup>](#)

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

Fragment identifiers used with [application/microdata+json<sup>p1122</sup>](#) resources have the same semantics as when used with [application/json<sup>p1145</sup>](#) (namely, at the time of writing, no semantics at all). [\[JSON\]<sup>p1150</sup>](#)

## 16.8 Ping-From

This section describes a header for registration in the Permanent Message Header Field Registry. [\[RFC3864\]<sup>p1152</sup>](#)

**Header field name:**

Ping-From

**Applicable protocol:**

http

**Status:**

standard

**Author/Change controller:**

W3C

**Specification document(s):**

This document is the relevant specification.

**Related information:**

None.

## 16.9 Ping-To

This section describes a header for registration in the Permanent Message Header Field Registry. [\[RFC3864\]<sup>p1152</sup>](#)

**Header field name:**

Ping-To

**Applicable protocol:**

http

**Status:**

standard

**Author/Change controller:**

W3C

**Specification document(s):**

This document is the relevant specification.

**Related information:**

None.

## 16.10 web+ scheme prefix

Spec bugs: [18496](#), [18671](#)

This section describes a convention for use with the IANA URI scheme registry. It does not itself register a specific scheme. [\[RFC4395\]](#)<sup>p1153</sup>

### URI scheme name:

Schemes starting with the four characters "web+" followed by one or more letters in the range a-z.

### Status:

permanent

### URI scheme syntax:

Scheme-specific.

### URI scheme semantics:

Scheme-specific.

### Encoding considerations:

All "web+" schemes should use UTF-8 encodings where relevant.

### Applications/protocols that use this URI scheme name:

Scheme-specific.

### Interoperability considerations:

The scheme is expected to be used in the context of Web applications.

### Security considerations:

Any Web page is able to register a handler for all "web+" schemes. As such, these schemes must not be used for features intended to be core platform features (e.g. network transfer protocols like HTTP or FTP). Similarly, such schemes must not store confidential information in their URLs, such as usernames, passwords, personal information, or confidential project names.

### Contact:

Ian Hickson <ian@hixie.ch>

### Author/Change controller:

Ian Hickson <ian@hixie.ch>

### References:

*Custom scheme and content handlers*, HTML Living Standard: <https://html.spec.whatwg.org/#custom-handlers><sup>p861</sup>

The following sections only cover conforming elements and features.

An asterisk (\*) in a cell indicates that the actual rules are more complicated than indicated in the table above.

† Categories in the "Parents" column refer to parents that list the given categories in their content model, not to elements that themselves are in those categories.

For example, the [a](#)<sup>p208</sup> element's "Parents" column says "phrasing", so any element whose content model contains the "phrasing" category could be a parent of an [a](#)<sup>p208</sup> element. Since the "flow" category includes all the "phrasing" elements, that means the [th](#)<sup>p414</sup> element could be a parent to an [a](#)<sup>p208</sup> element.

Spec bugs: [27570](#)

## Attributes

This section is non-normative.

List of attributes (excluding event handler content attributes)			
Attribute	Element(s)	Description	Value
<code>abbr</code>	<a href="#">th<sup>p415</sup></a>	Alternative label to use for the header cell when referencing the cell in other contexts	<a href="#">Text<sup>p113*</sup></a>
<code>accept</code>	<a href="#">input<sup>p477</sup></a>	Hint for expected file type in <a href="#">file upload controls<sup>p476</sup></a>	<a href="#">Set of comma-separated tokens<sup>p80*</sup></a> consisting of <a href="#">valid MIME types with no parameters<sup>p42</sup></a> or <a href="#">audio/*, video/*, or image/*</a>
<code>accept-charset</code>	<a href="#">Form<sup>p448</sup></a>	Character encodings to use for <a href="#">form submission<sup>p557</sup></a>	<a href="#">Ordered set of unique space-separated tokens<sup>p80</sup></a> , <a href="#">ASCII case-insensitive<sup>p58</sup></a> , consisting of <a href="#">labels<sup>p44</sup></a> of <a href="#">ASCII-compatible character encodings<sup>p44*</sup></a>
<code>accesskey</code>	<a href="#">HTML elements<sup>p738</sup></a>	Keyboard shortcut to activate or focus element	<a href="#">Ordered set of unique space-separated tokens<sup>p80</sup></a> , <a href="#">case-sensitive<sup>p58</sup></a> , consisting of one Unicode code point in length
<code>action</code>	<a href="#">form<sup>p531</sup></a>	<a href="#">URL<sup>p48</sup></a> to use for <a href="#">form submission<sup>p557</sup></a>	<a href="#">Valid non-empty URL potentially surrounded by spaces<sup>p82</sup></a>
<code>allowfullscreen</code>	<a href="#">iframe<sup>p306</sup></a>	Whether to allow the <a href="#">iframe<sup>p299</sup></a> 's contents to use <a href="#">requestFullscreen()<sup>p52</sup></a>	<a href="#">Boolean attribute<sup>p59</sup></a>
<code>alt</code>	<a href="#">area<sup>p391</sup></a> ; <a href="#">img<sup>p273</sup></a> ; <a href="#">input<sup>p480</sup></a>	Replacement text for use when images are not available	<a href="#">Text<sup>p113*</sup></a>
<code>async</code>	<a href="#">script<sup>p592</sup></a>	Execute script when available, without blocking	<a href="#">Boolean attribute<sup>p59</sup></a>
<code>autocomplete</code>	<a href="#">form<sup>p448</sup></a>	Default setting for autofill feature for controls in the form	"on", "off"
<code>autocomplete</code>	<a href="#">input<sup>p535</sup></a> ; <a href="#">select<sup>p535</sup></a> ; <a href="#">textarea<sup>p535</sup></a>	Hint for form autofill feature	<a href="#">Autofill field<sup>p537</sup></a> name and related tokens*

Attribute	Element(s)	Description	Value
autofocus	<code>button<sup>p533</sup>; input<sup>p533</sup>; keygen<sup>p533</sup>; select<sup>p533</sup>; textarea<sup>p533</sup></code>	Automatically focus the form control when the page is loaded	<a href="#">Boolean attribute<sup>p59</sup></a>
autoplay	<code>audio<sup>p345</sup>; video<sup>p345</sup></code>	Hint that the <a href="#">media resource<sup>p328</sup></a> can be started automatically when the page is loaded	<a href="#">Boolean attribute<sup>p59</sup></a>
challenge	<code>keygen<sup>p514</sup></code>	String to package with the generated and signed public key	<a href="#">Text<sup>p113</sup></a>
charset	<code>meta<sup>p146</sup></code>	<a href="#">Character encoding declaration<sup>p153</sup></a>	<a href="#">Encoding label<sup>p44</sup>*</a>
charset	<code>script<sup>p592</sup></code>	Character encoding of the external script resource	<a href="#">Encoding label<sup>p44</sup>*</a>
checked	<code>menuitem<sup>b575</sup>; input<sup>p457</sup></code>	Whether the command or control is checked	<a href="#">Boolean attribute<sup>p59</sup></a>
cite	<code>blockquote<sup>p193</sup>; del<sup>p262</sup>; ins<sup>p262</sup>; q<sup>p216</sup></code>	Link to the source of the quotation or more information about the edit	<a href="#">Valid URL potentially surrounded by spaces<sup>p82</sup></a>
class	<a href="#">HTML elements<sup>p128</sup></a>	Classes to which the element belongs	<a href="#">Set of space-separated tokens<sup>p80</sup></a>
cols	<code>textarea<sup>b510</sup></code>	Maximum number of characters per line	<a href="#">Valid non-negative integer<sup>p61</sup> greater than zero</a>
colspan	<code>td<sup>p416</sup>; th<sup>p416</sup></code>	Number of columns that the cell is to span	<a href="#">Valid non-negative integer<sup>p61</sup> greater than zero</a>
command	<code>menuitem<sup>b575</sup></code>	Command definition	<a href="#">ID<sup>p51</sup>*</a>
content	<code>meta<sup>b146</sup></code>	Value of the element	<a href="#">Text<sup>p113</sup>*</a>
contenteditable	<a href="#">HTML elements<sup>p739</sup></a>	Whether the element is editable	"true", "false"
contextmenu	<a href="#">HTML elements<sup>p577</sup></a>	The element's context menu	<a href="#">ID<sup>p51</sup>*</a>
controls	<code>audio<sup>p382</sup>; video<sup>p382</sup></code>	Show user agent controls	<a href="#">Boolean attribute<sup>p59</sup></a>
coords	<code>area<sup>b392</sup></code>	Coordinates for the shape to be created in an <a href="#">image map<sup>p393</sup></a>	<a href="#">Valid list of integers<sup>p64</sup>*</a>
crossorigin	<code>audio<sup>p329</sup>; img<sup>p274</sup>; link<sup>p142</sup>; script<sup>p593</sup>; video<sup>p329</sup></code>	How the element handles crossorigin requests	"anonymous <sup>p87</sup> ", "use-credentials <sup>p87</sup> "
data	<code>object<sup>p311</sup></code>	Address of the resource	<a href="#">Valid non-empty URL potentially surrounded by spaces<sup>p82</sup></a>
datetime	<code>del<sup>p262</sup>; ins<sup>p262</sup></code>	Date and (optionally) time of the change	<a href="#">Valid date string with optional time<sup>p77</sup></a>
datetime	<code>time<sup>b227</sup></code>	Machine-readable value	<a href="#">Valid month string<sup>p67</sup>, valid date string<sup>p67</sup>, valid yearless date string<sup>p68</sup>, valid time string<sup>p69</sup>, valid local date and time string<sup>p70</sup>, valid time-zone offset string<sup>p71</sup>, valid global date and time string<sup>p72</sup>, valid week string<sup>p74</sup>, valid non-negative integer<sup>p61</sup>, or valid duration string<sup>p74</sup></a>
default	<code>menuitem<sup>b575</sup></code>	Mark the command as being a default command	<a href="#">Boolean attribute<sup>p59</sup></a>
default	<code>track<sup>p325</sup></code>	Enable the track if no other <a href="#">text track<sup>p365</sup></a> is more suitable	<a href="#">Boolean attribute<sup>p59</sup></a>
defer	<code>script<sup>p592</sup></code>	Defer script execution	<a href="#">Boolean attribute<sup>p59</sup></a>
dir	<a href="#">HTML elements<sup>p125</sup></a>	<a href="#">The text directionality<sup>p125</sup></a> of the element	"ltr <sup>p125</sup> ", "rtl <sup>p125</sup> ", "auto <sup>b125</sup> "
dir	<code>bdo<sup>p241</sup></code>	<a href="#">The text directionality<sup>p125</sup></a> of the element	"ltr <sup>p125</sup> ", "rtl <sup>p125</sup> "
dirname	<code>input<sup>p529</sup>; textarea<sup>p529</sup></code>	Name of form field to use for sending the element's <a href="#">directionality<sup>p125</sup></a> in <a href="#">form submission<sup>p557</sup></a>	<a href="#">Text<sup>p113</sup>*</a>
disabled	<code>button<sup>p530</sup>; menuitem<sup>p575</sup>; fieldset<sup>p525</sup>; input<sup>p530</sup>; keygen<sup>p530</sup>; optgroup<sup>p505</sup>; option<sup>p506</sup>; select<sup>p530</sup>; textarea<sup>p530</sup></code>	Whether the form control is disabled	<a href="#">Boolean attribute<sup>p59</sup></a>
download	<code>a<sup>p246</sup>; area<sup>p246</sup></code>	Whether to download the resource instead of navigating to it, and its file name if so	Text
draggable	<a href="#">HTML elements<sup>p758</sup></a>	Whether the element is draggable	"true"; "false"

Attribute	Element(s)	Description	Value
dropzone	<a href="#">HTML elements</a> <sup>p759</sup>	Accepted item types for drag-and-drop	<a href="#">Unordered set of unique space-separated tokens</a> <sup>p80</sup> , <a href="#">ASCII case-insensitive</a> <sup>p58</sup> , consisting of accepted types and drag feedback*
enctype	<a href="#">form</a> <sup>p532</sup>	Form data set encoding type to use for <a href="#">form submission</a> <sup>p557</sup>	" <a href="#">application/x-www-form-urlencoded</a> <sup>p532</sup> "; " <a href="#">multipart/form-data</a> <sup>p532</sup> "; " <a href="#">text/plain</a> <sup>p532</sup> "
for	<a href="#">label</a> <sup>p451</sup>	Associate the label with form control	<a href="#">ID</a> <sup>p51*</sup>
for	<a href="#">output</a> <sup>p516</sup>	Specifies controls from which the output was calculated	<a href="#">Unordered set of unique space-separated tokens</a> <sup>p80</sup> , <a href="#">case-sensitive</a> <sup>p58</sup> , consisting of IDs*
form	<a href="#">button</a> <sup>p527</sup> ; <a href="#">fieldset</a> <sup>p527</sup> ; <a href="#">input</a> <sup>p527</sup> ; <a href="#">keygen</a> <sup>p527</sup> ; <a href="#">label</a> <sup>p527</sup> ; <a href="#">object</a> <sup>p527</sup> ; <a href="#">output</a> <sup>p527</sup> ; <a href="#">select</a> <sup>p527</sup> ; <a href="#">textarea</a> <sup>p527</sup>	Associates the control with a <a href="#">form</a> <sup>p447</sup> element	<a href="#">ID</a> <sup>p51*</sup>
formaction	<a href="#">button</a> <sup>p531</sup> ; <a href="#">input</a> <sup>p531</sup>	<a href="#">URL</a> <sup>p48</sup> to use for <a href="#">form submission</a> <sup>p557</sup>	<a href="#">Valid non-empty URL potentially surrounded by spaces</a> <sup>p82</sup>

Attribute	Element(s)	Description	Value
ondragleave	HTML elements <sup>P843</sup>	dragleave <sup>P758</sup> event handler	Event handler content attribute <sup>P839</sup>
ondragover	HTML elements <sup>P843</sup>	dragover <sup>P758</sup> event handler	Event handler content attribute <sup>P839</sup>
ondragstart	HTML elements <sup>P843</sup>	dragstart <sup>P758</sup> event handler	Event handler content attribute <sup>P839</sup>
ondrop	HTML elements <sup>P843</sup>	drop <sup>P758</sup> event handler	Event handler content attribute <sup>P839</sup>
ondurationchange	HTML elements <sup>P843</sup>	durationchange <sup>P387</sup> event handler	Event handler content attribute <sup>P839</sup>
onemptied	HTML elements <sup>P843</sup>	emptied <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onended	HTML elements <sup>P843</sup>	ended <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onerror	HTML elements <sup>P844</sup>	error <sup>P1144</sup> event handler	Event handler content attribute <sup>P839</sup>
onfocus	HTML elements <sup>P844</sup>	focus <sup>P1144</sup> event handler	Event handler content attribute <sup>P839</sup>
onhashchange	body <sup>b844</sup>	hashchange <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
oninput	HTML elements <sup>P843</sup>	input <sup>P1144</sup> event handler	Event handler content attribute <sup>P839</sup>
oninvalid	HTML elements <sup>P843</sup>	invalid <sup>P1144</sup> event handler	Event handler content attribute <sup>P839</sup>
onkeydown	HTML elements <sup>P843</sup>	keydown <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onkeypress	HTML elements <sup>P843</sup>	keypress <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onkeyup	HTML elements <sup>P843</sup>	keyup <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onlanguagechange	body <sup>b844</sup>	languagechange <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
onload	HTML elements <sup>P844</sup>	load <sup>P1144</sup> event handler	Event handler content attribute <sup>P839</sup>
onloadeddata	HTML elements <sup>P843</sup>	loadeddata <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onloadedmetadata	HTML elements <sup>P843</sup>	loadedmetadata <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onloadstart	HTML elements <sup>P843</sup>	loadstart <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onmessage	body <sup>b844</sup>	message <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
onmousedown	HTML elements <sup>P843</sup>	mousedown <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onmouseenter	HTML elements <sup>P843</sup>	mouseenter <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onmouseleave	HTML elements <sup>P843</sup>	mouseleave <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onmousemove	HTML elements <sup>P843</sup>	mousemove <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onmouseout	HTML elements <sup>P843</sup>	mouseout <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onmouseover	HTML elements <sup>P843</sup>	mouseover <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onmouseup	HTML elements <sup>P843</sup>	mouseup <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onmousewheel	HTML elements <sup>P843</sup>	mousewheel <sup>P52</sup> event handler	Event handler content attribute <sup>P839</sup>
onoffline	body <sup>b844</sup>	offline <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
ononline	body <sup>b844</sup>	online <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
onpagehide	body <sup>b844</sup>	pagehide <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
onpageshow	body <sup>b844</sup>	pageshow <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
onpause	HTML elements <sup>P843</sup>	pause <sup>P387</sup> event handler	Event handler content attribute <sup>P839</sup>
onplay	HTML elements <sup>P843</sup>	play <sup>P387</sup> event handler	Event handler content attribute <sup>P839</sup>
onplaying	HTML elements <sup>P843</sup>	playing <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onpopstate	body <sup>b844</sup>	popstate <sup>P1144</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
onprogress	HTML elements <sup>P843</sup>	progress <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onratechange	HTML elements <sup>P843</sup>	ratechange <sup>P387</sup> event handler	Event handler content attribute <sup>P839</sup>
onreset	HTML elements <sup>P843</sup>	reset <sup>P1144</sup> event handler	Event handler content attribute <sup>P839</sup>
onresize	HTML elements <sup>P844</sup>	resize <sup>P53</sup> event handler	Event handler content attribute <sup>P839</sup>
onscroll	HTML elements <sup>P844</sup>	scroll <sup>P53</sup> event handler	Event handler content attribute <sup>P839</sup>
onseeked	HTML elements <sup>P843</sup>	seeked <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onseeking	HTML elements <sup>P843</sup>	seeking <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onselect	HTML elements <sup>P844</sup>	select <sup>P1145</sup> event handler	Event handler content attribute <sup>P839</sup>
onshow	HTML elements <sup>P844</sup>	show <sup>P1145</sup> event handler	Event handler content attribute <sup>P839</sup>
onsort	HTML elements <sup>P844</sup>	sort <sup>P1145</sup> event handler	Event handler content attribute <sup>P839</sup>
onstalled	HTML elements <sup>P844</sup>	stalled <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
onstorage	body <sup>b844</sup>	storage <sup>P1145</sup> event handler for Window <sup>P768</sup> object	Event handler content attribute <sup>P839</sup>
onsubmit	HTML elements <sup>P844</sup>	submit <sup>P1145</sup> event handler	Event handler content attribute <sup>P839</sup>
onsuspend	HTML elements <sup>P844</sup>	suspend <sup>P386</sup> event handler	Event handler content attribute <sup>P839</sup>
ontimeupdate	HTML elements <sup>P844</sup>	timeupdate <sup>P387</sup> event handler	Event handler content attribute <sup>P839</sup>

Attribute	Element(s)	Description	Value
ontoggle	HTML elements <sup>p844</sup>	toggle <sup>p1145</sup> event handler	Event handler content attribute <sup>p839</sup>
onunload	body <sup>b844</sup>	unload <sup>p1145</sup> event handler for window <sup>p768</sup> object	Event handler content attribute <sup>p839</sup>
onvolumechange	HTML elements <sup>p844</sup>	volumechange <sup>p387</sup> event handler	Event handler content attribute <sup>p839</sup>
onwaiting	HTML elements <sup>p844</sup>	waiting <sup>p386</sup> event handler	Event handler content attribute <sup>p839</sup>

## Element Interfaces

## Events

This section is non-normative.

Event	Interface	List of events	Description
Interesting targets			
<a href="#">abort</a>	<a href="#">Event</a> <sup>p51</sup>	<a href="#">Window</a> <sup>p768</sup>	Fired at the <a href="#">window</a> <sup>p768</sup> when the download was aborted by the user
<a href="#">autocomplete</a>	<a href="#">Event</a> <sup>p51</sup>	<a href="#">form</a> <sup>p447</sup> elements	Fired at a <a href="#">form</a> <sup>p447</sup> element when it is <a href="#">autofilled</a> <sup>b547</sup>
<a href="#">autocompleteerror</a>	<a href="#">Event</a> <sup>p51</sup>	<a href="#">form</a> <sup>p447</sup> elements	Fired at a <a href="#">form</a> <sup>p447</sup> element when a <a href="#">bulk autofill</a> <sup>b547</sup> fails

Event	Interface	Interesting targets	Description
<code>DOMContentLoaded</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Document<sup>p102</sup></a>	Fired at the <a href="#">Document<sup>p102</sup></a> once the parser has finished
<code>afterprint</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">Window<sup>p768</sup></a> after printing
<code>afterscriptexecute</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">script<sup>p591</sup></a> elements	Fired at <a href="#">script<sup>p591</sup></a> elements after the script runs (just before the corresponding <a href="#">load<sup>p1144</sup></a> event)
<code>beforeprint</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">Window<sup>p768</sup></a> before printing
<code>beforescriptexecute</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">script<sup>p591</sup></a> elements	Fired at <a href="#">script<sup>p591</sup></a> elements just before the script runs; canceling the event cancels the running of the script
<code>beforeunload</code>	<a href="#">BeforeUnloadEvent<sup>p806</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">Window<sup>p768</sup></a> when the page is about to be unloaded, in case the page would like to show a warning prompt
<code>blur</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Window<sup>p768</sup></a> , elements	Fired at nodes when they stop being <a href="#">focused<sup>p728</sup></a>
<code>cancel</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">dialog<sup>p586</sup></a> elements	Fired at <a href="#">dialog<sup>p586</sup></a> elements when they are canceled by the user (e.g. by pressing the Escape key)
<code>change</code>	<a href="#">Event<sup>p51</sup></a>	Form controls	Fired at controls when the user commits a value change (see also the <a href="#">change<sup>p494</sup></a> event of <a href="#">input<sup>p452</sup></a> elements)
<code>click<sup>p52</sup></code>	<a href="#">MouseEvent<sup>p51</sup></a>	Elements	Normally a mouse event; also synthetically fired at an element before its <a href="#">activation behaviour<sup>p725</sup></a> is run, when an element is activated from a non-pointer input device (e.g. a keyboard)
<code>close</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">dialog<sup>p586</sup></a> elements, <a href="#">WebSocket<sup>p891</sup></a>	Fired at <a href="#">dialog<sup>p586</sup></a> elements when they are closed, and at <a href="#">WebSocket<sup>p891</sup></a> elements when the connection is terminated
<code>connect</code>	<a href="#">MessageEvent<sup>p880</sup></a>	<a href="#">SharedWorkerGlobalScope<sup>p924</sup></a>	Fired at a shared worker's global scope when a new client connects
<code>contextmenu</code>	<a href="#">Event<sup>p51</sup></a>	Elements	Fired at elements when the user requests their context menu
<code>error</code>	<a href="#">Event<sup>p51</sup></a>	Global scope objects, <a href="#">Worker<sup>p929</sup></a> objects, elements, networking-related objects	Fired when unexpected errors occur (e.g. networking errors, script errors, decoding errors)
<code>focus</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Window<sup>p768</sup></a> , elements	Fired at nodes <a href="#">gaining focus<sup>p728</sup></a>
<code>hashchange</code>	<a href="#">HashChangeEvent<sup>p803</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">Window<sup>p768</sup></a> when the fragment identifier part of <a href="#">the document's address</a> changes
<code>input</code>	<a href="#">Event<sup>p51</sup></a>	Form controls	Fired at controls when the user changes the value (see also the <a href="#">change<sup>p494</sup></a> event of <a href="#">input<sup>p452</sup></a> elements)
<code>invalid</code>	<a href="#">Event<sup>p51</sup></a>	Form controls	Fired at controls during form validation if they do not satisfy their constraints
<code>languagechange</code>	<a href="#">Event<sup>p51</sup></a>	Global scope objects	Fired at the global scope object when the user's preferred languages change
<code>load</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Window<sup>p768</sup></a> , elements	Fired at the <a href="#">Window<sup>p768</sup></a> when the document has finished loading; fired at an element containing a resource (e.g. <a href="#">img<sup>p272</sup></a> , <a href="#">embed<sup>p307</sup></a> ) when its resource has finished loading
<code>loadend</code>	<a href="#">Event<sup>p51</sup> or <a href="#">ProgressEvent<sup>p52</sup></a></a>	<a href="#">img<sup>p272</sup></a> elements	Fired at <a href="#">img<sup>p272</sup></a> elements after a successful load
<code>loadstart</code>	<a href="#">ProgressEvent<sup>p52</sup></a>	<a href="#">img<sup>p272</sup></a> elements	Fired at <a href="#">img<sup>p272</sup></a> elements when a load begins (see also <a href="#">media element events<sup>p386</sup></a> )
<code>message</code>	<a href="#">MessageEvent<sup>p880</sup></a>	<a href="#">Window<sup>p768</sup></a> , <a href="#">EventSource<sup>p882</sup></a> , <a href="#">WebSocket<sup>p891</sup></a> , <a href="#">MessagePort<sup>p904</sup></a> , <a href="#">BroadcastChannel<sup>p908</sup></a> , <a href="#">DedicatedWorkerGlobalScope<sup>p924</sup></a> , <a href="#">Worker<sup>p929</sup></a>	Fired at an object when it receives a message
<code>offline</code>	<a href="#">Event<sup>p51</sup></a>	Global scope objects	Fired at the global scope object when the network connections fails
<code>online</code>	<a href="#">Event<sup>p51</sup></a>	Global scope objects	Fired at the global scope object when the network connections returns
<code>open</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">EventSource<sup>p882</sup></a> , <a href="#">WebSocket<sup>p891</sup></a>	Fired at networking-related objects when a connection is established
<code>pagehide</code>	<a href="#">PageTransitionEvent<sup>p803</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">Window<sup>p768</sup></a> when the page's entry in the <a href="#">session history<sup>p782</sup></a> stops being the <a href="#">current entry<sup>p783</sup></a>
<code>pageshow</code>	<a href="#">PageTransitionEvent<sup>p803</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">Window<sup>p768</sup></a> when the page's entry in the <a href="#">session history<sup>p782</sup></a> becomes the <a href="#">current entry<sup>p783</sup></a>
<code>popstate</code>	<a href="#">PopStateEvent<sup>p803</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">Window<sup>p768</sup></a> when the user navigates the <a href="#">session history<sup>p782</sup></a>
<code>progress</code>	<a href="#">ProgressEvent<sup>p52</sup></a>	<a href="#">img<sup>p272</sup></a> elements	Fired at <a href="#">img<sup>p272</sup></a> elements during a <a href="#">CORS-same-origin<sup>p87</sup></a> image load (see also <a href="#">media element events<sup>p386</sup></a> )
<code>readystatechange</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Document<sup>p102</sup></a>	Fired at the <a href="#">Document<sup>p102</sup></a> when it finishes parsing and again when all its subresources have finished loading
<code>reset</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">form<sup>p447</sup></a> elements	Fired at a <a href="#">Form<sup>p447</sup></a> element when it is <a href="#">reset<sup>p567</sup></a>

Event	Interface	Interesting targets	Description
<code>select</code>	<a href="#">Event<sup>p51</sup></a>	Form controls	Fired at form controls when their text selection is adjusted (whether by an API or by the user)
<code>show</code>	<a href="#">RelatedEvent<sup>b579</sup></a>	<a href="#">menu<sup>b571</sup></a> elements	Fired at a <a href="#">menu<sup>b571</sup></a> element when it is shown as a context menu
<code>sort</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">table<sup>b398</sup></a> elements	Fired at <a href="#">table<sup>b398</sup></a> elements before it is sorted; canceling the event cancels the sorting of the table
<code>storage</code>	<a href="#">StorageEvent<sup>b937</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at <a href="#">Window<sup>p768</sup></a> event when the corresponding <a href="#">localStorage<sup>p936</sup></a> or <a href="#">sessionStorage<sup>p936</sup></a> storage areas change
<code>submit</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">form<sup>p447</sup></a> elements	Fired at a <a href="#">form<sup>b447</sup></a> element when it is <a href="#">submitted<sup>p568</sup></a>
<code>toggle</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">details<sup>p567</sup></a> element	Fired at <a href="#">details<sup>p567</sup></a> elements when they open or close
<code>unload</code>	<a href="#">Event<sup>p51</sup></a>	<a href="#">Window<sup>p768</sup></a>	Fired at the <a href="#">window<sup>p768</sup></a> object when the page is going away

## MIME Types

This section is non-normative.

The following MIME types are mentioned in this specification:

[`application/atom+xml`](#)

Atom [\[ATOM\]<sup>p1148</sup>](#)

[`application/ecmascript`](#)

JavaScript (legacy type) [\[ECMA262\]<sup>p1150</sup>](#)

[`application/javascript`](#)

JavaScript (legacy type) [\[ECMA262\]<sup>p1150</sup>](#)

[`application/json`](#)

JSON [\[JSON\]<sup>p1150</sup>](#)

[`application/x-ecmascript`](#)

JavaScript (legacy type) [\[ECMA262\]<sup>p1150</sup>](#)

[`application/x-javascript`](#)

JavaScript (legacy type) [\[ECMA262\]<sup>p1150</sup>](#)

[`application/octet-stream`](#)

Generic binary data [\[RFC2046\]<sup>p1152</sup>](#)

[`application/microdata+jsonp1122`](#)

Microdata as JSON

[`application/rss+xml`](#)

RSS

[`application/x-www-form-urlencodedp1119`](#)

Form submission

[`application/xhtml+xmlp1118`](#)

HTML

[`application/xml`](#)

XML [\[XML\]<sup>p1154</sup>](#) [\[RFC7303\]<sup>p1153</sup>](#)

[`image/gif`](#)

GIF images [\[GIF\]<sup>p1150</sup>](#)

***image/jpeg***

JPEG images [\[JPEG\]](#)<sup>p1150</sup>

***image/png***

PNG images [\[JPEG\]](#)<sup>p1150</sup>

***image/svg+xml***

SVG images [\[JPEG\]](#)<sup>p1150</sup>

***multipart/form-data***

Form submission [\[RFC2388\]](#)<sup>p1152</sup>

***multipart/mixed***

Generic mixed content [\[RFC2046\]](#)<sup>p1152</sup>

***multipart/x-mixed-replace*<sup>p1117</sup>**

Streaming server push

***text/cache-manifest*<sup>p1120</sup>**

Offline application cache manifests

***text/css***

CSS [\[CSS\]](#)<sup>p1149</sup>

***text/ecmascript***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/event-stream*<sup>p889</sup>**

Server-sent event streams

***text/javascript***

JavaScript [\[ECMA262\]](#)<sup>p1150</sup>

***text/javascript1.0***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/javascript1.1***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/javascript1.2***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/javascript1.3***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/javascript1.4***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/javascript1.5***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/jscript***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/livescript***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

***text/plain***

Generic plain text [\[RFC2046\]](#)<sup>p1152</sup>

***text/html*<sup>p1116</sup>**

HTML

***text/ping*<sup>p1121</sup>**

Hyperlink auditing

***text/uri-list***

List of URLs [\[RFC2483\]](#)<sup>p1152</sup>

***text/vcard***

vCard [\[RFC6350\]](#)<sup>p1153</sup>

***text/x-ecmascript***

JavaScript (legacy type) [\[ECMA262\]](#)<sup>p1150</sup>

J. Crowder, Tab Atkins, Takeshi Yoshino, Tantek Çelik, 田村健人 (TAMURA Kent), Ted Mielczarek, Terrence Wood, Thijs van der Vossen, Thomas Broyer, Thomas Koetter, Thomas O'Connor, Tim Altman, Tim Johansson, TJ VanToll, Toby Inkster, Todd Moody, Tom Baker, Tom Pike, Tommy Thorsen, Tony Ross, Travis Leithead, Trevor Saunders, Tyler Close, Victor Carbune, Vipul Snehadip Chawathe, Vitya Muhachev, Vladimir Katardjiev, Vladimir Vukićević, voracity, Wakaba, Wayne Carr, Wayne Pollock, Wellington Fernando de Macedo, Weston Ruter, Wilhelm Joys Andersen, Will Levine, William Chen, William Swanson, Wladimir Palant, Wojciech Mach, Wolfram Kriesing, Xan Gregg, Yang Chen, Ye-Kui Wang, Yehuda Katz, Yi-An Huang, Yngve Nysaeter Pettersen, Yonathan Randolph, Yuzo Fujishima, Zhenbin Xu, Zoltan Herczeg, and Øistein E. Andersen, for their useful comments, both large and small, that have led to changes to this specification over the years.

Thanks also to everyone who has ever posted about HTML to their blogs, public mailing lists, or forums, including all the contributors to the [various W3C HTML WG lists](#) and the [various WHATWG lists](#).

Special thanks to Richard Williamson for creating the first implementation of [canvas](#)<sup>p607</sup> in Safari, from which the canvas feature was designed.

Special thanks also to the Microsoft employees who first implemented the event-based drag-and-drop mechanism, [contenteditable](#)<sup>p739</sup>, and other features first widely deployed by the Windows Internet Explorer browser.

Special thanks and \$10,000 to David Hyatt who came up with a broken implementation of the [adoption agency algorithm](#)<sup>p1015</sup> that the editor had to reverse engineer and fix before using it in the parsing section.

Thanks to the participants of the microdata usability study for allowing us to use their mistakes as a guide for designing the microdata feature.

Thanks to the many sources that provided inspiration for the examples used in the specification.

Thanks also to the Microsoft blogging community for some ideas, to the attendees of the W3C Workshop on Web Applications and Compound Documents for inspiration, to the #mrt crew, the #mrt.no crew, and the #whatwg crew, and to Pillar and Hedral for their ideas and support.

Thanks to Igor Zhanov for generating PDF versions of the specification.

This specification is written by Ian Hickson (Google, ian@hixie.ch), with contributions from Simon Pieters (Opera, simonp@opera.com) in the [img](#)<sup>p272</sup> section.

The image in the introduction is based on [a photo](#) by [Wonderlane](#). ([CC BY 2.0](#))

The image of two cute kittens in a basket used in the context menu example is based on [a photo](#) by [Alex G.](#) ([CC BY 2.0](#))

The Blue Robot Player sprite used in the canvas demo is based on [a work](#) by [JohnColburn](#). ([CC BY-SA 3.0](#))

The photograph of robot 148 climbing the tower at the FIRST Robotics Competition 2013 Silicon Valley Regional is based on [a work](#) by [Lenore Edman](#). ([CC BY 2.0](#))

Parts of this specification are © Copyright 2004-2014 Apple Inc., Mozilla Foundation, and Opera Software ASA. You are granted a license to use, reproduce and create derivative works of this document.
